2c)	Moteurs à excitation composée ayant une plage de vitesses supérieure à 35 % et moteurs à excitation série	Le constructeur doit attribuer une vitesse maximale de sécurité en fonctionnement qui sera marquée sur la plaque signalétique. La survitesse de ces moteurs sera égale à 1,1 fois cette vitesse maximale de sécurité en fonctionnement. Ce marquage est inutile si la survitesse correspond à 1,1 fois la vitesse à vide à la tension assignée

Ajouter le nouveau point 1d) suivant au tableau 16:

Point	Type de machines	Prescription de survitesse
1d)	Moteurs triphasés à induction à cage, à une seule vitesse selon l'article 8.5	1,2 fois la vitesse maximale de sécurité en fonctionnement

Table 15 – Maximum safe operating speed (min^{-1}) of three-phase single-speed cage induction motors for voltages up to and including 690 V

Frame number	2 pole	4 pole	6 pole
≤ 100	5 200	3 600	2 400
112	5 200	3 600	2 400
132	4 500	2 700	2 400
160	4 500	2 700	2 400
180	4 500	2 700	2 400
200	4 500	2 300	1 800
225	3 600	2 300	1 800
250	3 600	2 300	1 800
280	3 600	2 300	1 800
315	3 600	2 300	1 800

NOTE – When operating at speeds above rated speed, for example, when used with adjustable speed controls, noise and vibration levels will increase. The user may require to fine balance of the motor rotor for acceptable operation above rated speed. Bearing life may be reduced. Attention should be paid to the regreasing intervals and the grease service life.

Renumber the existing clauses 8.5 to 8.9 to 8.6 to 8.10

Renumber the existing tables 15 to 18 to 16 to 19.

Page 89

Table 15 – Overspeeds

No change to the English text.

Insert the following new item 1d) to table 16:

Item	Machine type	Overspeed
1d)	Three-phase single-speed cage induction motors according to clause 8.5	1,2 times the maximum safe operating speed

Page 90

8.8 Essai de commutation pour machines à collecteur

Remplacer le texte de cet article par le texte suivant:

Une machine à courant continu ou à courant alternatif comportant un collecteur doit être capable de fonctionner de la marche à vide à la marche en surintensité ou excès de couple spécifiée aux articles 8.2 et 8.3, sans dommage permanent à la surface du collecteur ou des balais et sans étincelles dangereuses, les balais restant calés dans la même position. Si possible, l'essai de commutation doit être effectué à chaud.

8.9.1 Généralités

Remplacer le texte de ce paragraphe par le texte suivant:

Les prescriptions du présent paragraphe ne s'appliquent qu'aux machines synchrones de puissance assignée égale ou supérieure à 300 kW (ou kVA), destinées à être raccordées à des réseaux fonctionnant à des fréquences nominales de $16^2/_3$ Hz à 100 Hz inclus en vue de réduire au minimum les interférences entre les lignes de transport et les circuits adjacents.

Page 92

8.9.3 Essais

Remplacer le premier alinéa de ce paragraphe par le texte suivant:

Les machines synchrones à courant alternatif doivent être soumises à des essais de type ayant pour objet de vérifier leur conformité à 8.9.2. La gamme des fréquences de mesure doit couvrir tous les harmoniques de la fréquence assignée à 5 000 Hz.

Page 96

9.2 Marquage

Remplacer le premier alinéa de cet article par le texte suivant:

Pour les machines de puissance assignée inférieure ou égale à 750 W (ou VA) et dont les dimensions ne relèvent pas du domaine de la CEI 60072, ainsi que pour les machines incorporées, pour usage spécial, de puissance assignée inférieure ou égale à 3 kW (ou kVA), les indications 1, 2, 11 et 12 doivent au moins figurer comme marquage minimal.

Remplacer le point 8) par le texte suivant:

8) Classification thermique et limite de température ou d'échauffement (quand elle est inférieure à celle de la classification thermique) et, si nécessaire, méthode de mesure, suivie dans le cas d'une machine à hydroréfrigérant de «P» ou «S», selon que l'échauffement est mesuré par rapport au fluide de refroidissement respectivement primaire ou secondaire; voir l'article 7.2. Cette information, présentée éditorialement avec un trait de fraction oblique, doit être donnée à la fois pour le stator et pour le rotor si leurs classifications thermiques diffèrent.

Page 91

8.8 Commutation test for commutator machines

Replace the text of this clause with the following new text:

A d.c. or a.c. commutator machine shall be capable of operating from no-load to operation with the excess current or excess torque, specified in clauses 8.2 and 8.3 respectively, without permanent damage to the surface of the commutator or brushes and without injurious sparking, the brushes remaining in the same set position. If possible, the commutation test shall be performed in warm conditions.

8.9.1 General

Replace the text of this clause with the following new text:

The requirements of this subclause apply only to synchronous machines having rated outputs of 300 kW (or kVA) or more, intended for connection to power networks operating at nominal frequencies of $16^{2}/_{3}$ Hz to 100 Hz inclusive, with a view to minimizing interference between power lines and adjacent circuits.

Page 93

8.9.3 Tests

Replace the first paragraph of this subclause with the following new paragraph:

Type tests shall be carried out on a.c. machines to verify compliance with 8.9.2. The range of frequencies measured shall cover all harmonics from rated frequency up to 5 000 Hz.

Page 97

9.2 Marking

Replace the first paragraph of this clause with the following new paragraph:

For machines with rated outputs up to and including 750 W (or VA) and dimensions not covered by IEC 60072 and for special-purpose built-in machines with rated outputs up to and including 3 kW (or kVA), items 1, 2, 11 and 12 shall be marked as a minimum.

Replace the text of item 8) with the following new text:

8) The thermal classification and the limit of temperature or of temperature rise (when lower than that of the thermal classification) and, if necessary, the method of measurement, followed in the case of a machine with a water-cooled heat exchanger by 'P' or 'S', depending on whether the temperature rise is measured above the primary or secondary coolant respectively (see clause 7.2). This information shall be given for both stator and rotor (separated by a slash) when their thermal classification differ.

Page 98

Remplacer le texte du point 10) par le nouveau texte suivant:

10) Puissance(s) assignée(s) ou plage de puissance assignée.

Modifer le titre du point 11) comme suit:

11) Tension(s) assignée(s) ou plage de tension assignée.

Supprimer le texte suivant du point 11):

Deux tensions assignées différentes X et Y doivent être indiquées par X/Y et une plage de tensions assignées de X à Y doit être indiquée X – Y.

Remplacer le texte du point 13) par le nouveau texte suivant:

13) Courant(s) assigné(s) ou plage de courant assigné.

Remplacer le texte du point 14) par le nouveau texte suivant:

14) Vitesse(s) assignée(s) ou plage de vitesse assignée.

Remplacer le texte du point 16) par le nouveau texte suivant:

16) Survitesse admissible si différente de celle spécifiée à l'article 8.6,
ou
vitesse maximale de sécurité en fonctionnement si inférieure à celle spécifiée à l'article 8.5.

Ajouter un nouveau cinquième alinéa comme suit:

Deux valeurs assignées différentes doivent être indiquées par X/Y et une plage de valeurs assignées doit être indiquée par X–Y (voir la CEI 61293).

Page 100

10.1 Mise à la terre des machines

Remplacer le deuxième alinéa de cet article par le nouveau texte suivant:

Dans le cas des machines de tension assignée supérieure à 50 V en courant alternatif ou 120 V en courant continu, mais ne dépassant pas 1 000 V en courant alternatif ou 1 500 V en courant continu, la borne du conducteur de terre doit être située à proximité des bornes de raccordement des conducteurs de phase, à l'intérieur de la boîte de connexions éventuelle. Les machines de puissance assignée supérieure à 100 kW (ou kVA) doivent également comporter une borne de terre montée sur la carcasse.

Page 99

Replace the text of item 10) with the following new text:

10) The rated output(s) or range of rated output.

Delete the following sentence from item 11:

Two different rated voltages X and Y shall be indicated by X/Y and a range of rated voltages from X to Y shall be indicated by X – Y.

Replace the first sentence of item 12) with the following new text

12) For a.c. machines the rated frequency or range of rated frequency.

Replace the text of item 13) with the following new text:

13) The rated current(s) or range of rated current.

Replace the text of item 14) with the following new text:

14) The rated speed(s) or range of rated speed.

Replace item 16 with the following new text:

16) The permissible overspeed if other than specified in clause 8.6,
or
the maximum safe operating speed if less than in clause 8.5.

Add, after the fourth paragraph, the following new paragraph:

Two different rated values shall be indicated by X/Y and a range of rated values shall be indicated by X – Y (see IEC 61293).

Page 101

10.1 Earthing of machines

Replace the second paragraph of this clause with the following new paragraph:

In the case of machines having rated voltages greater than 50 V a.c. or 120 V d.c., but not exceeding 1 000 V a.c. or 1 500 V d.c., the terminal for the earth conductor shall be situated in the vicinity of the terminals for the line conductors, being placed in the terminal box, if one is provided. Machines having rated outputs in excess of 100 kW (or kVA) shall have in addition an earth terminal fitted on the frame.

Page 102

10.2 Clavette(s) de bout d'arbre

Remplacer le texte de cet article par le nouveau texte suivant:

Quand un bout d'arbre d'une machine est prévu avec une ou plusieurs rainures de clavette, chaque rainure doit être pourvue d'une clavette entière de forme et de longueurs normales.

Page 104

Tableau 18 – Nomenclature des tolérances sur les valeurs des grandeurs

Remplacer les points 1, 1a), 1b) et 2 par ce qui suit:

1	Rendement η	
1a)	Par sommation des pertes:	
	– machines de puissance inférieure ou égale à 50 kW (ou kVA)	–15 % de (1 – η)
	– machines de puissance supérieure à 50 kW (ou kVA)	–10 % de (1 – η)
1b)	Par mesurage des pertes totales	–15 % de (1 – η)
2	Pertes totales	+10 % des pertes totales
NOTE 4 – Les tolérances dépendent du rapport de puissance P_N en kW, à la vitesse assignée en min^{-1}.		

Page 108

Remplacer les figures 1 à 13 par les nouvelles figures suivantes:

Page 103

10.2 Shaft-end key(s)

Replace the text of this clause with the following new text:

When a machine shaft end is provided with one or more keyways, each shall be provided with a full key of normal shape and length.

Page 105

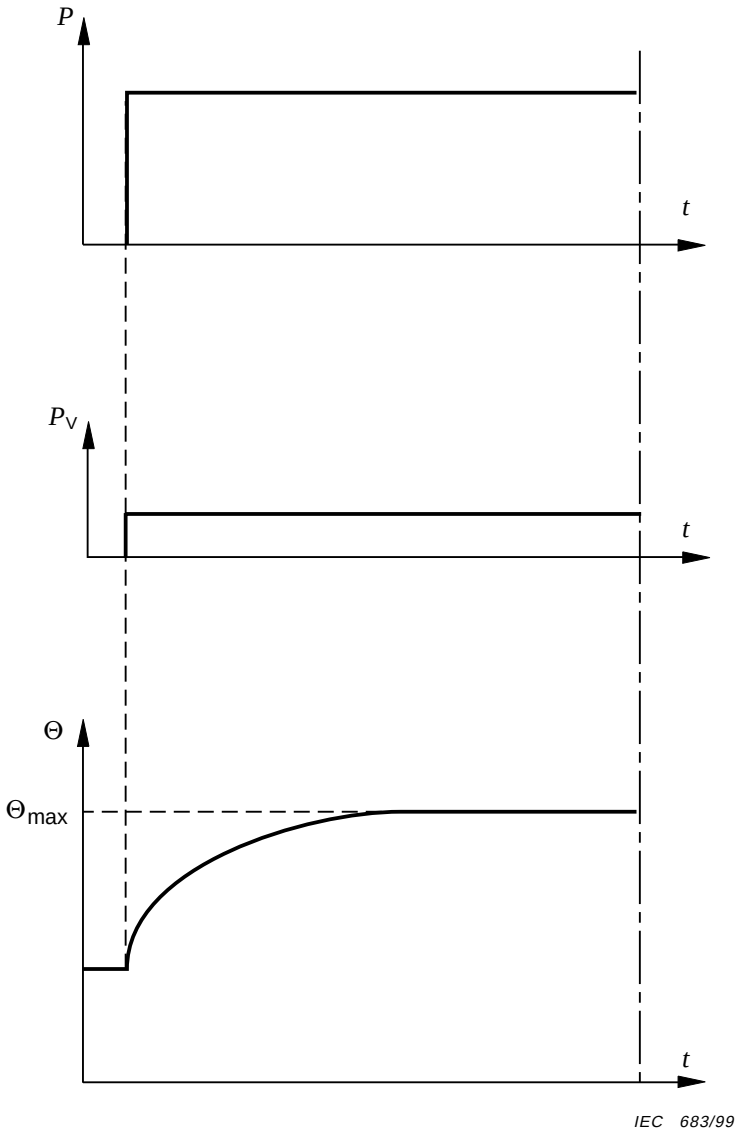
Table 18 – Schedule of tolerances on values of quantities

Replace items 1, 1a), 1b) and 2 of the above table with the following new items:

1	Efficiency η	
1a)	By summation of losses:	
	– machines up to and including 50 kW (or kVA)	–15 % of $(1 - \eta)$
	– machines above 50 kW (or kVA)	–10 % of $(1 - \eta)$
1b)	By total loss measurement	–15 % of $(1 - \eta)$
2	Total losses	+10 % of the total losses
NOTE 4 – Tolerances depend on the ratio of rated output P_N, in kW, to rated speed in min^{-1}.		

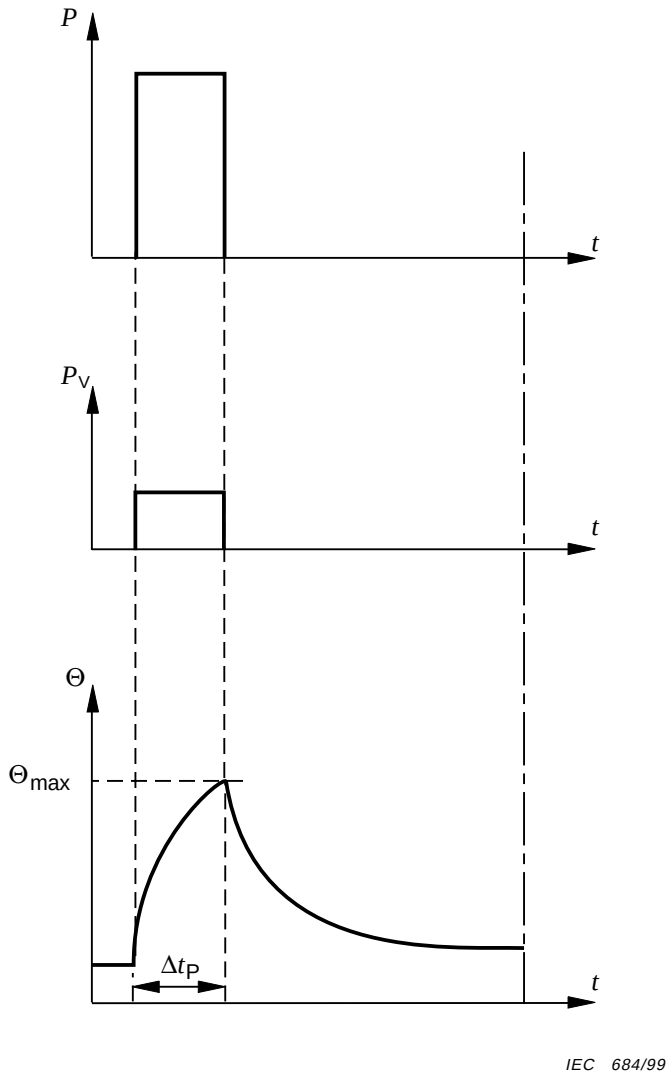
Page 108

Replace the existing figures 1 to 13 by the following new figures.



P	=	charge	P	=	load
P_V	=	pertes électriques	P_V	=	electrical losses
$Θ$	=	température	$Θ$	=	temperature
$Θ_{max}$	=	température maximale atteinte	$Θ_{max}$	=	maximum temperature attained
t	=	temps	t	=	time

Figure 1 – Service continu – Service type S1
Figure 1 – Continuous running duty – Duty type S1



P	=	charge	P	=	load

Page 14 de l'amendement 1 à la 10e édition

12.1 Compatibilité électromagnétique (CEM)

Ajouter le nouvel alinéa suivant entre le troisième et le quatrième alinéa:

Les prescriptions de la section 12 ne s'appliquent pas aux machines dont les caractéristiques de CEM sont notablement modifiées par les capotage et montage finals.

Page 18 de l'amendement 1 à la 10e édition

12.1.3.2 Essais d'émission

Remplacer les deuxième et troisième alinéas par le nouveau texte suivant:

Pour les machines à collecteur à courant alternatif, des essais de type à vide doivent être effectués afin de vérifier la conformité à 12.1.2.3 pour l'émission de conduction et l'émission de rayonnement.

Pour les machines à collecteur à courant continu, des essais de type à vide ou à charge minimale possible doivent être effectués afin de vérifier la conformité à 12.1.2.3 pour l'émission de rayonnement.

Ajouter à la fin de l'article 12.1 la note suivante:

NOTE – La mesure à vide se justifie par l'influence négligeable de la charge sur l'émission.

_____

Page 15 of amendment 1 to the 10th edition

12.1 Electromagnetic compatibility (EMC)

Add the following new paragraph between the third and fourth paragraph:

The requirements of section 12 do not apply to machines when the EMC performance is significantly affected by the final enclosure and assembly.

Page 19 of amendment 1 to the 10th edition

12.1.3.2 Emission tests

Replace the second and third paragraphs with the following new text:

For a.c. commutator machines, type tests on no-load for conducted and radiated emission shall be carried out to verify compliance with 12.1.2.3.

For d.c. commutator machines, type tests on no-load or minimum possible load for radiated emission shall be carried out to verify compliance with 12.1.2.3.

Add the following note at the end of clause 12.1:

NOTE – The measurement on no-load is justified by the negligible influence of load on the emission.

Validité de la présente publication

Le contenu technique des publications de la CEI est constamment revu par la CEI afin qu'il reflète l'état actuel de la technique.

Des renseignements relatifs à la date de reconfirmation de la publication sont disponibles auprès du Bureau Central de la CEI.

Les renseignements relatifs à ces révisions, à l'établissement des éditions révisées et aux amendements peuvent être obtenus auprès des Comités nationaux de la CEI et dans les documents ci-dessous:

- **Bulletin de la CEI**
- **Annuaire de la CEI**
  Publié annuellement
- **Catalogue des publications de la CEI**
  Publié annuellement et mis à jour régulièrement

Terminologie

En ce qui concerne la terminologie générale, le lecteur se reportera à la CEI 50: *Vocabulaire Electrotechnique International* (VEI), qui se présente sous forme de chapitres séparés traitant chacun d'un sujet défini. Des détails complets sur le VEI peuvent être obtenus sur demande. Voir également le dictionnaire multilingue de la CEI.

Les termes et définitions figurant dans la présente publication ont été soit tirés du VEI, soit spécifiquement approuvés aux fins de cette publication.

Symboles graphiques et littéraux

Pour les symboles graphiques, les symboles littéraux et les signes d'usage général approuvés par la CEI, le lecteur consultera:

– la CEI 27: *Symboles littéraux à utiliser en électrotechnique*;

– la CEI 417: *Symboles graphiques utilisables sur le matériel. Index, relevé et compilation des feuilles individuelles;*

– la CEI 617: *Symboles graphiques pour schémas;*

et pour les appareils électromédicaux,

– la CEI 878: *Symboles graphiques pour équipements électriques en pratique médicale.*

Les symboles et signes contenus dans la présente publication ont été soit tirés de la CEI 27, de la CEI 417, de la CEI 617 et/ou de la CEI 878, soit spécifiquement approuvés aux fins de cette publication.

Publications de la CEI établies par le même comité d'études

L'attention du lecteur est attirée sur les listes figurant à la fin de cette publication, qui énumèrent les publications de la CEI préparées par le comité d'études qui a établi la présente publication.

Validity of this publication

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology.

Information relating to the date of the reconfirmation of the publication is available from the IEC Central Office.

Information on the revision work, the issue of revised editions and amendments may be obtained from IEC National Committees and from the following IEC sources:

- **IEC Bulletin**
- **IEC Yearbook**
  Published yearly
- **Catalogue of IEC publications**
  Published yearly with regular updates

Terminology

For general terminology, readers are referred to IEC 50: *International Electrotechnical Vocabulary (IEV)*, which is issued in the form of separate chapters each dealing with a specific field. Full details of the IEV will be supplied on request. See also the IEC Multilingual Dictionary.

The terms and definitions contained in the present publication have either been taken from the IEV or have been specifically approved for the purpose of this publication.

Graphical and letter symbols

For graphical symbols, and letter symbols and signs approved by the IEC for general use, readers are referred to publications:

– IEC 27: *Letter symbols to be used in electrical technology;*

– IEC 417: *Graphical symbols for use on equipment. Index, survey and compilation of the single sheets;*

– IEC 617: *Graphical symbols for diagrams*;

and for medical electrical equipment,

– IEC 878: *Graphical symbols for electromedical equipment in medical practice.*

The symbols and signs contained in the present publication have either been taken from IEC 27, IEC 417, IEC 617 and/or IEC 878, or have been specifically approved for the purpose of this publication.

IEC publications prepared by the same technical committee

The attention of readers is drawn to the end pages of this publication which list the IEC publications issued by the technical committee which has prepared the present publication.

COMMISSION ÉLECTROTECHNIQUE INTERNATIONALE

MACHINES ÉLECTRIQUES TOURNANTES

Deuxième partie: Méthodes pour la détermination des pertes et du rendement des machines électriques tournantes à partir d'essais (à l'exclusion des machines pour véhicules de traction)

PRÉAMBULE

1) Les décisions ou accords officiels de la CEI en ce qui concerne les questions techniques, préparés par des Comités d'Etudes où sont représentés tous les Comités nationaux s'intéressant à ces questions, expriment dans la plus grande mesure possible un accord international sur les sujets examinés.

2) Ces décisions constituent des recommandations internationales et sont agréées comme telles par les Comités nationaux.

3) Dans le but d'encourager cette unification internationale, la CEI exprime le vœu que tous les Comités nationaux ne possédant pas encore de règles nationales, lorsqu'ils préparent ces règles, prennent comme base fondamentale de ces règles les recommandations de la CEI dans la mesure où les conditions nationales le permettent.

4) On reconnaît qu'il est désirable que l'accord international sur ces questions soit suivi d'un effort pour harmoniser les règles nationales de normalisation avec ces recommandations dans la mesure où les conditions nationales le permettent. Les Comités nationaux s'engagent à user de leur influence dans ce but.

PRÉFACE

La présente recommandation a été établie par le Sous-Comité 2D: Pertes et rendement, du Comité d'Etudes N° 2 de la CEI: Machines tournantes. Elle remplace la deuxième édition publiée en 1960.

Elle fait partie d'une série de recommandations traitant des machines électriques tournantes, et dont les autres parties sont:

Première partie: Valeurs nominales et caractéristiques de fonctionnement (Publication 34-1 de la CEI).
Troisième partie: Valeurs nominales et caractéristiques des turbomachines triphasées à 50 Hz (Publication 34-3 de la CEI).
Quatrième partie: Méthodes pour la détermination à partir d'essais des grandeurs des machines synchrones (Publication 34-4 de la CEI).
Cinquième partie: Degrés de protection procurés par les enveloppes des machines tournantes (Publication 34-5 de la CEI).
Sixième partie: Modes de refroidissement des machines tournantes (Publication 34-6 de la CEI).

Les travaux de révision commencèrent lors de la réunion tenue à Tokyo en 1965, et un projet fut discuté lors de la réunion tenue à Londres en 1968. A la suite de cette dernière réunion, un projet définitif fut soumis à l'approbation des Comités nationaux suivant la Règle des Six Mois en novembre 1969.

Les pays suivants se sont prononcés explicitement en faveur de la publication:

Afrique du Sud	Israël
Allemagne	Italie
Australie	Japon
Autriche	Norvège
Belgique	Pays-Bas
Corée (République Démocratique Populaire de)	Pologne
Danemark	Royaume-Uni
Etats-Unis d'Amérique	Suède
Finlande	Suisse
France	Turquie
Hongrie	Union des Républiques Socialistes Soviétiques

INTERNATIONAL ELECTROTECHNICAL COMMISSION

ROTATING ELECTRICAL MACHINES

Part 2: Methods for determining losses and efficiency of rotating electrical machinery from tests (excluding machines for traction vehicles)

FOREWORD

1) The formal decisions or agreements of the IEC on technical matters, prepared by Technical Committees on which all the National Committees having a special interest therein are represented, express, as nearly as possible, an international consensus of opinion on the subjects dealt with.

2) They have the form of recommendations for international use and they are accepted by the National Committees in that sense.

3) In order to promote this international unification, the IEC expresses the wish that all National Committees having as yet no national rules, when preparing such rules, should use the IEC recommendations as the fundamental basis for these rules in so far as national conditions will permit.

4) The desirability is recognized of extending international agreement on these matters through an endeavour to harmonize national standardization rules with these recommendations in so far as national conditions will permit. The National Committees pledge their influence towards that end.

PREFACE

This Recommendation has been prepared by Sub-Committee 2D, Losses and Efficiency, of IEC Technical Committee No. 2, Rotating Machinery. It supersedes the second edition published in 1960.

It constitutes part of a series of recommendations dealing with rotating electrical machinery, other parts being:

Part 1, Rating and Performance (IEC Publication 34-1).
Part 3, Ratings and Characteristics of Three-phase, 50 Hz Turbine-type Machines (IEC Publication 34-3).
Part 4, Methods for Determining Synchronous Machine Quantities from Tests (IEC Publication 34-4).
Part 5, Degrees of Protection by Enclosures for Rotating Machinery (IEC Publication 34-5).
Part 6, Methods of Cooling Rotating Machinery (IEC Publication 34-6).

Work on the revision started at the meeting held in Tokyo in 1965, and a further draft was discussed at the meeting held in London in 1968. As a result of this latter meeting, a final draft was submitted to the National Committees for approval under the Six Months' Rule in November 1969.

The following countries voted explicitly in favour of publication:

Australia
Austria
Belgium
Denmark
Finland
France
Germany
Hungary
Israel
Italy
Japan
Korea (Democratic People's Republic of)
Netherlands
Norway
Poland
South Africa
Sweden
Switzerland
Turkey
Union of Soviet Socialist Republics
United Kingdom
United States of America

MACHINES ÉLECTRIQUES TOURNANTES

Deuxième partie: Méthodes pour la détermination des pertes et du rendement des machines électriques tournantes à partir d'essais (à l'exclusion des machines pour véhicules de traction)

SECTION UN — GÉNÉRALITÉS

1. Domaine d'application

La présente recommandation s'applique aux machines à courant continu ainsi qu'aux machines à courant alternatif, synchrones et à induction, de toutes dimensions, qui sont du domaine de la Publication 34-1 de la CEI. Les principes de ces recommandations peuvent toutefois être adoptés pour d'autres types de machines telles que commutatrices, moteurs à collecteurs et moteurs à induction monophasés, pour lesquelles on applique en général d'autres méthodes de détermination des pertes.

2. Objet

La présente recommandation a pour objet de définir les méthodes de détermination du rendement à partir d'essais et également de spécifier les méthodes permettant de déterminer des pertes d'une nature donnée lorsqu'il est nécessaire de les connaître à d'autres fins.

3. Généralités

Les essais doivent être effectués sur une machine en parfait état, tous les couvercles étant montés comme en fonctionnement normal. Les dispositifs de réglage automatique de la tension qui ne font pas partie intégrante de la machine sont mis hors fonction, sauf spécification contraire.

Sauf spécification contraire, les appareils de mesure et leurs accessoires, tels que transformateurs de mesure, shunts et ponts utilisés pendant ces essais, doivent être d'une classe de précision ne dépassant pas 1,0 (Publication 51 de la CEI: Recommandations pour les appareils de mesure électriques indicateurs et leurs accessoires). Les appareils utilisés pour déterminer la résistance en courant continu doivent être d'une classe de précision ne dépassant pas 0,5.

Les appareils de mesure doivent être choisis de façon que la lecture s'effectue sur une zone de l'échelle telle qu'une fraction de division ne corresponde qu'à une faible proportion de la lecture effectuée, et puisse être facilement estimée.

Sur les machines à balais réglables, les balais doivent être placés dans la position correspondant au service nominal spécifié. Pour les mesures à vide, les balais peuvent être placés sur la ligne neutre.

La vitesse de rotation peut être mesurée par une méthode stroboscopique, par un compteur numérique ou par un tachymètre. Pour la mesure du glissement, la vitesse synchrone doit être déterminée à partir de la fréquence d'alimentation au cours de l'essai.

ROTATING ELECTRICAL MACHINES

Part 2: Methods for determining losses and efficiency of rotating electrical machinery from tests (excluding machines for traction vehicles)

SECTION ONE — GENERAL

1. **Scope**

This Recommendation applies to d.c. machines and to a.c. synchronous and induction machines of all sizes within the scope of IEC Publication 34-1. The principles can, however, be applied to other types of machines such as rotary convertors, a.c. commutator motors and single-phase induction motors for which other methods of determining losses are generally used.

2. **Object**

This Recommendation is intended to establish methods of determining efficiencies from tests, and also to specify methods of obtaining particular losses when these are required for other purposes.

3. **General**

Tests shall be conducted on a completely sound machine with all covers fitted in the manner required for normal service, with any devices for automatic voltage regulation not a composite part of the machine itself being made inoperative, unless otherwise agreed.

Measuring instruments and their accessories, such as measuring transformers, shunts and bridges used during the tests, unless otherwise specified, shall have an accuracy class not above 1.0 (IEC Publication 51, Recommendations for Indicating Electrical Measuring Instruments and their Accessories). Instruments for determining d.c. resistance shall be to accuracy class not above 0.5.

Instruments shall be selected to give readings over the effective range such that a fraction of a division is a small percentage of the actual reading and can be easily estimated.

On machines with adjustable brushes, the brushes shall be placed in the position corresponding to the specified rating. For measurements on no-load, the brushes may be placed on the neutral axis.

Speed of rotation may be measured by a stroboscopic method, digital counter or tachometer. When measuring slip, the synchronous speed should be determined from the supply frequency during the test.

Lorsqu'on mesure le rendement global ou la puissance absorbée d'un groupe de machines constitué de deux machines électriques, ou d'une machine et d'un transformateur, ou d'une génératrice et de son moteur d'entraînement, ou d'un moteur et de la machine qu'il entraîne, il n'est pas nécessaire d'indiquer les rendements individuels. Si toutefois ils sont indiqués séparément, ils doivent être considérés comme approximatifs.

3.1 *Liste des symboles*

Ci-dessous, la liste des symboles utilisés dans le texte, avec leur signification:

I = courant
I_l = courant en charge à la tension nominale
I_{lr} = courant primaire principal à tension réduite
I_o = courant à vide à la tension nominale
I_{or} = courant à vide à tension réduite
J = moment d'inertie
n = vitesse nominale, en tours par minute
P_l = puissance absorbée à la tension nominale
P_{lr} = puissance absorbée par l'enroulement primaire à tension réduite
s = glissement
U = tension d'excitation aux bornes du rhéostat principal
U_e = tension totale d'excitation
U_n = tension nominale
U_r = tension réduite pour essai en charge
φ = angle de déphasage en charge à tension nominale
φ_r = angle de déphasage en charge à tension réduite
φ_o = angle de déphasage à vide à tension nominale
φ_{or} = angle de déphasage à vide à tension réduite

4. Définitions

Pour les définitions des termes généraux employés dans la présente recommandation, il convient de se reporter au Vocabulaire Electrotechnique International [Publication 50 de la CEI].

Dans le cadre de la présente recommandation, les définitions suivantes sont applicables:

4.1 *Rendement*

Rapport de la puissance utile à la puissance absorbée, exprimées dans les mêmes unités, et généralement indiqué en pour-cent.

4.2 *Pertes totales*

Différence entre la puissance absorbée et la puissance utile.

4.3 *Essai au frein*

Essai dans lequel la puissance mécanique fournie par une machine fonctionnant en moteur est déterminée par la mesure du couple sur l'arbre au moyen d'un frein ou d'un dynamomètre et par la mesure simultanée de la vitesse de rotation; l'essai peut être également effectué sur une machine fonctionnant en génératrice au moyen d'un dynamomètre pour déterminer la puissance mécanique absorbée.

When the over-all efficiency or the absorbed power is measured for a group of machines comprising two electrical machines, or a machine and a transformer, or a generator and its driving machine, or a motor and its driven machine, there is no need to indicate the individual efficiencies. If, however, these are given separately, they should be regarded as approximate.

3.1 *List of symbols*

A list of symbols used in the draft, with the general meanings attributed to each one, is given below:

I = current
I_l = load current at rated voltage
I_{lr} = main primary current at reduced voltage
I_o = no-load current at rated voltage
I_{or} = no-load current at reduced voltage
J = moment of inertia
n = rated speed, in revolutions per minute
P_l = power absorbed at rated voltage
P_{lr} = power absorbed by main primary winding at reduced voltage
s = slip
U = excitation voltage across terminals of main rheostat
U_e = total excitation voltage
U_n = rated voltage
U_r = reduced voltage for load test
φ = load phase angle at rated voltage
φ_r = load phase angle at reduced voltage
φ_o = no-load phase angle at rated voltage
φ_{or} = no-load phase angle at reduced voltage

4. Definitions

For definitions of general terms used in this Recommendation, reference should be made to the International Electrotechnical Vocabulary [IEC Publication 50].

For the purpose of this Recommendation, the following definitions apply:

4.1 *Efficiency*

The ratio of output to input expressed in the same units and usually given as a percentage.

4.2 *Total loss*

The difference between the input and the output.

4.3 *Braking test*

A test in which the mechanical power output of a machine acting as a motor is determined by the measurement of the shaft torque, by means of a brake or dynamometer, together with the rotational speed. Alternatively, a test performed on a machine acting as a generator, by means of a dynamometer to determine the mechanical power input.

4.4 *Essai avec machine auxiliaire tarée*

Essai dans lequel la puissance mécanique absorbée ou fournie par une machine électrique est calculée à partir de la puissance électrique fournie ou absorbée par une machine auxiliaire tarée accouplée mécaniquement à la machine en essai.

4.5 *Essai en opposition*

Essai dans lequel deux machines identiques sont accouplées mécaniquement, les pertes totales des deux machines étant calculées par différence des puissances électriques que l'une absorbe et que l'autre fournit (voir figure 1, page 54).

4.6 *Essai en opposition avec marche en parallèle sur un réseau*

Essai dans lequel deux machines identiques sont accouplées mécaniquement et connectées toutes deux à un même réseau. Les pertes totales des deux machines sont égales à la puissance fournie par ce réseau (voir figure 2, page 54).

4.7 *Essai de ralentissement*

Essai dans lequel les pertes d'une machine sont calculées à partir du taux de ralentissement de la machine lorsque n'interviennent que ces pertes.

4.8 *Essai calorimétrique*

Essai dans lequel on détermine les pertes de la machine à partir de la quantité de chaleur qu'elles produisent. Les pertes sont calculées à partir du produit de la quantité de réfrigérant par son échauffement, et le cas échéant de la quantité de chaleur dissipée à l'extérieur.

4.9 *Essai à vide*

Essai dans lequel une machine fonctionne en moteur sans fournir de puissance mécanique utile sur l'arbre.

4.10 *Essai à circuit ouvert*

Essai dans lequel une machine fonctionne en génératrice avec ses bornes à circuit ouvert.

4.11 *Essai de court-circuit permanent*

Essai dans lequel une machine fonctionne en génératrice avec ses bornes en court-circuit.

4.12 *Essai au facteur de puissance nul*

Essai à vide effectué sur une machine synchrone surexcitée et fonctionnant à un facteur de puissance très voisin de zéro.

4.4 *Calibrated driving machine test*

A test in which the mechanical input or output of an electrical machine is calculated from the electrical output or input of a calibrated machine mechanically coupled to the machine on test.

4.5 *Mechanical back-to-back test*

A test in which two identical machines are mechanically coupled together, and the total losses of both machines are calculated from the difference between the electrical input to one machine and the electrical output of the other machine (see Figure 1, page 54).

4.6 *Electrical back-to-back test*

A test in which two identical machines are mechanically coupled together, and they are both connected electrically to a power system. The total losses of both machines are taken as the power input drawn from the system (see Figure 2, page 54).

4.7 *Retardation test*

A test in which the losses in a machine are deduced from the rate of deceleration of the machine when only these losses are present.

4.8 *Calorimetric test*

A test in which the losses in a machine are deduced from the heat produced by them. The losses are calculated from the product of the amount of coolant and its temperature rise, and the heat dissipated in the surrounding media.

4.9 *No-load test*

A test in which the machine is run as a motor providing no useful mechanical output from the shaft.

4.10 *Open-circuit test*

A test in which a machine is run as a generator with its terminals open-circuited.

4.11 *Sustained short-circuit test*

A test in which a machine is run as a generator with its terminals short-circuited.

4.12 *Zero power factor test*

A no-load test on a synchronous machine which is over-excited and operates at a power factor very close to zero.

5. **Température de référence**

Sauf spécification contraire, toutes les pertes par effet Joule doivent être ramenées à l'une des températures indiquées ci-après.

Classes A, E et B: 75 °C
Classes F et H: 115 °C

Note. — Il n'est pas nécessaire que la classe réelle d'isolant employée pour l'organe considéré de la machine corresponde aux limites d'échauffement choisies.

SECTION DEUX — MACHINES A COURANT CONTINU

6. **Pertes à comprendre**

Les pertes totales peuvent être considérées comme la somme des pertes suivantes:

6.1 *Pertes dans le circuit d'excitation*

a) Pertes par effet Joule dans les circuits d'excitation en dérivation ou séparés et dans les rhéostats d'excitation.

b) Pertes dans l'excitatrice.

Toutes les pertes dans l'excitatrice lorsque celle-ci, formant partie intégrante d'un ensemble complet, est entraînée mécaniquement par l'arbre principal et est utilisée exclusivement pour l'excitation de la machine, ainsi que les pertes dans le rhéostat d'excitation de cette excitatrice, mais à l'exception des pertes par frottement et par ventilation.

Dans le cas d'une excitation séparée, fournie par des moyens tels que batterie, redresseur ou groupe moteur-générateur, il n'y a pas à tenir compte des pertes dans la source d'excitation ou dans les connexions entre la source et les balais.

Note. — Quand les pertes dans un système d'excitation séparé sont demandées, elles peuvent être indiquées séparément et prises égales à la différence entre le quotient de la puissance d'excitation par le rendement du système d'excitation et la puissance d'excitation.

6.2 *Pertes constantes*

a) Pertes dans le fer et pertes supplémentaires à vide dans les autres parties métalliques.

b) Pertes dues au frottement (paliers et balais) à l'exclusion des pertes dans un système de graissage séparé. Les pertes dans les paliers communs doivent être indiquées séparément, que ces paliers soient fournis ou non avec la machine.

Note. — Si l'on doit indiquer les pertes dans un système de graissage séparé, celles-ci doivent être mentionnées séparément.

5. **Reference temperature**

Unless otherwise specified, all I^2R losses shall be corrected to one of the temperatures given below:

Classes A, E and B: 75 °C
Classes F and H: 115 °C

Note. — The reference temperature need not necessarily correspond with the limits of temperature rise permitted for the actual class of insulation used for a particular part of the machine.

SECTION TWO — D.C. MACHINES

6. **Losses to be included**

The total losses may be taken as the sum of the following component losses:

6.1 *Excitation circuit losses*

a) I^2R losses in shunt or separately excited windings and in the excitation rheostats.

b) Exciter losses.

All the losses in an exciter mechanically driven from the main shaft, which forms part of the complete unit and is used solely for exciting the machine, together with losses in the rheostat in the excitation circuit of such an exciter, but with the exception of friction and windage losses.

In the case of a separate excitation supply such as battery, rectifier or motor generator set, no allowance is made for the losses in the excitation source or in the connections between the source and the brushes.

Note. — When the losses in a separate excitation system are required, these should be listed separately and can be taken as the difference between the excitation power divided by the efficiency of the excitation system, and the excitation power.

6.2 *Constant losses*

a) Losses in active iron, and additional no-load losses in other metal parts.

b) Losses due to friction (bearings and brushes) not including any losses in a separate lubricating system. Losses in common bearings shall be stated separately, whether or not such bearings are supplied with the machine.

Note. — When the losses in a separate lubricating system are required, these should be listed separately.

c) Pertes totales par ventilation dans la machine, y compris la puissance absorbée par les ventilateurs faisant partie intégrante de la machine et par les machines auxiliaires, s'il en existe, faisant partie intégrante de la machine. Les pertes dans les machines auxiliaires telles que les ventilateurs extérieurs, pompes à eau et à huile ne faisant pas partie intégrante de la machine, mais destinées exclusivement à la machine en question, ne doivent être comprises que sur accord.

Note. — Si l'on doit indiquer les pertes dans un système de ventilation séparé, elles doivent être mentionnées séparément, étant donné qu'elles ne font pas partie des pertes de la machine.

6.3 *Pertes en charge*

a) Pertes par effet Joule dans l'induit et dans les enroulements parcourus par le courant d'induit (par exemple enroulements de commutation, de compensation, d'excitation et tous enroulements connectés en série avec l'induit).

b) Pertes électriques dans les balais.

6.4 *Pertes supplémentaires en charge*

a) Pertes supplémentaires en charge dans le fer et les autres parties métalliques autres que les conducteurs.

b) Pertes par courants de Foucault dans les conducteurs d'induit, dues à la pulsation de flux dépendant des courants et à la commutation.

c) Pertes dans les balais, dues à la commutation.

Note. — Ces pertes sont parfois dites pertes supplémentaires, mais ne comprennent pas les pertes supplémentaires à vide mentionnées au paragraphe 6.2 *a*).

7. Détermination du rendement

7.1 *Totalisation des pertes*

Le rendement peut être calculé à partir des pertes totales, considérées comme la somme des pertes déterminées de la façon suivante:

7.1.1 *Pertes par excitation*

Ces pertes sont les suivantes:

7.1.1.1 *Pertes par effet Joule dans l'enroulement d'excitation*

Ces pertes sont calculées par la formule RI^2, dans laquelle R est la résistance de l'enroulement d'excitation en dérivation ou séparée, ramenée à la température de référence, et I le courant d'excitation. Sauf dans le cas *c)* ci-dessous, le courant d'excitation est celui qui correspond à la vitesse nominale et au régime nominal. Dans le cas *c)* ci-dessous, c'est celui qui correspond à la vitesse nominale à vide.

c) The total windage loss in the machine including power absorbed in integral fans and in auxiliary machines, if any, forming an integral part of the machine. The losses in auxiliary machines such as external fans, water and oil pumps not forming an integral part of the machine, but provided exclusively for the machine in question, shall be included only by agreement.

Note. — When the losses in a separate ventilating system are required, they should be listed separately as they are not part of the machine losses.

6.3 *Load losses*

a) I^2R losses in armature, and windings carrying armature current (e.g. commutating, compensating, excitation and series connected windings).

b) Electrical losses in brushes.

6.4 *Additional load losses*

a) Losses introduced by load in active iron, and other metal parts other than the conductors.

b) Eddy current losses in armature conductors caused by current dependent flux pulsation and commutation.

c) Losses in the brushes caused by commutation.

Note. — These losses are sometimes called additional losses, but they do not include the additional no-load losses in Sub-clause 6.2 *a*).

7. Determination of efficiency

7.1 *Summation of losses*

The efficiency can be calculated from the total losses which are assumed to be the summation of the losses obtained in the following manner:

7.1.1 *Excitation losses*

These are:

7.1.1.1 *Excitation winding I^2R losses*

These losses are calculated from the formula I^2R, where R is the resistance of the shunt excitation winding (or separately excited winding), corrected to the reference temperature, and I is the excitation current. Except for case *c)* below, the excitation current shall be that corresponding to rated speed under rated load conditions. For case *c)* below, the excitation current shall be that corresponding to rated speed at no-load.

Si le courant d'excitation ne peut pas être mesuré au cours d'un essai en charge, on admet qu'il est égal:

a) Dans le cas des génératrices à excitation en dérivation ou à excitation séparée avec ou sans pôles de commutation, à 110% du courant d'excitation correspondant à la marche à vide sous une tension égale à la tension nominale majorée de la chute ohmique dans le circuit d'induit (induit, balais, enroulements de commutation, s'il y a lieu, voir aussi paragraphe 7.1.3.2) sous le courant nominal en charge.

b) Dans le cas des génératrices compensées à excitation en dérivation ou à excitation séparée, au courant d'excitation correspondant à la marche à vide sous une tension égale à la tension nominale majorée de la chute ohmique dans le circuit d'induit (induit, balais, enroulements de commutation et de compensation, s'il y a lieu, voir aussi paragraphe 7.1.3.2) sous le courant nominal en charge.

c) Dans le cas des génératrices à excitation compound ajustée, au courant d'excitation correspondant à la marche à vide à la tension nominale.

d) Dans le cas des génératrices à excitation hypercompound ou hypocompound et des types spéciaux de génératrices non couverts par les points *a)* à *c)*, à la valeur convenue entre le constructeur et l'acheteur.

e) Dans le cas des moteurs shunt, au courant d'excitation à vide à la tension nominale.

7.1.1.2 *Pertes dans le rhéostat principal*

Ces pertes sont calculées par la formule RI^2 dans laquelle R est la résistance de la partie du rhéostat en circuit pour le régime considéré et I la valeur du courant d'excitation défini au paragraphe 7.1.1.1 ci-dessus. Elles sont aussi égales au produit IU du courant d'excitation par la fraction U de la tension d'excitation qui doit être absorbée dans le rhéostat.

La somme des pertes, paragraphes 7.1.1.1 et 7.1.1.2, est aussi égale au produit IU_e du courant d'excitation I par la tension totale d'excitation U_e.

Note. — Quand une résistance est reliée en permanence en série dans le circuit d'excitation, elle doit être prise en compte de la même façon que le rhéostat principal.

7.1.1.3 *Pertes dans l'excitatrice*

Note. — Ceci s'applique seulement dans le cas où l'excitatrice est entraînée mécaniquement par l'arbre principal et est utilisée exclusivement pour l'excitation de la machine principale.

Ces pertes comprennent l'excès de la puissance absorbée sur l'arbre par l'excitatrice sur la puissance utile qu'elle fournit à ses bornes* ainsi que les pertes d'excitation de l'excitatrice si celle-ci est excitée par une source séparée.

Si l'excitatrice peut être désaccouplée de la machine principale et essayée séparément, la puissance qu'elle absorbe peut être mesurée par la méthode du moteur taré.

---

* La puissance utile aux bornes de l'excitatrice est égale à la somme des pertes, paragraphes 7.1.1.1 et 7.1.1.2, de la machine principale.

If the excitation current cannot be measured during a test on load, it should be taken as:

a) For shunt connected or separately excited generators with or without commutation poles; 110% of the excitation current, corresponding to no-load at a voltage equal to the rated voltage plus ohmic drop in the armature circuit (armature, brushes and commutating windings if any, see also Sub-clause 7.1.3.2) at rated load current.

b) For compensated shunt or separately excited generators: the excitation current corresponding to no-load at a voltage equal to the rated voltage plus the ohmic drop in the armature circuit (armature, brushes, commutating windings and compensating windings, see also Sub-clause 7.1.3.2) at rated load current.

c) For level-compounded generators: the excitation current for the rated no-load voltage.

d) For over-compounded and under-compounded generators, and special types of generator not covered by items *a)* to *c)*: as agreed between manufacturer and purchaser.

e) For shunt wound motors: equal to no-load excitation current corresponding to the rated voltage.

7.1.1.2 *Main rheostat losses*

These losses are calculated from the formula I^2R, where R is the resistance of the part of the rheostat in circuit for the rating considered, and I is the value of the excitation current defined as in Sub-clause 7.1.1.1 above. They are also equal to the product, IU, of the excitation current multiplied by U, the excitation voltage which must be absorbed in the rheostat.

The sum of the losses, Sub-clauses 7.1.1.1 and 7.1.1.2, is also equal to the product IU_e of the excitation current I and the total excitation voltage U_e.

Note. — Where a resistance is permanently connected in series in the excitation circuit it should be dealt with in the same way as the main rheostat.

7.1.1.3 *Exciter losses*

Note. — This applies only to the case where the exciter is mechanically driven from the main shaft and is used solely for exciting the main machine.

These losses include the difference between the power absorbed at the shaft by the exciter and the useful power which it provides at its terminals,* as well as the excitation losses in the exciter if this is excited from a separate source.

If the exciter can be uncoupled from the main machine and tested separately, the power which it absorbs may be measured by using the calibrated-machine method.

---

* The useful power at the terminals of the exciter is equal to the sum of the losses, Sub-clauses 7.1.1.1 and 7.1.1.2, of the main machine.

Si elle ne peut pas être désaccouplée de la machine principale, la puissance qu'elle absorbe peut être mesurée soit par la méthode de fonctionnement en moteur à vide, soit par la méthode du moteur taré (article 13), soit par la méthode de ralentissement (article 15), appliquée au groupe complet. Dans ces trois méthodes, la puissance absorbée par l'excitatrice s'obtient par différence entre les pertes totales du groupe mesurées dans des conditions identiques, d'abord avec l'excitatrice en charge, puis avec l'excitatrice non excitée, l'excitation étant fournie par une source indépendante.

Si aucune de ces méthodes n'est applicable, la puissance absorbée par l'excitatrice s'obtient en ajoutant à la puissance mesurée à ses bornes les différentes pertes séparées déterminées comme il est dit à l'article 6. Toutefois, il n'y a pas à tenir compte des pertes mécaniques par frottement et ventilation qui sont mesurées en même temps que celles de la machine principale.

7.1.2 *Pertes indépendantes du courant*

7.1.2.1 *Essai à vide à la tension nominale*

Les pertes constantes se déterminent en faisant fonctionner la machine en moteur à vide sous une tension égale à la tension nominale, la vitesse étant portée à sa valeur nominale par réglage de l'excitation, alimentée de préférence par une source séparée.

La puissance électrique totale absorbée, diminuée des pertes par effet Joule dans l'induit et dans l'enroulement d'excitation ou, s'il y a lieu, de la puissance absorbée par l'excitatrice, donne la somme des pertes constantes.

7.1.2.2 *Essai à circuit ouvert*

Les pertes constantes peuvent être déterminées séparément en entraînant la machine à sa vitesse nominale au moyen d'un moteur taré. La machine est excitée (de préférence par une source indépendante) de façon à fonctionner en génératrice à vide sous une tension égale à sa tension nominale. La puissance qu'elle absorbe sur son arbre, et qui s'obtient à partir de la puissance électrique absorbée par le moteur taré, donne la somme des pertes constantes. En supprimant l'excitation, on obtient de la même façon la somme des pertes par frottement et par ventilation. Les pertes dans le fer peuvent être déterminées séparément en déduisant les pertes mesurées au cours de cet essai de celles mesurées au cours de l'essai à vide précédent. En relevant les balais, on peut déterminer séparément les pertes par frottement des balais en déduisant les pertes mesurées au cours de cet essai de celles mesurées au cours de l'essai précédent sans excitation.

7.1.2.3 *Essai de ralentissement*

Dans les machines à grande inertie, les pertes totales constantes, ainsi que les pertes séparées constantes, peuvent être déterminées par la méthode de ralentissement.

7.1.3 *Pertes dépendant du courant*

Ces pertes sont les suivantes:

If the exciter cannot be uncoupled from the main machine, the power which it absorbs may be measured either by the method of working the main machine as a motor on no-load, or by the calibrated machine method (Clause 13), or by the retardation method (Clause 15), applied to the whole unit. In these three methods, the power absorbed by the exciter is obtained as the difference between the total losses of the unit measured under identical conditions, first with the exciter on-load and secondly with the exciter non-excited, the excitation being supplied by an independent source.

If none of these methods is applicable, the power absorbed by the exciter is obtained by adding to the power, measured at the terminals, the different separate losses determined as under Clause 6. However, mechanical friction and windage losses which are measured at the same time as those of the main machine need not be taken into account.

7.1.2 *Constant losses*

7.1.2.1 *No-load test at rated voltage*

The constant losses shall be determined by running the machine under no-load conditions as a motor with rated voltage applied and with rated speed achieved by adjustment of the excitation, which shall preferably be derived from a separate source.

The total electric power absorbed, less the I^2R losses in the armature and in the excitation winding or, if necessary, less the power absorbed by the exciter, gives the sum of the constant losses.

7.1.2.2 *Open circuit test*

The constant losses can be determined separately by driving the machine at its rated speed by means of a calibrated machine. The machine on test is excited (preferably from an independent source), so as to work as a generator on no-load at a voltage equal to its rated voltage, the power which it absorbs at its shaft, and which can be obtained from the electric power absorbed by the calibrated machine, giving the sum of the constant losses. By removing the excitation, the sum of the friction and windage losses is obtained in the same way. The core losses may be determined separately by subtracting the losses during this test from those measured during the previous no-load test. By lifting the brushes the brush friction loss may be determined separately by subtracting the losses during this test from those measured during the previous, unexcited test.

7.1.2.3 *Retardation test*

In machines with large inertia, the total constant losses, as well as the separate constant losses, can be determined by the retardation method.

7.1.3 *Load losses*

These are:

7.1.3.1 *Pertes par effet Joule dans le circuit d'induit*

Ces pertes sont calculées en partant du courant et des valeurs mesurées des résistances ramenées par le calcul à la température de référence; cependant, lorsque la mesure des résistances est impraticable en raison des très faibles valeurs en jeu, la détermination par le calcul est admise.

Note. — Ces pertes comprennent également celles dans les enroulements de compensation, les enroulements des pôles de commutation et les résistances de shuntage. Dans le cas d'une résistance de shuntage en parallèle avec un enroulement série, les pertes par effet Joule sont déterminées en partant du courant total et de la résistance résultante.

7.1.3.2 *Pertes électriques dans les balais*

On admet que la somme de ces pertes est égale au produit du courant total par une chute de tension déterminée.

La chute de tension admise pour tous les balais d'une même polarité est de 1,0 V pour les balais en carbone ou en graphite, et de 0,3 V pour les balais en carbone métallisé, c'est-à-dire que la chute de tension totale est de 2,0 V pour les balais en carbone ou en graphite, et de 0,6 V pour les balais en carbone métallisé.

7.1.4 *Pertes supplémentaires en charge*

Sauf spécification contraire, on admet que ces pertes varient comme le carré du courant et que leur valeur totale pour le courant nominal maximal est:

Pour les machines non compensées

1% de la puissance nominale absorbée pour les moteurs;
1% de la puissance nominale utile pour les génératrices.

Pour les machines compensées

0,5% de la puissance nominale absorbée pour les moteurs;
0,5% de la puissance nominale utile pour les génératrices.

Pour les machines à vitesse constante, la puissance nominale fournie ou absorbée est la puissance qui serait obtenue pour le courant nominal maximal et la tension nominale maximale.

Pour les moteurs à variation de vitesse par variation de la tension appliquée, la puissance nominale absorbée est définie pour chaque vitesse comme la puissance absorbée lorsque le courant nominal maximal à la vitesse considérée est associé à la tension correspondant à cette vitesse.

Pour les moteurs à vitesse variable compensés ou non, dans lesquels l'augmentation de la vitesse est obtenue par affaiblissement du champ, la puissance nominale absorbée est définie comme la puissance absorbée lorsqu'on associe la tension nominale au courant nominal maximal. Pour les génératrices à vitesse variable, dans lesquelles la tension est maintenue constante par variation du champ, la puissance nominale fournie est définie comme la puissance fournie disponible aux bornes à la tension nominale et au courant nominal maximal. Les pertes supplémentaires à la vitesse correspondant au plein champ sont celles spécifiées ci-dessus. Aux autres vitesses, on peut calculer les pertes supplémentaires en multipliant celles qui correspondent à la vitesse de plein champ par les facteurs de correction donnés au tableau 1, page 22.

7.1.3.1 *Armature circuit* I^2R *losses*

These losses are calculated from the current and the measured resistance, corrected to the reference temperature, except that where resistance measurement is impracticable due to very low resistances, calculation is permissible.

Note. — Under this heading are included compensating windings, commutating pole windings and diverters. In the case of diverters in parallel with a series winding, the I^2R losses should be determined using the total current and the resulting resistance.

7.1.3.2 *Electrical losses in brushes*

The sum of these losses shall be taken as the product of the armature current and a fixed voltage drop.

The voltage drop allowed for all brushes of each polarity shall be 1.0 V for carbon or graphite brushes and 0.3 V for metal-carbon brushes, i.e. a total drop of 2.0 V for carbon or graphite brushes, and 0.6 V for metal-carbon brushes.

7.1.4 *Additional load losses*

Unless otherwise specified, it is assumed that these losses vary as the square of the current. and that their total value at maximum rated current is, for:

Uncompensated machines

1% of the rated input for motors;
1% of the rated output for generators.

Compensated machines

0.5% of the rated input for motors;
0.5% of the rated output for generators.

For constant speed machines, the rated output or input as appropriate is taken as the output or input which would be obtained at maximum rated current and maximum rated voltage.

For variable speed motors where the speed change is obtained by applied voltage, the rated input is defined at each speed as being the input when the maximum rated current at any speed is associated with the applied voltage of the particular speed considered.

For variable speed motors where the increase in speed is obtained by weakening the field, the rated input is defined as being the input when the rated voltage is associated with the maximum rated current. For variable speed generators where the voltage is maintained constant by varying the field, the rated output is defined as being the output which is available at the terminals at rated voltage and maximum rated current. The allowances for additional losses at the speed corresponding to the full field shall be as specified above. The allowances for additional losses at other speeds shall be calculated using the appropriate multiplying factors given in Table 1, page 23.

TABLEAU I

Facteurs de correction pour divers rapports de vitesses

Rapport des vitesses	Facteur de correction
1,5:1	1,4
2 :1	1,7
3 :1	2,5
4 :1	3,2

Le rapport des vitesses figurant à la première colonne du tableau I est le rapport de la vitesse vraie considérée à la vitesse nominale minimale pour service continu.

Pour des rapports de vitesses différents de ceux indiqués dans ce tableau, on déterminera les facteurs de correction appropriés par interpolation.

Note. — Les pertes supplémentaires peuvent être obtenues par un essai en charge ou en opposition, en soustrayant des pertes totales mesurées toutes les autres pertes connues.

7.1.4.1 *Variation des pertes dans le fer due à la charge*

Cette variation est considérée généralement comme négligeable. Sur accord spécial, dans le cas de machines à très basse tension, la somme, paragraphes 6.2 *a)* et 6.4 *a)*, peut être mesurée comme il est indiqué pour les pertes constantes, paragraphe 6.2 *a)*, par l'une ou l'autre des deux méthodes de fonctionnement en moteur à vide ou en génératrice à vide, mais en faisant l'essai, non pas à la tension nominale, mais à cette tension nominale augmentée ou diminuée de la chute de tension dans le circuit de l'induit pour le courant considéré, selon qu'il s'agit d'une génératrice ou d'un moteur.

7.2 *Mesure globale des pertes*

7.2.1 *Essai au frein*

La machine fonctionne dans les conditions nominales de vitesse, de tension et de courant; le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

7.2.2 *Essai avec machine auxiliaire tarée* (voir article 13)

La machine fonctionne dans les conditions nominales de vitesse, de tension et de courant; le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

TABLE I

Multiplying factors for different speed ratios

Speed ratio	Multiplying factor
1.5:1	1.4
2 :1	1.7
3 :1	2.5
4 :1	3.2

The speed ratio in the first column of Table I shall be taken as the ratio of actual speed under consideration to the minimum rated speed for continuous running.

For speed ratios other than those given in Table I the appropriate multiplying factors can be ascertained by interpolation.

Note. — The additional load loss may be obtained from an input-output test or from a back-to-back test by subtracting from the total measured losses all other known losses.

7.1.4.1 *Change in core loss due to load*

In general, this variation is usually negligible. By special agreement, for very low voltage machines, the sum, Sub-clauses 6.2 *a)* and 6.4 *a)*, may be measured as described for the constant losses in active iron, Sub-clause 6.2 *a)* by one or other of the two methods, by operating as a motor on no-load or as a generator on no-load, but instead of making the test at the rated voltage, the test is made at the rated voltage increased or decreased by the voltage drop in the armature circuit for the current considered, depending on whether the machine is a generator or a motor.

7.2 *Total loss measurement*

7.2.1 *Braking test*

When the machine is run at rated conditions of speed, voltage and current, the efficiency is then taken as the ratio of output to input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

7.2.2 *Calibrated machine test* (see Clause 13)

When the machine is run at rated conditions of speed, voltage and current, the efficiency is taken as the ratio of output to input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

7.2.3 *Essai en opposition*

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes sont considérées comme également réparties et le rendement est calculé à partir de la moitié des pertes totales et de la puissance électrique absorbée (dans le cas d'un moteur) ou fournie (dans le cas d'une génératrice).

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

7.2.4 *Essai en opposition avec marche en parallèle sur un réseau* (voir article 16)

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes couvertes par le réseau sont considérées comme également réparties et le rendement est calculé comme indiqué au paragraphe 7.2.3 ci-dessus.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

SECTION TROIS — MACHINES A INDUCTION POLYPHASÉES

8. **Pertes à comprendre**

Les pertes totales peuvent être considérées comme la somme des pertes suivantes:

8.1 *Pertes constantes*

a) Pertes dans le fer et pertes supplémentaires à vide dans les autres parties métalliques.

b) Pertes dues au frottement (paliers et balais s'ils ne sont pas relevés en fonctionnement) à l'exclusion des pertes dans un système de graissage séparé. Les pertes dans les paliers communs doivent être indiquées séparément, que ces paliers soient fournis ou non avec la machine.

Note. — Si l'on doit indiquer les pertes dans un système de graissage séparé, celles-ci doivent être mentionnées séparément.

c) Pertes totales par ventilation dans la machine y compris la puissance absorbée par les ventilateurs faisant partie intégrante de la machine et par les machines auxiliaires, s'il en existe, faisant partie intégrante de la machine. Les pertes dans les machines auxiliaires telles que les ventilateurs extérieurs, pompes à eau et à huile ne faisant pas partie intégrante de la machine, mais destinées exclusivement à la machine en question, ne doivent être comprises que sur accord.

Note. — Si l'on doit indiquer les pertes dans un système de ventilation séparé, elles doivent être mentionnées séparément.

8.2 *Pertes en charge*

a) Pertes par effet Joule dans les enroulements primaires.

b) Pertes par effet Joule dans les enroulements secondaires.

c) Pertes électriques dans les balais (s'il y a lieu).

7.2.3 *Mechanical back-to-back test*

When identical machines are run at essentially the same rated conditions, the losses are assumed to be equally distributed, and the efficiency is calculated from half the total losses and the electrical input (in the case of a motor) or electrical output (in the case of a generator).

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

7.2.4 *Electrical back-to-back test* (see Clause 16)

When identical machines are run at essentially the same rated conditions, the losses supplied from the electrical system are assumed to be equally distributed and the efficiency is calculated as in Sub-clause 7.2.3.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

SECTION THREE — POLYPHASE INDUCTION MACHINES

8. **Losses to be included**

The total losses may be taken as the sum of the following component losses:

8.1 *Constant losses*

a) Losses in active iron, and additional no-load losses in other metal parts.

b) Losses due to friction (bearings and brushes, if not lifted during operation) not including any losses in a separate lubricating system. Losses in common bearings shall be stated separately whether or not such bearings are supplied with the machine.

Note. — When the losses in a separate lubricating system are required these should be listed separately.

c) The total windage loss in the machine, including power absorbed in integral fans, and in auxiliary machines, if any, forming an integral part of the machine. The losses in auxiliary machines such as external fans, water and oil pumps not forming an integral part of the machine, but provided exclusively for the machine in question, shall be included only by agreement.

Note. — When the losses in a separate ventilating system are required they should be listed separately.

8.2 *Load losses*

a) I^2R losses in primary windings.

b) I^2R losses in secondary windings.

c) Electrical losses in brushes (if any).

8.3 *Pertes supplémentaires en charge*

a) Pertes supplémentaires en charge dans le fer et les autres parties métalliques autres que les conducteurs.

b) Pertes par courants de Foucault dans les conducteurs d'enroulements primaires ou secondaires, dues à la pulsation du flux dépendant du courant.

Notes 1. — Les pertes, paragraphes *a)* et *b)*, sont parfois dites pertes supplémentaires, mais ne comprennent pas les pertes supplémentaires à vide mentionnées au paragraphe 8.1 *a)*.

2. — Dans le cas des machines auxiliaires telles que les compensateurs de phase entraînés mécaniquement par l'arbre principal, les pertes doivent être comprises de la même façon que les pertes dans l'excitatrice dans le cas des machines synchrones. Les pertes dans les compensateurs de phase ou appareils de régulation entraînés séparément doivent être indiquées séparément pour le régime nominal de la machine. Ces pertes doivent être déterminées par la méthode normale pour le type d'appareil considéré.

9. Détermination du rendement

9.1 *Totalisation des pertes*

Le rendement peut être calculé à partir des pertes totales, considérées comme la somme des pertes déterminées de la façon suivante:

9.1.1 *Pertes constantes*

9.1.1.1 *Essai à vide à la tension nominale*

La somme des pertes constantes, paragraphes 8.1 *a)*, *b)* et *c)*, se détermine par la méthode du fonctionnement en moteur à vide. La machine est alimentée à sa tension et à sa fréquence nominales. La puissance absorbée, diminuée des pertes par effet Joule dans l'enroulement primaire, donne le total des pertes constantes. Les pertes par effet Joule dans l'enroulement secondaire peuvent être négligées.

9.1.1.2 *Essais avec machine auxiliaire tarée* (voir article 13)

Les pertes constantes peuvent être déterminées séparément en entraînant la machine, séparée du réseau, à sa vitesse nominale au moyen d'un moteur taré (voir paragraphe 9.2.2). Avec les balais en place, s'il y a lieu, la puissance absorbée sur l'arbre par la machine, qui se déduit de la puissance électrique absorbée par le moteur taré, donne le total des pertes, paragraphes 8.1 *b)* et 8.1 *c)*. Avec les balais relevés, s'il y a lieu, on obtient de même la somme des pertes par frottement dans les paliers et des pertes totales par ventilation. Les pertes définies au paragraphe 8.1 *a)* se déduisent des précédentes par différence, à partir de l'essai au paragraphe 9.1.1.1.

9.1.1.3 *Essai à vide à tension variable*

Les pertes définies au paragraphe 8.1 *a)* et la somme des pertes définies au paragraphe 8.1 *b)* et *c)* peuvent être également déterminées séparément en faisant fonctionner la machine en moteur à vide à sa fréquence nominale, mais à des tensions différentes. La puissance absorbée,

8 3 *Additional load losses*

a) Losses introduced by load in active iron and other metal parts other than the conductors.

b) Eddy current losses in primary or secondary winding conductors caused by current dependent flux pulsation.

Notes 1. — Losses, Sub-clause 8.3 *a)* and *b)*, are sometimes called additional losses, but they do not include the additional no-load losses in Sub-clause 8.1 *a)*.

2. — In the case of auxiliary machines such as phase advancers driven mechanically from the main shaft, the losses should be included in the same way as the exciter losses are included for synchronous machines. Losses in separately driven phase advancers or regulating equipment should be given separately for rated operating conditions of the main machine. These losses should be determined by the standard method for the types of apparatus involved.

9. Determination of efficiency

9.1 *Summation of losses*

The efficiency can be calculated from the total losses which are assumed to be the summation of the losses obtained in the following manner:

9.1.1 *Constant losses*

9.1.1.1 *No-load test at rated voltage*

The sum of the constant losses, Sub-clause 8.1 *a), b)* and *c)*, is determined by running the machine as a motor on no-load. The machine is fed at its rated voltage and frequency. The power absorbed, decreased by the I^2R losses in the primary winding, gives the total of the constant losses. The I^2R losses in the secondary winding may be neglected.

9.1.1.2 *Calibrated machine test* (see Clause 13)

The constant losses may be determined separately by driving the machine, disconnected from the network, at its rated speed by means of a calibrated motor (see Sub-clause 9.2.2). With the brushes, if any, in place, the power absorbed at the shaft of the machine, which may be deduced from the electrical power absorbed by the calibrated motor, gives the sum of the losses in Sub-clause 8.1 *b)* and 8.1 *c)*. With the brushes, if any, lifted the sum of the bearing friction losses and the total windage losses is obtained in the same manner. The losses described in Sub-clause 8.1 *a)* may be obtained from the test described in Sub-clause 9.1.1.1 by subtraction.

9.1.1.3 *No-load test at variable voltage*

The losses described in Sub-clause 8.1 *a)* and the sum of the losses described in Sub-clause 8.1 *b)* and *c)* may alternatively be separated by running the machine as a motor at rated frequency but at different voltages. The power absorbed, less the I^2R losses in the primary

diminuée des pertes par effet Joule dans l'enroulement primaire, est reportée sur un diagramme en fonction du carré de la tension. On obtient ainsi, aux faibles saturations, une ligne droite qui peut être extrapolée jusqu'à une valeur nulle de la tension de façon à donner la somme des pertes, paragraphe 8.1 *b)* et *c)*.

Il ne faut pas oublier qu'à très faible tension les pertes reportées sur le diagramme peuvent être élevées en raison de l'augmentation des pertes dans l'enroulement secondaire lorsque le glissement devient important. Cette partie du diagramme doit donc être laissée de côté lors du tracé de la ligne droite.

Si le moteur est démarré avec un enroulement secondaire en court-circuit et avec les balais relevés (ce qui est possible si l'alternateur qui fournit l'alimentation est démarré en même temps que le moteur), les pertes par frottement et les pertes totales par ventilation s'obtiennent par extrapolation à une valeur nulle de la tension comme ci-dessus.

Note. — Pour les moteurs à rotor bobiné, un essai à vide au synchronisme peut être effectué comme pour une machine synchrone, en alimentant deux phases du rotor (ou éventuellement trois) par une excitation en courant continu.

9.1.2 *Pertes dépendant du courant*

9.1.2.1 *Essai en charge*

Les pertes définies au paragraphe 8.2 *a)* sont calculées à partir des résistances des enroulements primaires, mesurées en courant continu et ramenées à la température de référence, et du courant correspondant à la charge à laquelle les pertes sont calculées.

Pour déterminer les pertes définies au paragraphe 8.2 *b)* lorsqu'un essai en charge est fait, les pertes dans l'enroulement secondaire sont prises égales au produit du glissement par la puissance totale transmise à l'enroulement secondaire, c'est-à-dire la puissance absorbée diminuée des pertes dans le fer, paragraphe 8.1 *a)*, et des pertes par effet Joule dans l'enroulement primaire, paragraphe 8.2 *a)*. Cette méthode donne directement la somme des pertes, paragraphes 8.2 *b)* et 8.2 *c)* pour les machines à bagues, et des pertes, paragraphe 8.2 *b)* pour les machines à cage. Elle est la seule applicable pour ce dernier type de machines, où la mesure directe des résistances et du courant de l'enroulement secondaire n'est pas possible. Lorsqu'il est fait usage de cette méthode, le glissement peut être mesuré par une méthode stroboscopique, ou en comptant les battements d'un millivoltmètre à aimant permanent connecté entre deux bagues (pour les moteurs à rotor bobiné), ou aux bornes d'une bobine auxiliaire (pour les moteurs à rotor en court-circuit), ou encore entre les extrémités de l'arbre.

9.1.2.2 *Valeurs calculées*

Pour les moteurs à rotor bobiné, les pertes définies au paragraphe 8.2 *b)* peuvent être calculées à partir des résistances, mesurées en courant continu et ramenées à la température de référence, et du courant secondaire déduit du diagramme du cercle ou d'un circuit équivalent compte tenu du rapport de transformation vrai de la machine. Le type de diagramme du cercle à utiliser doit faire l'objet d'un accord entre constructeur et acheteur.

Pour l'essai en charge, les pertes dans les balais, paragraphe 8.2 *c)*, ne peuvent pas être mesurées directement. Elles sont alors prises égales au produit du courant passant dans les balais par une chute de tension déterminée. La chute de tension dans tous les balais d'une même phase est prise égale à 1,0 V pour les balais en carbone ou en graphite, et à 0,3 V pour les balais en carbone métallisé.

winding, is plotted against the square of the voltage. This, at low values of saturation, will give a straight line which can be extrapolated to zero voltage to give the sum of the losses, Sub-clause 8.1 *b)* and *c)*.

It should be borne in mind that at very low voltages, losses plotted on the diagram may be high because of the increased secondary winding losses with increased slip. When plotting the straight line, those values should not be taken into account.

If the motor is started with a short-circuited secondary winding and the brushes are lifted (which is possible if the supply generator is started at the same time as the motor) the bearing friction and total windage losses are obtained at zero voltage by extrapolation as above.

Note. — For wound rotor motors a synchronous no-load test can be carried out as for synchronous machines with d.c. excitation in two rotor phases (or three if desired).

9.1.2 *Load losses*

9.1.2.1 *Load test*

The losses described in Sub-clause 8.2 *a)* are calculated from the resistance of the primary windings measured using direct current and corrected to the reference temperature, and from the current corresponding to the load at which the losses are being calculated.

To determine the losses in Sub-clause 8.2 *b)* when an on-load test is made, the secondary winding losses are taken to be equal to the product of the slip and the total power transmitted to the secondary winding, i.e. the power absorbed, decreased by the core losses in Sub-clause 8.1 *a)* and the I^2R losses in the primary winding in Sub-clause 8.2 *a)*. This method gives directly the sum of the losses in Sub-clauses 8.2 *b)* and 8.2 *c)* for wound rotor machines, and the losses in Sub-clause 8.2 *b)* for cage machines. For this latter type of machine, this is the only applicable method as it is not possible to measure the resistance and current of the secondary winding directly. When use is made of this method, the slip may be measured by a stroboscopic method or by counting the beats of a permanent-magnet millivoltmeter connected between two rings (for motors with wound secondary windings) or the terminals of an auxiliary coil (for motors with short-circuited secondary windings) or between the ends of the shaft.

9.1.2.2 *Calculated values*

For wound rotor motors, the losses in Sub-clause 8.2 *b)* may be calculated from the resistance measured by direct current and corrected to the reference temperature, and from the secondary current calculated from a circle diagram or equivalent circuit, account being taken of the true transformation ratio of the machine. The type of circle diagram to be used should be agreed between manufacturer and purchaser.

To make an on-load test, the losses in Sub-clause 8.2 *c)* in the brushes cannot be measured directly and these losses shall be taken as the product of the current flowing in the brushes and a fixed voltage drop. The voltage drop in all brushes of the same phase shall be taken as 1.0 V for carbon or graphite brushes, and 0.3 V for metal-carbon brushes.

9.1.2.3 *Essai en charge à tension réduite*

Cette méthode est également applicable aux machines à rotor à cage.

Lorsqu'on réduit la tension en maintenant la vitesse de rotation à une valeur constante, les courants diminuent à peu près proportionnellement à la tension et la puissance à peu près proportionnellement au carré de la tension. Lorsque la tension est réduite à la moitié de sa valeur nominale, les courants sont réduits environ à la moitié et la puissance environ au quart de leur valeur à la tension nominale.

Lorsqu'on applique une charge à un moteur à induction à la tension réduite U_r, on mesure la puissance absorbée P_{lr}, le courant primaire principal I_{lr} et le glissement s ainsi que le courant à vide I_{or} à la même tension réduite U_r et le courant à vide I_o à la tension nominale U_n.

Le vecteur du courant I_l de la charge à la tension nominale s'obtient par construction d'un diagramme vectoriel (figure 3, page 55) de la façon suivante:

Au vecteur du courant I_n, multiplié par le rapport

$$\frac{\text{tension nominale}}{\text{tension réduite}} = \frac{U_n}{U_r}$$

on ajoute le vecteur:

$$\triangle I_o = I_o \sin \varphi_o - I_{or} \left(\frac{U_n}{U_r}\right) \sin \varphi_{or}$$

Le vecteur résultant représente le courant qui s'établirait à la tension nominale U_n pour la puissance absorbée suivante:

$$P_l = P_{lr} \left(\frac{U_n}{U_r}\right)^2$$

à l'aide des valeurs I_l et P_l ainsi déterminées et du glissement s, mesuré à tension réduite, on peut alors calculer les pertes dépendant du courant, comme indiqué au paragraphe 9.1.2.1.

9.1.3 *Pertes supplémentaires en charge*

Sauf spécification contraire, on admet que les pertes définies aux paragraphes 8.3 *a)* et 8.3 *b)* varient comme le carré du courant primaire et que leur valeur totale à pleine charge est égale à 0,5% de la puissance nominale absorbée pour les moteurs et 0,5% de la puissance nominale utile pour les génératrices.

Note. — Pour certains types de petites machines, ces pertes peuvent être supérieures à 0,5% de la puissance nominale. Si, dans un cas particulier, leur valeur présente de l'importance, les pertes doivent être déterminées par la méthode directe de mesure du rendement.

9.2 *Mesure globale des pertes*

9.2.1 *Essai au frein*

La machine tournant dans les conditions nominales de vitesse, tension et courant, le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

9.1.2.3 *Load test at reduced voltage*

This method is also applicable to cage rotor machines.

When the voltage is reduced, while keeping the rotational speed of the machine constant, the currents diminish approximately in proportion to the voltage, and the power approximately in proportion to the square of the voltage. When the voltage is down to half its rated value, the currents will then be reduced to about one half, and the power to about one quarter, of their values at the rated voltage.

When a load is applied to an induction motor at a reduced voltage U_r, the power absorbed P_{lr}, the main primary current I_{lr} and the slip s are measured, as well as the no-load current I_{or} at the same reduced voltage U_r, and the no-load current I_o at the rated voltage U_n.

The current vector I_l of the load at rated voltage is obtained by constructing a vector diagram (Figure 3, page 55) in the following manner:

To the current vector I_{lr}, multiplied by the ratio

$$\frac{\text{rated voltage}}{\text{reduced voltage}} = \frac{U_n}{U_r}$$

add the vector:

$$\triangle I_o = I_o \sin \varphi_o - I_{or} \left(\frac{U_n}{U_r}\right) \sin \varphi_{or}$$

The resultant vector represents the current which would flow at the rated voltage U_n for the following absorbed power:

$$P_l = P_{lr} \left(\frac{U_n}{U_r}\right)^2$$

By means of the values I_l, P_l, thus determined, and with the slip s measured at reduced voltage, it is then possible to calculate the on-load losses, as indicated in Sub-clause 9.1.2.1.

9.1.3 *Additional load losses*

Unless otherwise specified, it is assumed that the losses specified in Sub-clauses 8.3 *a)* and 8.3 *b)* vary as the square of the primary current and that their total value at full load is equal to 0.5% of the rated input for motors and 0.5% of the rated output for generators.

Note. — For some designs of small machines these losses might be higher than 0.5% of the rated input. If, for a particular case, the value is of importance, the loss should be determined by the direct method of efficiency measurement.

9.2 *Total loss measurement*

9.2.1 *Braking test*

When the machine is run at rated conditions of speed, voltage and current, the efficiency is taken as the ratio of output to input.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

9.2.2 *Essai avec machine auxiliaire tarée* (voir article 13)

La machine tournant dans les conditions nominales de vitesse, tension et courant conformément au paragraphe 13, le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

9.2.3 *Essai en opposition*

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes sont considérées comme également réparties et le rendement se calcule à partir de la moitié des pertes totales et de la puissance électrique absorbée. La machine entraînée fonctionne en génératrice asynchrone si on dispose d'une source de puissance réactive magnétisante et si l'on connecte à ses bornes une charge appropriée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

9.2.4 *Essai en opposition avec marche en parallèle sur un réseau* (voir article 16)

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes couvertes par le réseau sont considérées comme également réparties et le rendement est calculé à partir de la moitié des pertes totales et de la puissance électrique absorbée par l'une des machines.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

Note. — S'il y a lieu d'utiliser une boîte d'engrenages, comme c'est le cas pour les moteurs à induction, il faut déduire les pertes dans celle-ci de la puissance électrique absorbée avant de déterminer les pertes de la machine électrique.

SECTION QUATRE — MACHINES SYNCHRONES

10. **Pertes à comprendre**

Les pertes totales peuvent être considérées comme égales à la somme des pertes suivantes:

10.1 *Pertes constantes*

a) Pertes dans le fer et pertes supplémentaires à vide dans les autres parties métalliques.

b) Pertes dues au frottement (paliers et balais) à l'exclusion des pertes dans un système de graissage séparé. Les pertes dans les paliers communs doivent être indiquées séparément,

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

9.2.2 *Calibrated machine test* (see Clause 13)

When the machine is running in accordance with Clause 13 at rated conditions of speed, voltage and current, the efficiency is then taken as the ratio of output to input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

9.2.3 *Mechanical back-to-back test*

When identical machines are run at essentially the same rated conditions, the losses are assumed to be equally distributed, and the efficiency is calculated from half the total losses and the electrical input. The driven machine will operate as an induction generator if a source of reactive power is provided, and a suitable load is connected to its terminals.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

9.2.4 *Electrical back-to-back test* (see Clause 16)

When identical machines are run at essentially the same rated conditions, the losses supplied from the electrical system are assumed to be equally distributed and the efficiency is calculated from half the total losses and the electrical input to one machine.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

Note. — Where a gear box is required, as in the case of induction motors, it is necessary for the loss in this to be deducted from the electrical input before determining the losses in the electrical machine.

SECTION FOUR — SYNCHRONOUS MACHINES

10. Losses to be included

The total losses may be taken as the sum of the following component losses:

10.1 *Constant losses*

a) Losses in active iron, and additional no-load losses in other metal parts.

b) Losses due to friction (bearings and brushes), not including any losses in a separate lubricating system. Losses in common bearings shall be stated separately whether or not such

que ces paliers soient fournis ou non avec la machine. Pour les alternateurs hydrauliques et les moteurs synchrones pour pompes d'accumulation, les pertes dans les paliers de butée et, si les paliers de butée sont combinés avec des paliers guides, les pertes totales dans ceux-ci doivent être indiquées séparément. La poussée, la température des paliers et la qualité de l'huile pour lesquelles le chiffre des pertes est applicable doivent également être indiquées.

Note. — Si l'on doit indiquer les pertes dans un système de graissage séparé, elles doivent être mentionnées séparément.

c) Pertes totales par ventilation dans la machine y compris la puissance absorbée par les ventilateurs faisant partie intégrante de la machine et par les machines auxiliaires, s'il en existe, faisant partie intégrante de la machine. Les pertes dans les machines auxiliaires telles que les ventilateurs extérieurs, pompes à eau et à huile ne faisant pas partie intégrante de la machine, mais destinées exclusivement à la machine en question, ne doivent être comprises que sur accord.

Note. — Si l'on doit indiquer les pertes dans un système de ventilation séparé, elles doivent être mentionnées séparément.

10.2 *Pertes en charge*

a) Pertes par effet Joule dans les enroulements primaires.

b) Pertes par effet Joule dans les enroulements de démarrage ou amortisseurs.

Note. — Ces pertes ne présentent d'importance que dans le cas des machines monophasées.

10.3 *Pertes dans le circuit d'excitation*

a) Pertes par effet Joule dans les enroulements et rhéostats d'excitation.

b) Toutes les pertes dans l'excitatrice lorsque celle-ci, formant partie intégrante d'un ensemble complet, est entraînée mécaniquement par l'arbre principal, et est utilisée exclusivement pour l'excitation de la machine, ainsi que les pertes dans le rhéostat d'excitation de cette excitatrice, à l'exception des pertes par frottement et par ventilation.

Les pertes dans les redresseurs tournants et dans les engrenages, courroies ou transmissions analogues entre l'arbre et l'excitatrice doivent être comprises.

Toutes les pertes dans tout appareil d'auto-excitation et de réglage recevant sa puissance du réseau à courant alternatif relié aux bornes de la machine synchrone.

Dans le cas d'une excitation séparée, fournie par des moyens tels que batterie, redresseur ou groupe moteur-générateur, il n'y a pas à tenir compte des pertes dans la source d'excitation ou dans les connexions entre la source et les balais.

c) Pertes électriques dans les balais.

10.4 *Pertes supplémentaires en charge*

a) Pertes supplémentaires dans le fer et les autres parties métalliques autres que les conducteurs.

b) Pertes par courants de Foucault dans les conducteurs de l'enroulement primaire.

bearings are supplied with the machine. For water-driven generators and synchronous motors for pump storage schemes, the losses in thrust bearings, and if the thrust bearings are associated with guide bearings the total losses in those bearings, shall be stated separately. The thrust-load, temperature of the bearings, and type of oil and oil temperature at which the loss values are valid shall also be given.

Note. — When the losses in a separate lubricating system are required these should be listed separately.

c) The total windage loss in the machine including power absorbed in integral fans, and in auxiliary machines, if any, forming an integral part of the machine. The losses in auxiliary machines such as external fans, water and oil pumps not forming an integral part of the machine, but provided exclusively for the machine in question, shall be included only by agreement.

Note. — When the losses in a separate ventilating system are required they should be listed separately.

10.2 *Load losses*

a) I^2R losses in primary windings.

b) I^2R losses in starting or damping windings.

Note. — These are significant only for single-phase machines.

10.3 *Excitation circuit losses*

a) I^2R losses in the excitation windings and in the excitation rheostats.

b) All the losses in an exciter mechanically driven from the main shaft which forms part of the complete unit, and is used solely for exciting the machine, together with losses in the rheostat in the excitation circuit of such an exciter, but with the exception of friction and windage losses.

Losses in rotary rectifiers and in a gear, rope or belt, or similar drive between shaft and exciter should be included.

All the losses in any apparatus for self-excitation and regulation receiving its input from the a.c. supply connected to the terminals of the synchronous machine.

In the case of a separate excitation supply such as a battery, rectifier or motor generator set, no allowance is made for the losses in the excitation source or in the connections between the source and the brushes.

c) The electrical losses in brushes.

10.4 *Additional load losses*

a) Losses introduced by load in active iron and other metal parts other than the conductors.

b) Eddy current losses in primary winding conductors.

11. Détermination du rendement

11.1 *Totalisation des pertes*

Le rendement peut être calculé à partir des pertes totales, considérées comme la somme des pertes déterminées de la façon suivante:

11.1.1 *Pertes dans le circuit d'excitation*

11.1.1.1 *Pertes par effet Joule dans le circuit d'excitation*

Ces pertes sont calculées par la formule RI^2, dans laquelle R est la résistance de l'enroulement d'excitation ramenée à la température de référence, et I la valeur du courant d'excitation pour le régime considéré de la machine, mesurée directement lors d'un essai en charge, ou calculée lorsque cet essai n'est pas possible. Dans ce dernier cas, la méthode de calcul doit faire l'objet d'un accord entre le constructeur et l'acheteur.

11.1.1.2 *Pertes dans le rhéostat principal*

Ces pertes sont calculées par la formule RI^2, en admettant pour R la résistance de la partie du rhéostat en circuit pour le régime considéré et pour I la valeur du courant d'excitation pour le régime considéré de la machine, défini au paragraphe 11.1.1.1 ci-dessus. Elles sont aussi égales au produit IU du courant d'excitation au régime considéré par la tension U aux bornes du rhéostat.

Note. — Quand une résistance est reliée en permanence en série dans le circuit d'excitation, elle doit être prise en compte de la même façon que le rhéostat principal.

11.1.1.3 *Pertes électriques dans les balais*

La somme de ces pertes est prise égale au produit du courant d'excitation au régime considéré par une chute de tension déterminée. Cette chute de tension est fixée, pour tous les balais d'une même polarité, à 1,0 V pour les balais en carbone ou en graphite, et à 0,3 V pour les balais en carbone métallisé, c'est-à-dire que la chute de tension totale est de 2,0 V pour les balais en carbone ou en graphite et de 0,6 V pour les balais en carbone métallisé.

La somme des pertes conformément aux paragraphes 11.1.1.1, 11.1.1.2 et 11.1.1.3, est aussi égale au produit IU_e du courant d'excitation I par la tension totale d'excitation U_e.

11.1.1.4 *Pertes dans l'excitatrice*

Note. — Seulement dans le cas où l'excitatrice est entraînée mécaniquement par l'arbre principal et est utilisée exclusivement pour l'excitation de la machine synchrone.

Ces pertes comprennent l'excès de la puissance absorbée sur l'arbre par l'excitatrice sur la puissance utile qu'elle fournit à ses bornes*, ainsi que les pertes d'excitation de l'excitatrice si elle est elle-même excitée par une source séparée.

---

* La puissance utile aux bornes de l'excitatrice est égale à la somme des pertes conformément aux paragraphes 11.1.1.1, 11.1.1.2 et 11.1.1.3, de la machine principale.

11. Determination of efficiency

11.1 *Summation of losses*

The efficiency can be calculated from the total losses which are assumed to be the summation of the losses obtained in the following manner:

11.1.1 *Excitation circuit losses*

11.1.1.1 *Excitation winding* I^2R *losses*

These losses are calculated from the formula I^2R, taking for R the resistance of the excitation winding corrected to the reference temperature, and for I the value of the exciting current for the particular rating of the machine, measured directly during the on-load test or calculated when this test is not possible. Where such a calculation is made, the method to be used is for agreement between manufacturer and purchaser.

11.1.1.2 *Main rheostat losses*

These losses are calculated from the formula I^2R, where R is the resistance of the part of the rheostat in circuit for the rating considered, and I is the value of the exciting current for the rating considered defined as in Sub-clause 11.1.1.1. They are also equal to the product IU of the excitation current at the particular rating, and the voltage U at the terminals of the rheostat.

Note. — Where a resistance is permanently connected in series in the excitation circuit it should be dealt with in the same way as the main rheostat.

11.1.1.3 *Electrical losses in brushes*

The sum of these losses shall be taken as the product of the excitation current at the rating considered and a fixed voltage drop. The voltage drop allowed for all brushes of each polarity shall be 1.0 V for carbon or graphite brushes, and 0.3 V for metal-carbon brushes, i.e. a total drop of 2.0 V for carbon or graphite brushes, and 0.6 V for metal-carbon brushes.

The sum of the losses according to Sub-clauses 11.1.1.1, 11.1.1.2 and 11.1.1.3, is also equal to the product IU_e of the exciting current I and the total excitation voltage U_e.

11.1.1.4 *Exciter losses*

Note. — This applies only to the case where the exciter is mechanically driven from the main shaft and is used solely for exciting the synchronous machine.

These losses include the difference between the power absorbed at the shaft of the exciter and the useful power which it provides at the terminals of the exciter*, and the excitation losses of the exciter if this machine itself is excited by a separate source.

---

* The useful power at the terminals of the exciter is equal to the sum of the losses according to Sub-clauses 11.1.1.1, 11.1.1.2 and 11.1.1.3, of the main machine.

Si l'excitatrice peut être désaccouplée de la machine principale et essayée séparément, la puissance qu'elle absorbe peut être mesurée par la méthode du moteur taré.

Si elle ne peut être désaccouplée de la machine principale, la puissance qu'elle absorbe peut être mesurée, soit par la méthode de la machine tarée, soit par la méthode de ralentissement appliquée au groupe complet. Dans ces deux méthodes, la puissance absorbée par l'excitatrice s'obtient par différence entre les pertes totales du groupe mesurées dans des conditions identiques, soit avec l'excitatrice en charge, soit avec l'excitatrice non excitée, l'excitation étant fournie par une source indépendante.

Si aucune de ces méthodes n'est applicable, les pertes séparées doivent être déterminées comme indiqué à l'article 6 pour les machines à courant continu (voir paragraphe 7.1.1.3, dernier paragraphe).

Note. — Le constructeur et l'acheteur doivent se mettre d'accord sur la méthode à utiliser pour déterminer les pertes dans les appareils d'auto-excitation et de réglage de la tension recevant leur puissance du réseau à courant alternatif relié aux bornes de la machine.

11.1.2 *Pertes indépendantes du courant*

11.1.2.1 *Essai au facteur de puissance unité à la tension et à la fréquence nominales*

La somme des pertes constantes est déterminée généralement par la méthode du fonctionnement en moteur à vide. La machine synchrone est alimentée à sa tension nominale et à sa fréquence nominale de manière à fonctionner en moteur à vide. L'excitation est réglée de façon que la machine absorbe le courant minimal. La puissance électrique absorbée, diminuée des pertes Joule dans les enroulements primaires et, s'il y a lieu, de la puissance absorbée par l'excitatrice, donne la somme des pertes indépendantes du courant.

Note. — On peut éviter cette dernière correction en utilisant une source d'excitation séparée.

11.1.2.2 *Essai à circuit ouvert*

La somme des pertes constantes, paragraphes 10.1 *a)*, 10.1 *b)* et 10.1 *c)*, les pertes, paragraphe 10.1 *a)*, et la somme des pertes, paragraphes 10.1 *b)* et 10.1 *c)* peuvent également être déterminées en entraînant la machine à sa vitesse nominale au moyen d'un moteur taré. La machine étant excitée par une source indépendante de façon à fonctionner en alternateur à vide sous une tension égale à sa tension nominale, la puissance qu'elle absorbe sur son arbre, et qui se déduit de la puissance électrique absorbée par le moteur taré, donne la somme des pertes, paragraphes 10.1 *a)*, 10.1 *b)* et 10.1 *c)*. En supprimant l'excitation, on obtient de la même façon la somme des pertes, paragraphes 10.1 *b)* et 10.1 *c)*. Les pertes dans le fer 10.1 *a)* s'en déduisent par différence. Etant donné le petit nombre de balais utilisés sur les machines synchrones, il n'est généralement pas possible de séparer, au moyen d'un essai avec les balais relevés, les pertes par frottement des balais de la somme des autres pertes constantes.

11.1.2.3 *Essai de ralentissement* (voir article 15)

La somme des pertes constantes, paragraphes 10.1 *a)*, 10.1 *b)* et 10.1 *c)*, les pertes, paragraphe 10.1 *a)*, et la somme des pertes, paragraphes 10.1 *b)* et 10.1 *c)*, peuvent être déterminées en utilisant la méthode de ralentissement.

If the exciter can be uncoupled from the main machine and tested separately, the power which it absorbs may be measured by the calibrated machine method.

If the exciter cannot be uncoupled from the main machine, the power which it absorbs may be measured either by the calibrated machine method or by the retardation method applied to the whole unit. In these two methods, the power absorbed by the exciter is obtained as the difference between the total losses of the unit measured under identical conditions, first with the exciter on-load and secondly with the exciter not excited, the excitation being furnished by an independent source.

If none of these methods is applicable, the separate losses should be determined as described under Clause 6 for d.c. machines (see Sub-clause 7.1.1.3, last paragraph).

Note. — The manufacturer and purchaser should agree on the method of determining the losses in apparatus for self-excitation and regulation receiving their input from the a.c. lines connected to the terminals of the machine.

11.1.2 *Constant losses*

11.1.2.1 *Unity power factor test at rated voltage and frequency*

The sum of the constant losses is generally determined by the method of running the machine as a motor on no-load. The synchronous machine is fed at its rated voltage and rated frequency, so as to work as a motor on no-load. The excitation is adjusted so that the machine absorbs the minimum a.c. current. The electrical power absorbed, decreased by the I^2R loss in the primary windings, and, if appropriate, by the power absorbed by the exciter, gives the sum of the constant losses.

Note. — This latter correction may be avoided by the use of a separate source of excitation power.

11.1.2.2 *Open circuit test*

The sum of the constant losses, Sub-clauses 10.1 *a)*, 10.1 *b)* and 10.1 *c)*, the losses Sub-clause 10.1 *a)*, and the sum of the losses, Sub-clauses 10.1 *b)* and 10.1 *c)*, may also be determined by driving the machine at its rated speed by means of a calibrated machine. The machine is excited by an independent source so as to work as a generator with open circuit at a voltage equal to its rated voltage. The power which it absorbs at its shaft, and which may be calculated from the power absorbed from the calibrated motor, gives the sum of the constant losses Sub-clauses 10.1 *a)*, 10.1 *b)* and 10.1 *c)*. By removing the excitation, the sum of the losses, Sub-clauses 10.1 *b)* and 10.1 *c)* is obtained in the same manner. The core losses Sub-clause 10.1 *a)* are obtained by subtraction. Given the small number of brushes used on synchronous machines, it is generally not possible to separate the brush friction losses from the sum of the other constant losses by means of a test with the brushes lifted.

11.1.2.3 *Retardation test* (see Clause 15)

The sum of the constant losses Sub-clauses 10.1 *a)*, 10.1 *b)* and 10.1 *c)*, the losses Sub-clause 10.1 *a)* and the sum of the losses, Sub-clauses 10.1 *b)* and 10.1 *c)* may be determined by using the retardation method

11.1.2.4 *Essai au facteur de puissance unité à tension variable*

Les pertes, paragraphes 10.1 *a)*, 10.1 *b)* et 10.1 *c)*, peuvent être séparées en faisant fonctionner la machine en moteur à sa fréquence nominale, mais à des tensions différentes, comme indiqué au paragraphe 9.1.1.3 de la section trois.

Le facteur de puissance doit être maintenu à la valeur unité par ajustage du courant d'excitation pendant l'essai.

11.1.2.5 *Essai à des densités variables de gaz de refroidissement*

Dans le cas des machines refroidies par un gaz, les pertes totales par ventilation peuvent être séparées des pertes par frottement au moyen d'essais effectués à des densités différentes du gaz de refroidissement.

Note. — Des essais à différentes vitesses sont à l'étude.

11.1.2.6 *Essai calorimétrique* (voir article 17)

Les pertes dans les paliers peuvent être déterminées séparément, quand c'est possible, par la méthode calorimétrique.

Note. — Les essais relatifs aux pertes dans les paliers de butée éventuellement combinés avec des paliers-guides dans les machines à arbre vertical ne doivent être effectués que sur accord.

11.1.3 *Pertes en charge*

Ces pertes sont les suivantes:

— Pertes par effet Joule dans les enroulements d'induit.

— Les pertes par effet Joule dans les enroulements d'induit sont mesurées normalement au cours de l'essai en court-circuit, décrit au paragraphe 11.1.4.

Lorsqu'elles doivent être indiquées séparément, ces pertes sont calculées en partant du courant nominal et de la résistance des enroulements ramenée à la température de référence.

11.1.4 *Pertes supplémentaires en charge*

Sauf spécification contraire, la somme des pertes, paragraphes 10.4 *a)* et 10.4 *b)*, est mesurée par la méthode de l'essai en court-circuit.

La machine à essayer avec son enroulement d'induit mis en court-circuit est entraînée à sa vitesse nominale et excitée de façon que le courant dans l'induit en court-circuit soit égal au courant nominal. La puissance absorbée sur l'arbre, diminuée des pertes mécaniques, paragraphes 10.1 *b)* et 10.1 *c)* ci-dessus, et de la puissance absorbée par l'excitatrice, s'il y a lieu, représente la somme des pertes normales dépendant du courant et des pertes supplémentaires, paragraphes 10.2 et 10.4. Si la réactance de fuite est anormalement élevée, comme dans le cas d'une machine à haute fréquence, on doit également faire une correction pour les pertes dans le

11.1.2.4 *Unity power factor test at variable voltage*

The losses Sub-clauses 10.1 *a)*, 10.1 *b)* and 10.1 *c)* may be separated by running the machine as a motor at rated frequency, but at different voltages as described in Sub-clause 9.1.1.3 of Section Three.

The power factor shall be maintained at unity by adjusting the excitation current during the test.

11.1.2.5 *Variable cooling gas density test*

For machines cooled by a gas at variable pressure, the total windage loss may be separated from the friction losses by tests at different densities of cooling gas.

Note. — Tests at different speeds are under consideration.

11.1.2.6 *Calorimetric test* (see Clause 17)

The bearing losses may be separately determined when possible by using the calorimetric method.

Note. — The determination of losses in thrust bearings, possibly combined with guide bearings, in vertical shaft machines, should only be made by agreement.

11.1.3 *Load losses*

These consist of:

— I^2R loss in primary windings.

— The I^2R loss in primary windings is normally measured during the short-circuit test described in Sub-clause 11.1.4.

When it is to be given separately, the loss is calculated from the rated current and the resistance of the windings corrected to the reference temperature.

11.1.4 *Additional load losses*

Unless otherwise specified, the sum of the losses, Sub-clauses 10.4 *a)* and 10.4 *b)* is measured by means of the short-circuit test method.

The machine to be tested, with its primary winding short-circuited, is driven at its rated speed and so excited that the current in the short-circuited primary winding is equal to the rated current. The power absorbed at the shaft, decreased by the mechanical losses, Sub-clauses 10.1 *b)* and 10.1 *c)*, and the power absorbed by the exciter, if appropriate, presents the sum of the load losses and the additional losses, Sub-clauses 10.2 and 10.4. If the leakage reactance is abnormally high, as for a machine for high frequency, a correction shall also be made for core losses. The load losses vary in different senses as a function of the temperature. The sum of the

fer. Les pertes en charge varient dans des sens différents en fonction de la température. La somme des pertes dépendant du courant et des pertes supplémentaires est supposée indépendante de la température et il n'y a pas à faire de correction pour ramener cette somme à une température de référence.

Note. — Il est reconnu que la somme des pertes, paragraphes 10.4 *a)* et 10.4 *b)*, ainsi déterminée est généralement un peu plus élevée que les pertes existant réellement à pleine charge.

La puissance absorbée sur l'arbre de la machine pendant l'essai en court-circuit peut être mesurée soit par la méthode du moteur taré (article 13), soit par la méthode de ralentissement (article 15).

11.2 *Mesure globale des pertes*

11.2.1 *Essai au frein*

La machine tournant dans les conditions nominales de vitesse, tension et courant, le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

11.2.2 *Essai avec machine auxiliaire tarée* (voir article 13)

La machine tournant dans les conditions nominales de vitesse, tension et courant, le rendement est pris égal au rapport de la puissance utile à la puissance absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

11.2.3 *Essai en opposition*

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes sont considérées comme également réparties et le rendement est calculé à partir de la moitié des pertes totales et de la puissance électrique absorbée.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

11.2.4 *Essai en opposition avec marche en parallèle sur un réseau* (voir article 16)

Les machines identiques tournant dans des conditions nominales qui sont pratiquement les mêmes, les pertes couvertes par le réseau sont considérées comme également réparties et le rendement se calcule comme indiqué au paragraphe 11.2.3 ci-dessus.

L'essai doit être effectué à une température aussi voisine que possible de celle atteinte en fonctionnement à la fin du temps spécifié dans le service nominal. Il n'est pas effectué de correction tenant compte de la variation de résistance des enroulements avec la température.

load losses and additional losses is assumed to be independent of the temperature and no correction is made to a reference temperature.

Note. — It is recognized that the sum of the additional losses, Sub-clauses 10.4 *a)* and 10.4 *b)*, thus determined, is generally a little higher than the losses which actually exist at rated load.

The power absorbed at the shaft of the machine during the short-circuit test may be measured by the calibrated machine method (Clause 13), or by the retardation method (Clause 15).

11.2 *Total loss measurement*

11.2.1 *Braking test*

When the machine is run at rated conditions of speed, voltage and current, the efficiency is taken as the ratio of output to input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

11.2.2 *Calibrated machine test* (see Clause 13)

When the machine is run at rated conditions of speed, voltage and current, the efficiency is taken as the ratio of output to input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

11.2.3 *Mechanical back-to-back test*

When identical machines are run at essentially the same rated conditions, the losses are assumed to be equally distributed, and the efficiency is calculated from half the total losses and the electrical input.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

11.2.4 *Electrical back-to-back test* (see Clause 16)

When identical machines are run at essentially the same rated conditions, the losses are assumed to be equally distributed and the efficiency is calculated as in Sub-clause 11.2.3.

The test shall be made as nearly as possible at the temperature attained in operation at the end of the time specified in the rating. No winding temperature correction shall be made.

11.2.5 *Essai au facteur de puissance nul* (voir article 14)

La machine tournant dans les conditions nominales de vitesse, tension et courant, les pertes totales sont équivalentes à la puissance absorbée au cours de l'essai corrigée pour la différence entre les pertes de courant d'excitation effectives et celles en pleine charge.

SECTION CINQ — MÉTHODES D'ESSAIS

12. Généralités

Les essais peuvent être classés dans l'une des trois catégories suivantes:

a) Mesure de la puissance absorbée et de la puissance utile d'une seule machine. Elle implique en général la mesure de la puissance mécanique absorbée ou fournie par la machine.

b) Mesure de la puissance absorbée et de la puissance utile sur deux machines en opposition, par exemple deux machines identiques ou une machine à essayer accouplée à une machine tarée. Ceci a pour but d'éliminer la mesure de la puissance mécanique absorbée ou fournie par la machine.

c) Mesure des pertes réelles dans une machine dans des conditions déterminées.

Ces pertes ne sont pas en général les pertes totales, mais comprennent certaines pertes particulières. La méthode peut toutefois être appliquée pour calculer les pertes totales ou pour calculer des pertes particulières.

Le choix des essais à effectuer dépend des renseignements recherchés, de la précision recherchée, du type et des dimensions de la machine considérée. Lorsqu'on dispose de plusieurs méthodes pour un type donné de machine, la méthode préférentielle est indiquée (voir article 18).

On fait une distinction entre mesures directes et indirectes du rendement.

La mesure directe du rendement consiste à mesurer directement la puissance fournie par la machine et la puissance qu'elle absorbe.

La mesure indirecte du rendement consiste à mesurer les pertes de la machine. En ajoutant ces pertes à la puissance fournie par la machine, on obtient la puissance qu'elle absorbe.

La mesure indirecte du rendement peut être effectuée par les méthodes suivantes:

(i) détermination des pertes séparées en vue de leur sommation;
(ii) détermination des pertes totales.

Note. — Les méthodes de détermination du rendement des machines reposent sur un certain nombre d'hypothèses; il n'est donc pas possible d'établir une comparaison entre les pertes obtenues par mesure directe et celles obtenues par mesure des pertes séparées.

Sauf spécification contraire, le rendement garanti d'une machine est celui qui est basé sur la détermination des pertes séparées, mais lorsqu'on a le choix de la méthode, l'évaluation du rendement doit se baser sur la précision qu'offre la méthode, le rendement et le type de la machine considérée*.

Lorsque le rendement ou les pertes totales sont calculés à partir de la puissance absorbée et de la puissance utile mesurées, toute inexactitude dans ces mesures se traduit directement

---

**Note.* — Dans certains pays, un rendement de 90% est pris comme base d'application de la méthode indirecte, tandis que d'autres pays préfèrent une valeur plus faible, par exemple 70%.

11.2.5 *Zero power factor test* (see Clause 14)

When the machine is run at rated conditions of speed, voltage and current, the total losses are equivalent to the absorbed power during the test, corrected for the difference between actual and the full-load exciting current losses.

SECTION FIVE — METHODS OF TEST

12. General

Tests can be grouped in one of the three following categories:

a) Input-output measurement on a single machine. This usually involves the measurement of mechanical power into, or out of a machine.

b) Input and output measurement on two machines connected back-to-back, e.g. two identical machines or a test machine coupled to a calibrated machine. This is done to eliminate the measurement of mechanical power into or out of the machine.

c) Measurement of the actual loss in a machine under a particular condition.

This is not usually the total loss, but comprises certain component losses. The method may, however, be used to calculate the total loss or to calculate a component loss.

The choice of test to be made depends on the information required, the accuracy required, and the type and size of the machine involved. Where alternative methods are available for a particular type of machine, the preferred method is indicated (see Clause 18).

A distinction is made between direct and indirect efficiency measurement.

The direct measurement of efficiency is made by measuring directly the power supplied by the machine and the power absorbed by it.

The indirect measurement of efficiency is made by measuring the losses of the machine. Those losses are added to the power supplied by the machine, thus giving the absorbed power.

The indirect measurement may be carried out by the following methods:

(i) determination of separate losses for summation;
(ii) determination of total losses.

Note. — The methods for determining the efficiency of machines are based on a number of assumptions; it is therefore not possible to make a comparison between the losses obtained by the direct method of measurement and those obtained by the measurement of the separate losses.

Unless otherwise specified, the guaranteed efficiency of a machine is that which is based on the determination of separate losses, but when there is a choice of method, the evaluation of efficiency should be based on the accuracy obtainable from the method, the efficiency and the type of machine involved.*

When the efficiency or total loss is derived from the measured input and output power, any inaccuracy in these measurements appears as a direct error in the efficiency (e.g. with an

**Note.* — In some countries 90% efficiency is accepted as a basis for using the indirect method whereas some other countries prefer a lower value, e.g. 70%.

par une erreur dans le rendement (par exemple, avec une précision de la mesure de la puissance qui n'est pas meilleure que 1%, l'erreur sur le rendement peut être de 2% ou l'erreur sur les pertes totales peut être de 2% de la puissance totale absorbée). Sur les petites machines ou sur les machines de rendement relativement faible (inférieur par exemple à 90%)*, cette méthode peut être tout à fait admissible et représente une méthode d'essais commode pour ces machines. Sur ces machines et sur les autres machines, le rendement peut être obtenu avec une bonne précision par le calcul des pertes à partir des mesures directes.

13. **Méthode du moteur taré**

La machine dont il s'agit de mesurer les pertes est séparée du réseau, désaccouplée de son moteur d'entraînement, s'il y a lieu, et entraînée à sa vitesse nominale par un moteur taré, c'est-à-dire par un moteur électrique dont les pertes ont été déterminées auparavant avec une grande précision, de manière à permettre de déterminer la puissance mécanique qu'il fournit sur son arbre, connaissant la puissance électrique qu'il absorbe et sa vitesse de rotation. La puissance mécanique transmise par le moteur taré à l'arbre de la machine essayée mesure les pertes de cette dernière pour les conditions de fonctionnement dans lesquelles est fait l'essai. Dans cette méthode, la machine essayée peut être à vide, excitée ou non excitée, avec ou sans balais, ou en court-circuit, ce qui permet de séparer certaines catégories de pertes.

En variante, le moteur taré peut être remplacé par un moteur dynamométrique, ou par un moteur quelconque entraînant la machine à essayer par un torsiomètre approprié permettant de connaître le couple transmis à la machine essayée et, par suite, la puissance mécanique absorbée par cette dernière.

Lorsqu'il est fait usage de cette variante, la vitesse de rotation qui intervient directement dans le calcul de la puissance doit être mesurée avec la plus grande précision.

14. **Essai au facteur de puissance nul**

La machine fonctionne en moteur à vide, à la vitesse nominale et à un facteur de puissance voisin du zéro, le courant d'excitation étant réglé de façon que la machine soit parcourue par son courant primaire nominal.

La tension d'alimentation est telle que les pertes magnétiques ont la même valeur qu'en fonctionnement à vide à la tension nominale. La tension d'alimentation est en général prise égale à la tension nominale à moins que ceci ne donne des pertes dans le fer nettement plus élevées qu'à pleine charge. En principe, la puissance réactive doit être positive, c'est-à-dire que la machine est surexcitée, mais si ceci n'est pas possible du fait que la tension de l'excitatrice est insuffisante, l'essai peut être effectué avec absorption de puissance réactive (c'est-à-dire avec la machine sous-excitée).

Note. — La précision de cette méthode dépend de la précision à un faible facteur de puissance des wattmètres utilisés.

15. **Méthode de ralentissement**

Cette méthode est applicable en particulier aux grosses machines synchrones de grande inertie. Elle peut également être appliquée aux machines à courant alternatif à induction et aux machines à courant continu, pour les pertes appropriées de ces machines. Elle consiste

---

**Note* — Dans certains pays, un rendement de 90% est pris comme base d'application de la méthode indirecte, tandis que d'autres pays préfèrent une valeur plus faible, par exemple 70%.

accuracy of power measurement not better than 1%, the efficiency can be 2% in error or the total losses can be in error by 2% of the total input power). On small machines or machines with relatively low efficiencies (say below 90%),* this method may be quite acceptable and gives a convenient form of test for such machines. On these and other machines efficiency can be obtained with high accuracy by the calculation of losses from direct measurements.

13. Calibrated machine test

The machine of which the losses are to be measured is separated from the network, uncoupled from its driving motor if necessary, and driven at its rated speed by a calibrated motor, that is by an electric motor of which the losses have been previously determined with great accuracy, such that it is possible to determine the mechanical power which it furnishes at its shaft, knowing the electric power which it absorbs and its speed of rotation. The mechanical power transmitted by the calibrated motor to the shaft of the machine under test is a measure of the losses of this latter machine for the working conditions under which the test is made. In this method, the machine tested may be on no-load, excited or not excited, with or without brushes or short-circuited, which enables categories of losses to be separated.

As an alternative, the calibrated motor may be replaced by a dynamometer or by any other motor driving the machine under test through an appropriate torsionmeter, which enables the torque transmitted to the machine under test to be known, and hence the mechanical power absorbed by this latter machine.

When use is made of this alternative, the speed of rotation, which comes directly into the calculation of the power, must be measured with extreme care.

14. Zero power factor test

The machine operates as a motor at no-load and at rated speed, with a power factor in the neighbourhood of zero, while the excitation current is adjusted so that the machine carries its rated primary current.

The supply voltage is such that the magnetic losses have the same value as in no-load operation at rated voltage. The supply voltage is usually equal to the rated voltage unless this would give an active iron loss appreciably greater than that at full load. In principle, the reactive power should be positive, i.e. over-excited, but when this is impossible because the exciter voltage is not sufficient, the test can be made with absorption of the reactive power (i.e. under-excited).

Note. — The accuracy of this method is dependent upon the accuracy at low power factor of the wattmeters used.

15. Retardation method

This method is particularly applicable to large synchronous machines with considerable inertia. The method may also be used for a.c. induction machines and d.c. machines, using the appropriate losses for such machines. It consists of measuring the retardation time when the

---

**Note.* — In some countries 90% efficiency is accepted as a basis for using the indirect method whereas some other countries prefer a lower value, e.g. 70%.

à mesurer le temps employé par la machine pour ralentir, dans différentes conditions, entre deux vitesses prédéterminées, par exemple de 110% à 90% ou de 105% à 95% de la vitesse nominale. Ce temps varie en raison inverse de la valeur moyenne des pertes pendant le même temps.

Cette méthode permet de mesurer les pertes mécaniques (pertes par frottement et pertes totales par ventilation), les pertes dans le fer à différentes excitations et les pertes dues à la charge en court-circuit à différentes excitations.

Pendant l'essai, la machine fonctionne en moteur à vide alimenté par une génératrice pendant une durée suffisante pour que la température des paliers se stabilise. Si les pertes dans les paliers sont garanties pour une certaine température des paliers, l'arrivée d'eau dans le système de refroidissement du palier doit être réglée de façon à permettre d'obtenir la température spécifiée.

La machine en essai est portée à une vitesse suffisamment supérieure à celle à partir de laquelle le temps de ralentissement est mesuré. La machine en essai est ensuite séparée de la machine qui l'alimente et on réalise la valeur de l'excitation et les connexions de l'enroulement primaire nécessaires. Ces manœuvres doivent être faites suffisamment vite pour que le régime établi nécessaire pour l'essai soit réalisé avant que la vitesse de la machine, qui décroît constamment dans cet intervalle de temps, passe par la limite supérieure à partir de laquelle le temps de ralentissement est mesuré.

Dans les essais de ralentissement à vide, l'excitation et la tension statorique sont mesurées à l'instant où la machine passe par sa vitesse nominale. Dans les essais de ralentissement en court-circuit, le courant d'excitation et le courant statorique sont mesurés au même instant. L'essai doit être effectué à plusieurs valeurs d'excitation, les connexions étant ouvertes et en court-circuit.

Le temps entre les deux limites doit être mesuré avec une précision de 2%. L'intervalle entre les deux limites choisies dépend de la précision de la mesure. Une génératrice à aimant permanent ou une excitatrice peuvent être utilisées comme tachymètre; la mesure peut également être réalisée au moyen de dispositifs électroniques.

Pour obtenir la valeur absolue des pertes qui existaient dans les machines pendant l'essai correspondant de ralentissement à vide à l'instant de son passage par la vitesse nominale, on effectue des mesures, la machine fonctionnant en moteur à vide, à la vitesse normale, à un facteur de puissance égal à un et à la même tension que dans l'une des mesures de ralentissement, de préférence à la tension nominale. La puissance absorbée, qui est égale aux pertes, doit être mesurée avec une grande précision.

Lorsque l'on ne connaît pas avec une précision suffisante l'inertie de la machine, on peut la déterminer par un essai de ralentissement dans lequel on connaît les pertes, mesurées par une autre méthode.

On répète la mesure plusieurs fois et on calcule la valeur moyenne. Au lieu d'effectuer plusieurs mesures à la même tension, on peut déterminer plusieurs points à différentes tensions entre 95% et 105% de la tension nominale de façon à obtenir la courbe des pertes *en fonction* de la tension de part et d'autre de sa valeur nominale. Les mesures de ralentissement doivent avoir été effectuées dans le même domaine de tension. On établit alors la relation entre les pertes P et le temps de ralentissement.

Les pertes dans des conditions quelconques (par exemple à vide, en court-circuit, etc.) peuvent être prises égales au produit de la puissance absorbée P, mesurée lors de l'essai ci-dessus, par le rapport du temps de ralentissement de l'essai ci-dessus au temps de ralentissement de l'essai considéré.

machine is slowing down under different conditions between two predetermined speeds, say from 110% to 90% or from 105% to 95% of the rated speed. This time will vary inversely with the average losses during the same time.

The method permits the measurement of the mechanical loss (friction losses and total windage loss), core loss at different excitation and load loss on short-circuit under different excitation.

During the test, the machine is run as a motor at no-load fed from a generator for a sufficient time for the temperature of the bearings to be stabilized. If the bearing losses are guaranteed at a certain temperature of the bearing, the amount of cooling water to the bearing cooling system should be adjusted so that the agreed temperature will be obtained.

The machine on test is accelerated to a speed sufficiently above the speed from which the retardation time is measured. The test machine is then disconnected from its feeding machine and the required value of excitation, and primary winding connections, are established. This should be done with sufficient rapidity for the required steady electrical test conditions to have been reached before the speed of the machine, which is decreasing constantly during this interval, passes through the upper limit from which the retardation time is measured.

In the open-circuit retardation tests, the excitation and the stator voltage are measured as the machine passes through the rated speed. In the short-circuit retardation tests, the excitation current and the stator current are measured at this same instant. The test should be carried out for several values of excitation, with open-circuited and short-circuited connections respectively.

The time between the two limits of speed should be measured within an accuracy of 2%. The interval between the two limits chosen depends on the accuracy of measurement. A permanent magnet generator or an exciter may be used as a tachometer, or measurement may be made with electronic devices.

To obtain the absolute value of the losses, which are present in the machine during the corresponding open-circuit retardation test at the moment of passing through the rated speed, measurements are made with the machine running as a motor at no-load, normal speed and unity power factor, and at the same voltage as used in one of the retardation tests, preferably at normal voltage. The input, i.e. the losses, should be measured with great accuracy.

When the inertia of the machine is not known with sufficient precision, it may be determined by a retardation test with known losses, measured by another method.

The measurement is repeated several times and the average value calculated. Instead of measuring several times at the same voltage, several points can be measured at different voltages in the range of 95% to 105% to obtain a curve of losses *versus* voltage around the rated voltage. Retardation measurements should have been made in the same voltage range. The relation between losses P and retardation time is now established.

The losses at any condition (e.g., at no-load, at short-circuit, etc.) can be calculated as the input value P measured in the above test multiplied by the ratio between the retardation time in the above test and the retardation time in the actual test.

Les pertes mécaniques sont obtenues par un essai de ralentissement sans excitation; les pertes dans le fer sont obtenues à partir des essais à vide par soustraction des pertes mécaniques et les pertes en court-circuit à partir d'un essai de ralentissement en court-circuit par soustraction des pertes mécaniques.

Le moment d'inertie peut se calculer à partir de l'essai de ralentissement par la formule suivante:

$$J \simeq \frac{45600\,Pt}{\delta n^2}$$

où:

$$45600 = \frac{60^2 \times 10^3}{8\pi^2}$$

Le ralentissement se mesure de la vitesse $n\,(1+\delta)$ à la vitesse $n\,(1-\delta)$, n étant la vitesse nominale en tours par minute. Si P est exprimé en kilowatts, l'inertie J s'obtient en kgm², t étant la durée en secondes entre les deux instants où la vitesse est $n\,(1+\delta)$ et $n\,(1-\delta)$ respectivement.

Pendant l'essai de ralentissement, l'excitation de la machine essayée doit de préférence provenir d'une source séparée. On peut toutefois utiliser une excitatrice à accouplement direct si la variation de la vitesse lors du ralentissement est faible, par exemple de 105% à 95%. On doit alors faire une correction appropriée pour les pertes dans le circuit d'excitation en tenant compte également du fait que le courant d'excitation peut différer légèrement entre l'essai de ralentissement et l'essai à vide, bien que la tension reste la même. Il est toutefois nécessaire que l'excitatrice soit en excitation séparée.

Au lieu d'appliquer la méthode à vide pour obtenir la valeur absolue des pertes, on peut appliquer la méthode du moteur auxiliaire taré.

16. **Essai en opposition**

Cette méthode est applicable lorsqu'on dispose de deux machines identiques. Ces machines sont accouplées mécaniquement et couplées électriquement de façon à fonctionner à la vitesse nominale, l'une en moteur et l'autre en génératrice. La température réelle à laquelle sont effectuées les mesures doit être aussi voisine que possible de la température de régime et il n'est pas effectué de correction. Les pertes des machines accouplées sont couvertes soit par un réseau auquel elles sont connectées, soit par un moteur taré d'entraînement, soit par un survolteur, soit encore par une combinaison de ces divers moyens.

La valeur moyenne des courants d'induit est réglée à la valeur nominale; la moyenne de la tension des deux induits est supérieure ou inférieure à la tension nominale d'une valeur égale à la chute de tension, selon que les machines sont fournies pour être employées respectivement comme génératrice ou comme moteur.

Lorsque deux machines à induction sont couplées électriquement, elles doivent être accouplées mécaniquement à l'aide d'un dispositif de réglage de la vitesse, tel qu'une boîte d'engrenages, de façon à assurer la transmission correcte de la puissance. La valeur de la puissance transmise dépend de la différence de vitesse. Le réseau électrique couvrant les pertes des deux machines devra fournir de la puissance réactive magnétisante aux deux machines.

Lorsque deux machines synchrones sont couplées électriquement, elles doivent être accouplées mécaniquement avec un décalage correct entre les angles de phase. La valeur de la puissance transmise dépend du déphasage entre les deux machines.

The mechanical loss is obtained from a retardation test without excitation, the core loss from the open-circuit tests with the mechanical loss subtracted, and the short-circuit loss from a retardation test on short-circuit with the mechanical loss subtracted.

The moment of inertia can be calculated from the retardation test with the equation:

$$J \simeq \frac{45600\ Pt}{\delta n^2}$$

where:

$$45600 = \frac{60^2 \times 10^3}{8\pi^2}$$

The retardation is measured from the speed $n\,(1+\delta)$ to the speed $n\,(1-\delta)$ where n is the rated speed in revolutions per minute. If P is expressed in kilowatts, inertia J is obtained in kgm^2, t being the time in seconds between the two instants where the speed is $n\,(1+\delta)$ and $n\,(1-\delta)$ respectively.

During the retardation test, the excitation on the tested machine should preferably be from a separate source. A directly coupled exciter can, however, be used, if the change in speed during retardation is small, e.g. 105% to 95%. An appropriate correction for the loss in the excitation circuit must then be made taking into account also that the excitation current in the retardation test, and the no-load tests, may be a little different, although the voltage is the same. Separate excitation of the exciter is, however, necessary.

Instead of using the no-load method for obtaining the absolute value of the losses, the calibrated motor method can be used.

16. Electrical back-to-back test

This method is applicable when two identical machines are available. The machines are coupled mechanically and electrically so as to operate at rated speed, one as a motor and the other as a generator. The actual temperature at which the measurements are carried out should be as close as possible to the working temperature and no further correction should be made. The losses of the assembled machines are supplied either by a network to which they are connected, or by a calibrated driving motor, or by a booster, or else by a combination of these various means.

The average value of the armature currents is adjusted to the rated value, the average of the voltage of the two armatures is above or below the rated voltage by an amount equal to the voltage drop, depending on whether the d. c. machines are intended to be used respectively as generators or as motors.

Where two induction machines are electrically connected, they should be mechanically coupled with a speed adjusting device, such as a gear box, to ensure the correct circulation of power. The magnitude of power circulated depends upon the difference in speed. The electrical system supplying the losses to the two machines will be required to provide magnetizing kvar to both machines.

When two synchronous machines are electrically connected, they should be mechanically coupled with a correct angular phase relationship. The magnitude of the power circulated depends upon the difference in phase angle between them.

17. **Essai calorimétrique**

A l'étude.

18. **Indication des essais préférentiels**

18.1 *Machines à courant continu*

L'essai préférentiel des machines à courant continu est celui du paragraphe 7.1 et la méthode préférentielle de calcul du rendement est celle du paragraphe 7.1.2.

18.2 *Machines à induction polyphasées*

L'essai préférentiel des machines à induction polyphasées est celui du paragraphe 9.1 et la méthode préférentielle de détermination des pertes constantes est celle du paragraphe 9.1.1.1.

18.3 *Machines synchrones*

L'essai préférentiel des machines synchrones est celui du paragraphe 11.1 et la méthode préférentielle de détermination des pertes constantes est celle du paragraphe 11.1.2.1.

17. Calorimetric test

Under consideration.

18. Schedule of preferred tests

18.1 *D.C. machines*

The preferred test for d.c. machines is in accordance with Sub-clause 7.1 and the preferred method of calculating the efficiency is in accordance with Sub-clause 7.1.2.

18.2 *Polyphase induction machines*

The preferred test for polyphase induction machines is in accordance with Sub-clause 9.1 and the preferred method of determining the constant losses is in accordance with Sub-clause 9.1.1.1.

18.3 *Synchronous machines*

The preferred test for synchronous machines is in accordance with Sub-clause 11.1 and the preferred method of determining the constant losses is in accordance with Sub-clause 11.1.2.1.

Validité de la présente publication

Le contenu technique des publications de la CEI est constamment revu par la CEI afin qu'il reflète l'état actuel de la technique.

Des renseignements relatifs à la date de reconfirmation de la publication sont disponibles auprès du Bureau Central de la CEI.

Les renseignements relatifs à ces révisions, à l'établissement des éditions révisées et aux amendements peuvent être obtenus auprès des Comités nationaux de la CEI et dans les documents ci-dessous:

- **Bulletin de la CEI**
- **Annuaire de la CEI**
  Publié annuellement
- **Catalogue des publications de la CEI**
  Publié annuellement et mis à jour régulièrement

Terminologie

En ce qui concerne la terminologie générale, le lecteur se reportera à la CEI 50: *Vocabulaire Electrotechnique International* (VEI), qui se présente sous forme de chapitres séparés traitant chacun d'un sujet défini. Des détails complets sur le VEI peuvent être obtenus sur demande. Voir également le dictionnaire multilingue de la CEI.

Les termes et définitions figurant dans la présente publication ont été soit tirés du VEI, soit spécifiquement approuvés aux fins de cette publication.

Symboles graphiques et littéraux

Pour les symboles graphiques, les symboles littéraux et les signes d'usage général approuvés par la CEI, le lecteur consultera:

– la CEI 27: *Symboles littéraux à utiliser en électro-technique;*

– la CEI 417: *Symboles graphiques utilisables sur le matériel. Index, relevé et compilation des feuilles individuelles;*

– la CEI 617: *Symboles graphiques pour schémas;*

et pour les appareils électromédicaux,

– la CEI 878: *Symboles graphiques pour équipements électriques en pratique médicale.*

Les symboles et signes contenus dans la présente publication ont été soit tirés de la CEI 27, de la CEI 417, de la CEI 617 et/ou de la CEI 878, soit spécifiquement approuvés aux fins de cette publication.

Publications de la CEI établies par le même comité d'études

L'attention du lecteur est attirée sur les listes figurant à la fin de cette publication, qui énumèrent les publications de la CEI préparées par le comité d'études qui a établi la présente publication.

Validity of this publication

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology.

Information relating to the date of the reconfirmation of the publication is available from the IEC Central Office.

Information on the revision work, the issue of revised editions and amendments may be obtained from IEC National Committees and from the following IEC sources:

- **IEC Bulletin**
- **IEC Yearbook**
  Published yearly
- **Catalogue of IEC publications**
  Published yearly with regular updates

Terminology

For general terminology, readers are referred to IEC 50: *International Electrotechnical Vocabulary* (IEV), which is issued in the form of separate chapters each dealing with a specific field. Full details of the IEV will be supplied on request. See also the IEC Multilingual Dictionary.

The terms and definitions contained in the present publication have either been taken from the IEV or have been specifically approved for the purpose of this publication.

Graphical and letter symbols

For graphical symbols, and letter symbols and signs approved by the IEC for general use, readers are referred to publications:

– IEC 27: *Letter symbols to be used in electrical technology;*

– IEC 417: *Graphical symbols for use on equipment. Index, survey and compilation of the single sheets;*

– IEC 617: *Graphical symbols for diagrams;*

and for medical electrical equipment,

– IEC 878: *Graphical symbols for electromedical equipment in medical practice.*

The symbols and signs contained in the present publication have either been taken from IEC 27, IEC 417, IEC 617 and/or IEC 878, or have been specifically approved for the purpose of this publication.

IEC publications prepared by the same technical committee

The attention of readers is drawn to the end pages of this publication which list the IEC publications issued by the technical committee which has prepared the present publication.

MACHINES ÉLECTRIQUES TOURNANTES –

Partie 14: Vibrations mécaniques de certaines machines de hauteur d'axe supérieure ou égale à 56 mm – Mesurage, évaluation et limites de la vibration

AVANT-PROPOS

1) La CEI (Commission Electrotechnique Internationale) est une organisation mondiale de normalisation composée de l'ensemble des comités électrotechniques nationaux (Comités nationaux de la CEI). La CEI a pour objet de favoriser la coopération internationale pour toutes les questions de normalisation dans les domaines de l'électricité et de l'électronique. A cet effet, la CEI, entre autres activités, publie des Normes Internationales. Leur élaboration est confiée à des comités d'études, aux travaux desquels tout Comité national intéressé par le sujet traité peut participer. Les organisations internationales, gouvernementales et non gouvernementales, en liaison avec la CEI, participent également aux travaux. La CEI collabore étroitement avec l'Organisation Internationale de Normalisation (ISO), selon des conditions fixées par accord entre les deux organisations.

2) Les décisions ou accords officiels de la CEI concernant les questions techniques, représentent, dans la mesure du possible un accord international sur les sujets étudiés, étant donné que les Comités nationaux intéressés sont représentés dans chaque comité d'études.

3) Les documents produits se présentent sous la forme de recommandations internationales. Ils sont publiés comme normes, rapports techniques ou guides et agréés comme tels par les Comités nationaux.

4) Dans le but d'encourager l'unification internationale, les Comités nationaux de la CEI s'engagent à appliquer de façon transparente, dans toute la mesure possible, les Normes Internationales de la CEI dans leurs normes nationales et régionales. Toute divergence entre la recommandation de la CEI et la norme nationale correspondante doit être indiquée en termes clairs dans cette dernière.

5) La CEI n'a fixé aucune procédure concernant le marquage comme indication d'approbation et sa responsabilité n'est pas engagée quand un matériel est déclaré conforme à l'une de ses normes.

6) L'attention est attirée sur le fait que certains des éléments de la présente Norme internationale peuvent faire l'objet de droits de propriété intellectuelle ou de droits analogues. La CEI ne saurait être tenue pour responsable de ne pas avoir identifié de tels droits de propriété et de ne pas avoir signalé leur existence.

La Norme internationale CEI 34-14 a été établie par le comité d'études 2 de la CEI: Machines tournantes.

Cette deuxième édition annule et remplace la première édition, parue en 1982.

Le texte de cette norme est issu des documents suivants:

FDIS	Rapport de vote
2/940/FDIS	2/970/RVD

Le rapport de vote indiqué dans le tableau ci-dessus donne toute information sur le vote ayant abouti à l'approbation de cette norme.

L'annexe A est donnée uniquement à titre d'information.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

_____

ROTATING ELECTRICAL MACHINES –

Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher – Measurement, evaluation and limits of vibration

FOREWORD

1) The IEC (International Electrotechnical Commission) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of the IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, the IEC publishes International Standards. Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. The IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

2) The formal decisions or agreements of the IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested National Committees.

3) The documents produced have the form of recommendations for international use and are published in the form of standards, technical reports or guides and they are accepted by the National Committees in that sense.

4) In order to promote international unification, IEC National Committees undertake to apply IEC International Standards transparently to the maximum extent possible in their national and regional standards. Any divergence between the IEC Standard and the corresponding national or regional standard shall be clearly indicated in the latter.

5) The IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with one of its standards.

6) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. The IEC shall not be held responsible for identifying any or all such patent rights.

International standard IEC 34-14 has been prepared by IEC technical committee 2: Rotating machinery.

This second edition cancels and replaces the first edition published in 1982.

The text of this standard is based on the following documents:

FDIS	Report on voting
2/940/FDIS	2/970/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

Annex A is for information only.

MACHINES ÉLECTRIQUES TOURNANTES –

Partie 14: Vibrations mécaniques de certaines machines de hauteur d'axe supérieure ou égale à 56 mm – Mesurage, évaluation et limites de la vibration

1 Domaine d'application et objet

La présente partie de la CEI 34 spécifie les procédures d'essai de vibration et les limites pour certaines machines électriques, dans des conditions spécifiées, sans être couplées à une charge ou à une machine entraînée.

Elle est applicable aux machines à courant continu et aux machines à courant alternatif triphasé de hauteur d'axe supérieure ou égale à 56 mm et de puissance assignée inférieure ou égale à 50 MW, à des vitesses nominales de 600 tr/min jusqu'à et y compris 3 600 tr/min.

Pour les machines verticales et pour les machines à brides, cette norme n'est applicable qu'à celles qui sont mesurées en état de suspension libre.

Cette norme n'est pas applicable aux machines montées sur le site, aux moteurs triphasés à collecteurs, aux machines monophasées, aux machines triphasées alimentées en monophasé, aux générateurs hydrauliques verticaux, aux génératrices à aimant permanent ou aux machines à courant continu à enroulement série.

NOTE – Pour les machines mesurées sur le site, se référer à l'ISO 10816-1 (document de base).

2 Références normatives

Les documents normatifs suivants contiennent des dispositions qui, par suite de la référence qui y est faite, constituent des dispositions valables pour la présente partie de la CEI 34. Au moment de la publication, les éditions indiquées étaient en vigueur. Tout document normatif est sujet à révision et les parties prenantes aux accords fondés sur la présente partie de la CEI 34 sont invitées à rechercher la possibilité d'appliquer les éditions les plus récentes des documents normatifs indiqués ci-après. Les membres de la CEI et de l'ISO possèdent le registre des Normes internationales en vigueur.

CEI 34-1: 1996, *Machines électriques tournantes – Partie 1: Caractéristiques assignées et caractéristiques de fonctionnement*

ISO 2954: 1975, *Vibrations mécaniques des machines tournantes ou alternatives – Spécifications des appareils de mesurage de l'intensité vibratoire*

ISO/DIS 7919-1, *Vibrations mécaniques des machines non alternatives – Mesurages sur les arbres tournants et évaluation – Partie 1: Directives générales*

ISO 8821: 1989, *Vibrations mécaniques – Equilibrage – Conventions relatives aux clavettes d'arbres et aux éléments rapportés*

ROTATING ELECTRICAL MACHINES –

Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher – Measurement, evaluation and limits of vibration

1 Scope and object

This part of IEC 34 specifies the vibration test procedures and limits for certain electrical machines under specified conditions, when uncoupled from any load or prime mover.

It is applicable to d.c. and three-phase a.c. machines, with shaft heights 56 mm and higher and a rated output up to 50 MW, at nominal speeds from 600 rev/min up to and including 3600 rev/min.

For vertical machines and flange-mounted machines, this standard is only applicable to those machines that are measured in a state of free suspension.

This standard is not applicable to machines mounted *in situ*, three-phase commutator motors, single-phase machines, three-phase machines operated on single-phase systems, vertical water power generators, permanent magnet generators, or series-wound d.c. machines.

NOTE – For machines measured *in situ* refer to ISO 10816-1 (basic document).

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of IEC 34. At the time of publication, the editions indicated were valid. All normative documents are subject to revision, and parties to agreements based on this part of IEC 34 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

IEC 34-1: 1996, *Rotating electrical machines – Part 1: Rating and performance*

ISO 2954: 1975, *Mechanical vibration of rotating and reciprocating machinery – Requirements for instruments for measuring vibration severity*

ISO/DIS 7919-1, *Mechanical vibration of non-reciprocating machines – Measurements on rotating shafts and evaluation – Part 1: General guidelines*

ISO 8821: 1989, *Mechanical vibration – Balancing – Shaft and fitment key convention*

ISO 10816-1: 1995, *Vibrations mécaniques – Evaluation des vibrations des machines par mesurage sur les parties non tournantes – Partie 1: Directives générales*

ISO/DIS 10817-1, *Systèmes de mesurage des vibrations des arbres tournants – Partie 1: Capteurs des signaux relatifs et absolus des vibrations radiales produites par les arbres tournants*

3 Définitions

Pour les besoins de la présente norme, les définitions données dans les références normatives ci-dessus s'appliquent.

4 Grandeurs de mesurage

4.1 *Généralités*

Les grandeurs de mesurage sont la vitesse de vibration aux paliers de la machine et le déplacement relatif de la vibration sur l'arbre à l'intérieur ou près des paliers de la machine.

4.2 *Intensité vibratoire*

Le critère à adopter pour la vibration aux paliers de la machine doit être la valeur efficace de la vitesse vibratoire en millimètres par seconde. La valeur la plus élevée déterminée aux points de mesurage prescrits caractérise l'intensité vibratoire de la machine (voir ISO 10816-1).

Les moteurs à induction (spécialement du type bipolaire) présentent fréquemment des vitesses de vibration battant à deux fois la fréquence de glissement. Dans ces cas l'intensité vibratoire doit être déterminée à partir de la relation:

$$v_{\text{eff.}} = \sqrt{\frac{(v_{\max}{}^2 + v_{\min}{}^2)}{2}}$$

où

$v_{\max}$ est la valeur maximale efficace de la vitesse;

$v_{\min}$ la valeur minimale.

4.3 *Vibration relative de l'arbre*

Le critère à adopter pour la vibration relative de l'arbre doit être le déplacement vibratoire $S_{p\text{-}p}$ dans le sens du mesurage (voir ISO/DIS 7919-1).

5 Appareillage de mesurage

L'appareillage de mesurage pour les mesurages d'intensité vibratoire doit satisfaire aux prescriptions de l'ISO 2954.

L'appareillage de mesurage pour les mesurages de la vibration relative de l'arbre doit être conforme aux règles de l'ISO/DIS 10817-1.

ISO 10816-1: 1995, *Mechanical vibration – Evaluation of machine vibration by measurement on non-rotating parts – Part 1: General guidelines*

ISO/DIS 10817-1, *Rotating shaft vibration measuring system – Part 1: Relative and absolute signal sensing of radial vibration from rotating shafts*

3 Definitions

For the purpose of this standard, the definitions in the normative references listed in clause 2 apply.

4 Measurement quantities

4.1 *General*

Measurement quantities are the vibration velocity at the machine bearings and the relative shaft vibration displacement within or near to the machine bearings.

4.2 *Vibration severity*

The criterion for the vibration at the machine bearings shall be the r.m.s. value of the vibration velocity in millimetres per second. The greatest value, determined at the prescribed measurement points, characterizes the vibration severity of the machine (see ISO 10816-1).

Induction motors (especially of two-pole type) frequently show vibration velocities beating at twice slip frequency. In these cases the vibration severity shall be determined from the relationship:

$$v_{\text{r.m.s.}} = \sqrt{\frac{(v_{\text{max}}{}^2 + v_{\text{min}}{}^2)}{2}}$$

where

v_{max} is the maximum r.m.s. velocity value;

v_{min} is the minimum value.

4.3 *Relative shaft vibration*

The criterion adopted for the relative shaft vibration shall be the vibratory displacement $S_{\text{p-p}}$ in the direction of measurement (see ISO/DIS 7919-1).

5 Measurement equipment

Measurement equipment for vibration severity measurements shall comply with the requirements in ISO 2954.

Measurement equipment for relative shaft vibration measurements shall comply with the requirements in ISO/DIS 10817-1.

6 Montage de la machine

La vibration d'une machine électrique est étroitement liée au montage de la machine. Pour permettre une évaluation spécifique de l'équilibrage et des vibrations des machines électriques tournantes, il est nécessaire de mesurer la vibration sur la machine seule, selon des conditions d'essai convenablement définies, de façon à permettre des essais reproductibles et à fournir des mesurages comparables.

6.1 *Suspension libre*

Cet état est obtenu par suspension de la machine à un ressort, ou par montage sur un support élastique (ressorts, caoutchouc, etc.)

La fréquence d'oscillation naturelle du système de suspension et de la machine, dans les six degrés de liberté possibles, doit être inférieure au tiers de la fréquence correspondant à la vitesse de la machine en essai, comme défini en 7.3. L'élasticité nécessaire du système de suspension en fonction de la vitesse nominale peut être déterminée à partir de la figure 1.

6.2 *Montage rigide*

La machine doit être fermement attachée à un sol rigide.

Les vitesses de vibration maximales mesurées selon les directions horizontale et verticale sur les pattes de la machine (ou sur le cadre d'embase près des supports des paliers ou pattes du stator) ne doivent pas excéder 25 % des vitesses maximales qui sont mesurées sur le palier adjacent selon l'une ou l'autre des directions de mesurage.

NOTES

1 La présente règle confirme que les fréquences naturelles horizontale et verticale de l'arrangement d'essai complet ne coïncident pas avec:

a ± 10 % de la fréquence de rotation de la machine;

b ± 5 % de deux fois la fréquence de rotation;

c ± 5 % de une ou deux fois la fréquence électrique de ligne.

2 Le rapport de 25 % exigé entre les vitesses au niveau de la patte et du palier est valable pour une vibration une fois par tour et la vibration avec deux fois la fréquence de ligne si cette dernière est évaluée.

6.3 *Détermination de l'environnement actif*

Les systèmes de support mentionnés en 6.1 et 6.2 sont considérés comme passifs, en admettant que les perturbations externes à la machine sont insignifiantes. Si la vibration de la machine à l'arrêt est supérieure à 25 % de la valeur lorsque la machine est en marche, alors un environnement actif est censé exister et la présente norme ne s'y applique pas (voir ISO 10816-1).

6 Machine mounting

The vibration of an electrical machine is closely linked with the mounting of the machine. To permit evaluation as far as balance and vibration of rotating electrical machines are concerned, it is necessary to measure the vibration on the machine alone, under properly determined test conditions, to enable reproducible tests to be carried out and to provide comparable measurements.

6.1 *Free suspension*

This condition is achieved by suspending the machine on a spring or by mounting on an elastic support (springs, rubber, etc.).

The natural oscillation frequency of the suspension system and machine, in the six possible degrees of freedom, shall be less than 1/3 of the frequency corresponding to the speed of the machine under test, as defined in 7.3. The necessary elasticity of the suspension system, as a function of nominal speed, can be determined from figure 1.

6.2 *Rigid mounting*

The machine shall be clamped firmly to a solid floor.

The maximum vibration velocity measured in the horizontal and vertical directions at the machine feet (or at the base frame near to the bearing pedestals or stator feet) shall not exceed 25 % of the maximum velocity which is measured at the adjacent bearing in either the horizontal or vertical direction.

NOTES

1 This requirement ensures that the horizontal and vertical natural frequencies of the complete test arrangement do not coincide within:

a ± 10 % of the rotational frequency of the machine;

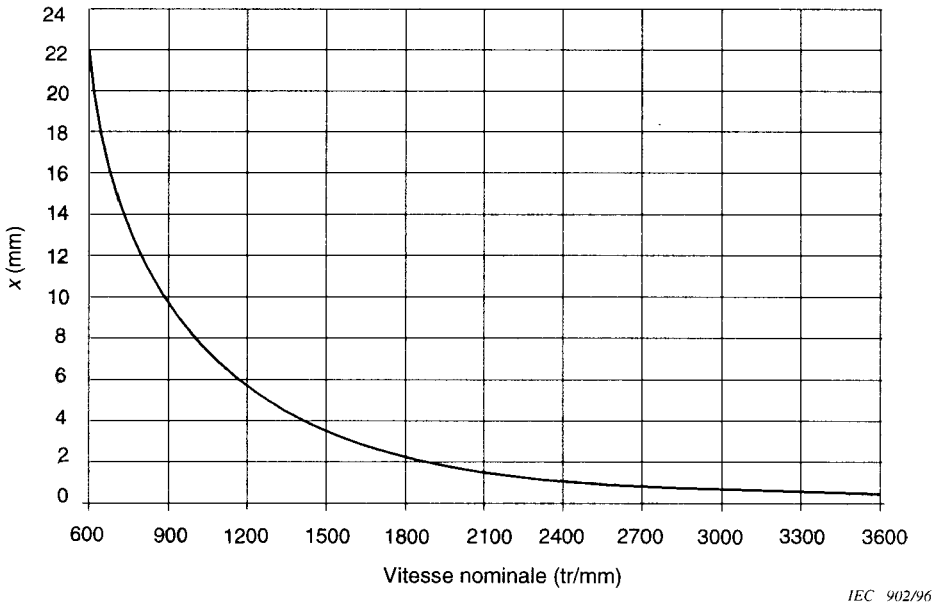
b ± 5 % of two times rotational frequency;

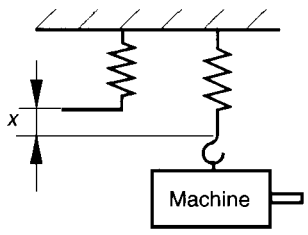
c ± 5 % of one and two times electrical line frequency.

2 The ratio of 25 % of foot to bearing vibration velocities is valid for once per revolution vibration and the vibration at twice line frequency (if the latter is being evaluated).

6.3 *Active environment determination*

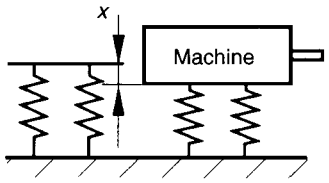
The support systems described in 6.1 and 6.2 are considered passive, admitting insignificant external disturbances to the machine. If the vibration with the machine stationary exceeds 25 % of the value when the machine is running, then an active environment is said to exist and this standard does not apply (see ISO 10816-1).





Suspension à ressort

IEC 903/96

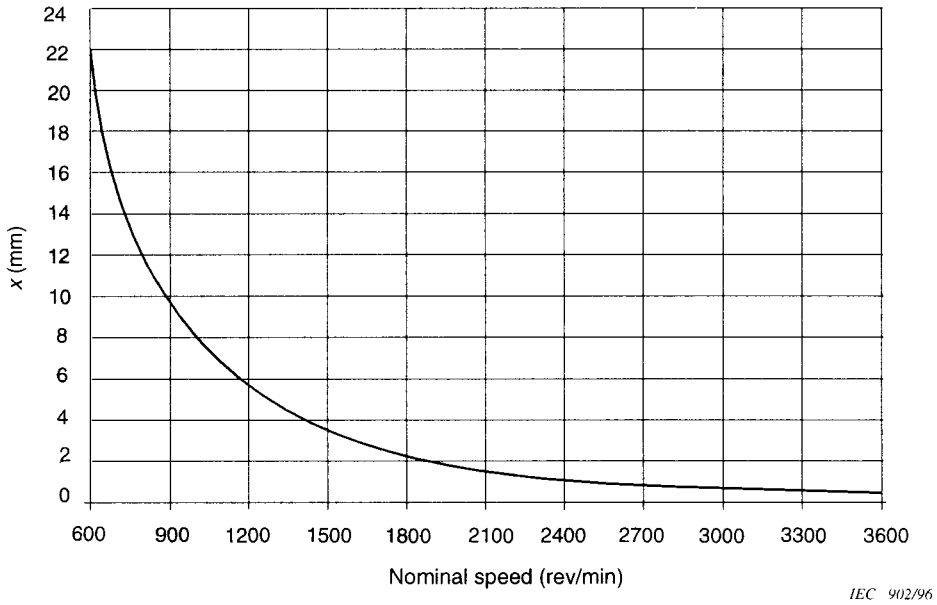


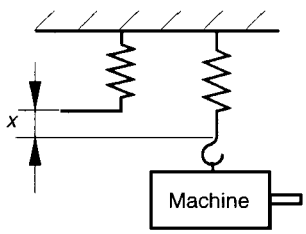
Montage sur un support élastique

IEC 904/96

NOTE – Il convient que la masse effective du support élastique ne soit pas supérieure à 1/10 de celle de la machine, afin de réduire l'influence de la masse et des moments d'inertie de ces éléments sur le niveau de vibration.

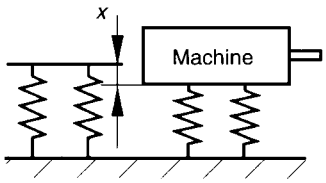
Figure 1 – Déplacement élastique minimal en fonction de la vitesse nominale





Spring suspension

IEC 903/96



Mounting on an elastic support

IEC 904/96

NOTE – To reduce the influence of the mass and the moments of inertia of the suspension system on the vibration level the effective mass of the elastic support should not be greater than 1/10 of that of the machine.

Figure 1 – Minimum elastic displacement as a function of nominal speed

7 Conditions de mesurage

7.1 *Clavette*

Pour l'équilibrage et le mesurage de l'intensité vibratoire des machines équipées d'une rainure de bout d'arbre, la rainure doit être obstruée par une demi-clavette.

NOTE – Une clavette rectangulaire de pleine longueur et de demi-hauteur ou une clavette de demi-longueur et de pleine hauteur (qu'il convient de centrer selon l'axe dans la rainure de la clavette) sont acceptables (voir 3.3 de l'ISO 8821).

7.2 *Points de mesurage*

7.2.1 *Points de mesurage de la vitesse de vibration*

L'emplacement des points de mesurage et les directions auxquelles se rapportent les niveaux de l'intensité vibratoire sont indiqués à la figure 2 pour les machines à flasques paliers et à la figure 4 pour les machines à supports de palier. La figure 3 est applicable aux machines dont les mesurages conformément à la figure 2 ne sont pas possibles sans démontage des éléments.

7.2.2 *Points de mesurage du déplacement relatif de l'arbre*

Des capteurs sans contact doivent être installés à l'intérieur du palier, mesurant directement le déplacement relatif journalier de l'arbre ou bien (si le montage interne n'est pas réalisable) doivent être installés près de la coquille de coussinet. Les positions radiales préférentielles sont celles indiquées en figure 5.

7.3 *Conditions d'essai*

Les machines doivent être essayées à vide, toutes les grandeurs correspondantes étant à leur valeur assignée.

Les machines à courant alternatif doivent être alimentées avec une forme d'onde pratiquement sinusoïdale conformément à 6.2 de la CEI 34-1.

Sauf spécification contraire, l'essai doit être effectué à chaque vitesse assignée ou dans toute la plage des vitesses assignées. Pour chaque essai à une vitesse donnée, les valeurs ne doivent pas être supérieures aux limites correspondantes données dans le tableau 1.

Pour les machines ayant deux sens de rotation, les limites de vibration sont applicables à ces deux sens.

7.4 *Capteur de vibration*

Le contact entre le capteur utilisé pour le mesurage de la vitesse de vibration et la surface de la machine doit être tel que spécifié par le constructeur du capteur et ne doit pas perturber l'état vibratoire de la machine en essai.

Pour cela, il est nécessaire que la masse totale couplée du capteur monté soit inférieure à 1/50 de la masse de la machine.

7 Conditions of measurement

7.1 *Key*

For the balancing and measurement of vibration on machines provided with a shaft extension keyway, the keyway shall be filled with a half key.

NOTE – A full length rectangular key of half height or a half length key of full height (which should be centred axially in the keyway) is acceptable (see 3.3 of ISO 8821).

7.2 *Measurement points*

7.2.1 *Measurement points for vibration velocity*

The location of the measurement points and directions to which the levels of vibration severity apply are shown in figure 2 for machines with end-shield bearings and in figure 4 for machines with pedestal bearings. Figure 3 applies to those machines where measurement positions according to figure 2 are not possible without disassembly of parts.

7.2.2 *Measurement points for relative shaft displacement*

Non-contacting transducers shall be installed inside the bearing, measuring directly the relative shaft journal displacement, or (when inside mounting is not possible) adjacent to the bearing shell. The preferred radial positions are as indicated in figure 5.

7.3 *Test conditions*

Machines shall be tested at no-load with all relevant quantities at their rated value.

AC machines shall be run with a virtually sinusoidal wave form according to 6.2 of IEC 34-1.

Unless otherwise agreed, the test shall be performed at each rated speed or over the whole range of rated speeds. For each tested speed the values shall not exceed the corresponding limit in table 1.

For machines with bidirectional rotation, the vibration limits apply for both directions.

7.4 *Vibration transducer*

The mounting of the transducer used for vibration velocity measurement and the machine surface shall be as specified by the manufacturer of the transducer and shall not disturb the vibratory condition of the machine under test.

For this it is necessary that the total coupled mass of the transducer assembly is less than 1/50 of the mass of the machine.

8 Limites de vibration du logement de palier

8.1 *Limites de l'intensité vibratoire*

Les limites de l'intensité vibratoire des machines à courant continu et des machines triphasées à courant alternatif, de hauteur d'axe égale et supérieure à 56 mm, dans les deux conditions de montage spécifiées à l'article 6 sont spécifiées dans le tableau 1. Les valeurs sont données pour trois niveaux de vibration, N (normal), R (réduit) et S (spécial).

Tableau 1 – Limites d'intensité vibratoire, en mm/s et en valeurs efficaces, pour une hauteur d'axe *H* (mm)

		Machine mesurée en état de suspension libre				Suspension rigide
Niveau de vibration	Vitesse nominale (tr/min)	$56 < H \leq 132$	$132 < H \leq 225$	$225 < H \leq 400$	$H > 400$	$H > 400$
N	600 à 3 600	1,8	2,8	3,5	3,5	2,8
R	600 à 1 800	0,71	1,12	1,8	2,8	1,8
	>1 800 à 3 600	1,12	1,8	2,8	2,8	1,8
S	600 à 1 800	0,45	0,71	1,12		
	>1 800 à 3 600	0,71	1,12	1,8		

NOTES

1 Si aucun niveau n'est spécifié, les machines conformes à la présente norme doivent être de niveau N.

2 Les machines de niveau R sont souvent demandées pour des entraînements de machines-outils. Les machines de niveau S sont utilisées pour entraîner des machines spéciales avec des exigences vibratoires très sévères. Ce niveau n'est applicable qu'aux machines de hauteur d'axe inférieure ou égale à 400 mm.

3 Pour les machines exigeant des valeurs inférieures à celles données dans le tableau 1, il est recommandé de choisir des valeurs de la série 0,45; 0,71; 1,12; 1,8 et 2,8 mm/s.

4 Pour les machines de hauteur d'axe supérieure à 400 mm, les deux méthodes de montage sont applicables. Sauf accord contraire, le choix de la méthode sera effectué par le constructeur.

5 Il est recommandé au constructeur et à l'acheteur de tenir compte du fait que l'instrumentation peut avoir une tolérance de mesurage de ±10 %.

6 Une machine par elle-même bien équilibrée et d'un niveau conforme au tableau peut, après installation sur le site, présenter des vibrations importantes provoquées par diverses raisons, telles qu'une assise mal adaptée, la réaction de la machine entraînée, etc. Des vibrations peuvent également être occasionnées par l'entraînement de pièces présentant une fréquence naturelle d'oscillation très proche de l'excitation en raison d'un faible balourd résiduel de la partie tournante de la machine. Dans de tels cas, il convient d'effectuer des vérifications non seulement sur la machine, mais également sur chaque partie de l'installation.

7 La hauteur d'axe d'une machine sans pattes ou d'une machine avec pattes surélevées, ou de toute machine verticale est à considérer comme étant égale à la hauteur d'axe d'une machine de même carcasse de base mais du type à pattes avec arbre horizontal.

8.2 *Limites de vitesse de vibration à deux fois la fréquence de ligne pour des machines à courant alternatif*

Les machines à deux pôles peuvent présenter des vibrations importantes à deux fois la fréquence de ligne du système d'alimentation. L'évaluation correcte de ces éléments de vibration exige une suspension rigide de la machine qui soit conforme aux prescriptions données en 6.2.

Pour les machines à deux pôles de hauteur d'axe supérieure à 225 mm, l'évaluation ci-dessus doit faire partie d'un essai de type de la machine de base pour établir l'existence d'une vibration importante à deux fois la fréquence de ligne.

8 Limits of bearing housing vibration

8.1 *Limits of vibration severity*

The limit of vibration severity for d.c. and three-phase a.c. machines with shaft heights 56 mm and higher and for the two mounting conditions as specified in clause 6 are specified in table 1. Values are given for three vibration grades: N (normal), R (reduced) and S (special).

Table 1 – Limits of vibration severity in mm/s r.m.s. for the shaft height *H* (mm)

		Machine measured in a state of free suspension				Rigid mounted
Vibration grade	Rated speed rev/min	56 < *H* ≤ 132	132 < *H* ≤ 225	225 < *H* ≤ 400	*H* > 400	*H* > 400
N	600 to 3 600	1,8	2,8	3,5	3,5	2,8
R	600 to 1 800	0,71	1,12	1,8	2,8	1,8
	>1 800 to 3 600	1,12	1,8	2,8	2,8	1,8
S	600 to 1 800	0,45	0,71	1,12		
	>1 800 to 3 600	0,71	1,12	1,8		

NOTES

1 If no grade is specified, machines complying with this standard shall be grade N.

2 Grade R machines are frequently ordered for machine-tool drives. Grade S machines are in use as drives for special machines with extreme vibration requirements. Grade S is applicable only to machines with shaft heights ≤400 mm.

3 For machines requiring values lower than those given in table 1, it is recommended to select values from the series 0,45; 0,71; 1,12; 1,8 and 2,8 mm/s.

4 For machines with H > 400 mm, both methods of mounting are applicable. Unless otherwise agreed, the choice of the method will be made by the manufacturer.

5 Manufacturer and purchaser should take into account that the instrumentation can have a measurement tolerance of ±10 %.

6 A machine, which is well balanced in itself and of a grade conforming with the table, may exhibit large vibrations, when installed *in situ*, arising from various causes, such as unsuitable foundations, reaction of the driven machine, etc. Vibration may also be caused by driving elements with a natural oscillation frequency very close to the excitation due to the small residual unbalance of the rotating masses of the machine. In such cases, checks should be carried out not only on the machine, but also on each element of the installation.

7 The shaft height of a machine without feet, or a machine with raised feet, or any vertical machine is to be taken as the shaft height of a machine in the same basic frame, but of the horizontal shaft, foot-mounting type.

8.2 *Limits of vibration velocity with twice line frequency for a.c. machines*

Two-pole machines may have significant vibration at twice the frequency of the power system. The correct evaluation of these vibration components requires a rigid mounting of the machine which complies with the requirements given in 6.2.

For two-pole machines with shaft heights *H* > 225 mm, the above evaluation shall be part of the basic machine type test to establish the existence of significant twice line frequency vibration.

Les machines de hauteur d'axe supérieure à 225 mm et avec une vibration à deux fois la fréquence de ligne, doivent être essayées avec un montage rigide et ne doivent pas présenter des valeurs supérieures aux valeurs limites du tableau 1 pour les machines de hauteur d'axe supérieure à 400 mm et à montage rigide.

8.3 *Vibration axiale*

L'évaluation de la vibration axiale du palier dépend de la fonction de palier et de la construction du palier.

Dans le cas de paliers de butée, la vibration axiale est corrélée aux pulsations de la poussée qui peuvent endommager la garniture métallique des paliers à douille ou parties des paliers à régule. La vibration axiale de ces paliers doit être évaluée de la même façon qu'une vibration transverse et les valeurs limites du tableau 1 sont applicables.

Si des paliers n'ont pas de limitation axiale par construction, il est permis d'adopter une exigence moins contraignante, soumise à un accord préalable entre le constructeur et l'acheteur.

9 Limites de vibration relative de l'arbre

Les mesurages des vibrations relatives de l'arbre sont seulement recommandées pour les machines deux et quatre pôles à paliers à douilles et de puissance assignée supérieure à 1 000 kW. En conséquence, un accord préalable entre le constructeur et l'utilisateur est nécessaire, quant à l'installation de capteurs de mesurage sur l'arbre.

Si les machines à paliers à douille présentent des dispositions particulières pour le montage des capteurs de mesurage de la vibration de l'arbre, les limites du déplacement relatif de la vibration de l'arbre sont spécifiées dans le tableau 2. Ces limites s'ajoutent à celles exigées à l'article 8.

Tableau 2 – Limites de vibration d'arbre maximale (S_{P-P}) et faux-rond maximal

Niveau de vibration	Nombre de pôles	Déplacement maximal relatif de l'arbre µm	Faux-rond maximal µm
N	2	70	18
	4	90	23
R	2	50	12,5
	4	70	18

NOTES

1 Les machines de niveau de vibration R sont fréquemment demandées pour des entraînements à vitesses élevées dans des installations critiques.

2 Toutes les limites s'appliquent à des machines 50 Hz et 60 Hz.

3 Les limites de déplacement maximal relatif de l'arbre incluent le faux-rond. Pour une définition du faux-rond voir ISO/DIS 7919-1.

Machines having H > 225 mm and twice line frequency vibration, shall be tested with rigid mounting and shall not exceed the values for H > 400 with rigid mounting in table 1.

8.3 *Axial vibration*

The evaluation of axial bearing vibration depends on the bearing function and bearing construction.

In the case of thrust bearings, axial vibration correlates with thrust pulsations which could cause damage to the metal liner of sleeve bearings or to parts of antifriction bearings. Axial vibration of these bearings shall be evaluated in the same manner as transverse vibration and table 1 limits apply.

Where bearings have no axial limiting construction, a less exacting requirement may be acceptable, subject to prior agreement between manufacturer and purchaser.

9 Limits of relative shaft vibration

Relative shaft vibration measurements are recommended only for two- and four-pole machines with sleeve bearings and rated power >1 000 kW and shall be the subject of prior agreement between manufacturer and purchaser with respect to the necessary provisions regarding the installation of shaft measurement transducers.

When machines with sleeve bearings have special provisions for the installation of shaft vibration measurement transducers, the limits for the relative shaft vibration displacement are specified in table 2. These limits are in addition to those required in clause 8.

Table 2 – Limits for the maximum shaft vibration (S_{P-P}) and the maximum run-out

Vibration grade	Number of poles	Maximum relative shaft displacement µm	Maximum run-out µm
N	2	70	18
	4	90	23
R	2	50	12,5
	4	70	18

NOTES

1 Machines with vibration grade R are frequently specified for high-speed drives in critical installations.

2 All limits apply to both 50 Hz and 60 Hz machines.

3 The maximum relative shaft displacement limits include the run-out. For the definition of the run-out (see ISO/DIS 7919-1).

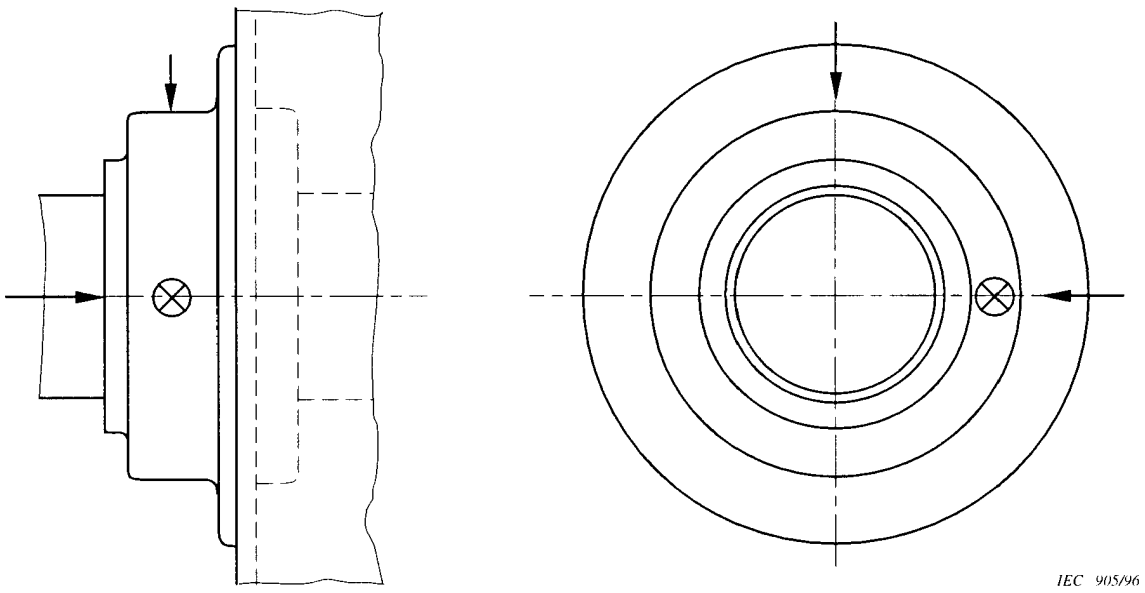


Figure 2 – Points préférentiels de mesurage applicables à une seule ou aux deux extrémités de la machine

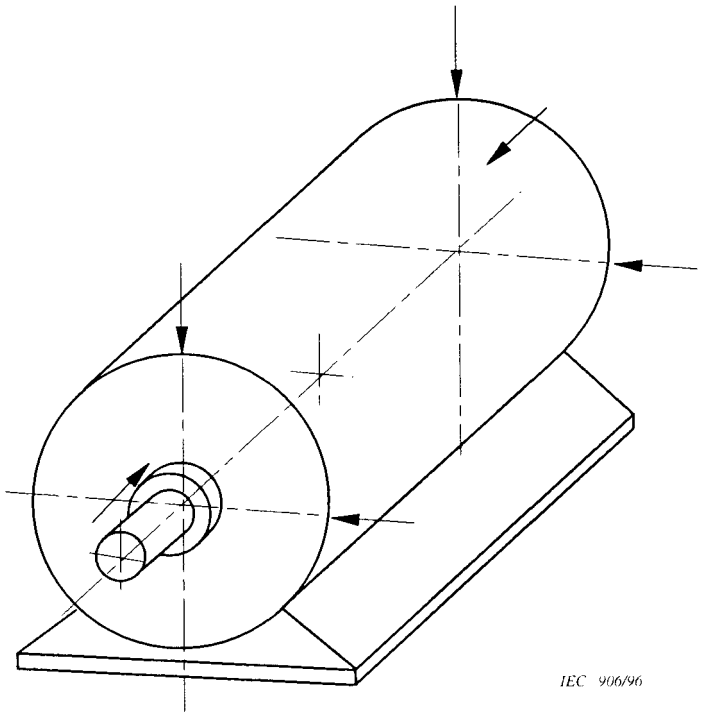

Figure 3 – Points de mesurage pour les extrémités de machines où les mesurages selon la figure 2 ne sont pas possibles sans le démontage des éléments

Standards Survey

We at the IEC want to know how our standards are used once they are published.

The answers to this survey will help us to improve IEC standards and standard related information to meet your future needs

Would you please take a minute to answer the survey on the other side and mail or fax to:

Customer Service Centre (CSC)

International Electrotechnical Commission
3, rue de Varembé
Case postale 131

1211 Geneva 20
Switzerland

or

Fax to: CSC at +41 22 919 03 00

Thank you for your contribution to the standards making process.

No. of IEC standard:

.....

2.

Tell us why you have the standard. (check many as apply). I am:

- ☐ the buyer
- ☐ the user
- ☐ a librarian
- ☐ a researcher
- ☐ an engineer
- ☐ a safety expert
- ☐ involved in testing
- ☐ with a government agency
- ☐ in industry
- ☐ other.....

3.

This standard was purchased from?

.....

4.

This standard will be used (check as many as apply):

- ☐ for reference
- ☐ in a standards library
- ☐ to develop a new product
- ☐ to write specifications
- ☐ to use in a tender
- ☐ for educational purposes
- ☐ for a lawsuit
- ☐ for quality assessment
- ☐ for certification
- ☐ for general information
- ☐ for design purposes
- ☐ for testing
- ☐ other.....

5.

This standard will be used in conjunction with (check as many as apply):

- ☐ IEC
- ☐ ISO
- ☐ corporate
- ☐ other (published by.....)
- ☐ other (published by.....)
- ☐ other (published by.....)

6.

This standard meets my needs (check one)

- ☐ not at all
- ☐ almost
- ☐ fairly well
- ☐ exactly

7.

Please rate the standard in the following areas as (1) bad, (2) below average, (3) average, (4) above average, (5) exceptional, (0) not applicable:

- ☐ clearly written
- ☐ logically arranged
- ☐ information given by tables
- ☐ illustrations
- ☐ technical information

8.

I would like to know how I can legally reproduce this standard for:

- ☐ internal use
- ☐ sales information
- ☐ product demonstration
- ☐ other.....

9.

In what medium of standard does your organization maintain most of its standards (check one):

- ☐ paper
- ☐ microfilm/microfiche
- ☐ mag tapes
- ☐ CD-ROM
- ☐ floppy disk
- ☐ on line

9A.

If your organization currently maintains part or all of its standards collection in electronic media please indicate the format(s):

- ☐ raster image
- ☐ full text

10.

In what medium does your organization intend to maintain its standards collection in the future (check all that apply):

- ☐ paper
- ☐ microfilm/microfiche
- ☐ mag tape
- ☐ CD-ROM
- ☐ floppy disk
- ☐ on line

10A.

For electronic media which format will be chosen (check one)

- ☐ raster image
- ☐ full text

11.

My organization is in the following sector (e.g. engineering, manufacturing)

.....

12.

Does your organization have a standards library:

- ☐ yes
- ☐ no

13.

If you said yes to 12 then how many volumes:

.....

14.

Which standards organizations published the standards in your library (e.g. ISO, DIN, ANSI, BSI, etc.):

.....

15.

My organization supports the standards-making process (check as many as apply):

- ☐ buying standards
- ☐ using standards
- ☐ membership in standards organization
- ☐ serving on standards development committee
- ☐ other.....

16.

My organization uses (check one)

- ☐ French text only
- ☐ English text only
- ☐ Both English/French text

Enquête sur les normes

La CEI se préoccupe de savoir comment ses normes sont accueillies et utilisées.

Les réponses que nous procurera cette enquête nous aideront tout à la fois à améliorer nos normes et les informations qui les concernent afin de toujours mieux répondre à votre attente.

Nous aimerions que vous nous consacriez une petite minute pour remplir le questionnaire joint que nous vous invitons à retourner au:

Centre du Service Clientèle (CSC)

Commission Electrotechnique Internationale
3, rue de Varembé
Case postale 131

1211 Genève 20
Suisse

Télécopie: IEC/CSC +41 22 919 03 00

Nous vous remercions de la contribution que vous voudrez bien apporter ainsi à la Normalisation Internationale

1.

Numéro de la Norme CEI:

.....

2.

Pourquoi possédez-vous cette norme? (plusieurs réponses possibles). Je suis:

- ☐ l'acheteur
- ☐ l'utilisateur
- ☐ bibliothécaire
- ☐ chercheur
- ☐ ingénieur
- ☐ expert en sécurité
- ☐ chargé d'effectuer des essais
- ☐ fonctionnaire d'Etat
- ☐ dans l'industrie
- ☐ autres.....

3.

Où avez-vous acheté cette norme?

.....

4.

Comment cette norme sera-t-elle utilisée? (plusieurs réponses possibles)

- ☐ comme reférence
- ☐ dans une bibliothèque de normes
- ☐ pour développer un produit nouveau
- ☐ pour rédiger des spécifications
- ☐ pour utilisation dans une soumission
- ☐ à des fins éducatives
- ☐ pour un procès
- ☐ pour une évaluation de la qualité
- ☐ pour la certification
- ☐ à titre d'information générale
- ☐ pour une étude de conception
- ☐ pour effectuer des essais
- ☐ autres.....

5.

Cette norme est-elle appelée à être utilisée conjointement avec d'autres normes? Lesquelles? (plusieurs réponses possibles):

- ☐ CEI
- ☐ ISO
- ☐ internes à votre société
- ☐ autre (publiée par).....)
- ☐ autre (publiée par).....)
- ☐ autre (publiée par).....)

6.

Cette norme répond-elle à vos besoins?

- ☐ pas du tout
- ☐ à peu près
- ☐ assez bien
- ☐ parfaitement

7.

Nous vous demandons maintenant de donner une note à chacun des critères ci-dessous (1, mauvais; 2, en-dessous de la moyenne; 3, moyen; 4, au-dessus de la moyenne; 5, exceptionnel; 0, sans objet)

- ☐ clarté de la rédaction
- ☐ logique de la disposition
- ☐ tableaux informatifs
- ☐ illustrations
- ☐ informations techniques

8.

J'aimerais savoir comment je peux reproduire légalement cette norme pour:

- ☐ usage interne
- ☐ des renseignements commerciaux
- ☐ des démonstrations de produit
- ☐ autres .....

9.

Quel support votre société utilise-t-elle pour garder la plupart de ses normes?

- ☐ papier
- ☐ microfilm/microfiche
- ☐ bandes magnétiques
- ☐ CD-ROM
- ☐ disquettes
- ☐ abonnement à un serveur électronique

9A.

Si votre société conserve en totalité ou en partie sa collection de normes sous forme électronique, indiquer le ou les formats:

- ☐ format tramé (ou image balayée ligne par ligne)
- ☐ texte intégral

10.

Sur quels supports votre société prévoit-elle de conserver sa collection de normes à l'avenir (plusieurs réponses possibles):

- ☐ papier
- ☐ microfilm/microfiche
- ☐ bandes magnétiques
- ☐ CD-ROM
- ☐ disquettes
- ☐ abonnement à un serveur électronique

10A.

Quel format serait retenu pour un moyen électronique? (une seule réponse)

- ☐ format tramé
- ☐ texte intégral

11.

A quel secteur d'activité appartient votre société? (par ex. ingénierie, fabrication)

.....

12.

Votre société possède-t-elle une bibliothèque de normes?

- ☐ Oui
- ☐ Non

13.

En combien de volumes dans le cas affirmatif?

.....

14.

Quelle organisations de normalisation ont publiées les normes de cette bibliothèque (ISO, DIN, ANSI, BSI, etc.):

.....

15.

Ma société apporte sa contribution à l'élaboration des normes par les moyens suivants (plusieurs réponses possible):

- ☐ en achetant des normes
- ☐ en utilisant des normes
- ☐ en qualité de membre d'organisations de normalisation
- ☐ en qualité de membre de comités de normalisation
- ☐ autres .....

16.

Ma société utilise (une seule réponse)

- ☐ des normes en français seulement
- ☐ des normes en anglais seulement
- ☐ des normes bilingues anglais/français

17.

34-17 (1992) Partie 17: Guide d'application des moteurs à induction à cage alimentés par convertisseurs.

34-18: — Evaluations fonctionnelles des systèmes d'isolation.

34-18-1 (1992) Section 1: Principes directeurs généraux.
Amendement 1 (1996).

34-18-21 (1992) Section 21: Procédures d'essai pour enroulements à fils – Evaluation thermique et classification.
Amendement 1 (1994).
Amendement 2 (1996).

34-18-22 (1996) Section 22: Procédures d'essai pour enroulements à fils – Classification des modifications et des substitutions de composants d'isolation.

34-18-31 (1992) Section 31: Procédures d'essai pour enroulements préformés – Evaluation thermique et classification des systèmes d'isolation utilisés dans les machines jusqu'à et y compris 50 MVA et 15 kV.
Amendement 1 (1996).

34-18-32 (1995) Section 32: Procédures d'essai pour enroulements préformés – Evaluation électrique des systèmes d'isolation utilisés dans les machines jusqu'à et y compris 50 MVA et 15 kV.

34-18-33 (1995) Section 33: Procédures d'essai pour enroulements préformés – Evaluation fonctionnelle à plusieurs facteurs – Endurance sous contrainte thermique et électrique combinée des systèmes d'isolation utilisés dans les machines jusqu'à et y compris 50 MVA et 15 kV.

34-19 (1995) Partie 19: Méthodes spécifiques d'essai pour machines à courant continu à alimentation conventionnelle ou redressée.

34-22 (1996) Partie 22: Génératrices à courant alternatif pour moteurs à combustion interne et à pistons.

72: — Dimensions et séries de puissances des machines électriques tournantes.

72-1 (1991) Partie 1: Désignation des carcasses entre 56 et 400 et des brides entre 55 et 1 080.

72-2 (1990) Partie 2: Désignation des carcasses entre 355 et 1 000 et des brides entre 1 180 et 2 360.

72-3 (1994) Partie 3: Petits moteurs incorporés – Désignation des brides BF10 à BF50.

136 (1986) Dimensions des balais et porte-balais pour machines électriques.
Amendement 1 (1995).

276 (1968) Définitions et nomenclature des balais de charbon, des porte-balais, des collecteurs et des bagues.
Modification n° 1 (1987).

279 (1969) Mesure de la résistance des enroulements d'une machine à courant alternatif en fonctionnement sous tension alternative.

356 (1971) Dimensions des collecteurs et des bagues.

413 (1972) Méthodes d'essai pour la mesure des propriétés physiques des matières de balais pour machines électriques.

560 (1977) Définitions et terminologie des porte-balais de machines électriques.

681: — Dimensions des moteurs de faible puissance pour applications particulières.

681-1 (1980) Première partie: Moteurs pour brûleurs à mazout.

773 (1983) Méthodes d'essai et appareils pour la mesure des propriétés opérationnelles des balais.

778 (1984) Porte-balais pour bagues, groupe R – exécution RA.

IEC publications prepared by Technical Committee No. 2 *(continued)*

34-16-3 (1996) Section 3: Dynamic performance

34-17 (1992) Part 17: Guide for application of cage induction motors when fed from converters.

34-18: — Functional evaluation of insulation systems.

34-18-1 (1992) Section 1: General guidelines.
Amendment 1 (1996).

34-18-21 (1992) Section 21: Test procedures for wire-wound windings – Thermal evaluation and classification.
Amendment 1 (1994).
Amendment 2 (1996).

34-18-22 (1996) Section 22: Test procedures for wire-wound windings – Classification of changes and insulation component substitutions.

34-18-31 (1992) Section 31: Test procedures for form-wound windings – Thermal evaluation and classification of insulation systems used in machines up to and including 50 MVA and 15 kV.
Amendment 1 (1996).

34-18-32 (1995) Section 32: Test procedures for form-wound windings – Electrical evaluation of insulation systems used in machines up to and including 50 MVA and 15 kV

34-18-33 (1995) Section 33: Test procedures for form-wound windings – Multifactor functional evaluation – Endurance under combined thermal and electrical stresses of insulation systems used in machines up to and including 50 MVA and 15 kV

34-19 (1995) Part 19: Specific test methods for d.c. machines on conventional and rectifier-fed supplies.

34-22 (1996) Part 22: AC generators for reciprocating internal combustion (RIC) engine driven generating sets.

72: — Dimensions and output series for rotating electrical machines.

72-1 (1991) Part 1: Frame numbers 56 to 400 and flange numbers 55 to 1 080.

72-2 (1990) Part 2: Frame numbers 355 to 1 000 and flange numbers 1 180 to 2 360.

72-3 (1994) Part 3: Small built-in motors – Flange numbers BF10 to BF50.

136 (1986) Dimensions of brushes and brush-holders for elec-trical machinery.
Amendment 1 (1995).

276 (1968) Definitions and nomenclature for carbon brushes, brush-holders, commutators and slip-rings.
Amendment No. 1 (1987).

279 (1969) Measurement of the winding resistance of an a.c. machine during operation at alternating voltage.

356 (1971) Dimensions for commutators and slip-rings.

413 (1972) Test procedures for determining physical properties of brush materials for electrical machines.

560 (1977) Definitions and terminology of brush-holders for electrical machines.

681: — Dimensions of small power motors for definite purpose application.

681-1 (1980) Part 1: Oil burner motors.

773 (1983) Test methods and apparatus for the measurement of the operational characteristics of brushes.

778 (1984) Brush-holders for slip-rings, Group R – type RA.

Numérotation des publications

Depuis le 1er janvier 1997, les publications de la CEI sont numérotées à partir de 60000. Ainsi, la CEI 34-1 devient la CEI 60034-1.

Editions consolidées

Les versions consolidées de certaines publications de la CEI incorporant les amendements sont disponibles. Par exemple, les numéros d'édition 1.0, 1.1 et 1.2 indiquent respectivement la publication de base, la publication de base incorporant l'amendement 1, et la publication de base incorporant les amendements 1 et 2.

Informations supplémentaires sur les publications de la CEI

Le contenu technique des publications de la CEI est constamment revu par la CEI afin qu'il reflète l'état actuel de la technique. Des renseignements relatifs à cette publication, y compris sa validité, sont disponibles dans le Catalogue des publications de la CEI (voir ci-dessous) en plus des nouvelles éditions, amendements et corrigenda. Des informations sur les sujets à l'étude et l'avancement des travaux entrepris par le comité d'études qui a élaboré cette publication, ainsi que la liste des publications parues, sont également disponibles par l'intermédiaire de:

- **Site web de la CEI (www.iec.ch)**
- **Catalogue des publications de la CEI**

  Le catalogue en ligne sur le site web de la CEI (www.iec.ch/catlg-f.htm) vous permet de faire des recherches en utilisant de nombreux critères, comprenant des recherches textuelles, par comité d'études ou date de publication. Des informations en ligne sont également disponibles sur les nouvelles publications, les publications remplacées ou retirées, ainsi que sur les corrigenda.
- **IEC Just Published**

  Ce résumé des dernières publications parues (www.iec.ch/JP.htm) est aussi disponible par courrier électronique. Veuillez prendre contact avec le Service client (voir ci-dessous) pour plus d'informations.
- **Service clients**

  Si vous avez des questions au sujet de cette publication ou avez besoin de renseignements supplémentaires, prenez contact avec le Service clients:

  Fax: +41 22 919 03 00

Publication numbering

As from 1 January 1997 all IEC publications are issued with a designation in the 60000 series. For example, IEC 34-1 is now referred to as IEC 60034-1.

Consolidated editions

The IEC is now publishing consolidated versions of its publications. For example, edition numbers 1.0, 1.1 and 1.2 refer, respectively, to the base publication, the base publication incorporating amendment 1 and the base publication incorporating amendments 1 and 2.

Further information on IEC publications

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology. Information relating to this publication, including its validity, is available in the IEC Catalogue of publications (see below) in addition to new editions, amendments and corrigenda. Information on the subjects under consideration and work in progress undertaken by the technical committee which has prepared this publication, as well as the list of publications issued, is also available from the following:

- **IEC Web Site (www.iec.ch)**
- **Catalogue of IEC publications**

  The on-line catalogue on the IEC web site (www.iec.ch/catlg-e.htm) enables you to search by a variety of criteria including text searches, technical committees and date of publication. On-line information is also available on recently issued publications, withdrawn and replaced publications, as well as corrigenda.
- **IEC Just Published**

  This summary of recently issued publications (www.iec.ch/JP.htm) is also available by email. Please contact the Customer Service Centre (see below) for further information.
- **Customer Service Centre**

  If you have any questions regarding this publication or need further assistance, please contact the Customer Service Centre:

COMMISSION ÉLECTROTECHNIQUE INTERNATIONALE

MACHINES ÉLECTRIQUES TOURNANTES – CHARGE ÉQUIVALENTE ET TECHNIQUES PAR SUPERPOSITION – ESSAIS INDIRECTS POUR DÉTERMINER L'ÉCHAUFFEMENT

AVANT-PROPOS

1) La CEI (Commission Électrotechnique Internationale) est une organisation mondiale de normalisation composée de l'ensemble des comités électrotechniques nationaux (Comités nationaux de la CEI). La CEI a pour objet de favoriser la coopération internationale pour toutes les questions de normalisation dans les domaines de l'électricité et de l'électronique. A cet effet, la CEI, entre autres activités, publie des Normes internationales. Leur élaboration est confiée à des comités d'études, aux travaux desquels tout Comité national intéressé par le sujet traité peut participer. Les organisations internationales, gouvernementales et non gouvernementales, en liaison avec la CEI, participent également aux travaux. La CEI collabore étroitement avec l'Organisation Internationale de Normalisation (ISO), selon des conditions fixées par accord entre les deux organisations.
2) Les décisions ou accords officiels de la CEI concernant les questions techniques représentent, dans la mesure du possible, un accord international sur les sujets étudiés, étant donné que les Comités nationaux intéressés sont représentés dans chaque comité d'études.
3) Les documents produits se présentent sous la forme de recommandations internationales. Ils sont publiés comme normes, spécifications techniques, rapports techniques ou guides et agréés comme tels par les Comités nationaux.
4) Dans le but d'encourager l'unification internationale, les Comités nationaux de la CEI s'engagent à appliquer de façon transparente, dans toute la mesure possible, les Normes internationales de la CEI dans leurs normes nationales et régionales. Toute divergence entre la norme de la CEI et la norme nationale ou régionale correspondante doit être indiquée en termes clairs dans cette dernière.
5) La CEI n'a fixé aucune procédure concernant le marquage comme indication d'approbation et sa responsabilité n'est pas engagée quand un matériel est déclaré conforme à l'une de ses normes.
6) L'attention est attirée sur le fait que certains des éléments de la présente Norme internationale peuvent faire l'objet de droits de propriété intellectuelle ou de droits analogues. La CEI ne saurait être tenue pour responsable de ne pas avoir identifié de tels droits de propriété et de ne pas avoir signalé leur existence.

La Norme internationale CEI 61986 a été établie par le sous-comité 2G: Méthodes et procédures d'essai, du comité d'études 2 de la CEI: Machines tournantes.

Le texte de cette norme est issu des documents suivants:

FDIS	Rapport de vote
2G/115/FDIS	2G/121/RVD

Le rapport de vote indiqué dans le tableau ci-dessus donne toute information sur le vote ayant abouti à l'approbation de cette norme.

Cette publication a été rédigée selon les Directives ISO/CEI, Partie 3.

Le comité a décidé que le contenu de cette publication ne sera pas modifié avant 2006. A cette date, la publication sera

- reconduite;
- supprimée;
- remplacée par une édition révisée, ou
- amendée.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

ROTATING ELECTRICAL MACHINES – EQUIVALENT LOADING AND SUPER-POSITION TECHNIQUES – INDIRECT TESTING TO DETERMINE TEMPERATURE RISE

FOREWORD

1) The IEC (International Electrotechnical Commission) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of the IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, the IEC publishes International Standards. Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. The IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
2) The formal decisions or agreements of the IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested National Committees.
3) The documents produced have the form of recommendations for international use and are published in the form of standards, technical specifications, technical reports or guides and they are accepted by the National Committees in that sense.
4) In order to promote international unification, IEC National Committees undertake to apply IEC International Standards transparently to the maximum extent possible in their national and regional standards. Any divergence between the IEC Standard and the corresponding national or regional standard shall be clearly indicated in the latter.
5) The IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with one of its standards.
6) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. The IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 61986 has been prepared by subcommittee 2G: Test methods and procedures, of IEC technical committee 2: Rotating machinery.

The text of this standard is based on the following documents:

FDIS	Report on voting
2G/115/FDIS	2G/121/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 3.

The committee has decided that the contents of this publication will remain unchanged until 2006. At this date, the publication will be

- reconfirmed;
- withdrawn;
- replaced by a revised edition, or
- amended.

MACHINES ÉLECTRIQUES TOURNANTES – CHARGE ÉQUIVALENTE ET TECHNIQUES PAR SUPERPOSITION – ESSAIS INDIRECTS POUR DÉTERMINER L'ÉCHAUFFEMENT

1 Domaine d'application

La présente Norme internationale s'applique aux machines couvertes par la CEI 60034-1 lorsque, pour une raison quelconque, il est impossible de les soumettre à une charge d'une condition spécifique (assignée ou autre). Elle est applicable tant aux moteurs qu'aux génératrices mais ces méthodes ne sont pas appropriées aux machines d'une puissance égale ou inférieure à 1 kW.

La présente norme a pour objet de décrire différents essais en charge indirects destinés à déterminer l'échauffement des machines électriques tournantes, y compris les machines à induction à courant alternatif, les machines synchrones à courant alternatif et les machines à courant continu. Dans certains cas, les méthodes d'essai permettent en outre de mesurer ou d'estimer d'autres paramètres tels que les pertes et les vibrations, mais ces méthodes ne sont pas conçues spécifiquement pour fournir de telles données.

Les méthodes d'essai proposées sont considérées comme équivalentes, le choix dépendant uniquement de l'emplacement, des appareils d'essai, du type de machine et de l'exactitude des résultats d'essai.

La présente norme n'est pas destinée à être interprétée comme une exigence de réaliser un ou tous les essais qu'elle décrit sur une quelconque machine donnée. Les essais particuliers à réaliser font l'objet d'accords spéciaux entre le fabricant et l'acheteur.

Etant donné que les méthodes ne reproduisent qu'approximativement les conditions thermiques des machines observées dans les conditions assignées normales, le fabricant et l'acheteur peuvent convenir de prendre les résultats des mesurages de l'échauffement obtenus lors d'essais réalisés selon ces méthodes comme base pour l'évaluation de l'échauffement de la machine conformément à 7.10 de la CEI 60034-1.

2 Références normatives

Les documents normatifs suivants contiennent des dispositions qui, par suite de la référence qui y est faite, constituent des dispositions valables pour la présente Norme internationale. Pour les références datées, les amendements ultérieurs ou les révisions de ces publications ne s'appliquent pas. Toutefois, les parties prenantes aux accords fondés sur la présente Norme internationale sont invitées à rechercher la possibilité d'appliquer les éditions les plus récentes des documents normatifs indiqués ci-après. Pour les références non datées, la dernière édition du document normatif en référence s'applique. Les membres de la CEI et de l'ISO possèdent le registre des Normes internationales en vigueur.

CEI 60034-1, *Machines électriques tournantes – Partie 1: Caractéristiques assignées et caractéristiques de fonctionnement*

CEI 60034-2, *Machines électriques tournantes – Partie 2: Méthodes pour la détermination des pertes et du rendement des machines électriques tournantes à partir d'essais (à l'exclusion des machines pour véhicules de traction)*

ROTATING ELECTRICAL MACHINES – EQUIVALENT LOADING AND SUPER-POSITION TECHNIQUES – INDIRECT TESTING TO DETERMINE TEMPERATURE RISE

1 Scope

This International Standard applies to machines covered by IEC 60034-1 when they cannot be loaded to a specific condition (rated or otherwise) for whatever reason. It is applicable to both motors and generators but the methods are not suitable for machines of and below 1 kW.

The object of this standard is to provide descriptions of various indirect load tests, the purpose of which is to determine the temperature rise of rotating electrical machines, including a.c. induction machines, a.c. synchronous machines and d.c. machines. The test methods in some cases provide, in addition, a means of measuring or estimating other parameters such as losses and vibration, but the methods are not designed specifically to provide such data.

The proposed methods of test are considered equivalent, the choice of them relying only on the location, the testing apparatus and the kind of machine, and the test result accuracy.

It is not intended that this standard be interpreted as requiring the carrying out of any or all of the tests described therein on any given machine. The particular tests to be carried out are subject to a special agreement between the manufacturer and the purchaser.

As the methods reproduce only approximately the thermal conditions of the machines which occur under normal rated condition, temperature-rise measurement results achieved from tests with these methods can be taken as the basis for the evaluation of machine heating according to 7.10 of IEC 60034-1 by agreement between the manufacturer and the purchaser.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this International Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of IEC and ISO maintain registers of currently valid International Standards.

IEC 60034-1, *Rotating electrical machines – Part 1: Rating and performance*

IEC 60034-2, *Rotating electrical machines – Part 2: Methods for determining losses and efficiency of rotating electrical machinery from tests (excluding machines for traction vehicles)*

4 Exigences générales d'essai

Les paramètres électriques doivent être mesurés de la façon suivante.

a) La classe d'exactitude des appareils de mesure ne doit pas être supérieure à 0,2, à l'exception des wattmètres avec un facteur cosφ inférieur à 0,5 et des fréquencemètres dont la classe d'exactitude peut être de 0,5.

b) L'étendue de mesure des appareils doit être choisie par rapport à des valeurs mesurées supérieures à 30 % de la pleine échelle. Il n'est pas nécessaire de satisfaire à cette exigence pour le mesurage de courant triphasé réalisé au moyen de deux wattmètres, mais les valeurs des courants et des tensions dans les circuits mesurés doivent être d'au moins 20 % des courants et tensions assignés des wattmètres utilisés. L'étendue de mesure des autres appareils de mesure doit être choisie de manière à ne pas augmenter les erreurs de mesure.

c) La forme d'onde et l'asymétrie de la tension d'alimentation aux bornes de la machine doivent être conformes aux exigences de 6.1 à 6.5 de la CEI 60034-1.

d) Chaque courant de ligne doit être mesuré. Si ces courants sont inégaux, la moyenne arithmétique doit être utilisée pour déterminer le point de fonctionnement de la machine.

e) La puissance absorbée d'une machine triphasée peut être mesurée au moyen de deux wattmètres monophasés montés comme pour la méthode des deux wattmètres ou au moyen d'un wattmètre polyphasé ou de trois wattmètres monophasés. La puissance totale relevée sur un wattmètre doit être réduite de la perte par effet Joule dans les circuits de tension ou dans les circuits de courant des appareils selon leur montage, chaque fois que cette perte est une fraction mesurable de la puissance totale. Pour les appareils de mesure numériques, il n'est pas nécessaire de déduire les pertes par effet Joule de la puissance totale relevée sur le wattmètre.

Toutes les grandeurs électriques à mesurer sont, sauf spécification contraire, des valeurs efficaces.

5 Principe des essais par superposition

5.1 Généralités

Les essais par superposition peuvent être appliqués à toute machine à courant continu ou alternatif. La méthode consiste en une série d'essais réalisés dans des conditions de fonctionnement autres qu'à la charge assignée, par exemple à charge réduite, à vide, en court-circuit, à tension réduite, à charge réactive en avant (sous-excitée) ou en retard (surexcitée) de phase.

La méthode permet de déduire l'échauffement des différents composants de la machine à pleine charge. Pour chaque composant, la perte doit être connue pour chaque condition d'essai donnée et à pleine charge. Il convient de réaliser les essais avec des conditions de refroidissement identiques aux conditions en fonctionnement à charge assignée. Un essai de rotor bloqué n'est par conséquent pas approprié puisque la répartition et les amplitudes du flux d'air seraient incorrects.

A l'issue des différents essais individuels, une série d'équations est construite, chaque équation étant du type:

$$\Delta\theta_{1m} = K_{11}P_{1m} + K_{12}P_{2m} + K_{13}P_{3m}$$

où

$\Delta\theta_{1m}$ est l'échauffement mesuré du composant 1 pour l'essai m;

P_{1m}, P_{2m}, etc. est la perte dans le composant 1, 2, etc. pour la condition d'essai m;

K_{11}, K_{12}, etc. sont les coefficients de pertes thermiques déterminant l'échauffement du composant 1 dû aux pertes dans le composant 1 et l'échauffement dans le composant 1 dû aux pertes dans le composant 2, etc.

4 General test requirements

Measurement of the electrical parameters shall be made as follows.

a) The class of accuracy of measuring instruments shall be not greater than 0,2, with the exception of wattmeters with $\cos\varphi$ lower than 0,5 and frequency meters, which may have accuracy class 0,5.

b) The measuring range of the instruments shall be chosen with a view to the measured values being higher than 30 % of the full-scale range. These requirements need not be complied with in the case of the three-phase power measurement by means of two wattmeters, but the currents and voltages in the measured circuits shall be at least 20 % of the rated currents and voltages of the wattmeters being used. The range of the other measuring instruments shall be chosen in such a way that the measuring errors are not increased.

c) The waveform and dissymmetry of the supply voltage at the machine terminals shall be in accordance with the requirements of 6.1 to 6.5 of IEC 60034-1.

d) Each line current shall be measured. If these are unequal, the arithmetic average value shall be used to determine the machine operating point.

e) Power input to a three-phase machine may be measured by two single-phase wattmeters connected as in the two-wattmeter method, or one polyphase wattmeter, or three single-phase wattmeters. The total power read on a wattmeter shall be reduced by the amount of the I^2R loss in the voltage circuits or in the current circuits of the instruments according to their connection whenever this loss is a measurable portion of the total power. There is no need to reduce the total power read on a wattmeter by the amount of the I^2R losses for digital measuring instruments.

All the electrical quantities to be measured are root-mean-square values unless otherwise indicated.

5 Principle of superposition tests

5.1 General

Superposition tests may be applied to any d.c. or a.c. machine. The method comprises a series of tests at operating conditions other than rated load, for example, reduced load, no load, short circuit, reduced voltage, leading (underexcited) or lagging (overexcited) reactive load.

The method allows the full-load temperature rise of various component parts of the machine to be deduced. For each component, the loss shall be known at each particular test condition and at full load. The tests should be undertaken with cooling conditions the same as when operating at rated load. Hence, a locked rotor test will not be suitable as the air-flow distribution and magnitudes will be incorrect.

On completion of the individual tests, a series of equations is constructed, each equation being of the form:

$$\Delta\theta_{1m} = K_{11}P_{1m} + K_{12}P_{2m} + K_{13}P_{3m}$$

where

$\Delta\theta_{1m}$ is the measured temperature rise of component 1 for test m;

P_{1m}, P_{2m} etc. is the loss in component 1, 2, etc. for test condition m;

K_{11}, K_{12}, etc. are the coefficients of heating losses determining the temperature rise of component 1 due to losses in component 1, and the temperature rise of component 1 due to losses in component 2, etc.

Les composants 1, 2 et 3 peuvent par exemple être l'enroulement statorique, le fer statorique et l'enroulement rotorique.

Dans certaines conditions d'essai, des pertes peuvent être égales à zéro et le terme associé disparaît par conséquent dans l'équation. Pour une machine synchrone par exemple, $K_{11}\,P_1$ = 0 à vide et $K_{12}\,P_2$ = 0 en court-circuit.

La méthode est fondée sur le principe selon lequel les coefficients K restent invariables d'un essai à l'autre, en d'autres termes que les conditions de refroidissement restent invariables entre les essais, ce qui implique la même vitesse pour chaque essai. La méthode est également fondée sur le principe de conditions thermiques linéaires de manière à pouvoir additionner les échauffements d'un cas à ceux d'un autre cas. Cette méthode nécessite de connaître pour chaque cas, par calcul ou par mesurage, les pertes dans les composants correspondants avec suffisamment d'exactitude.

Lorsque les essais sont terminés et les équations compilées, les coefficients K peuvent être calculés par simples calculs arithmétiques. Ces coefficients sont ensuite utilisés dans une équation finale avec les pertes pour les conditions à charge assignée afin de calculer l'échauffement du composant 1. Les échauffements à charge assignée des composants 2 et 3 peuvent être calculés de la même manière.

Si l'une quelconque des pertes dépend de la température (par exemple la perte dans le cuivre statorique), la procédure de calcul doit être répétée en utilisant les valeurs de pertes corrigées par rapport à l'échauffement estimé. Il est probablement suffisant de réaliser cette itération une seule fois.

La méthode peut être utilisée pour déterminer l'échauffement de tout composant à n'importe quelle charge si les pertes à cette charge sont connues. Les coefficients de transmission de chaleur (K_{12}, etc.) peuvent être utiles pour d'autres études de modélisation thermique, par exemple pour analyser la réponse au déséquilibre d'alimentation, la réduction de tension, etc.

Pour tous les essais par superposition, des corrections sont nécessaires pour compenser les variations des caractéristiques de fonctionnement de l'échangeur thermique (lorsque la machine en est équipée), dans la mesure où la résistance thermique de l'échangeur dépend entre autres de la perte totale dans chaque essai.

5.2 Echauffement admissible dans les essais par superposition

Lors de la détermination des échauffements des pièces constitutives de la machine au moyen d'essais par superposition, les écarts par rapport aux résultats obtenus lors des essais à charge assignée sont toujours disponibles (voir la présente norme). Dans le cas d'une erreur négative (voir 6.1, 6.2, 7.1, 7.2 et l'article 8), les échauffements admissibles spécifiés dans la CEI 60034-1 doivent être corrigés.

Si l'exactitude γ % pour les résultats obtenus lors des essais par superposition est une valeur négative, les échauffements possibles en fonctionnement à charge assignée sont généralement égaux à:

$$\Delta\theta_N = \Delta\theta_{N\,\text{super}} + \Delta\theta_{N\,\text{super}}\ \frac{|\gamma|}{100}$$

Pour les erreurs négatives, les échauffements admissibles spécifiés dans la CEI 60034-1 doivent par conséquent être multipliés par le facteur de correction σ suivant:

$$\sigma = \frac{1}{1+\dfrac{|\gamma|}{100}}$$

Components 1, 2, and 3 might be, for example, the stator winding, the stator iron, and the rotor winding.

In some test conditions, certain losses may be equal to zero, and hence the related term in the equation disappears. For example, a synchronous machine has $K_{11} P_1$ = 0 at no load and $K_{12} P_2$ = 0 at short circuit.

The method is based on the principle that the coefficients K do not change from test to test, i.e. that the cooling conditions are invariable between tests, which requires the speed to be the same in each test. The method is also based on the principle of the linear thermal conditions so that temperature rises in one case can be added to those for another case. It requires the losses in the relevant component parts to be known sufficiently accurately for each case, either by calculation or measurement.

When the tests have been completed and the equations compiled, then by simple arithmetic the coefficients K can be derived. These are then used in a final equation with the losses for the rated load condition in order to calculate the temperature rise of component 1. By similar means, the temperature rises at rated load of components 2 and 3 can be derived.

If any component loss is temperature dependent (for example, stator copper loss), then the calculation procedure has to be repeated using values for the loss corrected for the estimated temperature rise. It is probably necessary to do this iteration once only.

The method may be used to determine the temperature rise of any component at any load if the losses at that load are known. The heat transfer coefficients (K_{12}, etc.) may be useful in other thermal modelling studies, for example, in analysing the response to supply unbalance, voltage reduction, etc.

In all superposition tests, correction needs to be made for variation in heat exchanger performance (if one is fitted to the machine), as the thermal performance of the heat exchanger will partly depend on the total loss in each test.

5.2 Permissible temperature rise at superposition tests

When determining the temperature rises of the machine design parts at superposition tests, the variations from the results obtained at the rated load test are always available (see this standard). In the case of negative error (see 6.1, 6.2, 7.1, 7.2 and clause 8), the permissible temperature rises given in IEC 60034-1 shall be corrected.

If the accuracy γ % for the results obtained at the superposition tests is a negative value, the possible temperature rises during the operation at the rated load should be equal to:

$$\Delta\theta_N = \Delta\theta_{N\,\text{super}} + \Delta\theta_{N\,\text{super}} \frac{|\gamma|}{100}$$

Consequently, for negative errors, the permissible temperature rises given in IEC 60034-1 shall be multiplied by the correction factor σ, which is as follows:

$$\sigma = \frac{1}{1 + \dfrac{|\gamma|}{100}}$$

6 Méthodes par superposition pour les moteurs à induction

6.1 Méthode de la tension réduite et du courant assigné

Cette méthode consiste en une série de trois essais. Une alimentation à tension variable à la fréquence assignée et une génératrice de charge ou un dispositif de freinage de caractéristiques assignées sensiblement inférieures aux caractéristiques assignées du moteur soumis à l'essai sont nécessaires pour cette méthode. Pour chaque condition, la tension, le courant, les pertes de l'enroulement statorique et l'échauffement de l'enroulement statorique sont mesurés. Les conditions d'essai sont les suivantes.

Essai m: tension réduite en chargeant le moteur au courant assigné, donnant V_{m}, I_{m}, $P_{1\mathrm{m}}$ et $\Delta\theta_{1\mathrm{m}}$

Essai n: même tension réduite mais à vide, donnant V_{n}, I_{n}, $P_{1\mathrm{n}}$ et $\Delta\theta_{1\mathrm{n}}$

Essai o: tension assignée et à vide, donnant V_{o}, I_{o}, $P_{1\mathrm{o}}$ et $\Delta\theta_{1\mathrm{o}}$

Dans ces essais

$\Delta\theta_{1\mathrm{m}}$ est l'échauffement de l'enroulement statorique dû au courant assigné statorique, au courant quasi assigné rotorique et à la perte de tension réduite et à vide dans le fer ainsi qu'aux pertes par frottement et par ventilation;

$\Delta\theta_{1\mathrm{n}}$ est l'échauffement de l'enroulement statorique dû au courant réduit statorique et à la perte de tension réduite dans le fer ainsi qu'aux pertes par frottement et par ventilation;

$\Delta\theta_{1\mathrm{o}}$ est l'échauffement de l'enroulement statorique dû au courant de tension assignée et à vide dans le stator et à la perte de tension assignée dans le fer ainsi qu'aux pertes par frottement et par ventilation.

Il convient de noter que pour les grands moteurs à induction il peut y avoir des cas où l'essai m est impossible à réaliser avec un glissement inférieur au glissement de décrochage; dans ces cas, le fonctionnement au-dessus du glissement de décrochage est une alternative. Pour mesurer l'échauffement de l'enroulement statorique par variation de résistance lorsque la machine est à vide, il convient d'utiliser un moyen pour arrêter rapidement le moteur ou de mesurer la résistance directement sous charge.

Cette méthode suppose que le refroidissement reste inchangé pour chaque essai, ce qui implique que la vitesse reste également virtuellement inchangée.

Il est possible de déterminer la grandeur $\Delta\theta_{1\mathrm{n}}$ avec une exactitude suffisante en utilisant l'équation suivante:

$$\Delta\theta_{1\mathrm{n}} = \Delta\theta_{1\mathrm{o}} P_{1\mathrm{n}} / P_{1\mathrm{o}}$$

L'application de cette relation permet d'économiser un essai thermique complet à tension réduite et à vide comme pour les conditions d'essai n. Il convient, pour des raisons pratiques, d'envisager cette alternative.

L'exactitude de la détermination des échauffements est entre γ = –10 et γ = +6 % pour tous les types et toutes les caractéristiques assignées des machines. Il est préférable d'utiliser cette méthode pour les moteurs à induction à cage pour lesquels l'exactitude peut être estimée à $\gamma = \pm 3$ %.

Les résultats peuvent être analysés au moyen de calculs ou graphiquement de la manière décrite ci-dessous.

6 Superposition methods for induction motors

6.1 Method of reduced voltage and rated current

This method comprises a series of three tests. The method requires a variable-voltage supply at rated frequency and either a loading generator, or braking equipment with the rating much less than the rating of the test motor. For each condition, the voltage, current, stator winding losses, and stator winding temperature rise are measured. The test conditions are as follows:

Test m: reduced voltage, with the motor loaded to give rated current, giving V_{m}, I_{m}, $P_{1\mathrm{m}}$ and $\Delta\theta_{1\mathrm{m}}$

Test n: the same reduced voltage, but on no load, giving V_{n}, I_{n}, $P_{1\mathrm{n}}$ and $\Delta\theta_{1\mathrm{n}}$

Test o: rated voltage on no load, giving V_{o}, I_{o}, $P_{1\mathrm{o}}$ and $\Delta\theta_{1\mathrm{o}}$

In these tests

$\Delta\theta_{1\mathrm{m}}$ is the stator winding temperature rise due to rated stator current, quasi rated rotor current and reduced-voltage no-load iron loss and friction and windage losses;

$\Delta\theta_{1\mathrm{n}}$ is the stator winding temperature rise due to reduced stator current and reduced-voltage iron loss and friction and windage losses;

$\Delta\theta_{1\mathrm{o}}$ is the stator winding temperature rise due to rated-voltage no-load stator current and rated-voltage iron loss and friction and windage losses.

It should be noted that with large induction motors there may be cases when test m is not practicable with a slip below the pull-out slip; in such cases, operation above the pull-out slip is an alternative. To measure the stator winding temperature rise by resistance when the machine is on no load, some means of rapidly stopping the motor should be employed when shutting down the motor, or resistance should be measured direct under load.

The method assumes that the cooling is unchanged for each test, which implies that the speed is also virtually unchanged.

The quantity $\Delta\theta_{1\mathrm{n}}$ can be determined with sufficient accuracy by using the following equation:

$$\Delta\theta_{1\mathrm{n}} = \Delta\theta_{1\mathrm{o}} P_{1\mathrm{n}} / P_{1\mathrm{o}}$$

By applying this relation a complete thermal test at reduced voltage, no load, as for test condition n, can be saved. This should be taken up as an alternative for practical reasons.

The accuracy of determining temperature rises is within $\gamma = -10$ % and $\gamma = +6$ % for all types and ratings of machines. The method is preferable for squirrel-cage induction motors where the accuracy can be estimated within $\gamma = \pm 3$ %.

The results can be analysed either by means of calculation or by the use of a graph, as described below.

6.1.1 Détermination de l'échauffement par la méthode de calcul

La méthode de calcul suppose que l'échauffement de l'enroulement statorique, dans le cas de conducteurs en cuivre, au courant assigné pour toute charge, est une fonction linéaire de la manière suivante:

$$\Delta\theta_1 = \Delta\theta_{1\,p} + K_{11}^{*} P_1$$

où

$\Delta\theta_{1p}$ est l'échauffement théorique du stator qui serait observé à la tension assignée et avec un courant statorique nul (en d'autres termes, l'échauffement dû uniquement à la perte dans le fer et aux pertes par frottement et par ventilation);

P_1 est la perte dans l'enroulement statorique à la charge donnée;

K_{11}^{*} est le coefficient de transfert de chaleur du stator dû à la perte dans l'enroulement statorique, la perte dans l'enroulement rotorique et la perte supplémentaire (voir 8.3 de la CEI 60034-2).

Le coefficient K_{11}^{*} peut être déterminé à partir des essais normaux de 6.1 ci-dessus en utilisant l'expression

$$K_{11}^{*} = \frac{\Delta\theta_{1m} - \Delta\theta_{1n}}{P_{1m} - P_{1n}}$$

en d'autres termes, le rapport de l'augmentation de l'échauffement statorique dû à la variation du courant statorique entre les essais m et n (avec des pertes constantes dans le fer) à l'augmentation des pertes dans le stator dans les deux essais.

L'échauffement théorique du stator dû à la perte dans le fer et aux pertes par frottement et par ventilation $\Delta\theta_{1p}$ peut être déterminé par l'expression:

$$\Delta\theta_{1p} = \Delta\theta_{1o} - K_{11}^{*} P_{1o}$$

en d'autres termes, l'échauffement dû à la perte dans l'enroulement statorique et à la perte dans le fer moins l'échauffement dû à la perte dans l'enroulement statorique.

L'échauffement de l'enroulement statorique, dans le cas de conducteurs en cuivre, au courant assigné et à la tension assignée peut être déterminé de la manière suivante:

$$\Delta\theta_{1N} = \frac{\Delta\theta_{1o} - K_{11}^{*} P_{1o} + K_{11}^{*} P_{1N}(\theta_A)(235 + \theta_{A\,N})/(235 + \theta_A)}{1 - K_{11}^{*} P_{1N}(\theta_A)/(235 + \theta_A)}$$

où

θ_A est la température ambiante à la détermination de $P_{1N}(\theta_A)$;

θ_{AN} est la température ambiante de référence;

235 est le coefficient de température pour les conducteurs en cuivre.

Les échauffements de l'enroulement rotorique et du fer statorique peuvent être déterminés de manière semblable en utilisant les valeurs mesurées des pertes et des échauffements de ces composants pour chaque essai.

6.1.1 Determination of temperature rise by calculation method

The calculation method assumes that the stator winding temperature rise, in the case of copper conductors, at rated current for any load is linearly dependent as follows:

$$\Delta\theta_1 = \Delta\theta_{1\,p} + K_{11}^{*} P_1$$

where

$\Delta\theta_{1p}$ is the theoretical stator temperature rise that would occur at rated voltage and zero stator current (i.e. the rise due to the iron loss and friction and windage loss alone);

P_1 is the stator winding loss at the particular load;

K_{11}^{*} is the coefficient of stator heat transfer due to stator winding loss, rotor winding loss and additional loss (see 8.3 of IEC 60034-2).

The coefficient K_{11}^{*} can be found from the normal tests in 6.1 using the expression

$$K_{11}^{*} = \frac{\Delta\theta_{1m} - \Delta\theta_{1n}}{P_{1m} - P_{1n}}$$

i.e. the ratio of the increase in stator temperature rise due to the change in stator current between tests m and n (with constant iron losses), to the increase in stator losses in the two tests.

The theoretical stator temperature rise due to iron loss and friction and windage loss $\Delta\theta_{1p}$ can be found from the expression:

$$\Delta\theta_{1p} = \Delta\theta_{1o} - K_{11}^{*} P_{1o}$$

i.e. the rise due to stator winding loss and iron loss minus the rise due to the stator winding loss.

The stator winding temperature rise, in the case of copper conductors, at rated current and rated voltage can then be determined as follows:

$$\Delta\theta_{1N} = \frac{\Delta\theta_{1o} - K_{11}^{*} P_{1o} + K_{11}^{*} P_{1N}(\theta_A)(235 + \theta_{A\,N})/(235 + \theta_A)}{1 - K_{11}^{*} P_{1N}(\theta_A)/(235 + \theta_A)}$$

where

θ_A is the ambient temperature at the determination of $P_{1N}(\theta_A)$;

θ_{AN} is the reference ambient temperature;

235 is the temperature coefficient for the conductor material being copper.

The temperature rises of the rotor winding and the stator core can be found in a similar manner, using measured values of losses and temperature rises for these components for each test.

6.1.2 Détermination de l'échauffement par la méthode graphique

La méthode graphique est fondée sur les suppositions suivantes.

a) Les pertes en charge dépendent uniquement du courant et les pertes à vide dépendent uniquement de la tension.

b) Les échauffements peuvent être additionnés, c'est-à-dire que les effets du rayonnement sont négligeables et que les coefficients de transfert de chaleur sont indépendants de la température.

c) La perte en charge vagabonde en fonction de la charge dépend uniquement du courant. Dans la pratique, ces pertes dépendent en partie également de la tension.

Ces suppositions sont fondamentalement les mêmes que celles de la méthode de calcul décrite en 6.1.1 ci-dessus. Un graphique des échauffements mesurés dans les trois essais de 6.1 peut être tracé en fonction du carré du courant statorique comme illustré à la figure 1. Une ligne passant par les deux points à la tension réduite ($\Delta\theta_{1m}$ et $\Delta\theta_{1n}$) et une ligne parallèle passant par $\Delta\theta_{1o}$ peuvent être tracées. L'échauffement à la charge assignée $\Delta\theta_{1N}$ est obtenu comme illustré à la figure 1.

Si les courants statoriques des essais n et o sont suffisamment faibles (et pas trop différents) par rapport au courant assigné, l'échauffement statorique à tension et charge assignées est donné par

$$\Delta\theta_{1N} = \Delta\theta_{1m} + \Delta\theta_{1o} - \Delta\theta_{1n}$$

6.2 Méthode à tension assignée et à courant réduit

Cette méthode consiste en une série de deux essais. Une génératrice de charge ou un dispositif de freinage de caractéristiques assignées inférieures aux caractéristiques assignées du moteur soumis à l'essai est nécessaire pour cette méthode. La méthode de charge peut être la méthode de charge réelle ou une méthode de charge équivalente.

Les échauffements et les courants statoriques sont mesurés dans deux conditions d'essai de la manière suivante.

Essai p: Le moteur est entraîné à une charge réduite et à tension et fréquence assignées et l'échauffement de l'enroulement statorique $\Delta\theta'_{1m}$ et le courant statorique I_1' sont mesurés. Il est souhaitable que I_1' ne soit pas inférieur à 70 % du courant assigné statorique.

Essai o: Le moteur est entraîné à vide à tension et fréquence assignées et l'échauffement $\Delta\theta_{1o}$ et le courant statorique I_o sont mesurés.

L'échauffement à pleine charge est calculé par l'équation:

$$\Delta\theta_{1N} = \frac{\dfrac{\Delta\theta'_{1m} - \Delta\theta_{10}}{I'^2_1 - I^2_0} \times \left(I^2_N \times \dfrac{235 + \theta_{AN}}{235 + \theta_m} - I'^2_1 \right) + \Delta\theta'_{1m}}{1 - \dfrac{\Delta\theta'_{1m} - \Delta\theta_{10}}{I'^2_1 - I^2_0} \times \dfrac{I^2_N}{235 + \theta_m}}$$

où I_N est le courant assigné statorique.

L'exactitude de la détermination des échauffements est de γ = (–5 ± 6) % pour tous les types et toutes les caractéristiques assignées des machines. Il est préférable d'utiliser cette méthode pour les moteurs à induction à rotor bobiné haute tension pour lesquels l'exactitude peut être estimée à γ = ±1 %.

6.1.2 Determination of temperature rise by graphical method

The graphical method is based on the following assumptions.

a) The load losses are dependent solely on current, and the no-load losses are dependent solely on voltage.

b) The temperature rises can be added, i.e. the effect of radiation is negligible, and the heat transfer coefficients are independent of temperature.

c) The load-dependent stray-load loss depends on the current only. In practice, these losses are also partly voltage dependent.

These assumptions are fundamentally the same as those in the calculation method described in 6.1.1 above. A graph can be drawn of the measured temperature rises from the three tests in 6.1 plotted against the square of the stator current as shown in figure 1. A line can be drawn through the two points at the reduced voltage ($\Delta\theta_{1m}$ and $\Delta\theta_{1n}$) and a line parallel to this can be drawn through $\Delta\theta_{1o}$. The temperature rise at rated load $\Delta\theta_{1N}$ is obtained as shown in figure 1.

If the stator currents for tests n and o are sufficiently small (and not too dissimilar) compared with the rated current, then the stator temperature rise at rated voltage rated load is given by

$$\Delta\theta_{1N} = \Delta\theta_{1m} + \Delta\theta_{1o} - \Delta\theta_{1n}$$

6.2 Method of rated voltage and reduced current

This method comprises a series of two tests. The method requires a loading generator or a braking equipment with a rating less than the rating of the test motor. The loading method may be either the actual loading method or equivalent loading method.

Temperature rises and stator currents are measured at two test conditions as follows.

Test p: The motor is driven at a reduced load at rated voltage and frequency and the temperature rise of the stator winding $\Delta\theta'_{1m}$ and stator current I_1' are measured. It is preferable that I_1' is not less than 70 % of rated stator current.

Test o The motor is driven at no-load rated voltage and frequency, and the temperature rise $\Delta\theta_{1o}$ and the stator current I_o are measured.

The full-load temperature rise is calculated from the equation:

$$\Delta\theta_{1N} = \frac{\frac{\Delta\theta'_{1m} - \Delta\theta_{10}}{I'^2_1 - I^2_0} \times \left(I^2_N \times \frac{235 + \theta_{AN}}{235 + \theta_m} - I'^2_1 \right) + \Delta\theta'_{1m}}{1 - \frac{\Delta\theta'_{1m} - \Delta\theta_{10}}{I'^2_1 - I^2_0} \times \frac{I^2_N}{235 + \theta_m}}$$

where I_N is the rated stator current.

The accuracy of determining temperature rises is γ = (–5 ± 6) % for all types and ratings of machines. The method is preferable for high-voltage wound rotor induction motors where the accuracy can be estimated within γ = ±1 %.

6.3 Méthode pour les moteurs à induction à rotor bobiné

La méthode consiste en deux essais réalisés de la manière suivante.

Essai a: Court-circuiter le rotor et faire fonctionner le moteur à vide et à la tension assignée. L'échauffement statorique est principalement déterminé par la perte assignée dans le fer et la perte assignée par frottement et par ventilation.

Essai b: Exciter le rotor, court-circuiter les bornes du stator, faire fonctionner le moteur à la vitesse assignée et corriger le courant rotorique pour obtenir le courant assigné statorique. L'échauffement du stator est principalement déterminé par la perte assignée par effet Joule statorique. La perte dans le fer est faible puisque l'enroulement statorique est court-circuité et que la tension est faible. La perte par frottement et par ventilation est normale.

Les deux échauffements mesurés du stator sont additionnés pour donner l'échauffement qui serait observé à la tension assignée et au courant assigné. L'échauffement calculé du stator sera supérieur à la valeur vraie en raison des faibles effets sur le stator de la perte à vide dans le cuivre dans le premier essai et de la perte par frottement et par ventilation dans le second essai.

Les données d'essai de comparaison destinées à déterminer les échauffements selon cette méthode sont inconnues. Les experts estiment que l'exactitude de cette méthode est de l'ordre de $\gamma = \pm 10$ %.

7 Méthodes par superposition pour machines synchrones

7.1 Méthode de circuit ouvert, de court-circuit et d'excitation nulle

Dans cette méthode, un moteur auxiliaire entraîne la machine synchrone à la vitesse assignée. Les essais sont réalisés aux points de fonctionnement suivants:

Essai m: enroulement d'induit en court-circuit, courant d'excitation réglé pour donner le courant assigné d'induit;

Essai n: enroulement d'induit en circuit ouvert et courant d'excitation réglé pour donner la tension d'induit assignée;

Essai o: enroulement d'induit en circuit ouvert et courant d'excitation nul.

Pour chaque condition, l'échauffement de l'enroulement statorique est déterminé pour donner les valeurs $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ et $\Delta\theta_{1o}$. L'échauffement à la vitesse assignée, à la tension assignée et au courant assigné est déterminé par l'expression

$$\Delta\theta_{1N} = (\Delta\theta_{1m} - \Delta\theta_{1o}) + (\theta_{1n} - \Delta\theta_{1o}) + \Delta\theta_{1o}$$

(c'est-à-dire $(\Delta\theta_{1m} - \Delta\theta_{1o})$ est l'échauffement dû à la perte par effet Joule; $(\Delta\theta_{1n} - \Delta\theta_{1o})$ est l'échauffement dû à la perte dans le fer; $\Delta\theta_{1o}$ est l'échauffement dû aux pertes par frottement et par ventilation).

L'exactitude des échauffements de l'enroulement d'induit des machines synchrones, à l'exception des grands turbo-générateurs synchrones de puissance, est d'environ $\gamma = -10$ % des valeurs réelles.

Il est en même temps possible de déterminer l'échauffement de l'enroulement d'excitation dans les conditions assignées si l'échauffement d'excitation est mesuré pour chacune des trois conditions d'essai. Les échauffements peuvent être déterminés en mesurant la résistance de champ lors de l'arrêt de la machine après chaque essai. Il est possible d'augmenter l'exactitude de cette méthode pour l'excitation en réalisant un quatrième essai soit avec l'enroulement statorique en circuit ouvert et le courant d'excitation réglé sur la valeur assignée donnant une surtension statorique ou avec l'enroulement statorique en court-circuit et le courant d'induit supérieur au courant assigné. L'échauffement mesuré de l'un de ces essais remplace l'échauffement de l'essai n ou de l'essai m. Il convient d'obtenir l'accord du fabricant pour réaliser cet essai car l'enroulement d'induit peut être endommagé.

6.3 Method for wound-rotor induction motors

The method comprises two tests as follows.

Test a: The rotor is short-circuited and the motor is run on no load at rated voltage. The stator temperature rise is primarily determined by the rated iron loss and rated friction and windage loss.

Test b: The rotor is excited, the stator terminals are short-circuited, the motor is driven at rated speed, and the rotor current is adjusted to obtain rated stator current. The stator temperature rise is primarily determined by the rated stator I^2R loss. The iron loss is low as the stator winding is short-circuited and the voltage is low. The friction and windage loss is normal.

The two measured stator temperature rises are added together to give the rise that would occur with rated voltage and rated current. The deduced stator temperature rise will be higher than the true value, due to the small effects on the stator of the no-load stator copper loss in the first test and the friction and windage loss in the second test.

The comparative test data for determining temperature rises by this method are unknown. The experts estimate the accuracy of this method to be within $\gamma = \pm 10$ %.

7 Superposition methods for synchronous machines

7.1 Method of open circuit, short circuit, zero excitation

In this method, the synchronous machine is driven at rated speed by an auxiliary motor. Tests are undertaken at the following operating points:

Test m: armature winding short-circuited, and field current set to give rated armature current;

Test n: armature winding open-circuited, and field current set to give rated armature voltage;

Test o: armature winding open-circuited, and zero field current.

For each condition, the temperature rise of the stator winding is determined to give values $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ and $\Delta\theta_{1o}$. The temperature rise at rated speed, voltage and current is determined from the expression

$$\Delta\theta_{1N} = (\Delta\theta_{1m} - \Delta\theta_{1o}) + (\theta_{1n} - \Delta\theta_{1o}) + \Delta\theta_{1o}$$

(i.e. $(\Delta\theta_{1m} - \Delta\theta_{1o})$ is the rise due to I^2R loss; $(\Delta\theta_{1n} - \Delta\theta_{1o})$ is the rise due to iron loss; $\Delta\theta_{1o}$ is the rise due to friction and windage loss).

The accuracy of temperature rises of the armature winding of synchronous machines, except large power synchronous turbo-generators, are about $\gamma = -10$ % of the actual ones.

At the same time, the temperature rise of the field winding at rated conditions can be determined if the field temperature rise is measured for each of the three test conditions. The temperature rises can be determined by measuring the field resistance on shutdown of the machine after each test. The accuracy of this method for the field is increased if a fourth test is made either with the stator winding open-circuited and the field current set to the rated value giving a stator over-voltage or with the stator winding short-circuited and the armature current greater than the rated current. The measured temperature rise from one of these tests would replace that from test n or from test m respectively. The manufacturer's approval should be obtained for this test as armature winding damage could result.

Il est également possible d'utiliser la machine comme compensateur synchrone au courant assigné d'excitation et à un courant statorique intermédiaire jusqu'à ce que la tension d'excitation soit constante. Le rapport de la tension d'excitation (ajustée par rapport aux effets de contact par balai) au courant d'excitation donne la résistance de champ chaud à partir de laquelle il est possible de calculer l'échauffement d'excitation.

Il est possible d'utiliser une méthode graphique pour obtenir l'échauffement d'excitation à charge assignée si la perte d'excitation, P_{ft}, pour chaque essai est calculée à partir de $I_{ft}{}^2 R_{ft}$, où P_{ft}, I_{ft}, et R_{ft}, sont les valeurs d'essai de la perte, du courant et de la résistance de champ. La courbe de l'échauffement d'excitation en fonction de la perte d'excitation fournie à la figure 2 pour les trois conditions d'essai est approximativement une ligne droite. Une deuxième ligne droite est ensuite tracée qui indique les variations de la perte d'excitation en fonction du courant assigné I_{fN}, lorsque la résistance de champ augmente en fonction de la température par rapport à la valeur à température ambiante. L'intersection des deux lignes donne l'échauffement d'excitation à la charge assignée.

7.2 Méthode de charge à facteur de puissance nul et à circuit ouvert

Dans cette méthode, la machine est à nouveau entraînée à la vitesse assignée par un moteur auxiliaire. Des essais sont réalisés aux points de fonctionnement suivants:

Essai m: courant assigné d'excitation, courant assigné d'induit, facteur de puissance nul, tension réduite aux bornes du stator;

Essai n: stator en circuit ouvert, avec une tension aux bornes égale à la force électromotrice induite par le stator dans l'essai m, en d'autres termes:

$$V_n = V_m + I_m X_L$$

où X_L est la réactance de fuite calculée du stator;

Essai o: stator en circuit ouvert, avec une tension aux bornes égale à la force électromotrice induite à la charge assignée, en d'autres termes

$$V_o = \sqrt{(1 + \sin\phi \times X_L)^2 + (\cos\phi \times X_L)^2 \times I_N}$$

où

$\cos\varphi$ est le facteur de puissance assigné;

V_N est la tension d'induit assignée;

I_N est le courant d'induit assigné.

L'échauffement de l'enroulement statorique est donné par $\Delta\theta_{1N} = \Delta\theta_{1m} - \Delta\theta_{1n} + \Delta\theta_{1o}$ où $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ et $\Delta\theta_{1o}$ sont les échauffements statoriques mesurés respectivement dans les essais m, n et o.

$\Delta\theta_{1m}$ est l'échauffement de l'enroulement d'induit dû au courant assigné d'excitation, au courant assigné d'induit, à la perte par frottement et par ventilation à la vitesse assignée et à la faible perte dans le fer.

$\Delta\theta_{1n}$ est l'échauffement de l'enroulement d'induit dû au courant d'excitation en circuit ouvert, à la tension de phase V_n, à la perte par frottement et par ventilation à la vitesse assignée et à la faible perte dans le fer.

$\Delta\theta_{1o}$ est l'échauffement de l'enroulement d'induit dû au courant d'excitation à la tension de phase en circuit ouvert V_o, à la perte par frottement et par ventilation à la vitesse assignée et à la perte assignée dans le fer.

L'exactitude de l'échauffement obtenu pour l'enroulement d'induit des machines synchrones d'une puissance assignée inférieure ou égale à 500 kVA est de l'ordre de γ = –10 %.

L'échauffement de l'enroulement d'excitation est pris comme la valeur mesurée dans l'essai m.

Alternatively, the machine may be operated as a synchronous condenser at rated field current and at some intermediate stator current until the field voltage is constant. The ratio of the field voltage (adjusted for brush contact effects) to the field current gives the hot field resistance from which the field temperature rise can be calculated.

A graphical method can be used to obtain the field temperature rise at rated load if the field loss, P_{ft}, for each test is calculated from $I_{ft}{}^2 R_{ft}$, where P_{ft}, I_{ft}, and R_{ft}, are the test values of the field loss, current and resistance respectively. The graphical plot of field temperature rise against field loss in figure 2 for the three test conditions approximates a straight line. A second straight line is then plotted, showing the variation of the field loss with rated current I_{fN}, as the field resistance increases with temperature from the value at ambient temperature. The intersection of the two lines gives the temperature rise of the field at rated load.

7.2 Method of zero power factor and open circuit loading

In this method, the machine is again driven at rated speed by an auxiliary motor. Tests are undertaken at the following operating points:

Test m: rated field current, rated armature current, zero power factor, reduced stator terminal voltage;

Test n: stator open-circuited, with terminal voltage equal to stator-induced e.m.f. in test m, i.e.:

$$V_n = V_m + I_m X_L$$

where X_L is the calculated stator leakage reactance;

Test o: stator open-circuited, with terminal voltage equal to induced e.m.f. at rated load, i.e.:

$$V_o = \sqrt{(1 + \sin\phi \times X_L)^2 + (\cos\phi \times X_L)^2 \times I_N}$$

where

$\cos\varphi$ is the rated power factor;

V_N is the rated armature voltage;

I_N is the rated armature current.

The stator winding temperature rise is given by $\Delta\theta_{1N} = \Delta\theta_{1m} - \Delta\theta_{1n} + \Delta\theta_{1o}$ where $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ and $\Delta\theta_{1o}$ are the stator temperature rises measured in tests m, n and o, respectively.

$\Delta\theta_{1m}$ is the armature winding temperature rise due to rated field current, rated armature current, friction and windage loss at rated speed, and low iron loss.

$\Delta\theta_{1n}$ is the armature winding temperature rise due to field current at open-circuit, phase voltage V_n, friction and windage loss at rated speed, and low iron loss.

$\Delta\theta_{1o}$ is the armature winding temperature rise due to field current at open-circuit phase voltage V_o, friction and windage loss at rated speed, and rated iron loss.

The temperature rise accuracy obtained for the armature winding of synchronous machines with rating up to 500 kVA is within $\gamma = -10$ %.

The field winding temperature-rise is taken as the value measured in test m.

8 Méthode par superposition pour les machines à courant continu

La plupart des essais sur de grandes machines à courant continu sont réalisés selon la méthode en opposition. Une seule méthode d'essai indirect est disponible pour les machines à courant continu. Dans cette méthode par superposition, la machine est entraînée à la vitesse assignée par un moteur auxiliaire dont les caractéristiques assignées sont généralement inférieures à 20 % de celles de la machine à soumettre à l'essai. Les essais sont réalisés aux trois points de fonctionnement suivants:

Essai m: Induit en court-circuit et courant d'excitation réglé pour donner le courant d'induit assigné;

Essai n: Induit en circuit ouvert et courant d'excitation réglé pour donner la tension d'induit assignée;

Essai o: Induit en circuit ouvert avec courant d'excitation nul.

Lorsque les deux essais à circuit ouvert sont réalisés sur des machines de puissance assignée inférieure ou égale à 1 000 kW, il convient de relever les balais sauf lorsque la tension statorique est mesurée. Pour les machines de puissance assignée supérieure à 1 000 kW, les balais peuvent rester en place puisque la perte par frottement des balais sera faible par rapport aux autres pertes.

Le troisième essai n'est généralement nécessaire que sur les machines dont le rotor a une vitesse périphérique importante (>30 m/s) et pour lesquelles la perte par ventilation est importante.

Pour chaque condition, l'échauffement de l'enroulement d'induit est déterminé pour donner les valeurs $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ et $\Delta\theta_{1o}$. L'échauffement à la vitesse assignée, à la tension assignée et au courant assigné est déterminé par l'expression

$$\Delta\theta_{1N} = \Delta\theta_{1m} + \Delta\theta_{1n} - \Delta\theta_{1o}$$

(en d'autres termes, l'échauffement est égal à l'échauffement dû aux pertes par effet Joule d'induit et par frottement et par ventilation avec une perte négligeable dans le fer et une perte par effet Joule d'excitation négligeable plus l'échauffement dû à la perte dans le fer et à la perte par frottement et par ventilation avec une perte par effet Joule d'induit nulle et une perte assignée par effet Joule d'excitation, moins l'échauffement dû à la perte par frottement et par ventilation).

Pour l'enroulement d'induit, l'exactitude obtenue est d'environ $\gamma = \pm 10$ %.

9 Principe d'essais de charge équivalente

9.1 Généralités

Contrairement aux concepts à plusieurs essais des méthodes par superposition, un essai de charge équivalente est conçu pour permettre de déterminer l'échauffement d'un composant donné (pratiquement exclusivement l'enroulement statorique) à la charge assignée de manière expérimentale à partir d'un essai unique réalisé dans des conditions différentes de la charge assignée. Le but est de reproduire la distribution des pertes en charge assignée dans le moteur, notamment les pertes dans le composant considéré, dans ces conditions d'essai de charge équivalente. Pour l'enroulement statorique, ceci implique de créer le courant efficace à pleine charge dans l'enroulement.

La charge équivalente est également utilisée dans le cas de machines spéciales à extrémités d'arbre inaccessibles, de machines à haute vitesse ou de machines pour lesquelles l'accouplement des extrémités d'arbre avec la machine de charge nécessite des accouplements spéciaux et onéreux (par exemple des arbres cannelés, etc.).

8 Superposition method for d.c. machines

Most tests on larger d.c. machines are carried out by the back-to-back method. Only one indirect test method is available for d.c. machines. In this superposition method, the d.c. machine is driven at rated speed by an auxiliary motor, whose rating is usually less than 20 % of the machine to be tested. Tests are undertaken at the following three operating points:

Test m: armature short-circuited, and field current set to give rated armature current,

Test n: armature open-circuited, and field current set to give rated armature voltage,

Test o: armature open-circuited, with zero field current.

For the two open-circuit tests on machines rated at and below 1 000 kW, the brushes should be lifted except when the stator voltage is being measured. For machines rated above 1 000 kW, the brushes may be left in place as the brush frictional loss will be small compared with other losses.

The third test is usually only necessary for machines with high rotor surface speed (>30 m/s) where the windage loss is significant.

For each condition, the temperature rise of the armature winding is determined to give values $\Delta\theta_{1m}$, $\Delta\theta_{1n}$ and $\Delta\theta_{1o}$. The temperature rise at rated speed, voltage and current is determined from the expression

$$\Delta\theta_{1N} = \Delta\theta_{1m} + \Delta\theta_{1n} - \Delta\theta_{1o}$$

(i.e. the temperature rise is equal to the rise due to armature I^2R and friction and windage loss with negligible iron loss and negligible field I^2R loss plus the rise due to iron loss and friction and windage loss with zero armature I^2R loss and rated field I^2R loss, minus the rise due to friction and windage loss).

For the armature winding the accuracy obtained is about $\gamma = \pm 10$ %.

9 Principle of equivalent load tests

9.1 General

In contrast with the multi-test concept of the superposition methods, an equivalent load test is designed to allow the temperature rise of the chosen component (almost exclusively the stator winding) at rated load to be determined experimentally from a single test at conditions other than rated load. The intention is to replicate the rated-load loss distribution in the motor, but particularly the loss in the relevant component, at this equivalent load test condition. For the stator winding, this implies creating the effective (r.m.s.) full-load current in the winding.

The equivalent loading is used also in the cases of special machines with inaccessible free shaft ends, high-speed machines or machines where the coupling of the shaft ends with the loading machine requires special and expensive couplings to be made (for example, grooved shaft, etc.).

Pour que l'essai soit profitable, il convient que le matériel utilisé pour l'essai soit sensiblement moins compliqué et moins onéreux que le matériel qui serait nécessaire pour un essai direct à pleine charge. Il convient également que la consommation électrique soit sensiblement moins importante. Il convient dans la mesure du possible de réaliser l'essai avec l'arbre du moteur libre et non accouplé afin de simplifier l'opération et économiser le temps nécessaire à l'alignement de la machine soumise à l'essai avec une charge mécanique ou un moteur d'entraînement.

Les méthodes d'essai décrites dans les articles 10 et 11 permettent d'atteindre ces objectifs à différents niveaux.

9.2 Echauffement admissible lors des essais de charge équivalente.

Lors de la détermination des échauffements des pièces constitutives de la machine au moyen d'essais de charge équivalente, les écarts par rapport aux résultats obtenus lors des essais à charge assignée sont toujours disponibles (voir la présente norme). Dans le cas d'une erreur négative, les échauffements admissibles spécifiés dans la CEI 60034-1 doivent être corrigés.

Si l'exactitude γ % pour les résultats obtenus lors des essais de charge équivalente est une valeur négative, les échauffements possibles en fonctionnement à charge assignée sont généralement égaux à:

$$\Delta\theta_N = \Delta\theta_{N\text{equiv}} + \Delta\theta_{N\text{equiv}} \frac{|\gamma|}{100}$$

Pour les erreurs négatives, les échauffements admissibles spécifiés dans la CEI 60034-1 doivent par conséquent être multipliés par le facteur de correction σ suivant:

$$\sigma = \frac{1}{1 + \frac{|\gamma|}{100}}$$

10 Essais de charge équivalente pour les moteurs à induction

10.1 Essai de court-circuit direct

Le moteur à l'essai est entraîné à la vitesse assignée par une machine auxiliaire et est alimenté par une alimentation à une fréquence d'environ 80 % ou 120 % de la fréquence assignée du moteur. La tension de cette alimentation est ajustée jusqu'à ce que le courant dans le stator du moteur à l'essai soit égal à la valeur assignée. Lorsque la fréquence d'alimentation est d'environ 80 % de la fréquence assignée du moteur, la machine à l'essai fournit une puissance électrique puisqu'elle fonctionne comme une génératrice à induction à glissement négatif. Lorsque la fréquence d'alimentation est d'environ 120 % de la fréquence assignée du moteur, la machine auxiliaire fournit une puissance électrique, puisque le moteur fonctionne comme un moteur à induction à glissement positif.

Par rapport à un essai direct à pleine charge, la perte de fréquence fondamentale par effet Joule du stator reste inchangée, les pertes par frottement et par ventilation restent inchangées, la perte de fréquence fondamentale dans le fer statorique est plus faible, le courant de barre du rotor et les pertes dans le cuivre du rotor ainsi que les pertes de haute fréquence dans le fer des dents du stator sont plus élevées.

For the test to be advantageous, the equipment to be used in the test should be significantly less complex and expensive than that which would be required for a direct full-load test. Also, the demands on the electrical supply should be much less. Ideally, the motor should be tested with a free uncoupled shaft, so that the complexity and time involved in lining up the test machine with a mechanical load or a driving motor is avoided.

The test methods described in clauses 10 and 11 achieve these aims to varying degrees.

9.2 Permissible temperature rise at equivalent load tests

When determining the temperature rises of the machine design parts at equivalent load tests, the variations from the results obtained at the rated load test are always available (see this standard). In the case of negative error, the permissible temperature rises given in IEC 60034-1 shall be corrected.

If the accuracy γ % for the results obtained at the equivalent load tests is a negative value, the possible temperature rises during the operation at the rated load should be equal to

$$\Delta\theta_N = \Delta\theta_{N\text{equiv}} + \Delta\theta_{N\text{equiv}} \frac{|\gamma|}{100}$$

Consequently, for negative errors the permissible temperature rises given in IEC 60034-1 shall be multiplied by the correction factor σ being as follows:

$$\sigma = \frac{1}{1 + \frac{|\gamma|}{100}}$$

10 Equivalent load tests for induction motors

10.1 Forward short-circuit test

The motor under test is driven at rated speed by an auxiliary machine and is fed from a supply with a frequency of about 80 % or about 120 % of the motor rated frequency. The voltage of this supply is adjusted until the current in the test motor stator equals the rated value. When the supply frequency is about 80 % of the motor rated frequency, an electrical output is obtained from the test machine as it operates as an induction generator at negative slip. When the supply frequency is about 120 % of the motor rated frequency, an electrical output is obtained from the auxiliary machine as the motor operates as an induction motor at positive slip.

Compared with a direct full-load test, the stator fundamental-frequency I^2R loss is the same, the friction and windage losses are the same, the fundamental-frequency stator iron loss is lower, and the rotor bar current and rotor copper losses as well as the high-frequency stator-tooth iron losses are higher.

La réduction de la perte de fréquence fondamentale dans le fer n'est généralement pas compensée correctement par l'augmentation de la perte de haute fréquence et il convient par conséquent de compléter l'essai par deux essais à vide à la fréquence d'alimentation assignée, l'un à la tension d'alimentation assignée et l'autre à la tension la plus basse appliquée pendant l'essai de court-circuit direct. La différence entre les échauffements statoriques lors des deux essais à vide est additionnée à l'échauffement mesuré pendant l'essai de court-circuit direct. Afin de déterminer si la perte totale est ou n'est pas égale à la perte qui serait observée lors d'un essai en charge directe, il est nécessaire de mesurer la puissance absorbée et la puissance utile du moteur ou de réaliser des calculs de perte pour les conditions observées dans le moteur pendant l'essai de court-circuit direct.

L'essai peut être appliqué de manière utile aux machines de 60 Hz de toutes caractéristiques assignées lorsque seules des alimentations de 50 Hz sont disponibles et à des machines de 50 Hz de toutes caractéristiques assignées lorsque seules des alimentations de 60 Hz sont disponibles. Il est possible dans ce cas d'obtenir la vitesse correcte de la machine auxiliaire en utilisant une boîte d'engrenages, un entraînement à courant alternatif à vitesse variable ou un moteur à courant continu.

L'exactitude de la détermination des échauffements est de γ = ±10 % pour tous les types et toutes les caractéristiques assignées des machines.

Il est préférable d'utiliser la méthode pour les moteurs à induction à rotor bobiné à basse tension pour lesquels l'exactitude peut être estimée à γ = ±3 %.

En raison de la redistribution des pertes dans les différentes pièces de la machine, il convient de surveiller soigneusement les températures dans toute la machine. Si la température atteint des niveaux excessifs en un quelconque point de la machine, il convient d'interrompre l'essai.

10.2 Méthode de la fréquence modulée

Dans le présent essai, le moteur à induction est alimenté par une source de courant alternatif dont la fréquence est modulée autour d'une valeur moyenne, où

f est la fréquence moyenne (Hz);

δ est l'amplitude de la modulation de fréquence (Hz);

F est la fréquence de modulation (Hz);

Le moteur est soumis à une charge en raison des accélérations et décélérations répétées dues à l'augmentation et à la réduction répétée de la fréquence.

La source de l'alimentation modulée peut être une génératrice à courant alternatif à basse fréquence d'excitation, f_{ex}, où

$$f_{ex} = \delta \times \sin (2\pi F t)$$

La fréquence de la puissance utile de la génératrice, f, est donnée par l'équation:

$$f = f_{rot} + f_{ex}$$

où f_{rot} est la fréquence déterminée par la rotation de l'arbre.

Generally, the reduction in the fundamental frequency iron loss is not adequately offset by the increase in the high-frequency loss, so the test should be supplemented by two no-load tests at rated supply frequency, one at rated supply voltage and the other at the lower voltage applied during the forward short-circuit test. The difference between the stator temperature rises on the two no-load tests is added to the temperature rise measured during the forward short-circuit test. In order to determine whether or not the total loss equals the loss that would occur in a direct-load test, it is necessary to measure the motor input and output powers or undertake loss calculations for the conditions existing in the motor during the forward short-circuit test.

The test can usefully be applied to 60 Hz machines of any rating where only 50 Hz supplies are available and to 50 Hz machines of any rating where only 60 Hz supplies are available. The correct speed of the auxiliary machine in this case could be achieved by using a gearbox, a variable-speed a.c. drive, or a d.c. motor.

The accuracy of determining temperature rises is γ = ±10 % for all types and ratings of machines.

The method is preferable for wound rotor induction motors of low voltage where the accuracy can be estimated within γ = ±3 %.

Due to the significant redistribution of losses in the various component parts of the machine, the temperatures throughout the machine should be carefully monitored. If the temperature becomes excessive at any location, the test should be terminated.

10.2 Modulated frequency method

In this test, the induction motor is fed from an a.c. source, the frequency of which is modulated around a mean value, where

f is the mean frequency (Hz);

δ is the amplitude of frequency modulation (Hz);

F is the modulation frequency (Hz).

The motor is loaded due to the repetitive acceleration and deceleration as the frequency repeatedly increases and then decreases.

The source of the modulated supply can be an a.c. generator with low excitation frequency, f_{ex}, where:

$$f_{ex} = \delta \times \sin(2\pi F t)$$

The generator output frequency, f, is given by the equation:

$$f = f_{rot} + f_{ex}$$

where f_{rot} is the frequency determined by the shaft rotation.

La valeur moyenne du couple est donnée par

$$T_{\text{av}} = 2J \times \delta_{\omega} \times F$$

où:

J = moment d'inertie du moteur

δ_{ω} = amplitude de la variation de pulsation

En supposant une modulation sinusoïdale, la valeur instantanée maximale du couple est donnée par:

$$T_{\text{max}} = \frac{\pi}{2} T_{\text{av}}$$

Il convient que cette valeur soit inférieure au couple de décrochage de sorte que le moteur fonctionne dans la partie stable des caractéristiques de charge.

L'exactitude escomptée est d'environ $\gamma = \pm 10$ %.[1)]

Cette méthode convient tout particulièrement aux moteurs à inertie importante car plus l'inertie est grande moins il est nécessaire que l'amplitude et la fréquence de modulation soient importantes (généralement 1-2 Hz). Pour les moteurs à faible inertie, il peut être nécessaire d'ajouter de l'inertie sous la forme d'un volant.

Le moteur est démarré à la fréquence d'alimentation moyenne, f, et avec l'amplitude et le taux de modulation mis à zéro. L'amplitude et le taux de modulation sont ensuite augmentés jusqu'à ce que le courant statorique soit égal au courant assigné à pleine charge. Le courant d'excitation de la génératrice est ajusté pour donner la tension assignée statorique.

10.3 Injection de courant continu

Dans la présente méthode, le moteur à l'essai est raccordé à une génératrice source à courant alternatif et fonctionne à la tension assignée à vide. Pour cette méthode, il est nécessaire de monter le moteur et la génératrice en étoile et le point neutre doit être accessible tant sur le moteur que sur la génératrice. Une source d'alimentation peut être la génératrice avec un enroulement d'excitation multiphasé symétrique (ou le moteur à induction à rotor bobiné) excité par le courant multiphasé de basse fréquence à variation périodique f_{ex}. Une source de courant continu est ensuite branchée entre les deux points neutres comme illustré à la figure 3. La puissance de courant continu est ajustée jusqu'à ce que la valeur efficace du courant alternatif à vide plus le courant continu d'injection soit égale au courant à pleine charge du moteur. La génératrice source doit fournir la tension assignée et doit être capable de supporter le courant assigné.

Les données d'essai de comparaison destinées à déterminer les échauffements par cette méthode sont inconnues. Les experts estiment que l'exactitude de cette méthode est de l'ordre de $\gamma = \pm 10$ %.

La source de courant continu est à l'origine d'un champ magnétique stationnaire dans l'espace et avec trois fois le nombre de pôles de l'enroulement statorique. Des pertes supplémentaires sont par conséquent observées dans le rotor en raison des courants et des flux qui sont créés par la rotation du rotor.

Les mesurages du courant sont réalisés en utilisant des transformateurs de courant qui relient deux lignes, l'une dans le sens «direct» et l'autre dans le sens «inverse» de manière à annuler le composant de courant continu.

[1)] Si les erreurs de l'opérateur et du matériel de commande et de mesure sont amplifiées.

The average value of torque is given by

$$T_{\text{av}} = 2J \times \delta_{\omega} \times F$$

where

J is the moment of inertia of the motor

δ_{ω} is the amplitude of angular frequency variation

Assuming sinusoidal modulation, the maximum instantaneous value of torque is given by:

$$T_{\text{max}} = \frac{\pi}{2} T_{\text{av}}$$

This maximum value should be below the pull-out torque, so that the motor operates on the stable part of the load characteristic.

The expected accuracy is about $\gamma = \pm 10$ %.[1)]

This method is particularly appropriate for high-inertia motors, because the greater the inertia the smaller the required modulation amplitude and frequency (typically 1-2 Hz). For low-inertia motors, it may be necessary to add inertia in the form of a flywheel.

The motor is started up with the supply of mean frequency, f, and with the modulation amplitude and rate set to zero. Modulation amplitude and rate are then increased until the stator current equals the rated full-load current. The excitation current of the generator is adjusted to give the rated stator voltage.

10.3 DC injection

In this method, the motor under test is connected to an a.c. source generator and operates at rated voltage on no load. The method requires that the motor and generator are star-connected and that the neutral point is accessible on both motor and generator. A power source may be the generator with a symmetrical multiphase excitation winding (or the induction wound-rotor motor) excited by the multiphase current of periodically varying low frequency f_{ex}. A d.c. source is then connected between the two neutral points as shown in figure 3. The d.c. output is adjusted until the r.m.s. value of the a.c. no-load current plus the d.c. injection current equals the full-load current of the motor. The source generator shall provide rated voltage and shall be able to carry rated current.

The comparative test data for determining temperature rises by this method are unknown. The experts estimate the method accuracy to be within $\gamma = \pm 10$ %.

The d.c. source sets up a magnetic field that is stationary in space with three times the number of poles than the stator winding. Hence, extra losses appear in the rotor due to the currents and fluxes that are set up by the rotor rotation.

Current measurements are made using current transformers that link two lines, one in the "forward" direction and one in the "backward" direction so that the d.c. component is cancelled.

[1)] If the errors of the operator and control and measuring equipment are magnified.

10.4 Méthode de fréquence mixte ou de fréquence double

10.4.1 Alimentation statorique

Dans la présente méthode d'essai, le stator du moteur est alimenté simultanément par deux sources à différentes fréquences (figure 4), la source principale et une source auxiliaire. Il est également possible de brancher la génératrice auxiliaire par le biais d'un transformateur triphasé entre la génératrice principale et le moteur (figure 5). Il convient que les séquences de phase de tension de la fréquence principale et de la fréquence auxiliaire soient les mêmes. Le courant, la tension et la vitesse du moteur varient à une fréquence de battement. La génératrice principale fournit une fréquence assignée alors que la génératrice auxiliaire fournit une puissance de fréquence et d'amplitude réglable. La fréquence de la source auxiliaire est généralement égale à environ 80 % ou 120 % de la fréquence assignée et la tension est d'environ 20-30 % de la tension assignée. La fréquence auxiliaire est entre autres choisie de manière à ce que les variations n'empêchent pas une mesure exacte.

Le moteur est d'abord raccordé à l'alimentation principale et démarré à vide. La tension de sortie de la génératrice auxiliaire est augmentée progressivement (et si nécessaire la tension de l'alimentation principale est également ajustée) jusqu'à ce que les conditions suivantes soient atteintes simultanément:

a) la valeur efficace du courant variable du moteur est égale au courant assigné;

b) la valeur efficace de la tension variable du moteur est égale à la tension assignée;

c) la vitesse est égale à la vitesse assignée.

Lorsqu'il est difficile d'ajuster avec précision les valeurs efficaces du courant et de la tension variables du moteur aux valeurs assignées du moteur, il est possible de réaliser l'essai avec un courant et une tension proches de leurs valeurs assignées et à la vitesse assignée en ajustant la puissance absorbée du moteur par rapport aux pertes totales du moteur à la charge assignée.

Pour les moteurs à induction à cage de puissance assignée inférieure ou égale à 315 kW, et pour les moteurs à induction à rotor bobiné basse tension, l'exactitude est de l'ordre de γ = +3 % et γ = –13 %.

Pour les moteurs à induction à rotor bobiné haute tension de puissance assignée inférieure ou égale à 7 000 kW, l'exactitude est d'environ γ = ±3,0 %, mais pour certaines machines à faible niveau d'échauffement, l'erreur peut atteindre γ = +20 %.

Le point de fonctionnement du moteur, lorsque la fréquence de la source principale est de 50 Hz et celle de la source auxiliaire de 40 Hz, peut être déduit des courbes de vitesse/couple et de vitesse/courant pour les fréquences principales et auxiliaires, tel qu'illustré à la figure 6. Le couple positif dû à l'alimentation à 50 Hz (point A) est équilibré par le couple négatif dû à l'alimentation à 40 Hz (point B). Le courant net est principalement déterminé par le courant établi par l'alimentation à 40 Hz (point C) puisque le moteur fonctionne avec un glissement très faible (et ainsi avec un courant très faible) par rapport à l'alimentation à 50 Hz. Lorsque la fréquence de la source principale est de 50 Hz et celle de la source auxiliaire de 60 Hz, le couple positif dû à l'alimentation à 60 Hz est équilibré par le couple négatif dû à l'alimentation à 50 Hz. Le courant net est principalement déterminé par le courant établi par l'alimentation à 60 Hz.

La combinaison des fréquences produit *une* fréquence nette qui varie dans le temps de la manière suivante:

$$f = \frac{f_1 + \lambda^2 \ f_2 + (f_1 + f_2) \cos 2\pi \ (f_1 - f_2)t}{1 + \lambda^2 + 2\lambda \cos 2\pi \ (f_1 - f_2)t}$$

10.4 Mixed-frequency or bi-frequency method

10.4.1 Stator feeding

In this test method, the motor stator is fed simultaneously from two sources at different frequencies (figure 4), the main source and an auxiliary source. The auxiliary generator may alternatively be connected through a three-phase transformer between the main generator and the motor (figure 5). The voltage phase sequences of both main and auxiliary frequency should be the same. The motor current, voltage and speed fluctuate at a beat frequency. The main generator supplies rated frequency, while the auxiliary generator provides an output of adjustable frequency and amplitude. The frequency of the auxiliary source is typically either about 80 % or about 120 % of the rated frequency, and the voltage is about 20-30 % of the rated voltage. The auxiliary frequency is in part chosen so that the fluctuations do not prevent accurate readings.

The motor is first connected to the main supply and run on no load. The output voltage of the auxiliary generator is steadily increased (and if necessary the main supply voltage is adjusted also) until the following conditions are achieved simultaneously:

a) the r.m.s. value of the fluctuating motor current equals the rated current;

b) the r.m.s. value of the fluctuating motor voltage equals the rated voltage;

c) the speed equals the rated speed.

When it is difficult to adjust the r.m.s. values of the fluctuating motor current and voltage to the motor rated values precisely, the test can be performed with current and voltage which are close to their rated values and at rated speed by adjusting the motor input power to the total losses of the motor at rated load.

For squirrel-cage induction motors ratings up to 315 kW and for low-voltage wound-rotor induction motors the accuracy is within γ = +3 % and γ = –13 %.

For high-voltage wound-rotor induction motors rated up to 7 000 kW the accuracy is about γ = ±3,0 %, but, for some machines with a low level of heating, the error can reach γ = +20 %.

The operating point of the motor, when the frequency of the main source is 50 Hz and that of auxiliary source is 40 Hz, can be deduced from the speed/torque and speed/current curves for the main and auxiliary frequencies, as shown in figure 6. The positive torque due to the 50 Hz supply (point A) is balanced by the negative torque due to the 40 Hz supply (point B). The net current is mainly determined by the current set up by the 40 Hz supply (point C), as the motor runs at a very low slip (and hence at a low current) with respect to the 50 Hz supply. When the frequency of the main source is 50 Hz and that of auxiliary source is 60 Hz, the positive torque due to the 60 Hz supply is balanced by the negative torque due to the 50 Hz supply. The net current is mainly determined by the current set up by the 60 Hz supply.

The combination of frequencies results in a net frequency varying with time as follows:

$$f = \frac{f_1 + \lambda^2 \ f_2 + (f_1 + f_2) \cos 2\pi \ (f_1 - f_2)t}{1 + \lambda^2 + 2\lambda \cos 2\pi \ (f_1 - f_2)t}$$

Pour un cas type, les valeurs sont les suivantes:

fréquence de l'alimentation principale f_1 = 50 Hz;

fréquence de l'alimentation auxiliaire f_2 = 40 Hz;

tension auxiliaire/tension principale λ = 0,25.

Dans ce cas, la fréquence nette varie entre 48 Hz et 53,3 Hz, c'est-à-dire $50^{+3,3}_{-2,0}$ Hz et ne varie donc pas de manière symétrique autour de 50 Hz. Il s'agit là d'une différence fondamentale entre la méthode de la fréquence mixte et la méthode de la fréquence modulée décrite en 10.2. Dans cette dernière méthode, la fréquence varie généralement de manière sinusoïdale autour de la fréquence assignée.

10.4.2 Alimentation rotorique

Une autre méthode de fréquence mixte pour les moteurs à induction à rotor bobiné consiste à raccorder la génératrice auxiliaire au circuit du rotor plutôt qu'à celui du stator, tel qu'illustré à la figure 7. La tension et la fréquence auxiliaires sont alors ajustées pour établir le courant assigné statorique ou la perte assignée dans le moteur comme dans la méthode normale d'alimentation statorique. Il convient que la séquence de phase de la source auxiliaire soit telle que le rotor avec le stator en court-circuit tourne dans la même direction que celle de l'alimentation principale raccordée au stator avec le rotor en court-circuit. Il convient que la fréquence auxiliaire soit sensiblement inférieure à la moitié de la fréquence principale.

10.4.3 Niveau de vibration pendant l'essai à fréquence mixte

En raison de la combinaison des fréquences des courants et des champs statoriques (ou rotoriques), le couple d'arbre aura une composante d'oscillation considérable. Les niveaux de vibration auront tendance à être supérieurs à la normale et le risque d'observer une résonance mécanique est augmenté en raison du large spectre d'harmoniques de courant et de flux. Il est souhaitable de surveiller les niveaux de vibration pendant l'essai pour vérifier qu'aucun dommage n'a lieu.

A l'issue de l'essai à fréquence mixte, il est possible de faire marcher le moteur avec seulement l'alimentation principale à la tension assignée et de mesurer rapidement le vrai niveau de vibrations pendant que le moteur est à la température de fonctionnement à pleine charge. Il serait possible de surveiller la température du moteur au moyen d'un thermocouple pour s'assurer que la température est suffisamment proche de la valeur à pleine charge assignée pour être admissible. Si la température devait tomber au-dessous d'un niveau admissible, il serait possible de poursuivre l'essai à fréquence mixte pendant un certain temps.

11 Essai de charge équivalente pour machines synchrones – Facteur de puissance nul

Cette méthode consiste à faire fonctionner la machine comme un compensateur synchrone, avec des valeurs appropriées de courant, de tension et de fréquence statoriques. La machine surexcitée peut être raccordée à une charge constituée de machines synchrones sous-excitées tournant au ralenti. En ajustant l'excitation de la machine à l'essai et celle de sa charge, il est possible de faire varier la tension aux bornes tout en maintenant le courant statorique constant. Dans la mesure où la tension E_p en aval de la réactance de fuite du stator à un facteur de puissance nul surexcité est supérieure à ce qu'elle est avec des facteurs de puissance plus élevés pour la même tension de borne et le même courant statorique, la tension d'essai aux bornes peut être réduite à une valeur qui donne une valeur de E_p identique à celle à la charge assignée. L'échauffement qui en résulte dans le stator peut alors être mesuré et utilisé comme une indication de l'échauffement qui serait observé à la charge assignée.

In a typical case, the values are as follows:

frequency of main supply f_1 = 50 Hz;

frequency of auxiliary supply f_2 = 40 Hz;

auxiliary voltage/main voltage λ = 0,25.

In this case, the net frequency varies between 48 Hz and 53,3 Hz, i.e. $50\,^{+3,3}_{-2,0}$ Hz, and hence does not vary symmetrically around 50 Hz. This is the fundamental difference between this mixed-frequency method and the modulated-frequency method described in 10.2. In the latter method, the frequency generally varies sinusoidally around the rated frequency.

10.4.2 Rotor feeding

An alternative mixed-frequency method for wound-rotor induction motors involves the connection of the auxiliary generator to the rotor circuit rather than to the stator, as shown in figure 7. The auxiliary voltage and frequency are then adjusted in order to establish rated stator current or rated loss in the motor as in the normal stator-feeding method. The phase sequence of the auxiliary source should be such that the rotor rotation with the stator shorted would be in the same direction as that with the main supply connected to the stator with the rotor shorted. The auxiliary frequency should be significantly less than half the main frequency.

10.4.3 Vibration level during the mixed-frequency test

Due to the combination of the frequencies of the stator (or rotor) currents and fields, the shaft torque will have a considerable oscillating component. Vibration levels will tend to be higher than normal, and there is a greater chance of mechanical resonance occurring due to the broad spectrum of current and flux harmonics. It is desirable that vibration levels are monitored during the test to check that damage will not occur.

When the mixed-frequency test has been completed, the motor can then be operated with the main supply only at rated voltage, and the true vibration level can be measured quickly while the motor is at full-load running temperature. The motor temperature could be monitored by thermocouple to ensure that the temperature is acceptably close to the value at rated full load. If the temperature were to fall below an acceptable level, the mixed-frequency test could be re-continued for a while.

11 Equivalent load test for synchronous machines – Zero power factor

This method consists of operating the machine as a synchronous condenser, with appropriate values of stator current, voltage and frequency. The overexcited machine may be connected to a load consisting of idle-running underexcited synchronous machines. By adjustment of the excitation of the machine to be tested and that of its load, the terminal voltage may be varied while the stator current is held constant. Since the voltage E_p behind the stator leakage reactance at zero power factor overexcited is greater than it is at higher power factors for the same terminal voltage and stator current, the test terminal voltage may be reduced to a value which results in a value of E_p which is the same as that at rated load. The resulting stator temperature rise can then be measured and used as an indication of the rise that would occur at rated load.

La perte dans l'enroulement d'excitation s'écarte sensiblement de celle en fonctionnement normal. Il convient par conséquent de corriger l'échauffement d'excitation mesuré par la variation de résistance pour qu'elle corresponde à la perte associée au courant assigné d'excitation. L'échauffement peut être supposé proportionnel à la perte par effet Joule d'excitation de la manière suivante:

$$\Delta\theta_{fN} = \left(\frac{I_{fN}}{I_{ft}}\right)^2 \Delta\theta_{ft} \times \frac{235 + \theta_{AN}}{235 + \Delta\theta_{ft} + \theta_{Ft} - (I_{fN} / I_{ft})^2 \Delta\theta_{ft}}$$

où

I_{fN} est le courant assigné d'excitation;

I_{ft} est le courant d'excitation mesuré;

θ_{AN} est la température ambiante de référence;

θ_{Ft} est la température ambiante mesurée;

$\Delta\theta_{ft}$ est l'échauffement mesuré d'excitation.

Il est possible d'utiliser l'équation simplifiée suivante, moins *précise* et qui néglige la variation de résistance avec la température

$$\Delta\theta_{fN} = (I_{fN}/I_{ft})^2 \, \Delta\theta_{ft}$$

Ce calcul de l'échauffement d'excitation néglige les effets des pertes dans le stator, de surface de rotor et par ventilation.

Lorsqu'il est impossible de négliger l'échauffement de l'enroulement d'excitation dû aux pertes par ventilation, par exemple dans le cas de machines à vitesse périphérique élevée telles que des génératrices de type turbine, l'échauffement de l'enroulement d'excitation doit être déterminé par l'équation suivante:

$$\Delta\theta_{fN} = (I_{fN}/I_{ft})^2 \, (\Delta\theta_{ft} - \Delta\theta_{fw}) + \Delta\theta_{fw}$$

où $\Delta\theta_{fw}$ est l'échauffement de l'enroulement d'excitation mesuré en entraînant la machine à la vitesse assignée avec les enroulements d'induit et d'excitation en circuit ouvert.

Pour les machines dont les caractéristiques assignées ont un facteur de puissance supérieur à 0,9 (et notamment les machines dont les caractéristiques assignées ont un facteur de puissance unité), cette méthode d'essai peut être impossible à réaliser en raison des limites d'échauffement d'excitation. Dans ce cas, l'excitation peut être réglée à la valeur assignée et il convient de réduire la tension aux bornes pour donner le courant assigné statorique. La perte par effet Joule dans le stator est alors égale à la valeur assignée, mais une correction est nécessaire pour compenser l'échauffement du stator par rapport à la réduction de la perte dans le fer dans le stator, même si l'effet est faible puisque les pertes dans le cuivre dominent. Cet essai peut être complété par deux essais à circuit ouvert pour obtenir cette correction:

a) avec l'excitation réglée pour donner la tension réduite aux bornes;

b) avec l'excitation réglée pour donner la tension assignée aux bornes.

L'échauffement statorique est mesuré dans chaque cas et la différence entre les valeurs est ajoutée à la valeur mesurée dans l'essai de charge équivalente.

Il est impossible d'appliquer ces méthodes à des machines à service temporaire puisque ces essais doivent être réalisés suffisamment longtemps pour que les conditions de charge alternative puissent créer un équilibre thermique.

The field winding loss differs considerably from that in normal operation. Hence, the temperature rise of the field measured by change of resistance should be corrected to correspond to the loss associated with the rated field current. The temperature rise may be assumed to be proportional to the field I^2R loss, as follows:

$$\Delta\theta_{fN} = \left(\frac{I_{fN}}{I_{ft}}\right)^2 \Delta\theta_{ft} \times \frac{235 + \theta_{AN}}{235 + \Delta\theta_{ft} + \theta_{Ft} - (I_{fN} / I_{ft})^2 \Delta\theta_{ft}}$$

where

I_{fN} is the rated field current;

I_{ft} is the measured field current;

θ_{AN} is the reference ambient temperature;

θ_{Ft} is the measured ambient temperature;

$\Delta\theta_{ft}$ is the measured field temperature rise.

The following simplified less accurate equation, which neglects the change of resistance with temperature, may be used.

$$\Delta\theta_{fN} = (I_{fN}/I_{ft})^2 \, \Delta\theta_{ft}$$

This derivation of the field temperature rise neglects the effect of stator, rotor-surface and windage losses.

When the temperature rise of field winding due to windage losses cannot be neglected, for example, in the case of high-peripheral-speed machines such as turbine type generators, the temperature rise of field winding shall be determined by the following equation

$$\Delta\theta_{fN} = (I_{fN}/I_{ft})^2 \, (\Delta\theta_{ft} - \Delta\theta_{fw}) + \Delta\theta_{fw}$$

where $\Delta\theta_{fw}$ is the temperature rise of field winding measured by driving the machine at rated speed with open-circuit armature and field windings.

For machines rated at power factors above 0,9 (and particularly those rated at unity power factor), this test method may be impractical because of field heating limits. In this case, the excitation may be set to the rated value, and the terminal voltage should be reduced to give rated stator current. The I^2R loss in the stator will then equal the rated value, but correction is required to compensate the stator temperature rise for reduced iron loss in the stator, even though the effect is small as the copper losses predominate. This test may be supplemented by two open-circuit tests to achieve this correction:

a) with the excitation set to give the reduced terminal voltage;

b) with the excitation set to give the rated terminal voltage.

The stator temperature rise is measured in each case, and the difference between the values is added to the value measured in the equivalent load test.

These methods cannot be applied to short-time rated machines, as the tests have to be applied for a sufficiently long period of time so that the alternating loading conditions can result in thermal equilibrium.

Mobil
Product Data Sheet

Mobiltemp SHC 100
Synthetic High Temperature Grease

Product Description

Mobiltemp SHC 100 is a super premium, high temperature, anti-wear grease which combines the unique features of a synthetic base fluid with an organo-clay (non-soap) thickener. The clay thickener provides excellent structural stability at very high temperatures. The wax free nature of the synthetic base fluid, together with its low coefficient of traction compared with mineral oils, provide excellent low temperature lubrication, oxidation stability at high temperatures plus the potential for energy savings through reduced friction and lower torque.

Benefits

Mobiltemp SHC 100 offers the following benefits:

- Outstanding high and low temperature performance.
- Excellent resistance to oxidation.
- Structural stability at high temperatures.
- Low volatility.
- Outstanding low temperature pumpability.
- Extended lubrication intervals.
- Reduced energy consumption.
- Good pumpability in centralised lubrication systems.
- Lead, chlorine and nitrite free.

Application

Mobiltemp SHC 100 has a recommended operating temperature range of -50° to 200°C. It is recommended for use in high-speed bearings and thrust bearing where a wide temperature range is desired, and also high-temperature applications where extended re-lubrication periods are required. It is particularly suitable for use in electric motors where operating conditions demand reduced friction, low wear and long service life.

Health and Safety

Based on available toxicological information, it has been determined that this product poses no significant health risk when used and handled properly.

Details on handling, as well as health and safety information, can be found in the Material Safety Data Bulletin which can be obtained through Mobil Oil South Africa (Pty) Ltd., by telephoning 0800 600 383.

Characteristics

Typical physical characteristics of Mobiltemp SHC 100 are given in the table. These are intended as a guide to industry and are not necessarily manufacturing or marketing specifications. They may be changed without notice due to continued product research and development.

	Test Method	Mobiltemp SHC 100
NLGI Grade	ASTM D217	2
Thickener Type	-	Organo-Clay
Colour	Visual	Brown
Penetration, Worked	ASTM D217	280
Dropping Point °C	ASTM D2265	260+
Viscosity of Oil, cSt at 40° C	ASTM D445	100
Viscosity of Oil, cSt at 100°C	ASTM D445	14

Risø-R-1205(EN)

Conceptual survey of Generators and Power Electronics for Wind Turbines

L. H. Hansen, L. Helle, F. Blaabjerg, E. Ritchie, S. Munk-Nielsen, H. Bindner, P. Sørensen and B. Bak-Jensen.

Risø National Laboratory, Roskilde, Denmark
December 2001

Abstract

This report presents a survey on generator concepts and power electronic concepts for wind turbines. The report is aimed as a tool for decision-makers and development people with respect to wind turbine manufactures, utilities, and independent system operators as well as manufactures of generators and power electronics.

The survey is focused on the electric development of wind turbines and it yields an overview on:

- State of the art on generators and power electronics.
- Future concepts and technologies within generators and power electronics.
- Market needs in the shape of requirements to the grid connection.

This survey on generator and power electronic concepts was carried out in cooperation between Aalborg University and Risø National Laboratory, in the scope of the joint research programme *Electric Design and Control*.

The report has been reviewed by:

Preface

The present report is a result of the co-operation between Aalborg University and Risø National Laboratory within the scope of the research programme *Electric Design and Control* (EDS, alias Elektrisk Design og Styring).

The report has as an objective to compile and disseminate some of the knowledge on generators and power electronics for wind turbines, which now is at EDS' disposal. In this work, the following persons have contributed to the report writing:

- Birgitte Bak-Jensen.
- Henrik Bindner.
- Frede Blaabjerg.
- Lars Henrik Hansen.
- Lars Helle.
- Stig Munk-Nielsen.
- Ewen Ritchie.
- Poul Sørensen.

In order to focus the report towards the needs of the wind turbines manufactures a task group consisting of:

- NEG Micon: Niels Vilsbøll.
- Vestas: Michael Kinch.
- ABB: Hans Christian Christensen.
- Siemens: Kim Eskildsen and Ulf Lindhard.

have been asked to contribute to this report by valuable input – in specific on the concept evaluation criteria. Moreover, ABB and Siemens have kindly put pictures and drawings at disposal for this report.

Finally, the four largest wind turbine gearbox manufactures have been asked to supply specific gearbox data. The following two:

- Brook Hansen Transmission
- Lohmann & Solterfoht.

have contributed with data which are used to point out trends on gearboxes.

Frontpage picture has been supplied by Vestas

1 Introduction

1.1 Report outline

In recent years, the development in the area of electric machines and power electronics has been vigorous. Due to this development, the authors have a need for a survey on the present state of the art for generators and power electronics and a corresponding state of the art on wind turbines.

The survey presented in this report has the following objectives:

- to document state of the art for generators and power electronics with respect to wind turbines.
- to describe new concepts and technologies for generators and power electronics, which potentially could be used in wind turbines.
- to analyse market needs in terms of demands to the grid connection for wind turbines and wind farms.

The report is structured based on the philosophy sketched in Figure 1. When designing a new wind turbine, a number of function at demands are placed on e.g. the mode of operation etc., which is characteristic for a given wind turbine manufacture. It is foreseen that in the near future, these function at demands will be strongly influenced by customers desires, i.e. towards a more market demand oriented development. Therefore in this report, special emphasis is put on market needs – in particularly needs which shape demands to grid connection. Grid connection demands can be described objectively and simultaneously; they are important factors in the definitions of the function at demands.

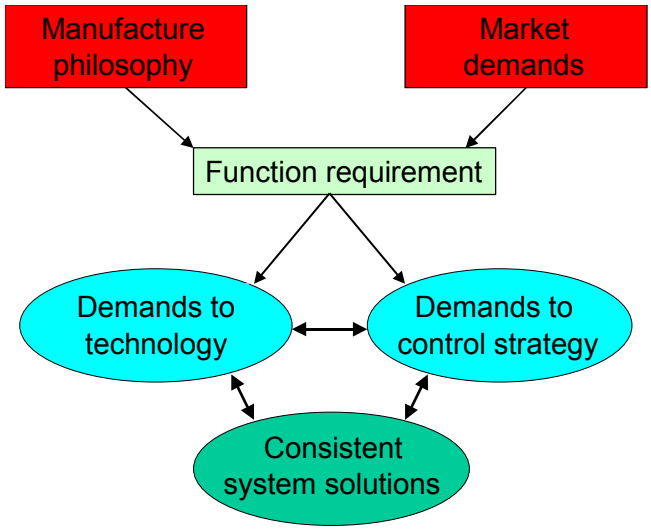

Figure 1.Philosophy of the report structure.

On basis of the function demands, it is a task of the designer to find a suitable technology, which combined with a matching control strategy, yields a consistent system solution. In the succeeding sections, the report presents examples of technological components for wind turbines in the form of concepts generator and power electronics. Control strategies will not be discussed further in this

report, since implementation of this issue typically is specific for each manufacturer, i.e. each has his own characteristic approach.

By nature a large number of consistent system solutions exist. The electrical part of a wind turbine is becoming more and more important. Therefore, it is very important to have this system highly integrated into the overall wind turbine design. Thus, a successor to this report would be one, which describes and analyses consistent system solutions (including aspects of controls), combined with an assessment of these solutions seen in the light of market needs regarding the grid connection demands.

1.2 State of the art

Since the start of modern wind turbine development in 1957, marked by the innovative Gedser wind turbine (200 kW), the main aerodynamic concept has been a horizontal axis, three bladed, downwind wind turbine, connected to a three phase AC-grid. Many different concepts have been developed and tested since. Activities in this field were encouraged by the oil crisis in 1973. Twenty years ago the concept of the Riisager wind turbine (22 kW) initiated a new area. The concept was similar to the innovative Gedser wind turbine, but it was built using inexpensive standard components, e.g. spare parts from cars. It became a success with many private households and it was the kick-off for the Danish wind generator industry.

During the last two decades, the production of wind turbines has grown in size from 20 kW to 2 MW. Many different concepts have been developed and tested. Those, which have been successful, are more or less descendants of the Gedser wind turbine concept. One modification is variable pitch blades. The pitch control concept has been applied during the last fourteen years. Recently, the active stall concept has been utilised. Another modification is in the electric field, where alternative concepts have been introduced. Since 1993, a few manufacturers have replaced the "traditional" asynchronous generator in their wind turbine design by a synchronous generator, while other manufacturers have introduced the asynchronous generator with wound rotor. Electrical developments include the use of advanced power electronics in the wind generator system design, introducing a new control concept, namely variable speed.

Due to the rapid development of power electronics, offering both higher power handling capability and lower price/kW, see e.g. (Thøgersen & Blaabjerg, 2000), the application of power electronics in wind turbines will increase further. Another interesting issue is the efforts, which have been put into research and development of new motor/generator concepts for some years. A comparison of 7 new concepts is presented in (Dubois et al., 2000). Thus, it is evident that the development departments of the wind turbine manufacturers are active analysing and evaluating potential new wind turbine concepts.

The scope of this section is to describe the "state of the art" of wind turbines seen from an electrical point of view, using two approaches. The first approach describes the state of art from a technical point of view, while the second applies a market-based point of view. The following chapters will look deeper into old and new concepts of generators and power electronics.

1.2.1 Concepts and wind turbine configurations

The generator and power electronic configurations most commonly applied in wind turbines are displayed in Figure 2.

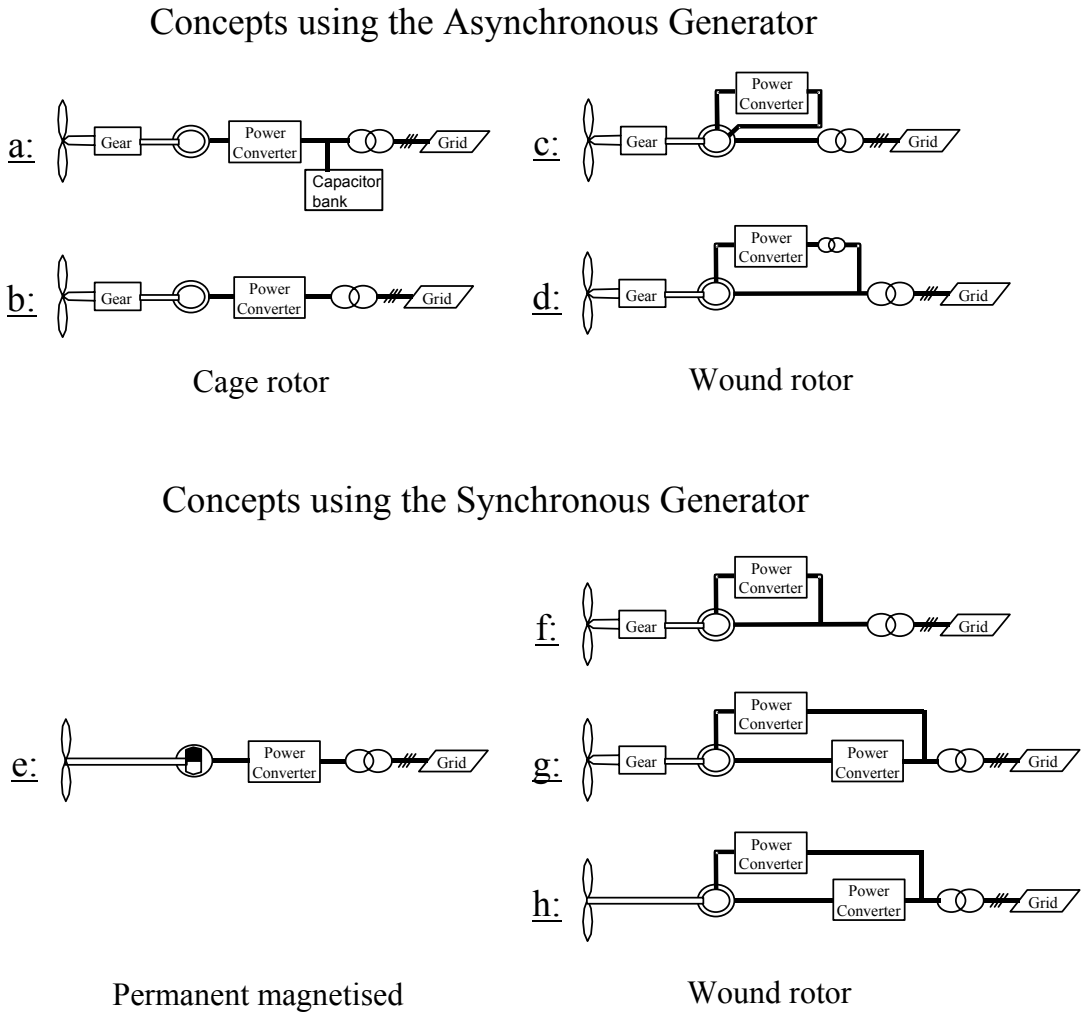

Figure 2. Standard wind turbine configurations using the asynchronous generator (AG) and the synchronous generator (SG). Depending on the particular configuration, the term Power Converter covers different types of power electronic components such as: a soft starter (part a), an external variable rotor resistance (part c), a rectifier (part e – stator connected or part f, g, h – rotor connected) and a frequency converter (part b, d, e, g and h).

The configurations depicted in Figure 2 present an outline of typical electrical topologies used in wind turbines. As listed in Table 1, these seven configurations cover a wide range of the applied power control concepts for wind turbines.

General comments on configurations in Figure 2:

a) This is the "conventional" concept applied by many Danish wind turbine manufacturers during the 1980's and 1990's, i.e. an upwind, stall regulated, three bladed wind turbine concept using an induction generator (cage rotor). During the 1980's this concept was extended with a capacitor bank (for reactive power compensation) and a soft-starter (for smoother grid connection).

Table 1 . The generally applied control concepts for wind turbines (refer to Figure 2*).*

Con-fig.	Power Converter	Multipole or gearbox	Power control features	Comments
A	Soft starter	Gearbox	Stall or active stall	One or two speed machine
B	Frequency converter	Gearbox	Stall or active stall	Variable speed
C	PE converter or passive components	Gearbox	Pitch	Limited variable speed
D	Frequency converter	Gearbox	Pitch	Variable speed (doubly fed generator)
E	Frequency converter	Multipole	Stall, active stall or pitch	Variable speed
F	Rectifier	Gearbox	Stall or pitch	Variable speed
G	Rectifier and frequency converter	Gearbox	Pitch	Variable speed with gearbox
H	Rectifier and frequency converter	Multipole	Pitch	Variable speed without gearbox

b) In this configuration, the capacitor bank and soft-starter are replaced by either a full scale frequency converter or a "low wind" region sized frequency converter – used e.g. by Wind World - where the frequency converter is bypassed (implying fixed speed) and used only for reactive power compensation when the wind speed exceeds the design wind speed. This concept uses a smaller frequency converter (20-30% of nominal generator power) compared to the full-scale concept (approximately 120% of nominal generator power). On the other hand the full-scale concept enables variable speed operation at all wind speeds.

c) This configuration employs a wound rotor and it has been used by Vestas since the mid 1990's – known as OptiSlip. The basic idea of this concept is to control the total rotor resistance using a variable external rotor resistance by means of a power electronic (PE) converter. With the power electronic converter mounted on the rotor shaft, it is possible to control the slip (by controlling the external rotor resistance) over a 10% range. Control of the slip implies control of the power output in the system. (Wallace & Oliver, 1998) describes an alternative concept using passive coponents instead of a PE converter, which also achieves a range of 10% slip variation. However, this concept does not support controllable slip.

d) An other configuration in wind turbines employs a doubly fed induction generator. A frequency converter directly controls the currents in the rotor windings. This enables control of the whole generator output, using a PE converter, rated at 20-30% of nominal generator power. Introduction of this concept is mainly motivated by two reasons: 1) variable speed in a wide speed range compared to the OptiSlip concept and 2) less expensive compared to the full power control concept.

e) A typical application of the full power control configuration is as a power source on sailing boats. A gearless two or three bladed upwind wind turbine using a PMG (typically less than 1kW) is used to charge a battery energy

storage through a rectifier. This configuration is also applied in wind turbines for home wind systems and hybrid systems, i.e. wind turbines larger than 1kW and smaller than approximately 20kW. A future concept – the Windformer – using this configuration has been suggested in year 2000 by ABB, with the following specifications: multipole 3.5MW PMG which together with a diode-rectifier produces 21kV DC. It is proposed to combine this configuration with a HVDC-light based grid.

f) This configuration is not widely used in wind turbines. It is externally excited as shown in the figure using a rectifier (the "Power Converter"). The low utilisation compared to the previous configuration could be due to three reasons: 1) the need for an exciter circuit, 2) the need for slip rings and 3) a more complex wind turbine safely strategy; which makes this configuration less attractive. Note that also internally excited configurations exist.
g) Neither this configuration is widely used in wind turbines. Compared to the previous configuration, this one supports variable speed, if the grid power converter is a four-quadrant frequency converter.
h) In this configuration a multipole wound SG is used. In principle, it is the same as the previous configuration, but due to the multipole generator no gearbox is needed. The wind turbine companies Enercon and Lagerwey are examples of manufacturers using this configuration.

Configuration "a" is the only commonly applied control concept, which does not support variable speed operation. Excluding this configuration for a while, a road map for conversion of mechanical energy into electrical energy may be drawn, as presented in Figure 3. The focus in this figure is the applied generator concept used in the conversion of a mechanical torque input at variable speed to an electrical power output at fixed frequency. Thus, except for configuration "a", the other configurations in Figure 2 (alias Table 1) are classified in the road map.

As it may be observed in Figure 3, the doubly-fed induction generator has two possible implementations, where 1) the rotor is connected to the grid through a small frequency converter or 2) the rotor is connected to an external power conversion unit (PE converter or passive components). The energy coming from the external power conversion unit is dissipated as heat loss – e.g. as in the case of the OptiSlip concept of Vestas. In the last case no slip rings are necessary.

The term "Novel Machines" in Figure 3, is used here to cover e.g. the reluctance machine, the Windformer (from ABB) etc. In the case of the Windformer, the "Large PE converter" is a simple diode bridge and the grid is a HVDC-grid (refer to comments on configuration "e", Figure 2).

Until now, the main focus has been on generators and generator concepts, while power electronics mostly has been referred to by the general terms "Power Converter" or "PE converter", which in this context covers devices like soft starters (and capacitor banks), rectifiers, inverters and frequency converters. Quite a variety of different design philosophies exist, both for rectifiers, inverters and frequency converters. A short introduction is presented below, while a more detailed description is presented in Section 3. A thorough introduction to this subject may be found in (Novotny & Lipo, 1996).

The basic elements for these converters are diodes and electronic switches such as: thyristors, GTO's (gate turn off thyristor), IGCT's (Integrated Gate Commutated Thyristors), BJT's (bipolar junction transistor), MOSFET's (metal oxide semiconductor field effect transistor) or IGBT's (insulated gate bipolar transis-

tor). A comparison of characteristics and ratings for five of these switches is presented in Table 2.

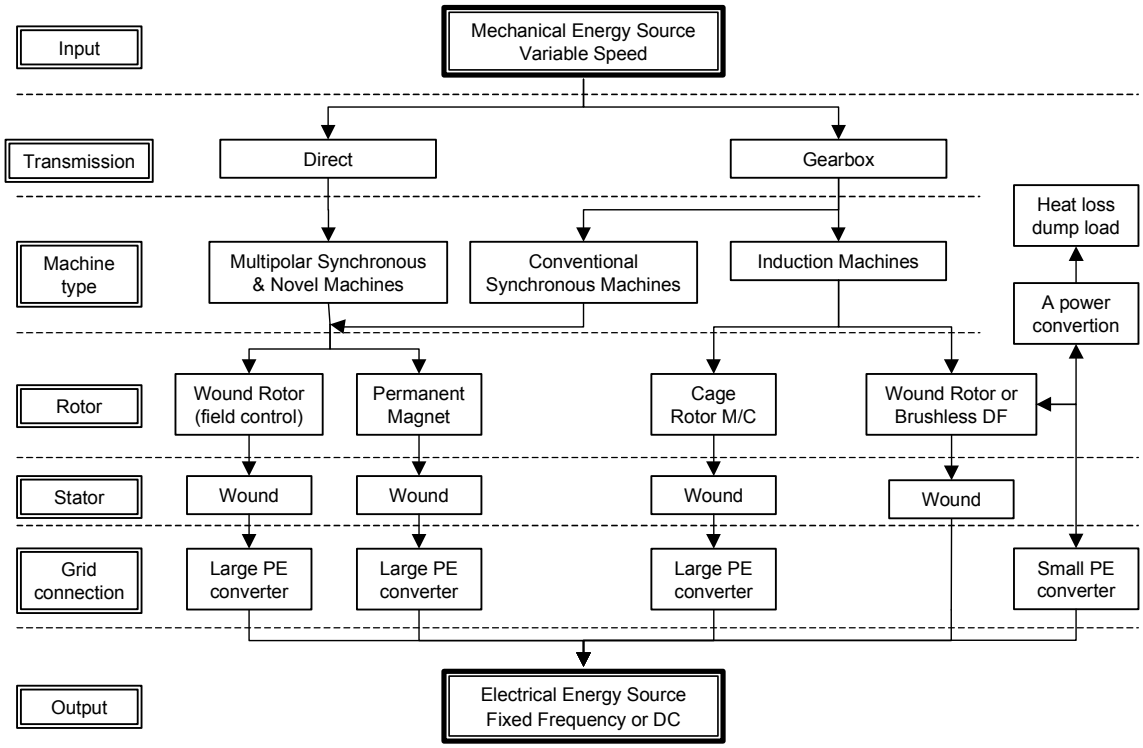

Figure 3. Road map: Conversion process of Mechanical Energy to Electrical Energy using power electronic converter (inspiried by (Wallace & Oliver, 1998)).

Table 2. Maximum ratings and characteristics. Source (Heier, 1998).

Switch type	**GTO**	**IGCT**	**BJT**	**MOSFET**	**IGBT**
Voltage (V)	6000	4500	1200	1000	3300
Current (A)	4000	2000	800	28	2000
Switched-off time (μs)	10-25	2-5	15-25	0.3-0.5	1-4
Pulse bandwidth (kHz)	0.2-1	1-3	0.5-5	5-100	2-20
Drive requirements	High	Low	Medium	Low	Low

In Table 2, voltage, current and output power are maximum ratings. The switch-off time is related to the circuit-commutated recovery time, while the pulse bandwidth defines the operational frequency range.

A traditional AC frequency converter (also called a drive), as seen from the grid, consists of: a rectifier (AC to DC unit), an energy storage, and an inverter (DC to AC with controllable frequency). Talking about motor drives the terms "semiconverter" and "full converter" are used to classify the type of drive. A semiconverter has single quadrant operation (only positive voltage and current rms-values), which utilises motor operation (or acceleration) in the forward direction. A full converter offers two-quadrant operation (i.e. positive/negative voltage and positive current rms-values), which utilises both motor operation in two directions and electrical braking. Since generators feed power back to the grid, it is necessary to use a "dual converter". A full dual converter offers four quadrant operation (i.e. positive/negative voltage and current rms-values), which utilises both motor and generator operation.

Inverters for variable speed operation, may in general be classified in two basic groups: VSI (voltage source inverter) or CSI (current source inverter) and CSC (current source converter). While the VSI creates a relatively well-defined, switched voltage waveform at the terminals of the electrical machine, the CSC produces a switched current waveform. In the case of a VSI, the voltage in the energy storage (the DC bus) is maintained stiff by a large capacitor or a DC source e.g. a battery (voltage source inverter) – while the resulting current is primarily formed by load and speed. In a CSC the opposite is the case, the current in the energy storage (the DC bus) is maintained stiff using a large inductor – while the resulting voltage is primarily formed by load and speed. Thus, VSI and CSI are dual. This duality is further investigated in (Novotny & Lipo, 1996). A diagram of the basic inverter concepts is shown in Figure 4. It must be stressed, that VSI and CSI are quite different concepts.

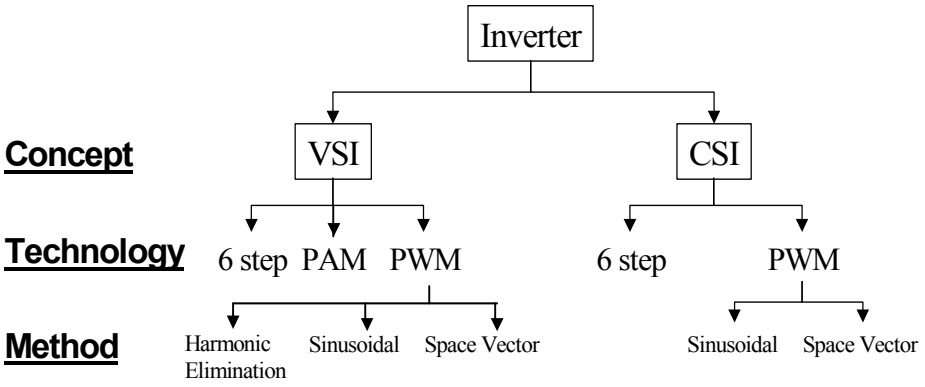

Figure 4. Diagram of basic inverter concepts for adjustable speed in wind turbines.

As indicated in Figure 4, the concepts of VSI and CSI may both be implemented in several ways, e.g. as: 1) six step inverter, 2) pulse amplitude modulated or 3) pulse width modulated inverter. Moreover, the implementation of a PWM inverter for a VSI e.g. may be realised by tree methods: 1) harmonic elimination 2) a "sinusoidal" PWM converter, or 3) a space vector strategy converter. The basic operation of these technologies is described further in Section 3.

A number of different strategies exist to combine a rectifier and an inverter to form a frequency converter. Table 3 serves as a short introduction to five drive topologies applicable for adjustable speed in a wind turbine.

Table 3. Comparison of five AC drives for adjustable speed.

Converter type	**Concept**	**Technology**	**Applicable configuration** (Figure 2)	**Comments**
Back to back	VSI	PWM	b,d,e,f,g and h	Mature technology
Tandem	CSC+VSI	6-step+PWM	b,d,e,g and h	Unproven technology
Matrix	VSI	PWM	b,d,e,f,g and h	Unproven technology
Multilevel	VSI	PWM	b,d,e,f,g and h	Mature technology
Resonant	VSI	PWM	b,c,d,e,f,g,h	Unproven technology

After this brief outline on generator and power electronics it would be appropriate to make a few comments on the grid performance of the various configurations of Figure 2. The performance depends of course on the applied frequency converter technology. In Table 4, some grid performance issues are presented for each configuration.

Table 4. Comments on grid performance of the various configurations in Figure 2 *using 1) a thyristor or 2) a pulse width based frequency converter.*

Con fig.	Voltage control	Reactive power control	Grid demand
a	No	No, reactive power consumer with step-wise compensation	Stiff
b	1) Yes 2) Yes	1) No, reactive power consumer 2) Yes, constant cos(φ) or constant reactive power	1) Stiff 2) Stiff or weak
c	2) Yes	2) Constant cos(φ) or constant reactive power could be made possible	2) Stiff or weak
d	1) Yes 2) Yes	1) No, reactive power consumer 2) Yes, constant cos(φ) or constant reactive power	1) Stiff or weak 2) Stiff or weak
e	1) Yes 2) Yes	1) No, reactive power consumer 2) Yes, constant cos(φ) or constant reactive power	1) Stiff 2) Stiff or weak
f	No	Yes, e.g. constant cos(φ) or constant reactive power	Stiff
g	1) Yes 2) Yes	1) No, reactive power consumer 2) Yes, constant cos(φ) or constant reactive power	1) Stiff 2) Stiff or weak
h	1) Yes 2) Yes	1) No, reactive power consumer 2) Yes, constant cos(φ) or constant reactive power	1) Stiff 2) Stiff or weak

1.2.2 Market aspects

One way of describing the "state of the art" of frequency converters applied to wind turbines is to survey the supply rates of the manufacturers – as presented in Table 5 – and then map the applied concept of each manufacturer with respect to Figure 2 and Table 1. Table 5 ranks the top 10 suppliers (BTM Consults Aps, 2000) with respect to sold MW of converters in 1999.

Table 5. The top-10 list of suppliers in 1999. Source (BTM Consults Aps, 2000).

Top 10 list suppliers	Sold MW 1999	Share in %	Accu. MW 1999	Share in %
1. NEG Micon	761	18.9	3034	21.0
2. Vestas	652	16.2	2530	17.5
3. Gamesa	494	12.3	853	5.9
4. Enercon	488	12.1	1553	10.7
5. Enron (Zond/Tacke)	360	8.9	1153	8.0
6. Bonus	338	8.4	1197	8.3
7. Nordex	306	7.6	638	4.4
8. Made	218	5.4	450	3.1
9. Ecotecnia	59	1.5	136	0.9
10. Dewind	58	1.4	86	0.6
Others	298	7.4	2839	19.6
Total	**4032**	**100**	**14469**	**100**

The applied concept of each manufacturer listed in Table 5 has been evaluated using publicly available data obtained from the Internet. The result is presented in Table 6, where the two largest wind turbines of each top-10 manufacturer have been assessed by their configuration and control concept. As it may be observed from Table 6, there is a trend towards the configuration using a doubly fed, asynchronous generator with variable speed control, combined with variable pitch control. Of the top-10 suppliers, only NEG Micon and Bonus are still using configuration "a" in Figure 2 – the conventional solution – updated with active stall control. All the machines presented in Table 6 are 3 bladed, upwind wind turbines.

Table 6. Applied concept of each manufacturer based on information found on the internet August 8th 2000 concerning the two biggest (alias newest) wind turbines from each manufacture.

Manufacture (top 10 supp.)	**Wind turbine**	**Conf.** Figure 2	**Power control features**	**Comments**
NEG Micon	NM 2000/72	a	Active stall	Two speed
	NM 1500C/64	a	Stall	Two speed
Vestas	V80 – 2 MW	d	Pitch and variable speed	Range: 905 rpm. to 1915 rpm.
	V66 – 1.65 MW	c	Pitch and OptiSlip	Range: 1500 rpm. to 1650 rpm.
Gamesa	G52 – 850 kW	d	Pitch and variable speed	Range: 900 rpm. to 1650 rpm.
	G47 – 660 kW	d	Pitch and variable speed	Range: 1200 rpm. to 1626 rpm.
Enercon	E-66 – 1.8 MW	h	Pitch and variable speed	Gearless. Range: 10 rpm. to 22 rpm.
	E-58 – 1 MW	h	Pitch and variable speed	Gearless. Range: 10 rpm. to 24 rpm.
Enron Wind	1.5s – 1.5 MW	d	Pitch and variable speed	Range: 989 rpm. to 1798 rpm.
	900s – 900 kW	d	Pitch and variable speed	Range: 1000 rpm. to 2000 rpm.
Bonus	2 MW	a	Active stall	Two speed
	1.3 MW	a	Active stall	Two speed
Nordex	N80/2500 kW	d	Pitch and variable speed	Range: 700 rpm. to 1303 rpm.
	N60/1300 kW	a	Stall	Two speed
Made	No technical information was available on the internet			
Ecotecnia	No technical information was available on the internet			
Dewind	D4 – 600 kW	d	Pitch and variable speed	Range: 680 rpm. to 1327 rpm.
	D6 – 1.25 MW	d	Pitch and variable speed	Range: 700 rpm. to 1350 rpm.

The manufacturers applying configuration "d" and "h" all use IGBT based converters. Moreover, manufacturers of configuration "d" use 4 or 6 pole, doubly fed machines.

1 The technical information supplied by some manufactures was in some cases quite limited, which implies that caution should be exercised on some of the indicated configurations.

To obtain an overview of the wind turbine prices, the sales departments of the manufacturers listed in Table 6 were contacted to ascertain the standard price for one machine, on the Danish market (if possible), or alternatively the price on the German market. The result is presented in Table 7. It should be noted that these prices may not be absolutely comparable, since no standard exists on what is to be included in the wind turbine price. E.g. on the German market the step-up transformer is included, while in general it is not on the Danish market. Moreover, service contracts and other optional items may or may not be included. In this connection the price formation on these markets are also different. Nevertheless, the listed prices generally include the wind turbine price (with tubular tower) and installation and start-up costs. Foundation costs are excluded. The hub height is also an optional parameter, which has been selected here to be as close to the rotor diameter as possible.

Table 7. Nominal power, typical rotor diameter, typical hub height and wind turbine prices on the Danish market. The wind turbine price also includes installation and start-up and excludes foundation costs. Data were supplied by the sales departments of the manufacturers.(Year 2000)

Manufacture (top 10 supp.)	Wind turbine	Power kW	Rotor diameter	Hub height meters	Wind turbine price DDK
NEG Micon	NM 2000/72	2000	72	68	12.800.000
	NM 1500C/64	1500	64	60	8.500.000
Vestas	V80	2000	80	78	13.500.000

1.2.3 Trends in wind turbine design

Based on the previous subsection the present "state of the art" large wind turbine may be summarised as a 3-bladed upwind turbine (with tubular tower) using:

- Active stall with a two speed asynchronous generator or
- pitch control combined with variable speed. Moreover, the variable speed concept is mainly realised using configuration "d", i.e. a doubly-fed induction generator with a rotor connected IGBT based frequency converter.
- Only one of the top-10 manufacturers offers a gearless (variable speed) wind turbine.

Meanwhile, it should be mentioned that a number of alternative wind turbine designs exist. Lagerwey uses configuration “h”, but with a 6-phase synchronous generator. Nordic Windpower promotes configuration “a” in a two bladed upwind version. Vergnet also uses configuration “a”, but in a two bladed upwind or downwind version. Scanwind has started to construct a wind turbine using configuration “e” based on the Windformer and a DC grid.

The trend in wind turbine prices is illustrated in Figure 5 and Figure 6, based on the data presented in Table 7. The specific wind turbine price on the Danish market has decreased from 12.000 DKK/kW for 20-30 kW machines down below 6.000 DKK/kW for 450-600 kW machines as reported e.g. in (Hansen & Andersen, 1999). Meanwhile, the Megawatt machines have an increasing specific price as it may be observed in Figure 5. This fact is partly explained by the development in offshore wind turbines, which are generally Megawatt turbines. It seems to be the technical performance, measured as the swept rotor area per nominal power, or the yearly energy production per unit swept rotor area, that is the optimising criterion – rather than the economic performance, measured as the cost per nominal power, or the cost per yearly energy unit production.

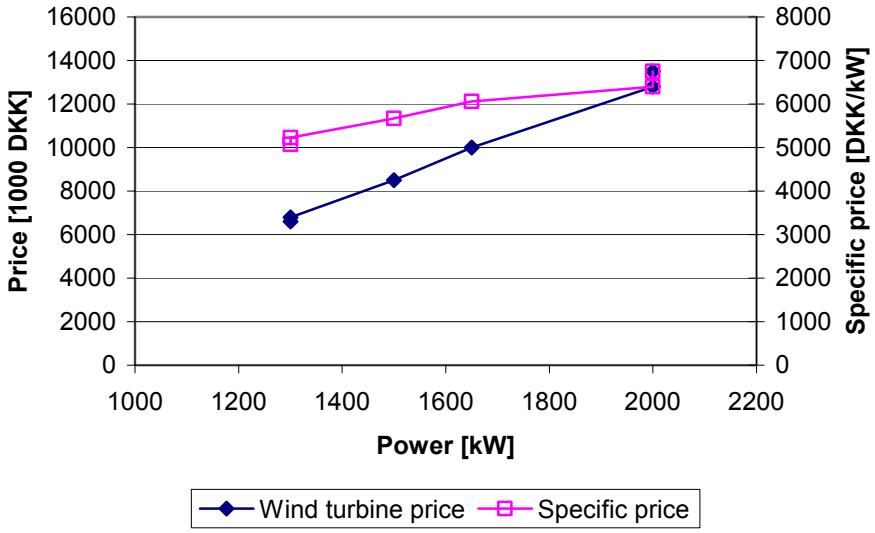

Figure 5. The trend on the Danish market in respect to wind turbine price and specific price (DKK/kW) as a function of wind turbine size.

On the German market, the specific wind turbine price from these limited data is continuously decreasing as shown in Figure 6.

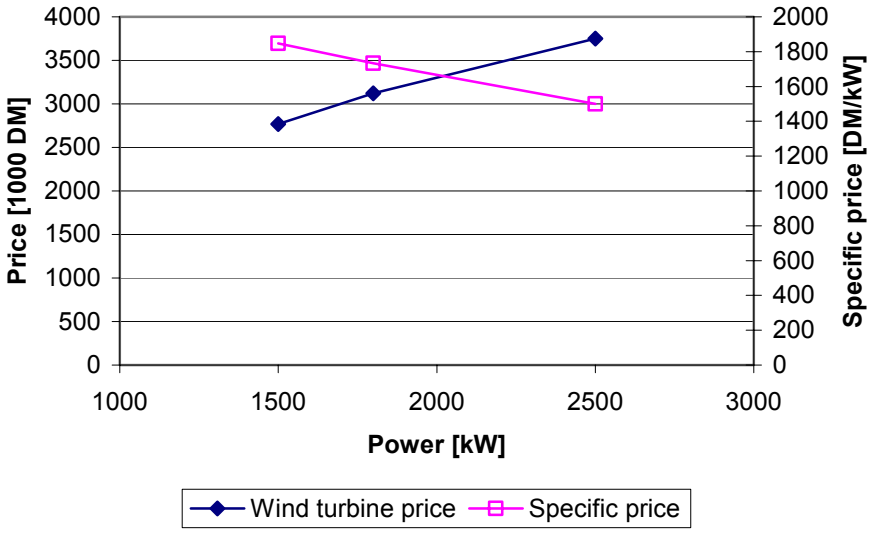

Figure 6. The trend on the German market in respect to wind turbine price and specific price (DKK/kW) as a function of wind turbine size.

The outline of this report is:

Chapter 2 will discuss different generator types, both the standard generators but also new generators, which may be a future solution.

Chapter 3 treats different power electronic concepts, which are possible for controlling the variable speed. It also includes a comparison of some topologies as well as it discusses some wind farm solutions.

In Chapter 4 the grid integration issues are discussed which include discussion of disturbances and standardized grids.

Finally, a summary of the report is done including a list of important research topologies in the area of electrical design and control of wind turbines.

2 Generic Generator Types

Several generic types of generator are possible candidates in wind turbines. Historically, the squirrel cage, induction generator has been frequently applied commercially. A second popular type is the induction generator with wound rotor, while a third is the current excited, synchronous generator. These types have been synchronised directly to the grid, providing a constant speed solution. This confines the choice of generator to a very few types, which exhibit inherently flexible behaviour, notably the induction machines, or where there is an established technology for control, for example, the separately excited synchronous generator.

The generator provides a means of energy conversion between the mechanical torque from the wind rotor turbine, as prime mover, and an electrical load. In this study, the electrical load is confined to the public utility supply grid system. Island operation is not considered, although islanding may be discussed in certain circumstances, e.g. during start-up.

Mechanical connection to the turbine rotor is through the main shaft. The connection may be by direct drive, or using a gearbox. The use of a gearbox allows matching of the generator speed to that of the turbine. This allows some optimisation of generator characteristics, but a disadvantage of the gearbox is that as a mechanical component it is subjected to wear and tear and in some cases has been relatively unreliable.

The ready availability of high power semiconductors for frequency converters has increased the interest in direct coupled, variable speed turbines and generators. The electrical converter thus acts as an electrical gearbox. This system is more flexible than the mechanical gearbox, and the converter may be mounted either in the nacelle, the tower, or elsewhere. Also new option and constraints for generator design are made available by the application of the semiconductor converter, as are new methods for control and protection.

The number of possible options is large. The selection of a final design thus becomes a very complicated process. The objective of this chapter is to illustrate the characteristics of some of the available candidate, generic generator types.

2.1 Criteria for Assessment of Generator Types

Criteria such as weight of active materials, operational characteristics, applicable type of semiconductor power converter, protection considerations, service and maintenance aspects, environmental considerations, and list price are all relevant for the assessment. It may however be difficult to derive some of this information from public literature, and other methods may have to be taken into use.

2.2 The Asynchronous Machine (Induction Machine)

Induction machines may generally be set in two categories, those with squirrel cage, and those with wound rotor. Both categories were considered, as each has some special features to offer. The search term ‘Induction Generator’ produced

an immediate list of some 303 articles, and standards dating from 1990 and later. This was reduced to 133, by rejecting the majority of articles concerning island operation, and studies of the power electronics converter, and control system. The list of 133 is included in the references. Some 15 representative articles have been studied for inclusion in this report.

Induction machines have been proposed as generators in many research articles and are currently the predominant commercial wind turbine generator. Advantages include the asynchronous operation, which allows some flexibility when the wind speed is fluctuating. A major disadvantage is the need for excitation of the magnetic field via the supply terminals. Other applications are also considered in the literature, e.g. Hydroelectric Power Plants (Shibata & Taka, 1990), energy recovery scheme (McQuin, 1989), large steam turbine generator (McQuin, 1989; Hammons et al., 1996; Jiang et al., 1998). An overall description of the function of the Induction Generator is provided in e.g. (Pham, 1991).

2.2.1 Squirrel Cage Induction Generator

The Squirrel Cage Induction Generator (SCIG) is a very popular machine due to its mechanical simplicity and robust construction. The stator winding is connected to the load/excitation source, and is insulated. The rotor is provided with an uninsulated winding, which is very resistant to the effects of possible dirt ingress, and vibration. Maintenance is generally restricted to bearing lubrication only. A major problem is the necessity of obtaining the excitation current from the stator terminals (Shibata & Taka, 1990).

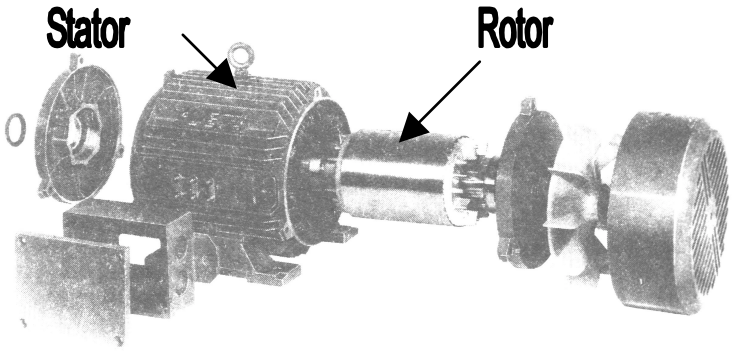

Figure 7. Exploded view of a Squirrel Cage Induction Machine.

Large machines are reported (16 MW (McQuin, 1989)) (several hundred MW (Hammons et al., 1996)). Applying a self-excited start, followed by a fully excited synchronisation, while generation is ensured (McQuin, 1989; Hammons et al., 1996; Jiang et al., 1998), may alleviate voltage dips during start-up. Shaft torques produced under fault conditions, are sometimes very high (Hammons et al., 1996).

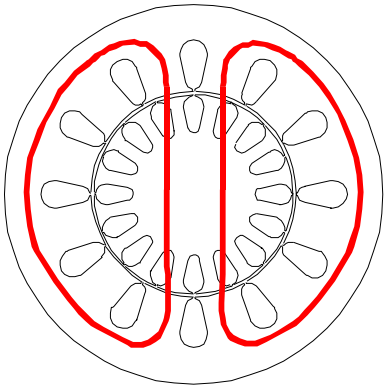

Figure 8. Cross section of a 2-pole squirrel cage induction machine showing main flux path.

Methods of control include full power frequency inverter, fixed capacitor, thyristor and static VAR controller (Abdin & Xu, 1998).

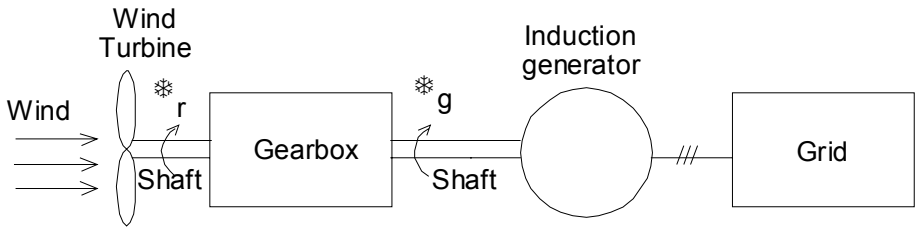

Figure 9. Diagram showing an uncontrolled, grid connected, Squirrel Cage Induction Generator, as a Wind turbine Generator.

At power frequencies, the SCIG is inherently stable, but when connected to a weak grid with an unbalanced, three-phase load, overheating and torque pulsations may occur in the SCIG (Muljadi et al., 1999).

2.2.2 Wound rotor Induction Generator

It has been found useful to apply the wound rotor Induction Machine as a Wind Power Generator. In this case, the rotor is provided with a three-phase insulated winding very similar to that of the stator. The rotating winding may be connected to the stationary supply circuits via a set of slip rings and brushes. This is the traditional manner. An alternative is to use a power electronic converter, which may or may not require slip rings.

The output of the generator may now be controlled, by controlling only the rotor losses. This is very convenient, as the alternative is to control the whole armature power on the stator. With the advent of power electronics it is possible to recover slip energy from the rotor circuit, and add this to the output of the stator. Vestas Wind Systems have made extensive use of this in their 'OptiSlip' system.

Although the inclusion of a wound rotor affords the advantage described above, the wound rotor is inevitably more expensive than a squirrel-cage rotor. The

insulated winding on the rotor may be subject to stresses arising from the rotation and vibration, which may reduce the lifetime of the generator.

2.2.3 Principle of Operation

The Induction Generator is provided with two windings, one on the stator, and one on the rotor. The stator winding of the induction motor has two functions. It provides the excitation or magnetisation, and carries the armature or generated current. The rotor winding carries the armature current only. When AC excitation is present, the magnetic field created rotates at a speed determined jointly by the number of poles in the winding and the frequency of the current, the synchronous speed.

If the rotor rotates at a speed other than the synchronous speed, voltage is generated in the rotor winding at a frequency corresponding to the difference in the two frequencies, known as the slip frequency. This voltage drives the armature current, and provided the rotor speed is faster than the synchronous speed, the machine acts as a generator. The function is thus asynchronous.

2.2.4 Methods of Analysis

The magnetic circuit may be analysed using analytic methods, which are heavily dependent on the availability of test results for machines with the same internal geometry. A more modern method, which has become viable due to the increase in speed of computing, is the Finite Element Method, which may be used to predict the performance of magnetic circuits of which one has no previous experience.

Having solved the magnetic circuit, the machine performance is most conveniently predicted using electric circuit techniques.

For many purposes, the steady state equivalent circuit is adequate for analysis. In other cases, it is necessary to use dynamic simulation of the differential equations (Li & Ching, 1997). Some authors use a version of the step by step method used for analysis of synchronous machines (Hammons et al., 1996), or symmetrical component analysis (Jiang et al., 1998) to simulate dynamic conditions.

Losses are important to know, as they determine the self-heating, hence the machine lifetime, and the energy conversion efficiency. Generally, losses are determined from the steady state equivalent circuit model, or from the loss models.

2.2.5 Operational Characteristics – Normal Duty

In normal duty and directly connected to a stiff AC grid, the Induction Generator is very robust and stable. The slip varies, increasing with increasing load. The major problem is that, due to the magnetising current supplied from the grid to the stator winding, the full load power factor is relatively low. This is to be compared with the fact that most power distribution utilities penalise industrial loads with low power factors. Clearly generation at low power factor cannot be allowed either. When the power factor is too low, connecting capacitors in parallel with the generator may be used to compensate it.

Operating in this manner, the Induction Generator is uncontrolled. Any fluctuations in shaft power are passed on to the net, modified only by the internal im-

pedance of the generator itself. This is to say that the damping is negligible. This is also a situation, which is difficult for the distribution utility to accept.

Some manufacturers seek to improve this situation by adding means of control. Modern power electronics converters have made this technically easier. One solution is to provide an insulated winding on the rotor, controlled by a power electronics converter. In this way, the power handled by the converter is restricted to the rotor power, in some cases the slip power only.

Another solution is to insert a power converter in series with the armature circuit. In this way, full control is obtained over the IG performance, by employing the somewhat cheaper SCIG, but at the cost of a converter capable of handling the full power of the generator.

Both the above controller solutions function well, smoothing the power supplied to the grid. Additional benefits may also be gained in special situations, such as start-up.

2.2.6 Operational Characteristics – Fault Conditions

Should external fault conditions occur, the fault current is reported to be sufficient to trip relays and operate protective relays.

Internal faults are more difficult to determine and isolate. Traditionally, they have been detected by excessive temperature being measured by embedded temperature detectors, or excessive vibrations being measured by accelerometers fitted at strategic positions. These methods detect only faults requiring immediate attention. It would be advantageous to be able to detect incipient faults, to enable maintenance to be planned on the basis of predicted actual necessity rather than predicted estimated necessity.

New methods are being researched and developed, enabled by the improvements to electronics, computing and signal processing techniques, where incipient faults may be detected and identified. The progress of these faults may be charted, and automatic predictions made regarding the seriousness of the fault, and the time remaining until maintenance attention becomes necessary. Such monitoring methods are studied by Aalborg University, Institute of Energy Technology, and Risø's Wind Energy Department, partly funded by the Danish Energy Agency.

2.2.7 Axial Flux Induction Machines

Because of the large numbers of slots on both the stator and the rotor, and the small air-gap, it has not been found practical to propose an axial air-gap induction generator.

2.2.8 Efficiency of Induction Generators as a Function of Load and Speed

The efficiency surface of a typical small induction motor is shown in Figure 10. Efficiency is shown plotted as a function of shaft speed and torque load. This motor was controlled to operate at the maximum efficiency for each working point tested. Scrutiny of this surface reveals that the efficiency may be controlled to give a reasonably flat plateau at a high efficiency for medium to high speeds, and over a wide torque range. However, when the speed drops below a critical level, it becomes impossible to obtain an acceptable efficiency.

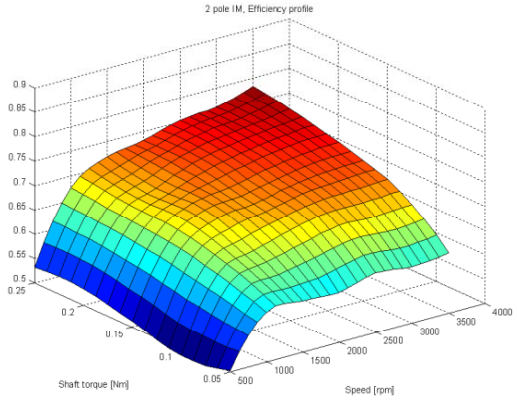

Figure 10. Tested efficiency surface of Induction Motor, controlled to operate at maximum possible efficiency for each working point.

The above figures were obtained by testing a small induction motor. It may be expected that a similar development of the efficiency would apply for a large induction generator, although in this case, the efficiency values would be higher

2.2.9 Well-Established or New Technology

The induction machine is a well-established technology, as is its application as a wind generator, using a gear drive to a generator with a low number of poles.

2.2.10 Gear or Direct Drive Multi-pole

In general, because of the small air-gap, the Induction Machine leakage flux increases to an unacceptable limit for machines with many poles. This causes the difficulty that the machine cannot use the current flowing to generate torque, but only leakage flux. Induction Machines with a large number of poles must be large enough to accommodate a sufficient number of slots per pole per phase, in order to prevent this situation from taking the upper hand. This means that induction machines with many poles will inevitably be oversized in relation to the rated output.

2.3 The Permanent Magnet Generator

Figure 11 shows the cross-section of a typical Permanent Magnet Generator (PMG). The PMG differs from the Induction Generator in that the magnetisation is provided by a Permanent Magnet Pole System on the rotor, instead of taking excitation current from the armature winding terminals, as it is the case with the Induction Generator. This means that the mode of operation is synchronous, as opposed to asynchronous. That is to say, in the PMG, the output frequency bears a fixed relationship to the shaft speed, whereas in the mains connected IG, the frequency is closely related to the network frequency, being related by the slip. These differences will be discussed at length. However, it must be recognised at the outset that the differences have a significant effect on the operating characteristics and performance of the two generator types.

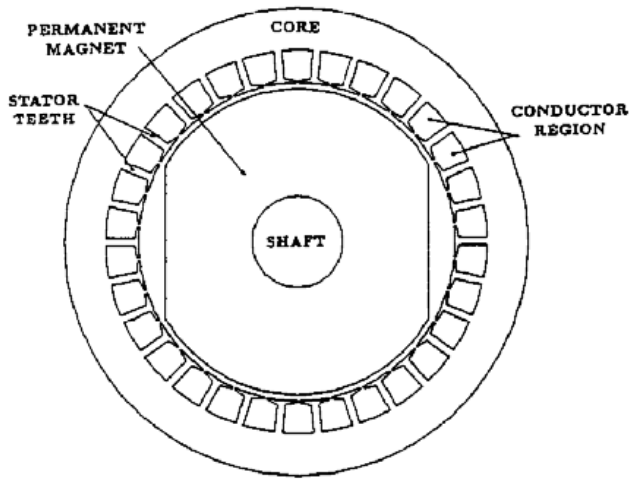

Figure 11. Cross-section of typical conventional Permanent Magnet Generator.

Permanent magnet machines may be set in several categories, those with surface mounted magnets, those with buried magnets, those with damper windings, etc., etc. All categories where data was found were considered, as each has some special features to offer. The search term 'Permanent Magnet Generator' produced an immediate list of some 50 articles, and standards dating from 1990 and later. In view of the small number of articles found, this was not reduced in any way, see Appendix A.2. Some 21 representative articles have actually been studied for this report. Other articles and references found have been included if they came to the notice of the author. This means that some significant articles may have been omitted from consideration. References [8, 9] in Appendix A.2 were ignored, as it concerned a high-speed, 400Hz generator, and cyclo converter. This combination was found interesting, but irrelevant to the case under consideration.

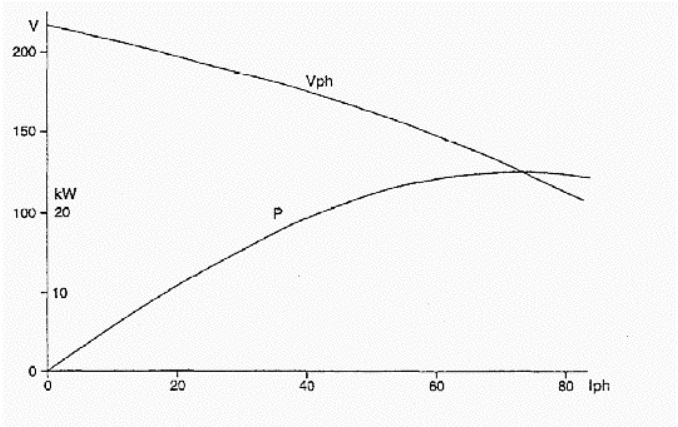

Figure 12. Voltage regulation of 12 pole, outer stator PMG with surface mounted magnets (Mitcham & Grum, 1998).

The PMG has been proposed as wind turbine generator in several research articles. Advantages include self-excitation, which allows operation at high power factor and efficiency. A disadvantage may be the synchronous operation, which causes a very stiff performance in the case of external short circuits, and when the wind speed is unsteady. This may lead to instabilities. Other applications are

also considered in the literature, e.g. animal driven generators (Van Niekerk & Hancke, 1999). An overall description of the function of the PMG was not found in the literature search.

2.3.1 Permanent Magnet Generator

The PMG is proposed as a wind turbine generator due to its property of self-excitation. The stator winding is connected to the load, and is insulated. The rotor is provided with a permanent magnet pole system, which is resistant to the effects of possible dirt ingress. However, the permanent magnets will attract ferromagnetic swarf. They also call for special care when assembling, to avoid damage and accidents to personnel. Maintenance is generally restricted to bearing lubrication only. A major problem is the necessity of maintaining the rotor temperature below the maximum operating temperature of the magnet, which may be limited by the Curie point of the magnetic material, and also by the thermal properties of the binding material in the case of powder metallurgy composites.

Large machines are reported (17 MW motors), but most research papers describing generators consider machines with ratings less than 10 kW. The synchronous nature of the operation causes problems of start, synchronisation, and voltage regulation.

Methods of control include full power frequency inverter, and cyclo-converter. Methods of improving voltage regulation include the application of full voltage, large capacitance capacitors.

2.3.1.1 Voltage Regulation

The main disadvantage of the permanent magnet generator is that it does not readily provide a constant voltage, when the shaft speed and the load current vary, (Mitcham & Grum, 1998). Voltage regulation is the term used to describe the variation of the terminal voltage, as a result of load variations, see Figure 12. In a synchronous machine with a wound field winding this regulation may be compensated by varying the magnetising current. In a 30 W generator, fitted with ferrite magnets, the regulation is reported to be too high (Naoe, 1997). It is also reported as high in an outer rotor, surface-mounted NdFeB 20 kW generator, but may be compensated for in each case, by means of a capacitor connection. Shunt connected capacitors give improved output voltage, when feeding an impedance (Ojo & Cox, 1996), i.e. in island duty. Voltage regulation may also be improved by fitting series capacitors (Naoe, 1995). Acceptable voltage regulation was reported when testing the 'Torus' generator (Chalmers et al., 1996). The synchronous reactance may be a problem, limiting the output of the PMG (Mitcham & Grum, 1998). This comprises mainly armature reaction and slot leakage, if the pole number is high, as would be the case with a many-pole generator, provided with surface mounted magnets of NdFeB or ferrite. Machines provided with soft iron pole shoes, or embedded magnets will also have a significant zigzag reactance.

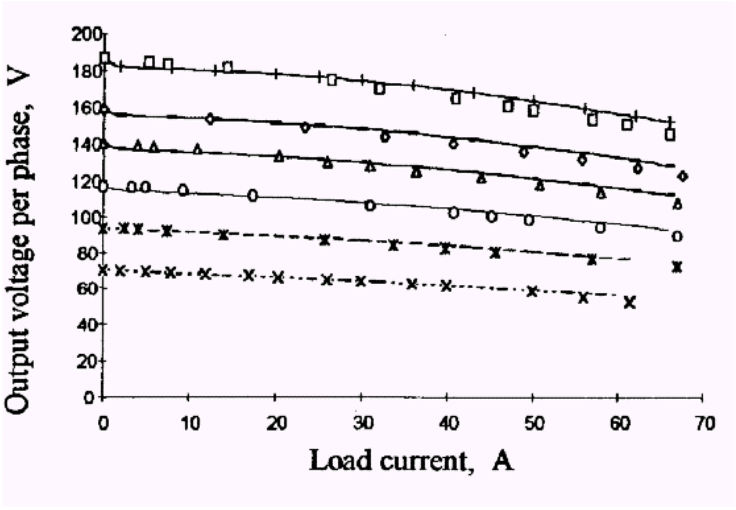

Figure 13 . Regulation of Outer Rotor PMG of (Chen & Nayar, 1998), on resistive load.

At power frequencies, the PMG is usually stable, but the response to fault situations is not well documented and will require some investigation.

2.3.2 Axial Flux Machines

Several authors promote the axial flux design as opposed to the radial flux design. Disadvantages include that it is difficult to manufacture an axial flux machine with a small mechanical air-gap, and that adequate stiffness must be provided in the mechanical design to maintain the air-gap during operation (Chalmers et al., 1996).

2.3.2.1 Torus

The Torus machine, see Figure 14, with a toroidal stator, wound without slots and employing an axial air-gap, has been proposed as a wind turbine generator (Chalmers et al., 1996; Spooner & Chalmers, 1992; Wu et al., 1995). Difficulty with assembly was overcome on a Torus machine. An axial force of 10 kN was experienced, with a 1.5 mm physical air-gap on a 5 kW generator (Chalmers et al., 1996). Use of a machine with a large diameter, a thick winding, and a low, air-gap flux density will reduce axial forces (Chalmers et al., 1996).

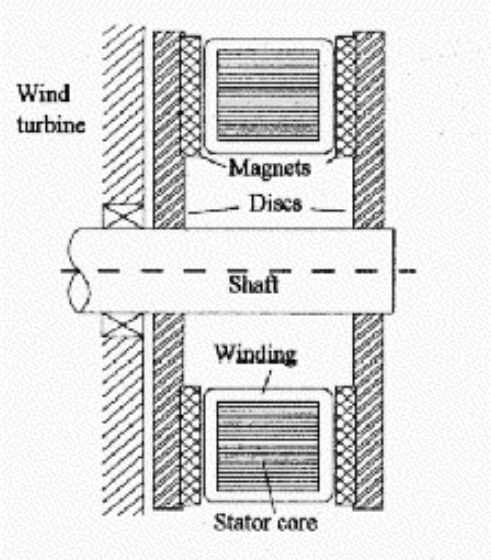

Figure 14. Cross-section of a TORUS generator (Chalmers et al., 1996; Spooner & Chalmers, 1992; Wu et al., 1995).

2.3.3 Hybrid Permanent Magnet machines

2.3.3.1 Doubly salient Permanent Magnet Generator (DSPMG)

The DSPMG in Figure 15 is described in (Sarlioglu & Lipo, 1998). No claims are made as to improvements in performance. It is expected that the DSPMG will improve the performance of an SRMG, by the addition of permanent magnets to bias the magnetic circuit. Alternatively, the performance of a surface mounted PMG is improved by the addition of saliency. This paper focuses on the modelling of the DSPMG, without comparing its performance with other types of generator.

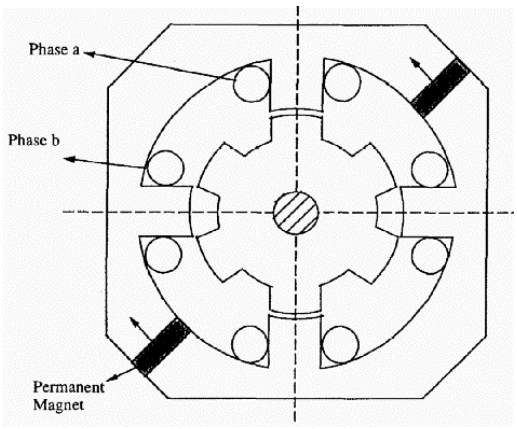

Figure 15. Cross-section of the Doubly Salient Permanent Magnet Generator (Sarlioglu & Lipo, 1998).

2.3.3.2 Axial Flux PMG with salient poles

The hybrid axial flux PMG with salient rotor poles is described in (Muljadi et al., 1998). This is a modular construction, which should make it easy to maintain. Like the transverse flux machines, for this design a complete rotor/stator unit is required for each phase. Poles may be added around the circumference to increase the torque.

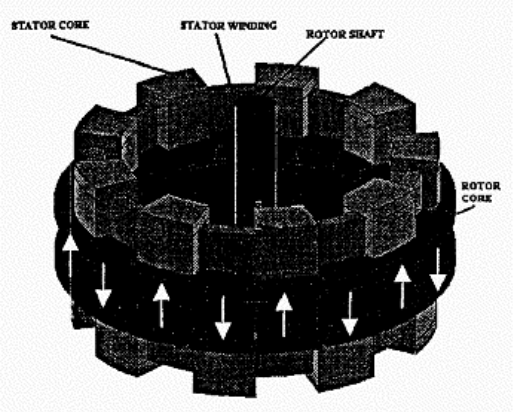

Figure 16. 3D representation of hybrid axial flux PMG with rotor saliency (Muljadi et al., 1998).

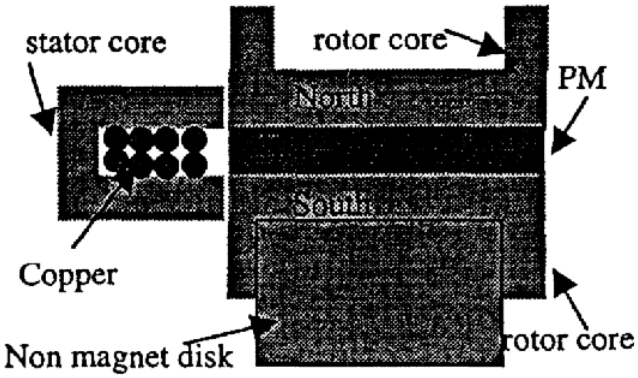

Figure 17. Cross section of hybrid axial flux PMG with rotor saliency (Muljadi et al., 1998).

2.3.4 Methods of Analysis of PMG

Models are reported, which are adjustable to allow for internal and surface mounted magnets, and for the current dependence of flux and inductance (Ojo & Cox, 1996). The model takes no account of current waveform and gives inaccurate results. (Lampola, 2000) reports extensive Finite Element modelling of surface mounted, NdFeB, cylindrical air-gap PMG. This may be supplemented by a linked circuit simulator. In (Polinder & Hoeijmakers, 1997) an analytic method is proposed, to determine the magnetic field distribution in a PMG. This is to ease the numerical problem of optimisation, as opposed to the Finite Element Method. It is also claimed that the method provides insight into the relationship between dimensions and equivalent circuit parameters.

2.3.5 Methods of loading the PMG

To apply the PMG as a wind turbine generator - Figure 18, it should be considered to take advantage of the self-excitation property and allow the machine to operate under variable speed conditions. This would necessitate the use of a line power converter, for the full power to be transmitted. Reasons for this are that variable speed of the PMG will give variable frequency and variable amplitude of the terminal output voltage.

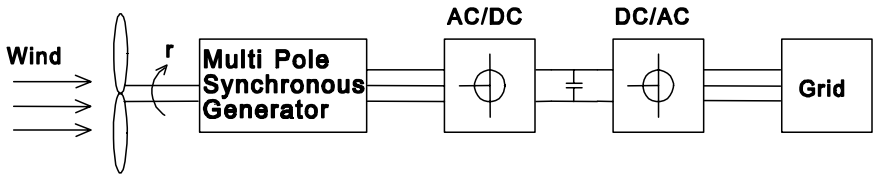

Figure 18. Typical arrangement of Wind turbine driving a PMG, loaded by a Power Converter and the Distibution Grid (Blaabjerg & Mohan, 1999).

Use of a diode bridge rectifier will cause harmonics in the current waveform, giving an exceptionally high peak current in relation to the RMS value of the load (Lampola, 2000). This will cause increased eddy current losses in the rotor, and also the danger of demagnetising the magnets at a relatively small load. This means that the PMG will give less output than it otherwise would, given a sinusoidal current. Additionally, the value of the DC link voltage is directly related to the shaft speed of the PMG. The use of a controlled rectifier allows several advantages. The current may be controlled to be sinusoidal, thus avoiding the above-mentioned problem. The amplitude of the voltage may be controlled to match the grid voltage, independent of shaft speed. Especially, the PMG is more isolated from the grid, making it possible to control fault currents in the PMG, arising from external faults in the grid. The use of the inverter effectively decouples the generator from the grid (Chen & Spooner, 1996). The inverter performance, such as voltage regulation, reactive power control, and power quality, depend mainly on the grid-side inverter. This also removes the need for special starting and synchronising equipment for the PMG. The system may operate at any power angle, without losing synchronism.

2.3.6 Design Considerations

Many authors promote a particular design of generator, where the basic version is possibly the cylindrical air-gap machine, with the stator on the outside and the rotor free to rotate inside it, see Figure 11. The basic magnet design must be NdFeB magnets, surface mounted, see Figure 11 and Figure 12. A problem with this design is that the magnets, which should be maintained at a low temperature, are in the hottest place.

2.3.6.1 Cylindrical air-gap with outer rotor

The outer rotor is proposed, as this gives good cooling conditions for the magnet poles (Chen & Nayar, 1998). An additional advantage is that the magnets are well supported by the drum outside them. For the same air-gap diameter, the outer diameter of the drum may be expected to be less than that of the equivalent outer stator, so a saving may be expected in the materials.

2.3.6.2 Cylindrical air-gap, outer stator

The machine with a cylindrical air-gap and outer stator is the conventional arrangement. It was chosen in (Lampola, 2000) for detailed optimisation studies. The surface mounted magnet, with magnets shaped to suit the radius of the rotor was found to be the best version. Fitting pole shoes was found to be a disadvantage, requiring more machine weight to give the same output, and giving reduced pull-out torque.

2.3.6.3 Modular design using E-cores

(Chen & Spooner, 1995) proposed a modular stator design using E-cores originally designed for the use in transformers, magnetised by ferrite magnets in a flux-amplifying magnetic circuit – see Figure 19. An advantage of this system is claimed to be that the modules may be combined to make a generator having any required number of poles. Tests were performed on a 26-pole unit, but results showing output power related to efficiency are not supplied. (Lampola, 2000) tested a similar arrangement, but with surface mounted NdFeB magnets, and concluded that it was inferior in performance and output/cost to the normal, slotted stator design.

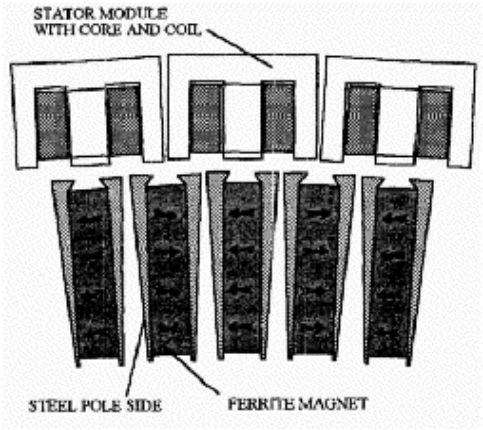

Figure 19. Cross-section of the modular design, using E-cores (Chen & Spooner, 1995).

2.3.6.4 Armature winding design

(Lampola, 2000) found that the conventional distributed winding gave more output from the same machine size than a winding wound around a single tooth.

2.3.6.5 Stator wound without teeth

A 2-pole version is reported, wound without teeth on the stator, (Vyas & Arkadan, 1994), see Figure 20. This was found to yield lower amplitudes of current harmonics on a diode rectifier load, but the total output power was reduced by about 15%.

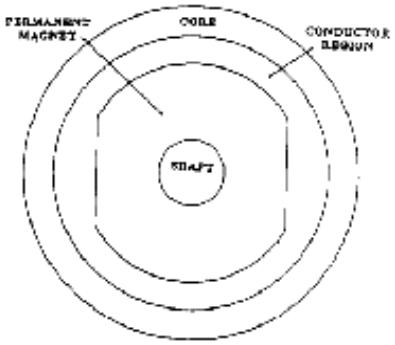

Figure 20. Showing a 2pole design with a toothless stator (Vyas & Arkadan, 1994).

2.3.6.6 Power Angle

(Muljadi et al., 1996) remarks that the power angle for maximum torque, of a PMG, feeding a rectifier, is 45°, instead of the 90°, one would expect of an excited synchronous machine. This means that a PMG will be relatively stiff and susceptible to the effects of sudden fault conditions, compared to the conventional, wound rotor synchronous machine. To obtain the best power characteristics, the DC bus voltage must be changed according to rotor speed. Compensation may be achieved by including a series capacitance in each phase. The DC bus may be used to optimise the output of the wind generator for any working condition.

2.3.7 Experimental Results

2.3.7.1 Efficiency

Efficiency of 83.9% was reported on a 5 kW Torus design (Chalmers et al., 1996). Efficiency of 86% was reported on a 20 kW outer rotor design (Arkadan et al., 1989).

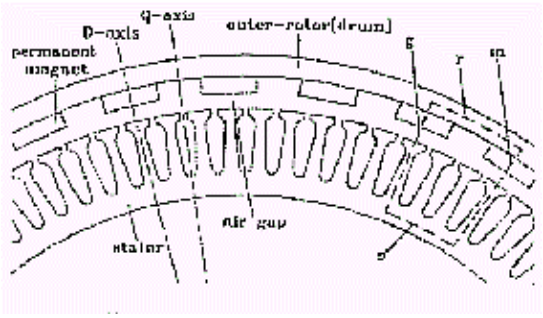

Figure 21. Cross section of PMG with outer rotor (Arkadan et al., 1989).

2.3.7.2 Magnetic Circuit

Efficient use of the magnetic circuit reduces the power to weight ratio (Wang, 1999).

2.3.7.3 Output Power

The fitting of a damper winding can increase the output power by about 4% (Arkadan et al., 1989). The specific power density is claimed to increase with increasing pole number, up to a maximum value (Wang, 1999).

2.3.7.4 Operational Characteristics – Normal Duty

The Permanent Magnet Generator is a form of synchronous machine. As such it will be very stiff in operation if directly connected to the grid. That is to say that all variations of load and power from the turbine must be accommodated at constant shaft speed. This situation is unlikely to produce robust stable operation.

The alternative is to use a power electronic controller between the generator and the grid. To compensate for the cost of the controller, the gearbox may be omitted. It may then be convenient to select a generator with many poles. The use of a full power line converter is expensive, but affords many advantages. E.g. the speed is no longer directly related to the frequency of the grid, energy may be stored locally in the system, as kinetic, electric or magnetic energy, to provide a cushion to even out the effects of wind gusting, etc. Power may be supplied to the grid over a speed range of the shaft.

2.3.7.5 Operational Characteristics – Fault Conditions

On external faults, the Permanent Magnet Generator will easily generate sufficient fault current to activate any type of protection system. The problem is more, if the fault will be cleared before the machine causes serious damage to itself, e.g. in the form of demagnetising the magnets.

Any overheating causing the magnets to achieve the Curie temperature will also cause demagnetisation of the magnets.

2.3.7.6 Efficiency of Permanent Magnet Generators as a Function of Load and Speed

The efficiency surface of a typical small permanent magnet motor is shown in Figure 22. This motor was controlled to operate at the maximum efficiency for each working point tested. Scrutiny of this surface reveals that the efficiency may be controlled to give a reasonably flat plateau at a high efficiency for medium to high torques, and over a wide speed range. However, when the torque drops below a critical level, it becomes impossible to obtain an acceptable efficiency.

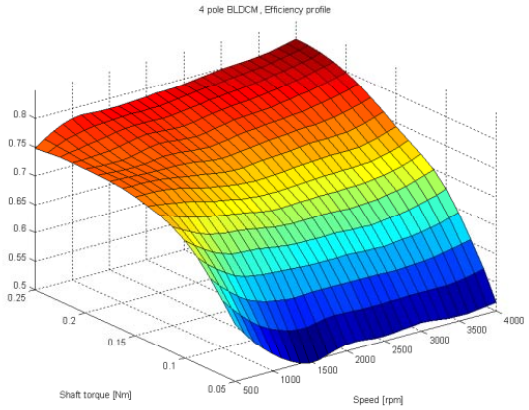

Figure 22. Tested efficiency surface of Permanent Magnet Motor, controlled to operate at maximum possible efficiency for each working point.

The above figures were obtained by testing a small permanent magnet motor. It may be expected that a similar development of the efficiency would apply for a large permanent magnet generator.

2.3.7.7 Well Established or New Technology

The permanent magnet machine is a newer technology than the induction machine, as an application as a wind turbine generator.

2.3.7.8 Gear or Direct Drive Multi-pole

In general, because of the relatively large air-gap, the Permanent magnet Machine leakage flux remains below an acceptable limit for machines with many poles. This means that the machine can use the current flowing to generate torque. Permanent magnet Machines with a large number of poles, may be designed with a reasonably small size compared to the output. This means that permanent magnet machines with many poles will have an acceptable size in relation to the rated output, and may be recommended.

2.3.7.9 One-Off Price

The price of a permanent magnet generator is unknown, as no permanent magnet wind turbine generator is in production. However, the permanent magnet material may be very expensive for NdFeB materials, or reasonably cheap for ferrite materials. The situation is complicated, as a machine provided with NdFeB will need less magnet and other materials than a corresponding machine provided with ferrite magnets. To obtain a reliable estimate, prototypes would have to be designed, built and tested extensively.

2.3.7.10 Other Comments

Acoustic Noise
The Torus machine is reported as having a low level of acoustic noise, (Chalmers et al., 1996).

2.3.8 Conclusion on PMG

The PMG seems attractive as a wind turbine generator. Advantages include self-excitation, high power factor, and high efficiency. Designs have been proposed

in cylindrical and axial flux versions. In the PM machine, efficiency is higher than in the induction machine, as the excitation is provided without energy supply, by the Permanent Magnets. However, permanent magnet materials are expensive in initial purchase, and are difficult to handle in manufacture. Additionally, the use of permanent magnet excitation forces the use of a full power converter, to adjust the frequency of generation to the frequency of transmission. This is an added expense, but the benefits are that generation may be at any speed to suit the current conditions.

The internal voltage generated inside a PMG is directly dependent on the speed. This may be catered for by the power converter, to a certain extent, but the voltage may reach a dangerous level if the speed becomes high enough. Field weakening may be applied, but this requires a special mechanical design of the field system, providing a saliency effect, in addition to extra current being required to reduce the effective magnetic field. This has the effect of reducing the efficiency obtained. Voltage regulation as a function of varying load is a problem, which has received some research attention. Various solutions have been proposed, including the use of a parallel-connected capacitor.

Special attention must be paid to the physical properties of the permanent magnet materials used. Some materials are brittle, others are highly reactive, and rust readily. All magnetic materials are sensitive to temperature. They lose their magnetic qualities at a high temperature, called the Curie Point. This may be in the mid 250˚C, which is critical, as these temperatures may be reached during fault conditions.

The stator of a permanent magnet generator is wound in a similar manner to an Induction Generator, and as such, should present no special problems.

PMG with surface mounted magnets may be designed with a relatively large air-gap. This eases the mechanical problems encountered when building and operating a large generator. On the other hand, surface mounted magnets exacerbate the problems of high voltages at speeds above the base speed.

In general, the efficiency of a PMG may be expected to be relatively high, as long as the torque is high. At low torques, the efficiency will fall off rapidly.

2.3.8.1 Further work

Further work is necessary to determine and study the operating characteristics of the various designs of PMG, and to study and eliminate quasi-periodic oscillations of power angle. At the same time it is important in large scale generators to have the possibility to easily repair broken/destroyed magnets. Otherwise repair cost can be too high.

2.4 The Switched Reluctance Generator

The Switched Reluctance Generator has in the last decades been considered for Wind Power applications, but much of the available literature is focussed on aircraft generators. However, the two applications should have similar requirements, the main differences being a matter of scale. The rotor construction is particularly robust, being without windings. Excitation of the magnetic field is provided by the stator current in the same way as for the Induction Machine. The Switched Reluctance machine in Figure 23 operates on a Vernier principle, making it suitable for low speed operation. A total of 19 articles were located,

dealing with Switched Reluctance Generators, and all 19 have been considered in this discussion.

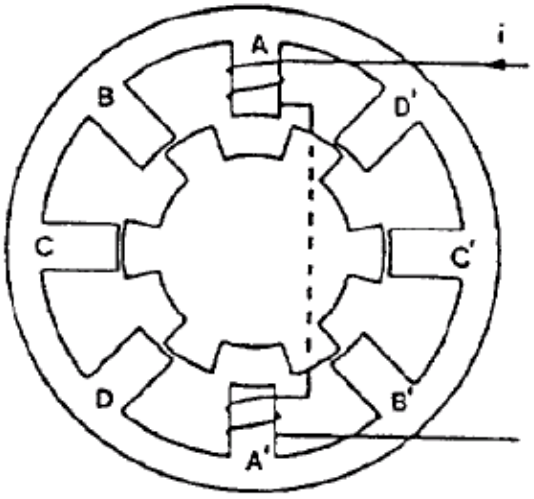

Figure 23. Cross-section of typical Switched Reluctance Generator (Cardenas et al., 1995).

2.4.1 Principle of operation

The SRG is a doubly salient construction, with salient poles on both the stator and the rotor (Mese et al., 2000). Phase windings are wound on the stator poles, each coil being wound around a single pole or tooth. The principle of operation is simple in concept, (Cardenas et al., 1995), but is easier to explain in the motoring mode. If the winding on poles D-D' be energised, the rotor will be pulled clockwise to align with the axis of the magnetic field produced. If now the winding on D-D' is de-energised, and the winding on poles A-A' be energised instead, the rotor will continue to move in the same direction. The machine is now acting as a motor, converting supplied electric energy into mechanical work. Movement in the direction of the torque produced tends to minimise the inductance of the winding (Mese et al., 2000). Generator action may be obtained simply by changing the angular position of the rotor at which current is supplied to the phase winding, to cause generating torque to be produced.

2.4.2 Operational Characteristics – Normal Duty

Generator operation is claimed to be characterised by single pulse operation, rather than chopping, the DC-link voltage being kept constant during operation. By arranging the switching timing to position current pulses where the inductance is decreasing, generating mode may be selected (Husain et al., 1999; Cardenas et al., 1995). The bulk of the generated current is carried by the diodes (Cardenas et al., 1995). The controlled switches mainly provide excitation current (Cardenas et al., 1995).

SRG is interesting for application as an aircraft generator because of its ability to continue operating at reduced output in the presence of faults on the generator itself (Sawata et al., 1997). For the same application, potential instability was reported in (Skvarenina et al., 1997). The SRG is suitable for gearless generation in aircraft applications, because it is capable of high-speed operation (Mitcham & Grum, 1998).

The SRG may be controlled to produce the best efficiency in a given working point (Mese et al., 2000).

Inverter output filtering of SRG current is necessary due to current ripple caused by the commutation (Heglund & Jones, 1997).

In a study (Abouzeid, 1998), the author studies the effects of the variable inductance of the SRG on the load characteristics, and concludes that the inductance/resistance ratio of the load is important to the operation. Otherwise, the SRG is judged to operate in a similar fashion to a separately excited DC generator, if loaded through a rectifier.

The SRG is inherently unstable and requires the firing angles to be adjusted to suit the load exactly (Sawata et al., 1999b). This applies to normal operation and fault conditions. Instability during faults may be controlled by proper detection of the conditions, and control (Sawata et al., 1999a).

A detailed design study (Mueller, 1999) presented an SRG for a 20 kW, 100 rpm wind generator. Torque densities of about 2 – 3.2 were achieved, the best being for a 12/16 design. A converter dimensioned for 80 kVA was predicted. The 12/8 version gives a somewhat lower torque/kg, 2.5, but has a reduced converter requirement, about 55 kVA. The specific torque may be increased, by increasing the iron saturation, at the expense of lower efficiency and increased converter requirement.

A high speed SRG (Ferreira et al., 1995) was successfully controlled, by fixing the turn-on and turn-off angles, and then controlling the output current by turning off both power switches when the current reached the threshold. This system was built and tested for military use. There was no current chopping when generating. Machine efficiency increases with increasing load, while the converter efficiency decreases.

A 30 kW SR-generator has been designed, built and tested (Heglund & Jones, 1997), operating in the speed range of 27,000 to 46,850 rpm. A 25 kW, 250 rpm, 100 Hz, 32/24 SR generator has been designed for a 250 V DC bus (Mitcham & Grum, 1998), the maximum speed was 3100 rpm, yielding 150 kW, 1240 Hz.

2.4.3 Comparison with other types of machine

The SRG is considered inferior to the PM machine, due to its lower power density, and the need for a sophisticated power converter (Mitcham & Grum, 1998). However, the rugged mechanical design and the concentrated coil design are attractive.

2.4.4 Axial Flux Machines

An axial design of 6/2 SRG is reported (Abou-Zaid et al., 1999), with the rating of 300 V, 4 A, where the test results are reported to give a 9% change in voltage, at a 2 A load, for a change of speed from 1500 rpm to 3000 rpm. Changes of load inductance can lead to large changes in output voltage at 2 A load. However, the test results are for voltages around 30 V only, the machine performance at a reasonable rating would be required to be established at a reasonable rating.

2.4.5 Methods for modelling and analysis

The SRG is inherently, extremely non-linear in the magnetic circuit, and in operation. For this reason, Finite Element Analysis is often used as an analysis method (Mese et al., 2000) for the magnetic circuit. Sophisticated simulation of the non-linear electro-mechanical normal duty is required to produce estimates of steady-state performance. Both of these may be effected using in-house software produced by AFEE, (Blaabjerg et al., 1999; Rasmussen et al., 1999).

(Husain et al., 1999) present a general modelling approach for a Switched Reluctance Generator. Modelling and tests were carried out on a 12/8, 250 kW, 22000 rpm machine, operating at 50 V DC. The model was found to be useful for investigating the response of the SRG to fault conditions.

2.4.6 Operational Characteristics – Fault Conditions

Armature phase shorts and open circuits are internal faults, other faults occurring in converters or wiring are external faults (Husain et al., 1999). The SRG investigated was found to continue generating in the presence of single-phase internal faults and converter faults. The excitation required to feed external faults adequately, so that protection equipment would operate as required.

Any generator system must be able to clear load faults by blowing fuses or tripping circuit breakers (Husain et al., 1999). In the case of the SRG, sufficient DC link current must be produced to enable fault clearance by tripping a relay or other fault protection device (Heglund & Jones, 1997). For the SRG tested, the load fault voltage collapsed to 35 V from around 270 V, the phase current was 1400 A, peak value, compared to full-load current of 900 A. (Sawata et al., 1998) found that the 8/8, single phase SRG tested could continue generating in the presence of an internal fault. For certain faults, this was at half capacity only.

2.4.7 Efficiency of the SRG as a Function of Load and Speed

No direct claims to efficiency were found. The SRG may be controlled to produce the best efficiency in a given working point (Mese et al., 2000). The specific torque may be increased, by increasing the iron saturation, at the expense of lower efficiency and increased converter requirement (Mueller, 1999). Many claims have been made that the SR machine should have a higher efficiency than the Induction Machine. This has been shown to be true, if a new design of SRM is compared with a commercial standard IM. However many commercial standard IM's have basic designs which were laid out in the 1950's, with no subsequent changes to lamination geometry. The difference would not be so large, and may even disappear, were the comparison to be made with a completely new design of IM.

Because the SRG is excited from the stator current, as opposed to being excited from a permanent magnet, the controlled best efficiency as a function of torque and speed may be expected to take the same form as for the Induction Motor. This is illustrated by test results obtained on a 100 W induction motor. Note that as the values shown correspond to a 100 W machine, only the form may be interesting here.

2.4.8 Well Established or New Technology

The SRG is a new technology. As a motor, the SRM has attracted a great deal of research interest. However, the number of available commercial suppliers of motors is very small and the even fewer suppliers of SRG are all aiming at the aerospace market, and are building very small, high-speed generators for aircraft duty. It is doubtful whether any real series production of SR machines is currently in manufacture, despite the amount of advertising.

2.4.9 One off Price

The SRG should be reasonably cheap in manufacturing cost, as there are no permanent magnets, and special inter-coil insulation is not required. The air-gap is relatively small, due to the excitation being provided via stator current, which will make the mechanical construction relatively expensive. By using a high number of phases, which will be expensive in wiring and converter costs, an improvement in fault tolerance may be possible.

2.4.10 Gear versus Multi-pole

Due to the Vernier action of the SR machine, it should be easy to manufacture slow running versions. However, the performance characteristics of such a machine are unknown.

2.4.11 Other Comments

(Cardenas et al., 1996) treated a PMG system, and merely mentioned the SRG as a possible solution for further investigation. (Skvarenina et al., 1997) treated the application of a particular commercial graphic modelling language to the solution of problems involving SRG. Only a very simple problem of resistive switching was tested, in order to demonstrate the language. (Wiegele, 1996) treated the detailed design problems of a micro-SRG, considering mostly problems of the impulse-turbine used. (Cardenas et al., 1995) contains a discussion on how to control a DC motor in order to emulate the behaviour of a wind-turbine in the laboratory. (Ke Liu & Striebler, 1998), treated a fuzzy logic controller, suitable for an SRG. (Ferreira & Richter, 1996) treated the subject of channel independence for an SRG feeding two separate bus-bar systems for aircraft use.

2.4.12 Conclusion on SRG

The SRG is a possible candidate for a Wind Turbine Generator. However, the literature is not substantial, and much investigative work remains to be done before the SRG is well prepared for application.

The SRG will require a full power converter in order to function as a grid connected generator, but will otherwise perform in a similar manner to the Induction Generator, as the excitation is provided from the grid.

2.5 The Transverse Flux machine

The Transverse Flux (TF) machine topology is new, but appears to be interesting. The high values of torque per kilogram of active materials reported make it seem very attractive. The transverse flux principle may be applied to a range of machine types, e.g. both permanent magnet and reluctance machines could be made. The machine will inherently behave as the generic type applied, but will

have characteristics, influenced by the TF design. Here, the Transverse Flux Permanent Magnet Machine will be discussed. Most of the researchers have treated motors, but here, we are interested in generators. In principle, the generator is very similar to the motor, except that the windings are subject to severe loads due to short circuits on the generator. This means that the windings need to be strengthened, to cope with the resulting stresses.

2.5.1 Reported machine type designs

Different designs of TFPM will be considered here:

- Double-sided and single-sided.
- Flat magnets and embedded magnets.
- Flux concentrated and not flux concentrated.

In the double-sided design, stator poles are sited on both sides of the rotor and in the single-sided design; only one side is provided with stator poles. Flat magnets are surface mounted magnets and embedded magnets are internal in the rotor structure. Finally, flux concentration means that soft iron pole pieces are fitted to the permanent magnets.

A comparison of several reported TFPM machines was undertaken by Harris, Pajooman and Sharkh, Southampton University (Harris et al., 1997). The various topologies are referred to by the city/university where they were developed;

- Southampton: Single-Sided with Surface Magnets (SSSM)
- Aachen: SSSM with non-conducting stator bridges
- Braunschweig/Newcastle: Double-Sided with Flux Concentration (DSFC)

The findings of this study are that the SSSM machines from Southampton and Aachen can deliver approximately the same torque: circa T_{spec} = 30 kNm/m^3. The DSFC types are superior in specific torque with up to T_{spec} = 52 kNm/m^3. This compares to about 15 kNm/m3 for a standard Induction Motor, and is a dramatic improvement.

According to Harris et al, the larger specific torque of the DSFC machine is caused by the better utilisation of both the stator excited flux and the magnet flux. The power factor of DSFC machines is also higher than SSSM machines - typically 0.53 versus 0.35-0.40. Disadvantages are a more complex and less robust construction - more parts to manufacture and assemble with small tolerances requiring greater accuracy. This construction could be improved by using powder core technology instead of a laminated steel core. Powder metallurgy offers high utilisation of the material and the ability to form and produce complex shapes. This would ease the manufacture and assembly of the motors. However, both material costs and tools will be increased by this solution.

Several attempts have been made to use powdered iron as a direct replacement for laminated steel, but with poor result. According to (Jack et al., 1999) this is because the designs were unsuited for the use of powder cores, where the advantages are three-dimensional flux distribution, lower component count, and, as mentioned, new methods of manufacture and assembly. Hence, designing a wheel motor with powdered core or cores offers new challenges to the designer. To benefit properly from the material, the designer has to have exact knowledge of the material at hand, moulding techniques and assembly methods. Although reported in the literature, the application of powder technology to cores of elec-

tric machines is in its infancy, and requires much more study and material characterisation before application is advisable.

These factors, set limitations for the choice of machine type. The double-sided, transverse-flux, permanent magnet generator seems very attractive for further work, due to its high torque-density and low leakage inductance.

2.5.2 TFPM technology

The TFPM machine has its origins in the SR machine, and it is found to be a promising new design of a linear SR machine. The SR machine is named after its ability to exploit the change in air gap reluctance. This means it produces force by moving according to the maximum inductance of the excited winding. The motion may be rotary or linear, and the rotor may be interior or exterior (Miller, 1989).

In a TFPM machine the flux path in the core back iron is perpendicular (transverse) to the direction of movement – see Figure 24. The opposite, a core back flux path parallel to the direction of movement, is found in the Longitudinal Flux Permanent Magnet machine (LFPM). The LFPM machines are claimed to have inferior performance than the TFPM machines because of their larger rotor mass and difficulties in design, due to unwanted magnetic coupling. All in all LFPM machines do not exhibit results as promising as those of the TFPM machines.

An SR machine consists of a number of separate electromagnets, which are excited in turn. The position of the rotor determines the exact timing of the excitation of each phase. Because of this, the machine will always need to be supplied by a converter and a controller and provided with an accurate position indicator for the rotor position. The excitation of TFPM machine is produced by the permanent magnets instead of by current flowing in rotor windings. The machine must be controlled via current flowing in the stator windings, which like the SR machine must be fed by a converter, preferably a simple converter. The requirement for a simple converter feeding the wheel motors, leads to the proposal of a three-phase motor design. However, a final decision on this point must be the result of a careful study of cost and performance analysis.

The control of the SR machine or TFPM machine is difficult; the air gap flux is non-sinusoidal, and the magnetic circuit of the machine changes continuously and is non-linear when the rotor moves. Also, there is strong local saturation at the edges of the overlapping stator and rotor poles, which means the machine constantly operates in a more or less saturated condition. As a result, the design of a TFPM motor must contain some modelling by use of numerical methods and/or prototyping followed by measurements.

2.5.3 TFPM basic design

The magnetic circuit of the TFPM is complex due to stray flux and the constantly changing saturation of the iron. This means that analytical analysis of the magnetic circuit is difficult. Therefore, numerical methods are attractive. A well-known and documented method is the Finite Element Method (FEM), where the problem is defined inside a boundary and solved by division into small segments with knowledge of the surrounding boundary conditions.

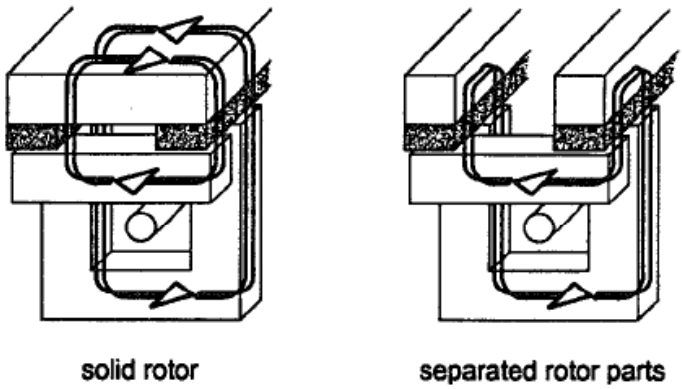

Figure 24. Sketch of the flux path in a transverse flux design. Source (Henneberger & Bork, 1997).

FEM calculations may be used to determine the steady state performance of the non-linear TFPM machine magnetic circuit. According to (Salo et al., 1999) an FEM analysis of only the basic pole-pair will be adequate to determine the traction force and the flux linkage. These are functions of the current and the position of the machine but of course the physical dimensions, the pole number, the air gap length, etc. and the properties of the magnetic material will determine the torque and flux linkage supplied by a pole pair. The torque and inductance for a whole motor may then be found by multiplying by the number of pole pairs of the motor and the number of phases.

The design steps are as follows:

- Decide traction force
- Decide cross-sectional area of pole leg face
- Total mmf is chosen from calculated database or analytical expressions
- Current density is chosen by cooling method. Table in (Hendershot, 1994).

Some dimensional constraints common for SR machines are listed in (Salo et al., 1999):

- Width of the stator poles and the rotor poles is equal
- Distance between two stator poles is equal to the pole width.
- Minimum length of the whole motor is an electric length determined by the number of phases
- Stray flux . 0 and may be ignored in the dimensioning equations
- Pole width is chosen so that it together with the pole length gives the minimum mass of the rotor.

The ultimate *simplicity in design* is obtained with one-pole-pair per phase and then choosing a three, four- or five-phased motor. A three-phase design will lead to a simple converter. The design process uses analysis of the simple basic pole-pair concept.

After determining the basic dimensions i.e. geometric properties, the performance of the magnetic circuit may be predicted by using a numerical method such as FEM. After design and construction of the FEM model, it may be used to calculate the forces on a plane in the air gap. It must be remembered that the steady-state performance represents ideal conditions. Electric, magnetic and friction losses impair the performance of the real machine and should be taken

into account. This must be done using separate calculations, as they are not considered in the FEM environment. When the magnetic design is finished, the weight of materials used may be calculated, and the circuit parameters estimated, to enable system calculations, etc.

2.5.4 Force production and calculation

The linear SR motor produces a traction force when that pole pair which has an increasing inductance in the direction of movement is excited. Force is produced to oppose the change in inductance i.e. to attempt to minimize the field energy in the SR motor, and not by induced current as in the case of induction machines. The mechanism is the same as for the production of reluctance torque in the salient pole synchronous machine. The magnetic flux and the torque producing current must be perpendicular to each other. The magnetic flux must cross the air gap in the normal direction to produce a tangential force component. The magnetic flux is excited by current flowing in the stator winding.

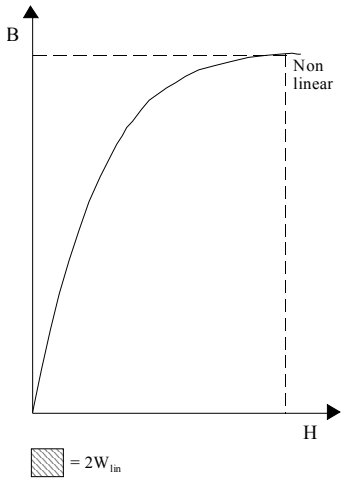

Figure 25. B,H-curve for a ferromagnetic material.

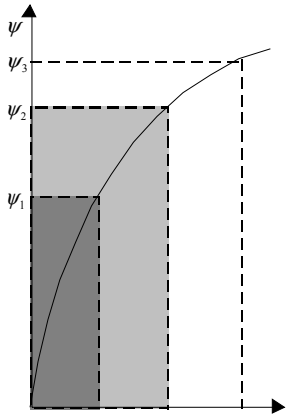

Figure 26. Magnetisation curve for a transverse flux machine.

The magnetic circuit is very complex for analytical calculation due to the effects of stray flux and saturation in the soft iron flux paths. This complex magnetic circuit and the relative unfamiliarity of the construction make it necessary to use a general numerical method for modelling and solution of magnetic problems. A suitable and available method is the Finite Element Method (FEM). After the FEM model is built, and solved, a force determining method is applied to calculate forces on a plane in the air gap. Because the force is strongly dependent on the rotor position, it is necessary to calculate it for a number of different rotor positions and then determine the average traction force. In order to explore saturation effects, the calculations may be repeated with various values of armature current. A suitable modelling tool is Opera-2D a commercially available FEM platform, by Vector Fields Ltd. of Oxford, UK.

The force calculation method used in Opera-2D is the Maxwell Stress Tensor Method. This method is provided for two-dimensional (2D) modelling, because here the closed surface integral is modelled by a line integral around a closed path. This eases the calculation. It is important to note, that the integration path must be completely in air and not pass through elements, which touch the surface of any iron or dielectric. This would give large errors due to abrupt changes flux in the tangential direction in those positions [Opera-2D, pp 3-127]. Another

precaution to take is to draw the integration path, avoiding nodes of the FEM model, preferably in the centre of elements.

2.5.5 Flux linkage calculation

Magnetic flux induced by the armature coil penetrates all the physical objects of the TFPM and thereby creates the armature field of the machine. The flux linkage is an expression of the electrical properties of the motor, and a flux linkage calculation may be used to design the motor windings. However, the flux linkage is strongly dependent on the eddy current losses of the motor cores and the skin effect and proximity effect losses in the windings. Therefore, the flux linkage cannot be accurately determined from a static solution of the motor magnetic circuit. If these losses are very small, their influence on the flux linkage may be neglected and a static magnetic solution used to determine the flux linkages of the motor.

Figure 25 shows the B/H-curve of a non-linear material. The region above the curve is the stored field energy and the region below the curve is the co-energy. The static magnetic field energy and co-energy must be obtained from the FEM solution - like the force performance. The static flux linkages may be calculated by summing their energies and dividing by the current flowing in each calculation when the rotor position is kept constant.

$$\lambda(i,x) = \frac{W_f(i,x) + W_{CO}(i,x)}{i}$$

where i is the armature current and x is the rotor position. A magnetisation curve is plotted for each rotor position, which is changed by altering the size of the air gap in the model.

2.5.6 Conclusion on TFPM Machine

The TFPM machine seems suitable for application as a wind power generator. The nature of its operation is that of a synchronous machine, and it will function in principle in a similar manner to any other permanent magnet machine. It can be made with a very large number of poles, which may make it suitable for direct drive, gearless applications. The TFPM has however, a relatively large leakage inductance. In the reluctance version, this may cause problems that the power factor becomes very low in normal operation, and the short circuit current may be insufficient to trip normal protection. Similar problems exist for the permanent magnet version, but because of the PM, they will not be so severe.

A disadvantage of the TFPM is the large number of individual parts required to produce it, using lamination technology. This may be alleviated, if powder technology becomes viable.

More research study will be required, before it is clear that the TFPM machine is suitable for application as a wind power generator.

2.6 The Wound Rotor Generator

The wound rotor synchronous generator is the workhorse of the electrical power supply industry. As such, it has been described in a multitude of research papers over the years. Both the steady state performance and the fault performance are

well documented. Versions are found with cylindrical rotor, (steam turbine, high speed machines), and with salient poles (diesel driven, and water turbine driven machines). Extremely large machine have been built, up to about 1200 MW. Very slow running machines have been built as water turbine generators. This machine type could be applied as a wind turbine generator, as it could be built with a suitable pole number for direct drive applications, and in suitably large sizes. Enercon and Lagerwey are examples of wind turbine manufacturers that have selected this type of machine.

As a synchronous machine, it is probably most suited for full power control, using a power electronics converter. This would enable variable speed operation. Otherwise, the synchronous machine is strictly fixed speed operation, and is unforgiving if affected by transient and sub-transient loads. The load characteristics may be further controlled, by controlling the magnetising current in the rotor winding.

The operational characteristics should be excellent in all respects, due to the many years of research, design, development and operational experience.

The construction, with an insulated wound rotor makes the machine vulnerable to vibration, which could degrade the rotor insulation. In addition, the rotor current must be supplied, either by using a brushless exciter, and rotating rectifiers, or by using slip rings and brushes. The brushless exciter design adds another rotating winding, and the rotating rectifiers. The slip ring design has the disadvantage of brush losses, and brush wear, requiring maintenance attention. Both of these designs have the potential of regular maintenance and low reliability.

2.6.1 Description

The synchronous machine is usually built with a rotor carrying the field system, provided with a winding excited by DC. The stator carries a three-phase winding quite similar to that of the induction machine. The rotor may have salient poles, or may be cylindrical - Figure 27. Salient poles are more usual in slow speed machines, and may be the most useful version for application to wind turbine generators. The saliency gives added torque, and a stiffer machine operation.

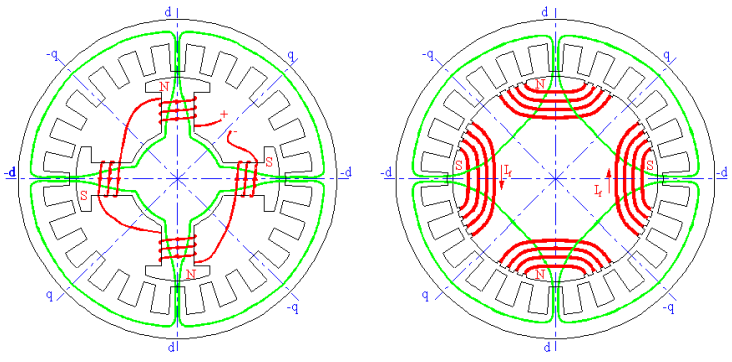

Figure 27. Cross-section diagram of typical salient pole and cylindrical synchronous machines.

Figure 28 illustrates the torque characteristics of salient pole synchronous machine as functions of load angle.

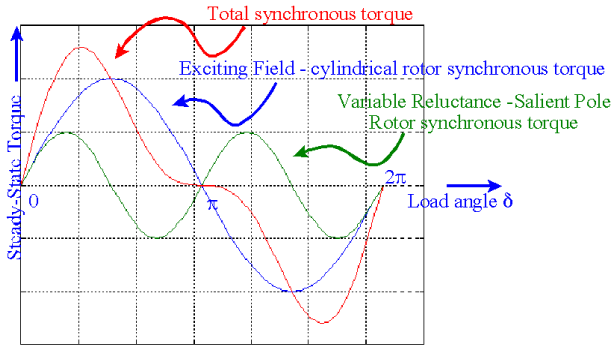

Figure 28. Typical synchronous torque characteristics of salient pole synchronous machine.

Typical low speed synchronous machines are of the salient pole type, with many poles. A typical multi-pole, salient pole, synchronous machine rotor is shown in Figure 29. A typical low-speed, high voltage stator is shown in Figure 30.

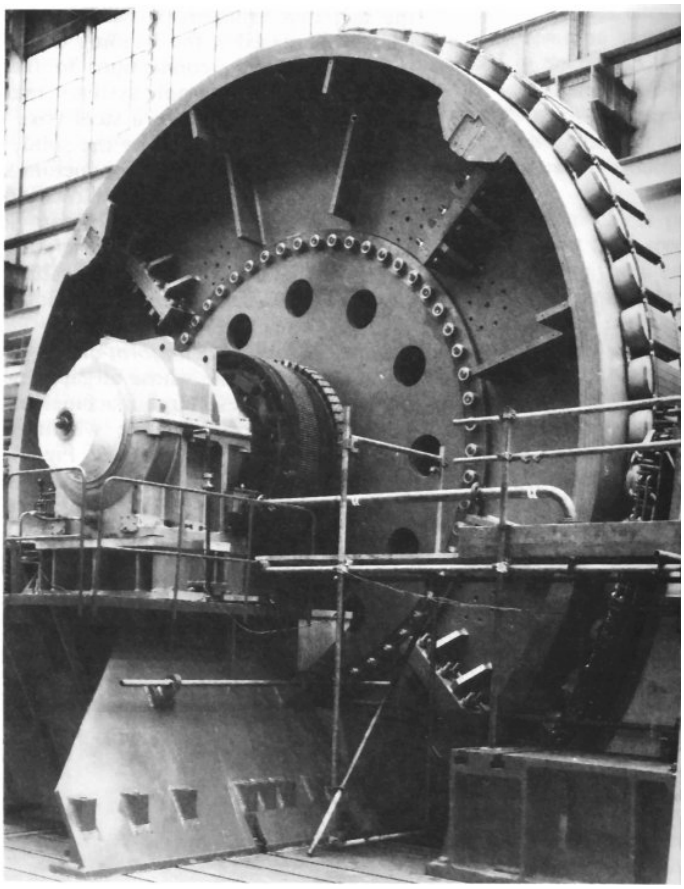

Figure 29. Photograph of a multi-pole, salient pole, synchronous machine rotor.

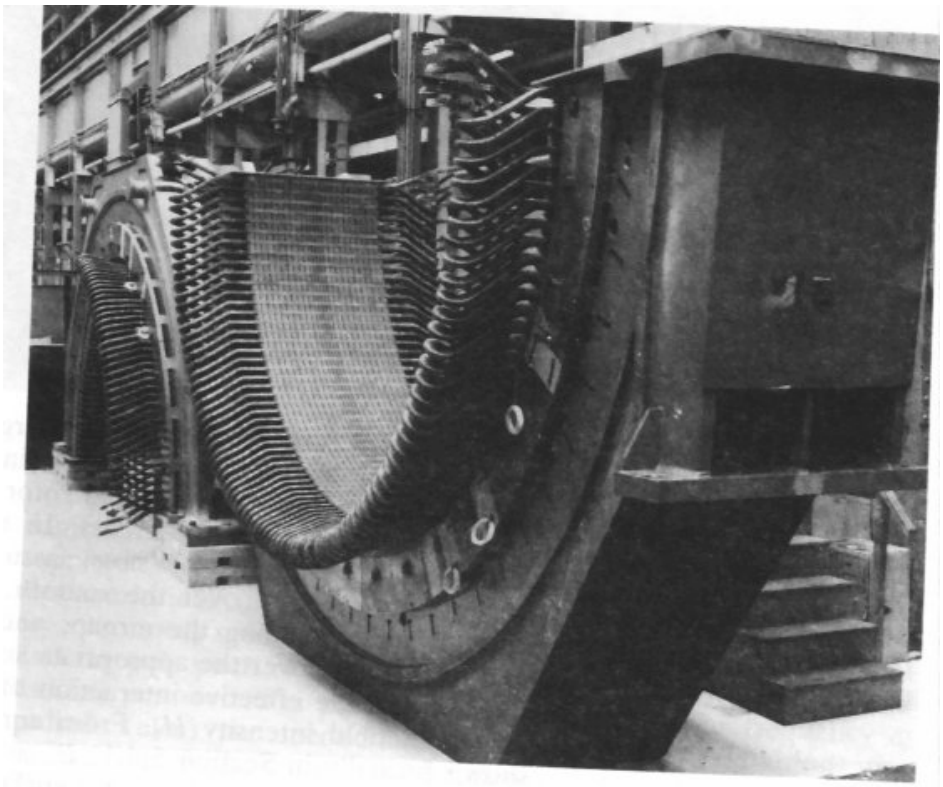

Figure 30. Typical high voltage, low speed, synchronous machine stator with three-phase winding.

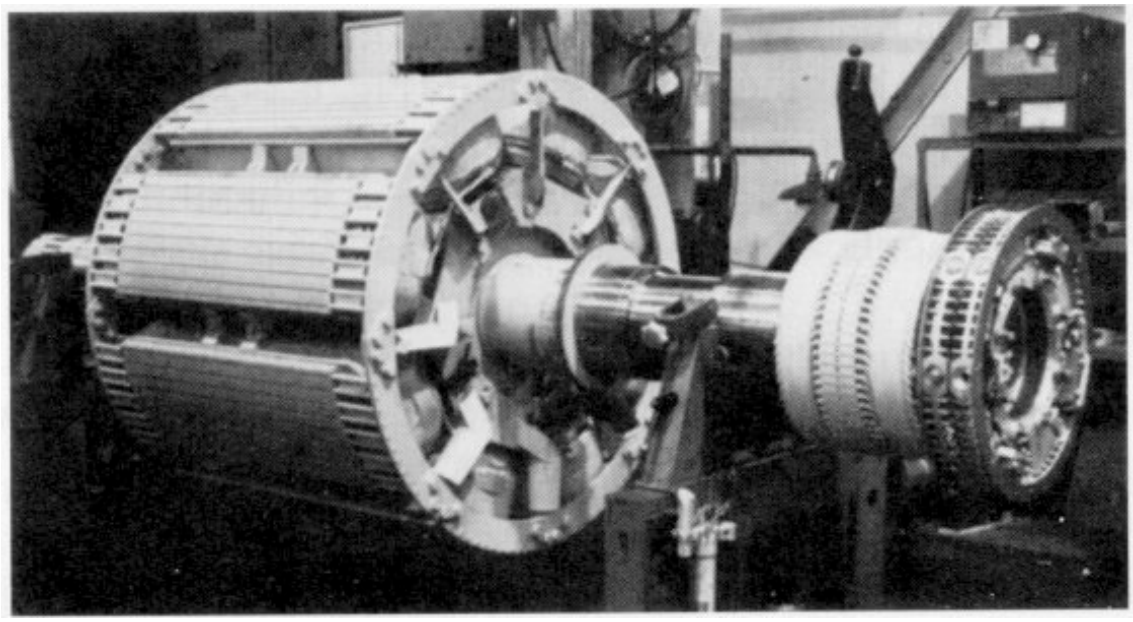

Figure 31. 8 pole, salient pole rotor, fitted with brushless exciter and damper winding.

2.6.2 Operation

To operate as a wind turbine generator, it will be preferable to feed the power through a power electronics converter, carrying the full output power. The system will act as storage for the power fluctuations, which are inevitable with a synchronous generator, driven by an inherently gusting wind. It will also buffer transients coming from the net side, and enable variable speed operation of the wind turbine.

2.6.3 Conclusion on Wound Rotor Synchronous Generator

The Wound Rotor Synchronous Generator is already in application as a wind power generator. The large number of parts and windings probably make it an expensive solution.

It may be supplied in high voltage and industrial voltage versions, and it is widely used as a generator in connection with other forms of prime mover. It may be used, at constant speed, and fixed to the net frequency with consideration of the drive train dependencies and synchronization at start-up. There is a massive amount of research and technical literature. The WRSG may also be applied using a full power inverter, with the option of variable speed operation. In all cases, it is necessary to excite the rotor winding with DC, using slip rings and brushes, or a brush less exciter, employing a rotating rectifier.

2.7 The High Voltage Machine

High voltage machines are manufactured both as synchronous machines and as asynchronous machines. They have been used in applications where high power is needed. They have especially been used for power generation in large power stations, but also for large loads such as large pumps, cement mills and fans. The main motivations for using high voltage machines are the reduction in current, leading to lower copper losses and possible direct connection to the grid without the need for a transformer.

So far only very few wind turbines are provided with high voltage generators. These have been prototype wind turbines, usually designed by utilities or large manufacturers of electric equipment e.g. Tjæreborg 2 MW, applying an induction generator, and Growian 3 MW, applying a doubly fed induction generator. So far, commercially available wind turbines have not applied high voltage machines.

The choice of generator, including the voltage level, should be part of the overall design of the wind farm, from the wind turbine to the point of common coupling of the total wind farm to the grid. Issues that have to be taken into consideration include cost and availability of components, grid connection and control properties, maintenance requirements, required skills of the maintenance workers, safety requirements, etc.

The main motivation for increasing the voltage of the generator is to reduce the current and by that to reduce the copper losses and therefore the amount of heat that has to be dissipated. This can lead to a reduction in the size of the generator and to an increased efficiency of the wind turbine, especially at higher loads. The grid connection and control requirements are the same for the low voltage equivalent generators.

High voltage machines are potentially an interesting alternative for wind turbines from 3 MW and upward. This size limit is mainly due to the high cost of the machine and to the high cost of the auxiliary equipment, such as switchgear. The manufacturing costs may be reduced if a number of wind turbines applying high voltage generators becomes significant. Power electronics are more expensive at these high voltages and there are very few suppliers. The application of high voltage generators means that the requirements regarding safety etc. according to international standards are very different from the requirements applying at low voltage (<1000Vac). These requirements include increased requirements on the level of training of maintenance crew, and different rules of safety. The need for service and maintenance are similar to the equivalent type of system at low voltage. It depends on the type of machine and if gearbox is included, see above.

Recently ABB have announced the WINDFORMER - a high voltage multi-pole permanent magnet synchronous generator, specially developed for application in wind turbines. The WINDFORMER is based on ABB's POWERFORMER concept in which the windings of the stator are made from high voltage cables. This makes a robust construction that is directly connected to the high voltage grid. The utilisation of permanent magnets in a multi-pole rotor also reduces the rotor losses significantly and makes it possible to eliminate the gearbox. The idea of ABB is to combine the WINDFORMER technology with their HVDC-light technology in order to provide a complete concept for the electrical design of not only the wind turbine but of the whole wind farm including the grid connection. The main ideas of the WINDFORMER concept are:

- To provide a simple mechanical construction, without a gearbox, simple power electronics at the wind turbine (diode rectifier) in order to reduce maintenance and increase availability.
- To provide an efficient drive train by having an efficient generator, no gearbox, and a low loss diode rectifier.
- To exploit the features of the HVDC-light technology to have a simple internal grid in the wind farm and to have a high quality grid interface.

ABB is currently testing a prototype of the generator and will later test a complete wind turbine together with Scanwind A/S.

The major disadvantages involved are the cost of the total system and the uncertainty of the long-term performance of the equipment since it uses all new concepts.

2.8 Trends and perspectives

In the previous subsections, the focus has been on technical issues, whereas trends and perspectives are more the subject of this section. The present situation for seven types of generators regarding specific weight and specific price are illustrated in Figure 32 and Figure 33, respectively. These figures present the case of five asynchronous machines – i.e. three cage rotor machines with 4, 6 and 4/6 poles and two slip ring machines 4 and 6 poles, and two synchronous machines 4 and 6 poles, with wound rotor. The two synchronous machines are not relevant for application in wind turbines. They were included solely for comparison purposes. The origin of the data from ABB or Siemens have not been specified, since the purpose of Figure 32 and Figure 33 is to indicate trends rather than to benchmark products from these companies.

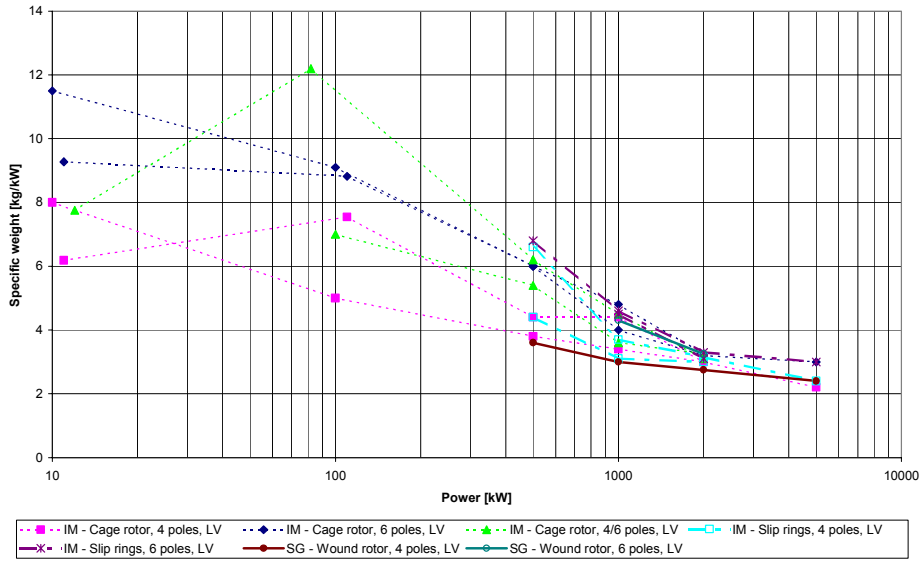

Figure 32. Specific weight for five relevant types of induction generators (IM) and two synchronous generators (SG). Estimated data supplied by ABB and Siemens.

As may be observed in Figure 32, the general trend of specific generator weight approximates to 3 kg/kW in the case of the Megawatt machines. The deviation is quite small in this area.

Regarding the specific price in Figure 33, larger machines may be expected to have an improved price-power ratio. The classical 4-pole cage rotor machine is the most cost efficient of the selected designs, while the slip ring machines turn out to have the poorest price performance.

It should be noted that the machines discussed in Figure 32 and Figure 33 are low voltage machines. The increasing nominal wind turbine power size may lead to application of medium or high voltage machines. This is highly likely, as the machines are getting more compact and the currents are increasing, i.e. higher losses will occur, and higher demands to cooling may be expected.

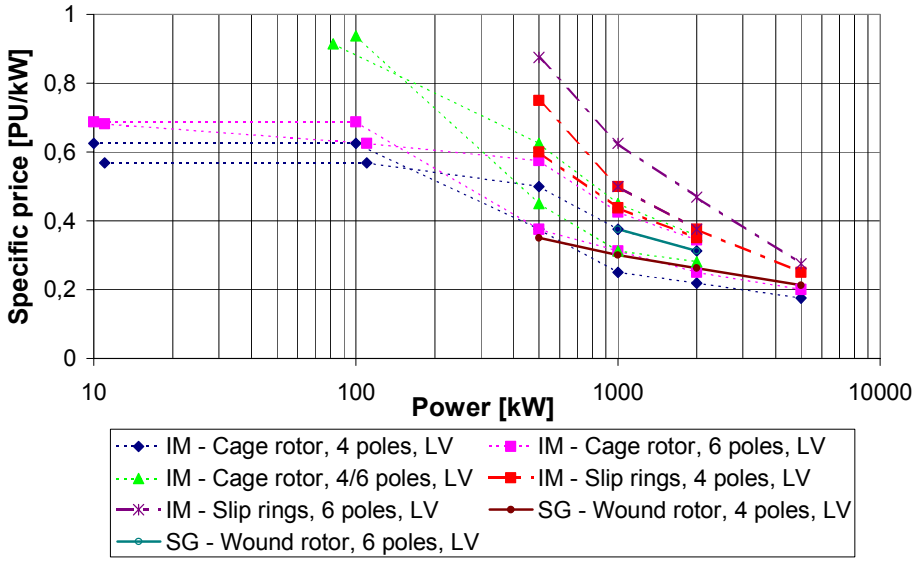

Figure 33. Specific price for five relevant types of induction generators (IM) and two equivalent synchronous generators (SG). Estimated data supplied by ABB and Siemens.

An equivalent analysis of multi-pole machines would be of interest. At present, it seems that this market is quite sensitive, and data is not easy to obtain. Nevertheless, in order to analyse and forecast trends on this aspect a number of gear manufactures have been asked to supply this report with gear data.

Based on the previous analysis of generators, it may be stated that an increasing size will both give a better specific weight and specific price. Therefore, the trend will move against still bigger wind turbines. Further on, consideration on solutions with gear versus without gear becomes still more important because the development in power electronics make it more feasible to use gearless solutions. Important solutions are the synchronous generator with field winding, the switched reluctance generator and the transverse flux machine. Also generators with permanent magnets become still more interesting, due to the lower price of the magnets. It can therefore be recommended that more research is conducted in this area. However, new generator concepts in Mega watt scale are very expensive to prototype. Further on, making a new production line also include huge investments.

More research is also necessary in the classical solutions using power electronics. Especially, it is important to be able to predict the losses in order to keep a high reliability. Related to this it is also at interest to investigate gearboxes and drive train loads using variable speed. The mechanical stress may be reduced using variable speed. The doubly fed induction generator is now widely used but still research is needed in diagnosis, control and even more optimized design in order to reduce the losses to a minimum but also to reduce the overall prices of the generator system. New solutions with a gearbox (low gearing) together with a multi-pole generator may also be an interesting solution both in respect to cost but also in respect to weight.

An indirect way to shed some light on the gear versus gearless machine concept is to take a closer look on the gearbox. The most interesting factor is probably the weight of the gearbox. Data on this parameter is shown in Figure 34. The origin of the data from Brook Hansen Transmission and Lohmann & Solterfoht

is not directly specified, since the purpose of Figure 34 and the following 3 figures it is to indicate trends rather than benchmark products from these companies.

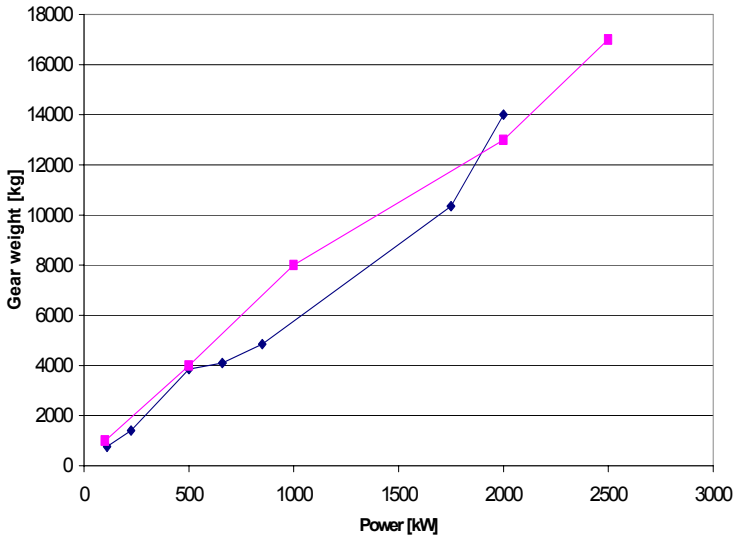

Figure 34: Weight data on gearboxes. Estimated data from Brook Hansen Transmission and Lohmann & Solterfoht.

As it can be observed in Figure 34, the weight of the gearbox is approximately a linear function of the power of the wind turbine. In Figure 35 the specific weight is presented.

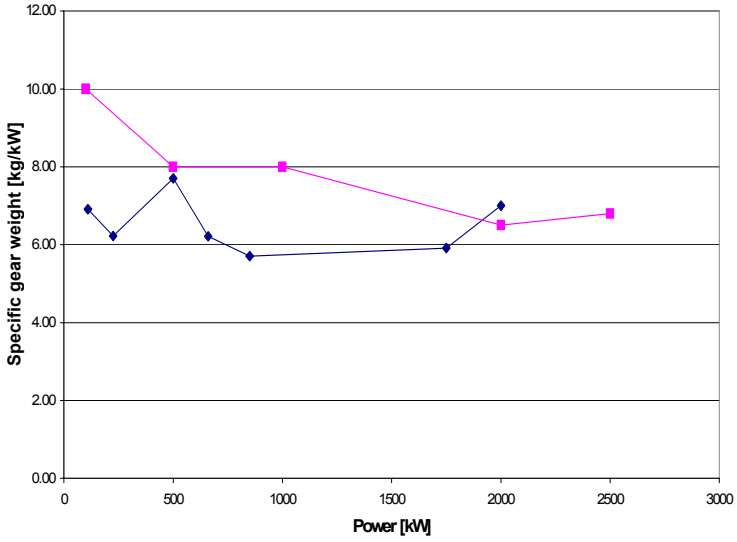

Figure 35: Specific gear weight. Estimated data from Brook Hansen Transmission and Lohmann & Solterfoht.

The trend presented in Figure 35 converges to a specific gear weight of 6-7 kg/kW. The specific weight of the gearbox and e.g. a 4 pole cage rotor machine is approximately 10 kg/kW. The corresponding number of a synchronous multipole generator is in the range of 20-30 kg/kW (Søndergaard & Bindner, 1995). Thus the gearless concept is more than twice as heavy.

Another interesting gearbox parameter is the oil volume. This is shown in Figure 36, based on the same setup as above.

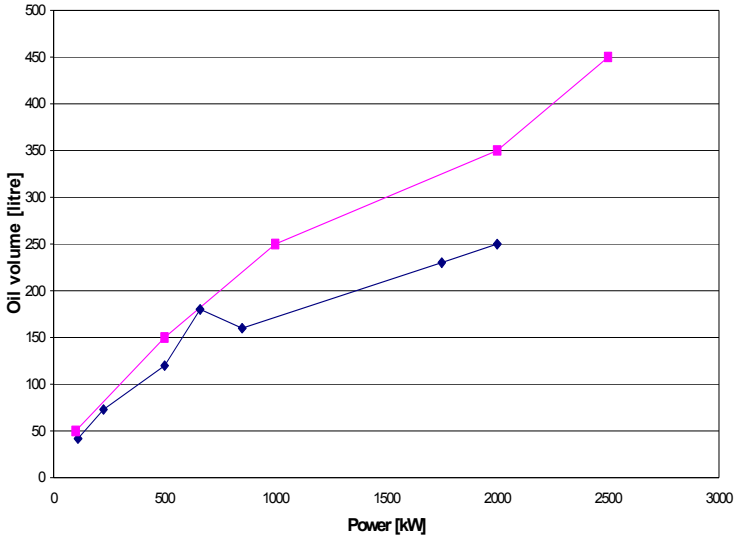

Figure 36: Oil volume of gearboxes. Estimated data from Brook Hansen Transmission and Lohmann & Solterfoht.

The trend in Figure 36 is clear – higher power of course implies more oil. Looking at the specific oil volume a surprising fact is revealed. The specific oil volume decreases exponentially with the power – see Figure 37. This clearly indicates an intensive optimization of the gearbox.

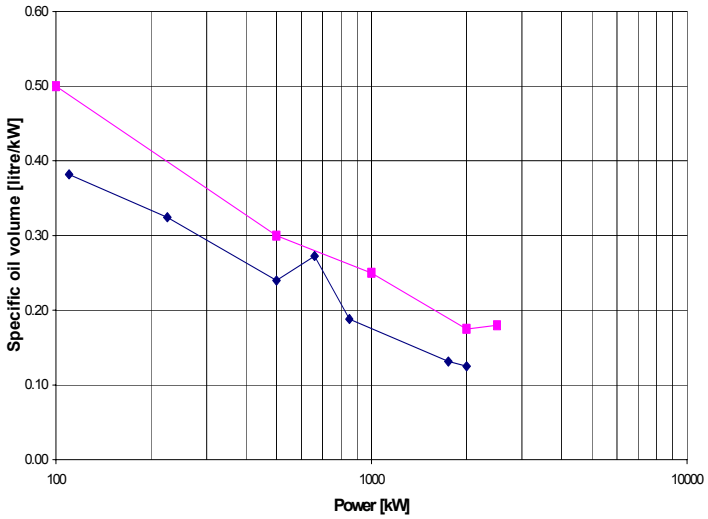

Figure 37: Specific oil volume of gearboxes. Estimated data from Brook Hansen Transmission and Lohmann & Solterfoht.

3 Power Electronic Concepts

Power electronics is a rapidly developing technology. Components are getting higher current and voltage ratings, the power losses decrease and the devices become more reliable. The devices are also very easy to control with a mega scale power amplification. The prices are still going down pr. kVA and power converters are becoming attractive as a mean to improve the performance of a wind turbine. This chapter will discuss the standard power converter topologies from the simplest converters for starting up the turbine to advanced power converter topologies, where the whole power is flowing through the converter. Further, different park solutions using power electronics are also discussed.

3.1 Criteria for concept evaluation

The most common topologies are selected and discussed in respect to advantages and drawbacks. Very advanced power converters, where many extra devices are necessary in order to get a proper operation, are omitted.

3.2 Power converters

Many different power converters can be used in wind turbine applications. In the case of using an induction generator, the power converter has to convert from a fixed voltage and frequency to a variable voltage and frequency. This may be implemented in many different ways, as it will be seen in the next section. Other generator types can demand other complex protection. However, the most used topology so far is a soft-starter, which is used during start up in order to limit the in-rush current and thereby reduce the disturbances to the grid.

3.2.1 Soft starter

The soft starter is a power converter, which has been introduced to fixed speed wind turbines to reduce the transient current during connection or disconnection of the generator to the grid. When the generator speed exceeds the synchronous speed, the soft-starter is connected. Using firing angle control of the thyristors in the soft starter the generator is smoothly connected to the grid over a predefined number of grid periods. An example of connection diagram for the soft-starter with a generator is presented in Figure 34.

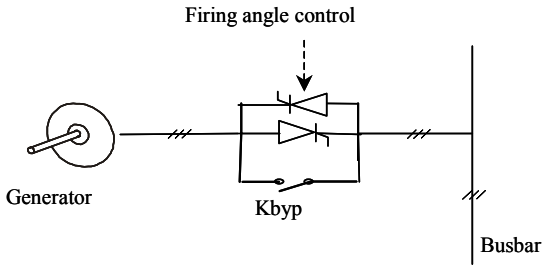

Figure 38. Connection diagram of soft starter with generators.

The commutating devices are two thyristors for each phase. These are connected in anti-parallel. The relationship between the firing angle (α) and the resulting amplification of the soft starter is non-linear and depends additionally on the power factor of the connected element. In the case of a resistive load, α may vary between 0 (full on) and 90 (full off) degrees, in the case of a purely inductive load between 90 (full on) and 180 (full off) degrees. For any power factor between 0 and 90 degrees, α will be somewhere between the limits sketched in Figure 39.

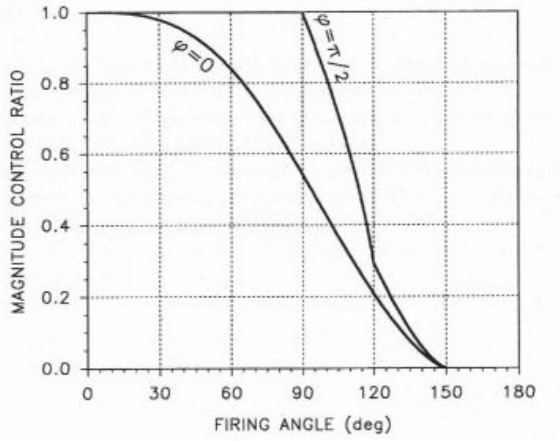

Figure 39. Control characteristic for a fully controlled soft starter.

When the generator is completely connected to the grid a contactor (Kbyp) bypass the soft-starter in order to reduce the losses during normal operation. The soft-starter is very cheap and it is a standard converter in many wind turbines.

3.2.2 Capacitor bank

For the power factor compensation of the reactive power in the generator, AC-capacitor banks are used, as shown in Figure 36. The generators are normally compensated into whole power range. The switching of capacitors is done as a function of the average value of measured reactive power during a certain period.

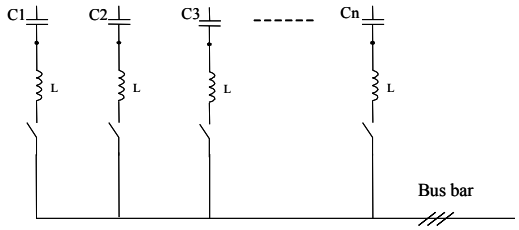

Figure 40. Capacitor bank configuration for power factor compensation in a wind turbine.

The capacitor banks are usually mounted in the bottom of the tower or in the nacelle. In order to reduce the current at connection/disconnection of capacitors a coil (L) can be connected in series. The capacitors may be heavy loaded and damaged in the case of over-voltages to the grid and thereby they may increase the maintenance cost.

3.2.3 Diode rectifier

The diode rectifier is the most common used topology in power electronic applications. For a three-phase system it consists of six diodes. It is shown in Figure 36a.

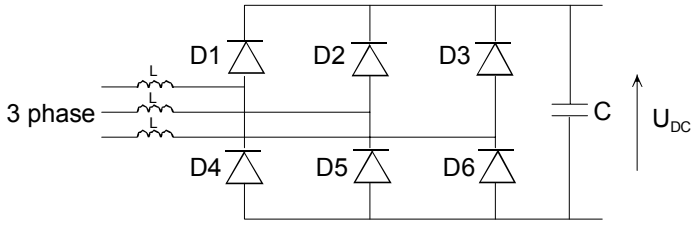

Figure 36a. Diode rectifier for three-phase ac/dc conversion

The diode rectifier can only be used in one quadrant, it is simple and it is not possible to control it. It could be used in some applications with a dc-bus.

3.2.4 The back-to-back PWM-VSI

The back-to-back PWM-VSI is a bi-directional power converter consisting of two conventional PWM-VSI. The topology is shown in Figure 41.

To achieve full control of the grid current, the DC-link voltage must be boosted to a level higher than the amplitude of the grid line-line voltage. The power flow of the grid side converter is controlled in order to keep the DC-link voltage constant, while the control of the generator side is set to suit the magnetization demand and the reference speed. The control of the back-to-back PWM-VSI in the wind turbine application is described in several papers (Bogalecka, 1993), (Knowles-Spittle et al., 1998), (Pena et al., 1996), (Yifan & Longya, 1992), (Yifan & Longya, 1995).

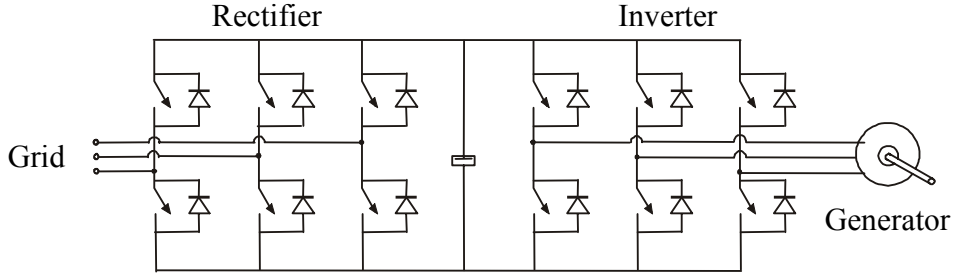

Figure 41. The back-to-back PWM-VSI converter topology.

3.2.4.1 Advantages related to the use of the back-to-back PWM-VSI

The PWM-VSI is the most frequently used three-phase frequency converter. As a consequence of this, the knowledge available in the field is extensive and well established. The literature and the available documentation exceed that for any of the other converters considered in this survey. Furthermore, many manufacturers produce components especially designed for use in this type of converter (e.g., a transistor-pack comprising six bridge coupled transistors and anti paralleled diodes). Due to this, the component costs can be low compared to converters requiring components designed for a niche production.

A technical advantage of the PWM-VSI is the capacitor decoupling between the grid inverter and the generator inverter. Besides affording some protection, this decoupling offers separate control of the two inverters, allowing compensation of asymmetry both on the generator side and on the grid side, independently.

The inclusion of a boost inductance in the DC-link circuit increases the component count, but a positive effect is that the boost inductance reduces the demands on the performance of the grid side harmonic filter, and offers some protection of the converter against abnormal conditions on the grid.

3.2.4.2 Disadvantages of applying the back-to-back PWM-VSI

This section highlights some of the reported disadvantages of the back-to-back PWM-VSI which justify the search for a more suitable alternative converter:

In several papers concerning adjustable speed drives, the presence of the DC-link capacitor is mentioned as a drawback, since it is heavy and bulky, it increases the costs and maybe of most importance, - it reduces the overall lifetime of the system. (Wen-Song & Ying-Yu, 1998); (Kim & Sul, 1993); (Siyoung Kim et al., 1998).

Another important drawback of the back-to-back PWM-VSI is the switching losses. Every commutation in both the grid inverter and the generator inverter between the upper and lower DC-link branch is associated with a hard switching and a natural commutation. Since the back-to-back PWM-VSI consists of two inverters, the switching losses might be even more pronounced. The high switching speed to the grid may also require extra EMI-filters.

To prevent high stresses on the generator insulation and to avoid bearing current problems (Salo & Tuusa, 1999), the voltage gradient may have to be limited by applying an output filter.

3.2.5 Tandem converter

The tandem converter is quite a new topology and a few papers only have treated it up till now ((Marques & Verdelho, 1998); (Trzynadlowski et al., 1998a); (Trzynadlowski et al., 1998b)). However, the idea behind the converter is similar to those presented in ((Zhang et al., 1998b)), where the PWM-VSI is used as an active harmonic filter to compensate harmonic distortion. The topology of the tandem converter is shown in Figure 42.

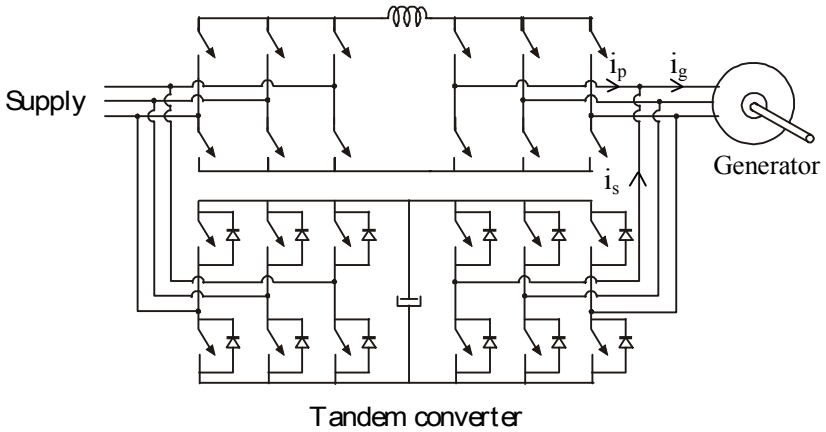

Figure 42. The tandem converter topology used in an induction generator wind turbine system.

The tandem converter consists of a current source converter, CSC, in the following designated the primary converter, and a back-to-back PWM-VSI, designated the secondary converter. Since the tandem converter consists of four controllable inverters, several degrees of freedom exist which enable sinusoidal input and sinusoidal output currents. However, in this context it is believed that the most advantageous control of the inverters is to control the primary converter to operate in square-wave current mode. Here, the switches in the CSC are turned on and off only once per fundamental period of the input- and output current respectively. In square wave current mode, the switches in the primary converter may either be GTO's, or a series connection of an IGBT and a diode.

Unlike the primary converter, the secondary converter has to operate at a high switching frequency, but the switched current is only a small fraction of the total load current. Figure 43 illustrates the current waveform for the primary converter, i_p, the secondary converter, i_s, and the total load current i_l.

In order to achieve full control of the current to/from the back-to-back PWM-VSI, the DC-link voltage is boosted to a level above the grid voltage. As mentioned, the control of the tandem converter is treated in only a few papers. However, the independent control of the CSC and the back-to-back PWM-VSI are both well established, (Mutschler & Meinhardt, 1998); (Nikolic & Jeftenic, 1998); (Salo & Tuusa, 1997); (Salo & Tuusa, 1999).

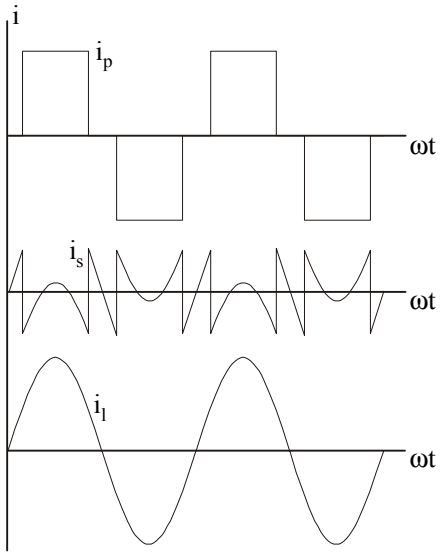

Figure 43. Current waveform for the primary converter, i_p, the secondary converter, is, and the total load current i_l.

3.2.5.1 Advantages in the use of the Tandem Converter

The investigation of new converter topologies is commonly justified by the search for higher converter efficiency. Advantages of the tandem converter are the low switching frequency of the primary converter, and the low level of the switched current in the secondary converter. It is stated that the switching losses of a tandem inverter may be reduced by 70%, (Trzynadlowski et al., 1998a) in comparison with those of an equivalent VSI, and even though the conduction losses are higher for the tandem converter, the overall converter efficiency may be increased.

Compared to the CSI, the voltage across the terminals of the tandem converter contains no voltage spikes since the DC-link capacitor of the secondary converter is always connected between each pair of input- and output lines (Trzynadlowski et al., 1998b).

Concerning the dynamic properties, (Trzynadlowski et al., 1998a) states that the overall performance of the tandem converter is superior to both the CSC and the VSI. This is because current magnitude commands are handled by the voltage source converter, while phase-shift current commands are handled by the current source converter (Zhang et al., 1998b).

Besides the main function, which is to compensate the current distortion introduced by the primary converter, the secondary converter may also act like an active resistor, providing damping of the primary inverter in light load conditions (Zhang et al., 1998b).

3.2.5.2 Disadvantages of using the Tandem Converter

An inherent obstacle to applying the tandem converter is the high number of components and sensors required. This increases the costs and complexity of both hardware and software. The complexity is justified by the redundancy of the system (Trzynadlowski et al., 1998a), however the system is only truly redundant if a reduction in power capability and performance is acceptable.

Since the voltage across the generator terminals is set by the secondary inverter, the voltage stresses at the converter are high. Therefore the demands on the output filter are comparable to those when applying the back-to-back PWM-VSI.

In the system shown in Figure 38, a problem for the tandem converter in comparison with the back-to-back PWM-VSI is the reduced generator voltage. By applying the CSI as the primary converter, only 0.866% of the grid voltage can be utilized. This means that the generator currents (and also the current through the switches) for the tandem converter must be higher in order to achieve the same power.

3.2.6 Matrix converter

Ideally, the matrix converter should be an all silicon solution with no passive components in the power circuit. The ideal conventional matrix converter topology is shown in Figure 44.

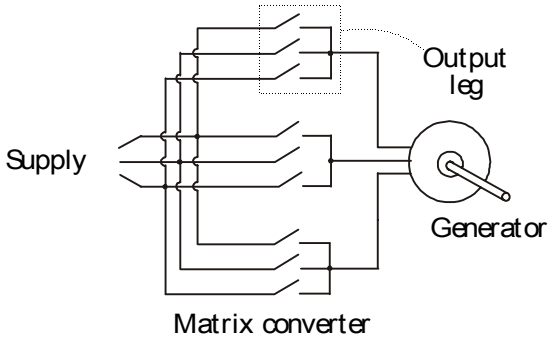

Figure 44. The conventional matrix converter topology.

The basic idea of the matrix converter is that a desired input current (to/from the supply), a desired output voltage and a desired output frequency may be obtained by properly connecting the output terminals of the converter to the input

terminals of the converter. In order to protect the converter, the following two control rules must be complied with: Two (or three) switches in an output leg are never allowed to be on at the same time. All of the three output phases must be connected to an input phase at any instant of time. The actual combination of the switches depends on the modulation strategy.

3.2.6.1 Advantages of using the Matrix Converter

This section summarises some of the advantages of using the matrix converter in the control of an induction wind turbine generator.

For a low output frequency of the converter the thermal stresses of the semiconductors in a conventional inverter are higher than those in a matrix converter. This arises from the fact that the semiconductors in a matrix converter are equally stressed, at least during every period of the grid voltage, while the period for the conventional inverter equals the output frequency. This reduces the thermal design problems for the matrix converter.

Although the matrix converter includes six additional power switches compared to the back-to-back PWM-VSI, the absence of the DC-link capacitor may increase the efficiency and the lifetime for the converter (Schuster, 1998).

Depending on the realization of the bi-directional switches, the switching losses of the matrix inverter may be less than those of the PWM-VSI, because the half of the switchings become natural commutations (soft switchings) (Wheeler & Grant, 1993).

Compared to converters with constant DC-link voltage and only two output levels, the output harmonic content of the matrix converter is lower, due to the fact that the output voltage of the matrix converter is composed of three voltage levels.

3.2.6.2 Disadvantages and problems of the matrix converter

A disadvantage of the matrix converter is the intrinsic limitation of the output voltage. Without entering the over-modulation range, the maximum output voltage of the matrix converter is 0.866 times the input voltage. To achieve the same output power as the back-to-back PWM-VSI, the output current of the matrix converter has to be 1.15 times higher, giving rise to higher conducting losses in the converter (Wheeler & Grant, 1993).

In many of the papers concerning the matrix converter, the unavailability of a true bi-directional switch is mentioned as one of the major obstacles for the propagation of the matrix converter. In the literature, three proposals for realizing a bi-directional switch exists. The diode embedded switch (Neft & Schauder, 1988) which acts like a true bi-directional switch, the common emitter switch and the common collector switch (Beasant et al., 1989). The latter two are able to control the current direction, which is preferable in the phase commutations.

Since real switches do not have infinitesimal switching times (which is not desirable either) the commutation between two input phases constitutes a contradiction between the two basic control rules of the matrix converter. In the literature at least six different commutation strategies are reported, (Beasant et al., 1990); (Burany, 1989); (Jung & Gyu, 1991); (Hey et al., 1995); (Kwon et al., 1998); (Neft & Schauder, 1988). The most simple of the commutation strategies are those reported in (Beasant et al., 1990) and (Neft & Schauder, 1988), but neither of these strategies complies with the basic control rules. The most used

commutation strategies are those reported in (Burany, 1989) and (Kwon et al., 1998). In either of (Burany, 1989) or (Kwon et al., 1998), half of the switchings become soft switchings, thereby reducing the switching losses. The solutions in (Jung & Gyu, 1991) and (Hey et al., 1995) require a more complex hardware structure of the converter.

Due to the absence of the DC-link, there is no decoupling between the input and output of the converter. In ideal terms, this is not a problem but in the case of unbalanced or distorted input voltages, or unbalanced load, the input current and the output voltage also become distorted. Several papers have dealt with the problems of unbalanced input voltages and various solutions have been proposed (Casadei et al., 1994); (Casadei et al., 1995a); (Casadei et al., 1995b); (Casadei et al., 1996); (Enjeti & Wang, 1990); (Nielsen, 1996); (Nielsen et al., 1996); (Oyama et al., 1997); (Zhang et al., 1998a). Each of the solutions has superiorities and drawbacks, and the choice of solution depends on which performance indicator has the highest priority (input disturbance, line losses, controllability of the input power factor etc.).

Finally, the protection of the matrix converter in a fault situation presents a problem. The protection of the matrix converter is treated in (Nielsen, 1996). This protection circuit adds an extra 12 diodes and a DC-link capacitor to the component list, although these components are rated much smaller than the components in the power part of the matrix converter.

3.2.7 Multilevel Converter

Since the development of the neutral-point clamped three-level converter (Nabae et al., 1981), several alternative multilevel converter topologies have been reported in the literature. The general idea behind the multilevel converter technology is to create a sinusoidal voltage from several levels of voltages, typically obtained from capacitor voltage sources. The different proposed multilevel converter topologies can be classified in the following five categories (Lai & Peng, 1996); (Lai & Peng, 1995); (Manjrekar & Venkataramanan, 1996); (Marchesoni & Mazzucchelli, 1993); (Suh et al., 1998):

- Multilevel configurations with diode clamps (Nam et al., 1991); (Sun-Kyoung Lim et al., 1999); (Nabae et al., 1981); (Lixiang & Fahai, 1999).
- Multilevel configurations with bi-directional switch interconnection (Brumsickle et al., 1998); (Nabae et al., 1981).
- Multilevel configurations with flying capacitors (Xiaoming et al., 1999).
- Multilevel configurations with multiple three-phase inverters (Cengelci et al., 1998).
- Multilevel configurations with cascaded single phase H-bridge inverters (Peng et al., 1997).

A common feature of the five different multilevel converter concepts is, that in theory, all the topologies may be constructed to have an arbitrary number of voltage levels, although in practice some topologies are easier to realize than others. The principle of the five topologies is illustrated in Figure 45.

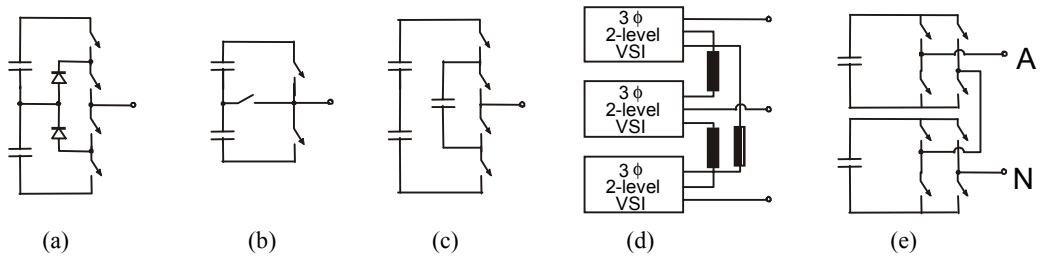

Figure 45. Multilevel topologies. a) One inverter leg of a three-level diode clamped multilevel converter. b) One inverter leg of a three-level multilevel converter with bi-directional switch interconnection. c) One inverter leg of a three level flying capacitor multilevel converter. d) Schematic presentation of a three-level converter consisting of three three-phase inverters. e) One inverter leg of a three-level converter consisting of H-bridge inverters.

Below is a brief comment on the different multi-level converter topologies:

a) Despite the more complex structure, the diode clamped multilevel converter is very similar to the well known back-to-back PWM-VSI. Unlike the multilevel topologies shown in Figure 45d and Figure 45e, the diode clamped multilevel converter may be coupled directly to the grid without transformers. For a converter based on the diode clamped multilevel converter a voltage-balancing problem occurs for levels higher than three, but for a three level converter this is only a minor problem.

b) For a three level structure, the topology of the multilevel converter with bi-directional switch interconnection requires the same number of switches as the diode clamped three-level converter and the three-level flying capacitor converter. However, half of the switches have to block the full DC-link voltage.

c) The topology of the flying capacitor multilevel converter is very similar to that of the diode clamped multilevel converter shown in Figure 45a. In the literature it is stated, that the voltage-balancing problem is relatively easy to solve, compared to the diode clamped converter. The difference in component count between the diode clamped multilevel converter and the flying capacitor multilevel converter is, that two diodes per phase may be substituted by one capacitor.

d) The number of switches (and other components) required realizing a three level converter is very high compared to the concepts a-c, but the converter can be realized from the well-proven VSI technology.

e) The multilevel converter based on multiple H-bridge inverters is heavy, bulky and complex (Nam et al., 1991), and maybe of most importance, - connecting separated DC-sources between two converters in a back-to-back fashion is very difficult because a short circuit will occur when two back-to-back converters are not switching synchronously (Lai & Peng, 1996), (Suh et al., 1998).

3.2.7.1 Advantages in the use of the multilevel converter

Initially, the main purpose of the multilevel converter was to achieve a higher voltage capability of the converters. As the ratings of the components increases

and the switching- and conducting properties improve, the secondary effects of applying multilevel converters become more and more advantageous. In recent papers, the reduced content of harmonics in the input and output voltage is highlighted, together with the reduced EMI (Tolbert & Peng, 1999). The multilevel converter distinguishes itself by being that converter in this survey with the lowest demands to the input filters. (or alternatively reduced number of switchings) (Rodriguez et al., 1999).

The switching losses of the multilevel converter are another feature, which is often accentuated. In (Marchesoni & Mazzucchelli, 1993), it is stated, that for the same harmonic performance the switching frequency can be reduced to 25% of the switching frequency of a two-level converter. Even though the conducting losses are higher for the multilevel converter, it is stated in (Tolbert & Peng, 1999) that the overall efficiency for the diode clamped multilevel converter is higher than the efficiency for a comparable two-level converter. Of course, the truth in this assertion depends on the ratio between the switching losses and the conducting losses.

3.2.7.2 Disadvantages concerning the multilevel converter

The most commonly reported disadvantage of the three level converters with split DC-link is the voltage imbalance between the upper and the lower DC-link capacitor. However, for a three-level converter this problem is not very serious, and the problem in the three-level converter is mainly caused by differences in the real capacitance of each capacitor, inaccuracies in the dead-time implementation or an unbalanced load (Shen & Butterworth, 1997). By a proper modulation control of the switches, the imbalance problem can be solved (Sun-Kyoung Lim et al., 1999). In (Shen & Butterworth, 1997), the voltage balancing problem is solved by hardware, while (Newton & Sumner, 1997) and (Peng et al., 1995) proposed solutions based on modulation control. However, whether the voltage-balancing problem is solved by hardware or software, it is necessary to measure the voltage across the capacitors in the DC-link.

For converters based on the topology in Figure 45a to Figure 45c, another problem is the unequal current stress on the semiconductors. It appears that the upper and lower switches in an inverter branch might be derated compared to the switches in the middle. For an appropriate design of the converter, different devices are required (Lai & Peng, 1996). For the topology in Figure 45b it appears that both the unequal current stress and the unequal voltage stress might constitute a design problem.

From the topologies in Figure 45, it is evident that the number of semiconductors in the conducting path is higher than for the other converters treated in this survey, this might increase the conduction losses of the converter. On the other hand, each of the semiconductors need only block half the total DC-link voltage and for lower voltage ratings, the on-state losses per switch decreases, which to a certain extent might justify the higher number of semiconductors in the conducting path.

3.2.8 Resonant converter

In the efforts towards reducing the switching losses in power converters, several resonant converter topologies have been proposed. A common drawback of these converter topologies is that they suffer from one or more of the following properties.

- Complex hardware structure and complex control.
- High peak voltage in the DC-link and across the load.
- High power flow through the resonant circuit.

The only resonant converter treated in this section is a topology, which does not suffer from the disadvantages mentioned above. The converter topology is termed *Natural Clamped Converter* (NCC). The NCC topology is shown in Figure 46.

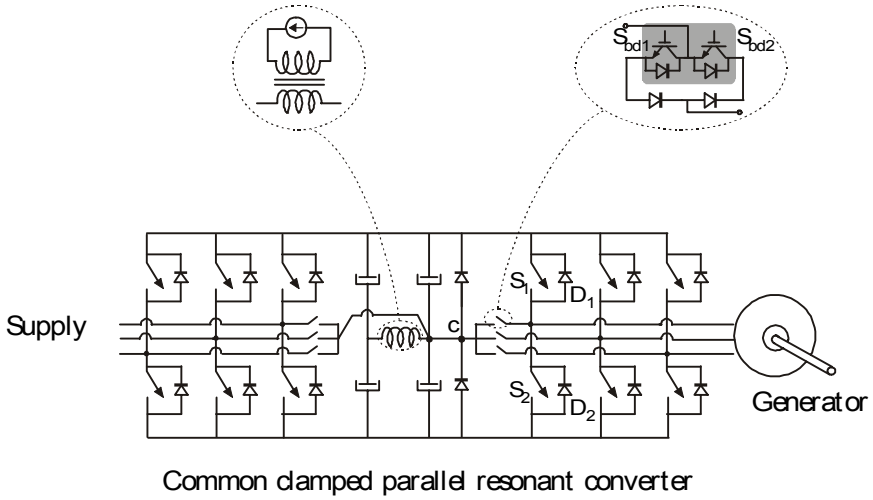

Figure 46. The natural clamped converter topology used in the induction generator wind turbine system.

The NCC consists of the conventional back-to-back PWM-VSI and in addition a circuit to obtain the resonance. To start and to maintain the resonance an inductive energy transfer is used. In order to control the current to/from the supply grid, the DC-link voltage is boosted. Like for the back-to-back PWM-VSI, it is assumed that the voltage is boosted to 800 V. In Figure 46, the boost inductances are shown as a part of the line filter. The used switches in the resonance circuit are bi-directional switches and as in the case of the matrix converter, these have to be built from several discrete devices. The bi-directional switch shown in Figure 46 is made from a standard two-pack transistor module and additional two diodes, but may as well be constructed as a common-emitter, a common-collector or a diode-embedded switch.

3.2.8.1 The commutation process for the NCC.

To explain the operating mode of the NCC, assume that the load current is flowing through diode D_2, resulting from a positive load current. At a given time, the controller demands turn off of S_2. To achieve the commutation, both switches S_{bd1} and S_{bd2} in the bi-directional switch are first turned on when the voltage at point *c* is equal to $u_{DC}/2$. Then S_2 is turned off at zero voltage (and zero current because D_2 was conducting). During the following half period of the resonance, the load current is supplied through S_{bd1} and the voltage across S_1 decreases. When the voltage at point *c* reaches $u_{DC}/2$, the voltage across S_1 is zero. Then, first S_{bd2} is turned off, then S_1 is turned on and finally S_{bd1} may be turned off. The commutation process is depicted in Figure 47.

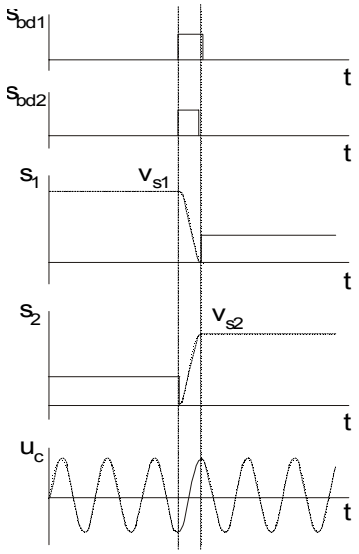

Figure 47. Illustration of the commutation procedure for the NCC.

The NCC is suitable both for discrete pulse modulation (DPM), and pulse width modulation (PWM). Both techniques are described in several papers concerning different resonant converters and a brief survey is given in (Munk-Nielsen, 1997).

3.2.8.2 Advantages in the use of the NCC

Compared to other resonant converters, the NCC possesses the advantageous properties of the different resonant converters while the unsuitable properties are avoided. The advantageous properties of the NCC are: the resonant voltage is clamped and never exceeds the DC-link voltage, the resonant circuit is not in the power part of the converter, and only one resonant circuit is needed for the entire converter.

By inspection of the topology of Figure 46, it appears that the NCC also supports three level operations. This implies however, that the bi-directional switches must be rated for a higher power level. In comparison with the back-to-back PWM-VSI, the main advantage of the NCC is the reduced switching losses, which in applications where the switching losses dominate might increase the overall converter efficiency. Furthermore, due to the lower du/dt, the radiated EMI is reduced, and the demands to the output filter inductance might be reduced. The conduction losses of the NCC are similar to those of the back-to-back PWM-VSI.

The modulation of the NCC may be either PWM or DPM (Direct Pulse Modulation). It may also be possible to use a different modulation strategy in the machine inverter and in the grid inverter. The use of DPM makes the response of the converter very fast, while the use of PWM more or less gives a harmonic spectrum comparable to that of a back-to-back PWM-VSI.

3.2.8.3 Disadvantages of the NCC

Although the complexity is less than the pole commutated resonant converter (Pickert & Johnson, 1998); (Teichmann & Bernet, 1998), the converter is still more complex (hardware and control) than the back-to-back PWM-VSI and several additional components are needed. Furthermore sensors are needed to

detect the zero voltage events and to determine the energy needed to maintain the resonance.

As mentioned above, the use of the DPM technique yields fast response time, but a consequence of the DPM is that the switching harmonics are distributed over a broader spectrum (Dehmlow et al., 1993). The broad switching harmonic spectrum makes the grid filter design procedure a quite difficult task since the harmonics may coincide with the resonant frequency of the filters. However, this increases the complexity of the converter.

The voltage imbalance of the two main capacitors may constitute a problem for the NCC. For every commutation, only one of the main capacitors is discharged. In the case of asymmetrical commutations due to small differences in the switch characteristics, the voltage unbalance has to be compensated actively.

3.2.9 Comparison of the five frequency converters

The five converters presented above: the back-to-back PWM VSI, the tandem converter, the matrix converter, the multilevel converter and the NCC, may be evaluated in terms of their applicability to wind turbine systems. For each converter, a presentation of the topology and the working principles has been presented, combined with a discussion of advantages and disadvantages.

It is evident that the back-to-back converter is highly relevant, as this converter is the one used in wind turbines today. Therefore, this converter type may be used as a reference in a benchmark of the other converter topologies:

- Components and ratings. Considering the number of used components, the matrix converter differs from the other converters, because it consists only of active components in the power part. The back-to-back converter includes a moderate number of passive components, while it has the least number of active components. The latter three converters all include a high number of both active and passive components.
- Auxiliary components. Two converters distinguish themselves, namely the matrix converter and the multilevel converter. The main reason for this statement is that in both the transformer may be omitted, without requiring excessively high voltage ratings for the components. On the other hand, the tandem converter and the NCC both require a greater number of transducers than the other three converters.
- Efficiency. Assessment of the efficiency of the five converters is based on the literature and includes the reported conducting losses and switching losses. The NCC is assessed to have potentially the highest efficiency of the five converters – followed by the multilevel converter and the tandem converter.
- Harmonic performance. Considering the harmonic performance, and the requirements for filters, the multilevel converter shows the best spectra on both the grid side and the generator side. The only converter that really seems to constitute a problem for the filter design is the DPM modulated NCC. Due to a broad switching spectrum, the filter design may be complicated.

- Implementation. Because the back-to-back converter and the multi-level converter are the most used commercial converters of the five, it is believed that these two converters are the least troublesome converters to implement, while the three latter all are quite undiscovered in a commercial sense.

Summarising the findings on the converters presented it is concluded that the back-to-back converter, the matrix converter and the multilevel converter are to be recommended for further studies in different generator topologies.

3.3 Park solutions

Wind power installations with blade angle control and/or power converters are able to control the active power supply to the power system. Moreover, wind power installations with power converters are able also to control the reactive power supply to the power system. The active power control in these wind power installations normally serve to obtain maximum production, and limit the power to avoid only overloading and stress of the wind turbine components, whereas the reactive power control serves to obtain a constant, high power factor, e.g. at unity.

Other types of active control of power plants in the power system contribute to the frequency control by regulation of the active power, and to the voltage control by regulation of the reactive power. Such control capabilities can also be obtained in wind power installations fitted with power converters, but have only been practised in a few cases. The main reason for this is caution because the impact on the stability of the power system becomes a concern when thousands of wind turbines were to regulate the voltage on the local terminals independently. However, in the future such performance is expected from the parks.

For power systems with a large amount of wind energy, the ability of the wind power installations to contribute to the regulation of the voltage and frequency of the power system becomes an important issue, because it influences the ability of the wind power installations to replace other power plants strongly. Thus, both the capacity credit of the wind power installation and the fuel savings at other power plants are influenced by the control capabilities of the wind power installations.

To provide the wind power installations with power system control capabilities and to improve the influence on the power system stability, central power electronic units in large wind farms are a promising technical solution. Central units may be connected to the power system at the wind farm connection point, and consequently could contribute to the control of the voltage and frequency at that point. In this respect, wind farms with central power electronic units can act more like a regular power plant. Also, the application of central units is likely to be the most cost effective way to provide control capabilities for large wind farms.

3.3.1 Reactive power compensation units

Reactive power compensation units are widely used in power systems to provide the reactive power balance and improve the voltage stability. These compensation units are used to supply both inductive and capacitive power. Typically, capacitive power is supplied to compensate for reactive loads while inductive power is supplied to compensate for capacitive consumption in cables.

The most used units to compensate for reactive power in the power systems are either synchronous condensers or shunt capacitors, the latter either with mechanical switches or with thyristor switches, as in Static Var Compensators (SVC). The disadvantage of using shunt capacitors is that the reactive power supplied is proportional to the square of the voltage. Consequently, the reactive power supplied from the capacitors decreases rapidly when the voltage decreases. The reactive power is needed to maintain voltage stability.

STATCOMs or ASVCs are inverters based on forced-commutated switches, i.e. with full, continuous control of the reactive power. The maximum available reactive power from a STATCOM is proportional to the voltage, and consequently the available maximum reactive power decreases more slowly for STATCOMs than SVCs, when the voltage decreases.

The transmission system operator ELTRA in the western half of Denmark has installed a 2×4 MVA ASVC (Stöber et al., 1998) on the 24 MW wind farm at Rejsby Hede, to demonstrate and test this concept. The Rejsby Hede wind farm consists of forty, 600 kW, NEG-Micon wind turbines with directly connected induction generators. The no-load consumption of reactive power in the induction generators is compensated by shunt capacitors on the 700 V level, in the individual wind turbines.

The ASVC at Rejsby Hede compensates for the load-dependent reactive power consumption in the wind farm by a fast, continuous reactive power regulation at the wind farm connection point. Thus, the ASVC runs in the power factor control mode, i.e. controls the power factor to be unity at the wind farm connection point.

The ASVC may in principle also run in a voltage regulation mode, i.e. participate in the voltage regulation on the grid. However, the grid is very strong at the wind farm connection point of the Rejsby Hede wind farm. Therefore, the ASVC has not been designed to participate in the voltage regulation, and it has also not been tested in that mode.

Further issues on these compensation units may be found in Table 10 and Table 11 in the next section.

3.3.2 Power regulation and storage units

The normal power regulation strategy of a wind turbine is designed to combine optimisation of operation and limitation of the power to protect the wind turbine. Overall wind farm regulation of the power to meet the requirements of the grid is not so common, but some examples of voltage dependent power regulation are known. At Cronalaght wind farm in Ireland (Bindner, 1999a), the blade angle control is used to limit the power. At Bockstigen wind farm in Sweden, dump loads and disconnection of wind turbines are used (Lange et al., 1999) as control options.

When wind energy penetration in the power system becomes high, the use of storage units becomes interesting, because the limitation of power required by the power system may lead to substantial loss of available energy from the wind turbines. At the same time, storage units may ensure power delivery from the wind farm, even when the wind speed is low. Consequently, storage units can provide large wind farms with power regulation capabilities, which can enable wind farms to replace, and not just to supplement, other power plants. Besides a

capacity reduction of other power plants, such regulation capabilities may further reduce the requirement for spinning reserve and thus reduce the total fuel costs in the power system. Therefore, the development of storage technologies is very important to the development of wind energy.

When the natural resources are available, pumped storage may be competitive to grid reinforcement today (Bindner, 1999b). However, in many places, pumped storage is not an option. Therefore, the development of batteries, fuel cells and other storage technologies is very important. The main drawback of batteries today is the relatively high cost. An additional cost item for battery storage systems is the conversion from the AC grid to a DC. That cost could be avoided if the batteries were connected to an existing DC voltage, e.g. the DC link in an ASVC, or an HVDC transmission.

3.3.3 HVDC

One of the most widely discussed concepts for grid connection of large (offshore) wind farms is HVDC. This is due to a combination of the rapid development of this technology and the advantages that this technology can give for system operation as well as wind turbine operation.

An HVDC link consists of a minimum of two AC/DC converter stations and a DC cable to link the stations. The latest semiconductor technology development, combined with advanced control of series connected semiconductors has provided modern HVDC transmission systems, like ABBs HVDC Light, with fully controllable converters, based on forced commutated semiconductors.

HVDC technologies are mainly interesting for power transmission over longer distances. The DC cable is less expensive than an AC transmission cable with the same capacity, but the costs of the converter stations make the complete HVDC link more expensive than the corresponding AC link, if the transmission distance is below a certain threshold. The exact threshold distance for HVDC Light today is not public because of commercial interests (Asplund, 2000), but it is very long. Still, the threshold distance is expected to decrease rapidly with the technology development of power electronics, which reduces the cost of the converter stations.

For offshore applications, HVDC links may also be viable when the critical cable length for AC transmission is reached. In that case, a compensation unit is required on the AC transmission system, which is also very costly in the case of offshore transmission.

The world's first HVDC Light installation is operating today on Gotland. It was installed to increase the transmission capacity from the many wind turbines installed in the south of the island to the consumers in the town in the north of the island (Castro, 2000). At the same time, it serves to feed reactive power into the AC grid, particularly to the wind turbines in the south, and to ensure voltage stability. ELTRA has also installed an HVDC Light connection in Tjæreborg to test the use of it for large wind turbines. This is because HVDC Light is a candidate for connection to some of the large offshore wind farms, which are targets in "Energi 21", the Danish government action plan for energy.

Because of the advantages for the power system, HVDC Light will probably be installed for transmission of power over long distance from a number of large wind farms, both offshore and on land. This will open up new possibilities for variable speed control of wind turbines, because the frequency (or frequencies)

of the grid(s) at the wind turbines can be controlled independently of the power system frequency.

The simplest HVDC Light configuration for connection of a wind farm is the group connection shown in Figure 48. The HVDC link is connected to the power system in one end and to the wind farm AC grid in the other end.

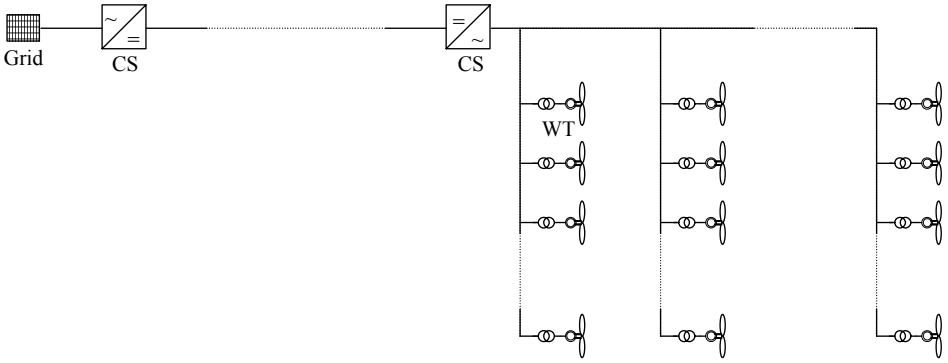

Figure 48. Group connection of a wind farm to an HVDC link.

In principle, all wind turbines designed for connection to AC grid may be connected to the wind farm AC grid in Figure 48, but many of the advantages in using power converters in the wind turbines are reduced. It is therefore most obvious to use wind turbines with directly connected induction generators. With such a concept, the converter at the wind farm will supply the wind turbines with reactive power, and in that way make the wind farm grid more robust to grid faults.

HVDC connection also makes it possible to control the frequency of the wind farm grid in order to improve the aerodynamic efficiency in the same way as for wind turbines with individual power converters. The frequency control must set the frequency as a compromise between the optimum frequency for all the individual wind turbines in the wind farm, because the wind speed and consequently the optimum frequency is different from wind turbine to wind turbine. Therefore, the aerodynamic efficiency is reduced slightly compared to wind turbines with individual power converters.

Another aspect of the group connection concept, which is probably more important is that the common frequency control cannot be used to reduce mechanical loads on the drive train like individual power converters in the wind turbines can. This is important for stall controlled wind turbines and in particular for pitch controlled wind turbines where it may be necessary to have additional speed control of the individual wind turbine, e.g. Optislip.

Another configuration, which appears to have all the technical advantages of wind turbines with individual power converters is shown in Figure 49. The wind turbines are provided with their own AC/DC converter.

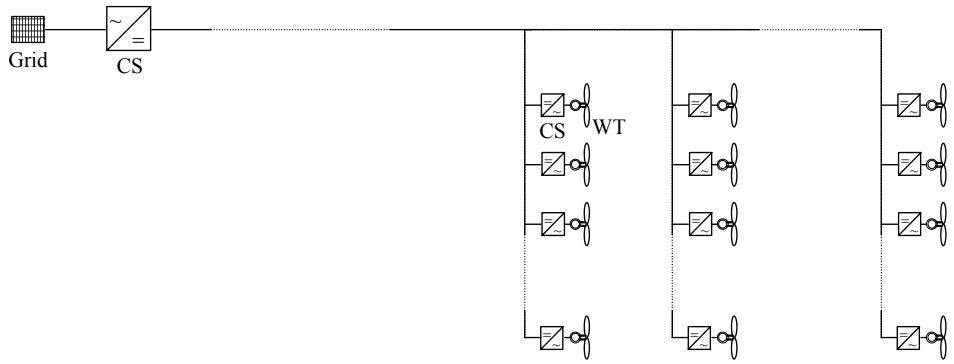

Figure 49. Individual connection of wind turbines to HVDC link.

If the AC/DC converters in the individual wind turbines are based on forced-commutated semiconductors, the frequency and consequently the speed of the wind turbines can be controlled individually. In that case, the frequency control may be used to reduce mechanical loads on the drive train, effectively using the rotor moment of inertia to absorb the fastest fluctuations in the aerodynamic loads.

ABB has proposed a new Windformer concept with individual AC/DC converters as shown in Figure 49, but using diode rectifiers in the converters (Nielsen, 2000). The generators are of synchronous type, because they must provide the magnetic field themselves. ABB proposes a multipole (gearless), high voltage permanent magnet generator, which can be connected directly to the rectifier without a transformer. The wind turbine in the Windformer concept will be pitch controlled.

The Windformer concept removes the ability to use the frequency control to reduce mechanical loads on the drive trains, because the speed control is based on control of the DC voltage at the converter at the power system connection point, which is common for all the wind turbines. The mechanical drive train loads are, however, not so critical for the Windformer concept, because the wind turbines are gearless.

A more critical aspect of the Windformer concept is whether it will be stable with the required blade pitch angles. Both the steady state stability and the dynamic stability must be studied. The system is very complicated, with speed dependent aerodynamic loads and generator AC impedances in the individual wind turbines, and only one common DC voltage, which must be controlled with compromise between all the wind turbines.

3.4 Trends and perspectives

As in Section 2, this final subsection is dedicated to a discussion on trends and perspectives. The rapid development of power electronics, as described in e.g. (Thøgersen & Blaabjerg, 2000), is already reflected in commercial converters. The present situation for two types of converters regarding specific weight and normalised specific price (per unit price) are illustrated in Figure 50 and Figure 51, respectively. The depicted data are related to back-to-back PWM VSI converters using a vector control strategy. The low voltage converters are air cooled, while the medium voltage converters are water-cooled. Again, the origin of data from the ABB or Siemens has not been specified, since the purpose of Figure 50 and Figure 51 is to indicate trends rather than to benchmark products from these companies.

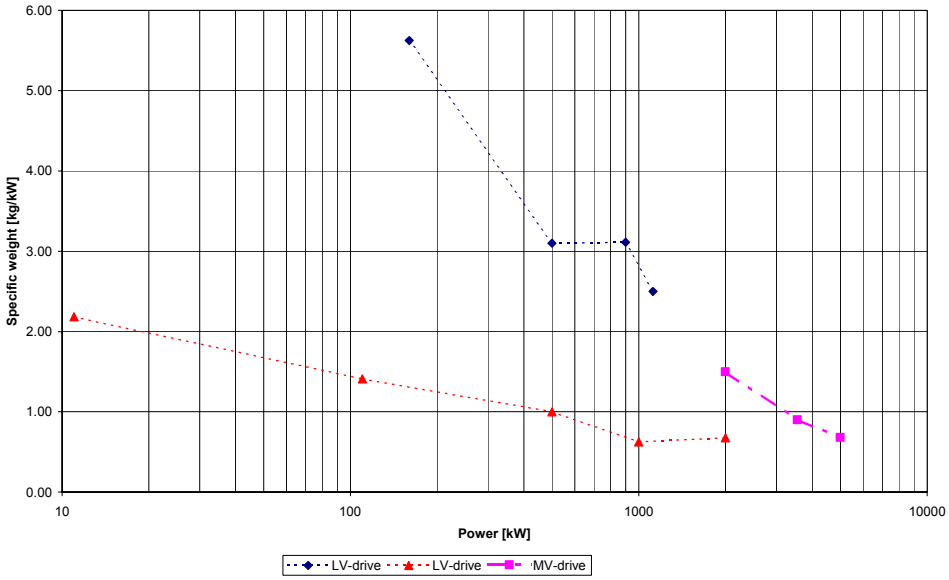

Figure 50. Specific weight of LV and MV converters. Estimated data supplied by ABB and Siemens.

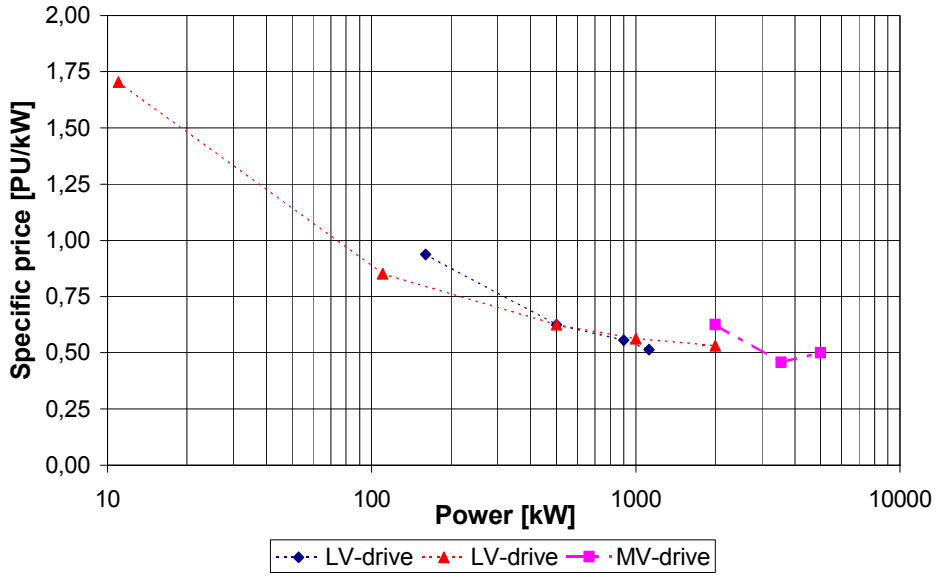

Figure 51. Specific price of LV and MV converters. Estimated data supplied by ABB and Siemens.

In Figure 50, the specific weight of the LV-converters indicates two different implementations, while Figure 51 states that this is not important for the price. The specific weight of the converters in the Megawatt range is approximately half the specific weight of the generators presented in section 2 – and still decreasing. Meanwhile, the specific price of the converters in this area is only twice the specific price of the generators presented.

4 Grid Integration Issues

This section describes the grid integration issues. The first part of this section is generic grid issues. The second part is mainly concerned with the influence of wind turbines on the power quality of the grid. Moreover, power equipment to enhance or control power quality is discussed. The third part presents different types of grids. Each of these standardised grids defines a number of demands and characteristics for a specific wind turbine design. Therefore, each grid presents different market demands. The last part of the chapter focus on integration issues on large amounts of wind power in the power system.

4.1 Grid Generics and Main Focus

A power supply system consists of three main components: 1) power generation units, 2) a grid and 3) loads, which are the customers. The primary aim of a power supply system is to meet the demands for energy imposed by the customers. The function of the grid depends on the size of the power supply system. If the amount of generated, distributed and consumed energy is of considerable size, the grid is divided in a transmission grid (high voltage) and a distribution network (medium and low voltage).

The activities related to "large", deregulated, power supply systems, i.e. generation, transmission and distribution, are in general widely different. Therefore, these activities are (or may be) covered by different supply organisations, e.g. power generation companies, transmission system operators and distribution system operators. The function of the transmission grid is to transmit energy from large power generation plants to the distribution networks, whereas the distribution networks distribute the energy from the transmission grid or from small/local power generation plants to the customers. The main objective of the power generator companies is to produce power at a cost efficient price. Meanwhile the two other organisations have a number of objectives to pursue, which may be summarised by the following goals: to achieve an acceptable level of reliability, quality and safety for the power supply at an economic price – since the price a customer has to pay is determined by the costs of the associated generation, transmission and distribution. Moreover, the transmission system operators are responsible for the overall energy production planning in their own area.

To be able to fulfil the objectives of reliability, quality and safety for the power supply at an economic price, the system operator of the transmission grid has to attend to a number of tasks, e.g.:

- To form and specify Power Station Specifications.
- To plan further development of the transmission grid.
- To contribute to optimal allocation of resources, including balancing of the requirements on various types of plants.
- To ensure the properties essential for the power system operation as regards reliability, power quality and security of supply in the short term as well as in the long run.

On a distribution network level, the same tasks are valid for the system operator of the distribution network.

The key issues for the last task are: power system control and power system specifications. The purpose of power system specifications is to ensure certain abilities and characteristics in the power input for use in the operation and control of the power system. In this way, it becomes possible to operate and control the power system under various load conditions and disturbances. Thus, the main control aspects are power system stability and power quality.

In the rest of the report, focus will be on power quality. Other important issues, which will not be discussed, are various economic items.

4.2 Power Quality and other Demands to Grid Connection

The used term 'Power Quality' is usually considered to include two aspects of power supply, namely Voltage Quality and Supply Reliability (CIGRE WG14-31, 1999). The Voltage Quality part includes different disturbances such as: rapid changes, harmonics, interharmonics, flicker, unbalance and transients, whereas the reliability part involves phenomena with a longer duration, like interruptions, voltage dips and sags, over and under voltages and frequency deviations. Figure 52 gives a simplified view of the characterisation of Power Quality.

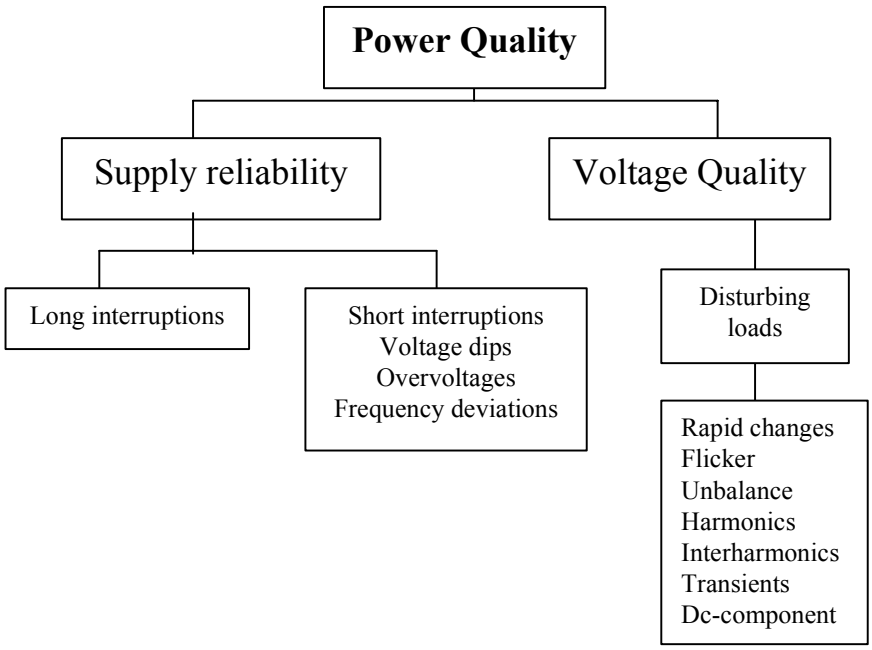

Figure 52. Simplified characterisation of Power Quality.

To give a complete idea of Power Quality, also a third phenomenon may be introduced, i.e. information (Thomsen, 1999). Information about planned outages and information after faults and disturbances, give the customer a better impression of the quality of supply, and of the supplier. So as to complete the term Power Quality a figure like Figure 53 can be drawn.

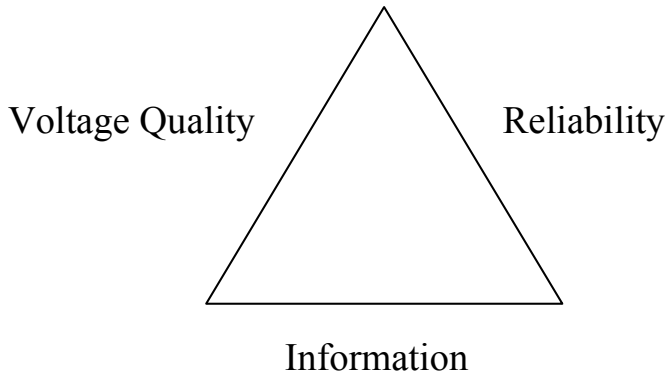

Figure 53. Three important factors for Power Quality.

With the emergence of computers, a high level of automation with sensitive loads and modern communication, reliable electricity supply with a good voltage quality has become a necessity. Electricity is fundamental to economic activity, to the standard of living and quality of life. Over the last ten years the customers perception of reliability has changed. Outage times of a few cumulative hours per year are no longer considered as an characteristic of an extremely reliable supply for an increasing number of sensitive customers, in particular industrial and commercial customers. A few cycles interruption or a voltage reduction to less than 90 % may cause serious problems for industrial customers. The number of voltage dips and swells and their duration becomes more important than the cumulative outage time per year (CIGRE WG14-31, 1999).

The variety of disturbances that may affect customers' equipment are the parameters that describe Voltage Quality and Reliability, and these parameters, and equipment to compensate for their influence, will be described in the following.

4.2.1 Categorisation and characterisation of disturbances in the grid

According to (Dugan et al., 1996) and (Thomsen, 1999) the different disturbances may be classified as in Table 8.

Table 8. Categories and typical characteristics (Low-Voltage grid) for variations in the supply voltage with given voltage quality parameters. EN for chapters in EN 50160 (Thomsen, 1999).

Category	**Typical characteristics**			**Voltage quality parameters**	**EN**
	Spectrum	duration	magnitude		
1.0 Transients					9
1.1 Impulsive	5 ns - 0.1 ms	50 ns - > 1ms	< 6 kV		
1.2 Oscillatory	<5 kHz-5 MHz	5µs – 0.3 ms	0 - 4 pu		
2.0 Short duration variations					
2.1 Interruptions		10 ms - 3 min.	< 1 %	Short duration interruption	6
2.2 Sag		10 ms - 1 min.	1 - 90 %	Voltage sag	5
2.3 Swell		10 ms - 1 min.	110 - 180 %	Voltage swell	8
2.4 Rapid voltage changes		not defined	> +- 5 %	Rapid voltage changes	41
3.0 Long duration variations		stationary	< 106 % > 90 %	Supply voltage	3
3.1 Under voltages		> 1 min.	80 - 90 %		
3.2 Over voltages		> 1 min.	106 - 120 %		
4.0 Voltage unbalance		stationary	0.5 - 2 %	Voltage Unbalance	10
5.0 Curve distortion					
5.1 DC offset	n=0	stationary	0 - 0.1 %		
5.2 Harmonics	n=2 - 40	stationary	0 - 20 %	Harmonics	11
5.3 Interharmonics	0 - 6 kHz	stationary	0 - 2 %	Interharmonics	12
5.4 Notches		stationary			
5.5 Noise	Broadband	stationary	0 - 1 %		
5.6 Signal transmis-sion	< 148 kHz	stationary	0.09	Signal transmis-sion	13
6.0 Voltage - fluctuations	< 25 Hz	intermittent	0.2 - 7% Plt< 1	Voltage Fluctuations (flicker)	4.2
7.0 Net frequency-variations	50 Hz	< 10 s	1 %	Net frequency	1

These categories and the description of the different disturbances in Table 8 are important to classify measurement results and to describe the actual phenomena, which may cause the Power Quality problem. These disturbances are not all new, and the utilities are aware of them. However, they have to take a new look because of the rapidly changing customers' needs and the nature of loads (CIGRE WG14-31, 1999). This may force the utilities to be able to provide value-added options to industrial and commercial customers relating to their specific needs. The way to give some customers better service than others is by using Custom Power equipment to secure better reliability and improved voltage quality.

Another way to categorise the different disturbances is to look at possible causes for each kind of disturbance and to look at the consequences they might give. They are summarised in Table 9.

Table 9. Voltage disturbances their origin and their consequences (Thomsen, 1999; CIGRE WG14-31, 1999).

Disturbance		Origin	Consequences
Voltage sag undervoltage 2.2		Short circuits in the network grid passing or on another radial. Start up of large motors	Disconnection of sensitive loads Fail functions.
Voltage swell Overvoltages 2.3		Earth fault on another phase Shut down of large loads Lightning strike on network structure Incorrect setting in substations	Ageing of insolation Disconnection of equipment May harm equipment with inadequate design margins
Harmonic distortion 5.2-5.3		Nonlinear loads Resonance-phenomena Transformer saturation Notches	Extended heating . Fail function of electronic equipment
Transients 1.1-1.2		Lightning strike Switching event	Insulation failure Reduced lifetime of transformers, motors etc.
Voltage-fluctuations/ flicker 6.0		Arc furnaces Sawmill, crushing mill Welding Wind turbines Start up of large motors	Ageing of insulation Fail functions Flicker
Short duration interruptions 2.1		Direct short circuit Disconnection False tripping Load shedding	Disconnection Disconnection
Unbalanced 4.0		One phase loads Weak connections in the network	Voltage quality for overloaded phase Overload and noise from 3-phase equipment

In Table 9, the distortion caused by DC-offset is not taken into account. This is not considered by IEC. The DC-offset may occur from geomagnetic disturbance or due to the effects of half-wave rectification. Also voltage setting on equipment with iron cores, or short circuits close to the generators can give DC-offset in the voltage. The consequence of a DC-offset is that transformer cores may be biased, so they can saturate in normal operation, leading to heating and loss of transformer life. DC-current can also cause electrolytic erosion of grounding electrodes and other connectors (Dugan et al., 1996).

Also interharmonics are not mentioned in Table 9. Interharmonics are sinusoidal voltages and currents having a frequency that are not an integer multiple of the frequency of the supply voltage. Depending on the source of the interharmonics, they appear as discrete frequencies or as a wideband spectrum. The main source of interharmonics is static frequency converters, cycloconverters and arcing devices. Interharmonics may affect power line carrier signalling, and can induce flicker in display devices such as cathode ray tubes (Dugan et al., 1996).

Finally, power frequency variations are not mentioned in Table 9. The frequency of the power system is directly related to the rotational speed of the generators supplying the network. Frequency variations occur when the dynamic balance between load and generators change, the size and duration depending on the load characteristics and the response of the generation control. Large frequency deviations may be caused by faults on the bulk power transmission system, disconnection of large blocks of load, or a large source of generation going off-line. On modern interconnected power systems, this kind of frequency variation is rare, but the phenomenon may occur on isolated systems.

All the different Power Quality terms are now defined and the origin of the different disturbances is also mentioned. One could also claim that reactive power should be a Power Quality parameter, but in the literature, it is not defined as an independent Power Quality parameter, since the voltage is chosen here as the Power Quality parameter. It may be relevant to take the reactive power into consideration, since the magnitude of the losses in the network and the sizes of transformers and generators may be increased, due to the reactive power in the network. The losses in the network result in large voltage drops, giving rise to poorer Voltage Quality. With the above terms of Power Quality, the effect of the reactive power must be considered under the term voltage fluctuation, and the effect of reactive power must then be compensated with regard to this term (Thomsen, 1999).

4.2.2 Equipment used to enhance the Power Quality.

In this section, the focus will primarily be on the distribution level (up to 60 kV), where equipment used to enhance the Power Quality is called Custom Power Systems (CUPS), as opposed to equipment used on the transmission level, which is called Flexible AC-systems (FACTS). Anyway for some of the apparatus used on the distribution level, corresponding apparatus exists on the transmission level, and this relationship is shown in a later table.

There are many different types of apparatus, which may be used to enhance the Power Quality, and these may be divided into three groups:

- On/off apparatus, switches
- Stepwise controllable apparatus
- Continuously controllable apparatus

4.2.3 On/off apparatus, switches

On/off apparatus is installed typically at industrial or commercial facilities, with a dual, medium voltage supply, to switch between service from one source to the other. Electromechanical switches normally take from 1 to 10 seconds to switch. Such electromechanical switches are too slow to protect sensitive electronic devices, which are sensitive to, for instance, voltage sags and swells. Here solid-state switches based on GTO thyristor technologies are emerging in transfer switch, fault current limiter, and breaker applications (CIGRE WG14-31, 1999). At 600V level and below the Voltage Static Transfer Switch, which uses low voltage power electronic devices, is being used. The use for medium-voltage power electronics for similar applications has evolved in the recent past. In the case of local generation or in case where a transfer between asynchronous sources is needed, solid state breakers may be useful. These are able to interrupt current and they use GTO's or equivalent. Solid state circuit breakers are often used in connection fault current limiters to reduce the fault current, and thereby reduce the voltage sags on the unfaulted system segments.

4.2.4 Stepwise controllable apparatus

Stepwise controllable apparatus may either regulate the voltage by use of an electronic controlled voltage tap changer, or by the use of stepwise-coupled capacitors as in Static Var Compensators or in Thyristor Switched Capacitors. Such apparatus may also be used for compensation of reactive power. In smaller systems, the electronic switches may be replaced by mechanical switches.

4.2.5 Continuously controllable apparatus

This group of apparatus will normally include a voltage source converter, controlled by various control strategies. The connection to the network grid is usually done by use of transformers. New power electronic devices such as Insulated Gate Bipolar Transistors (IGBT), Insulated Gate Commutated Thyristors (IGCT), and MOS controlled Thyristors (MCT) are used in the converters. Depending on the topology used for the converters they are split up into two groups:

1) Shunt converters.
2) Series converters.

The shunt converter injects current into the network at its coupling point. This current injection may then be used to compensate for different disturbances. Typical shunt connected apparatus may be the following: Static Var Compensator SVC, Static Synchronous Compensator (STATCOM) and for harmonic compensation Active Harmonic Filters (AHF).

The series converter injects a voltage with a certain phase lag or lead to the line between the supply and load. The resulting power flow in the circuit where the voltage is injected will be changed, dependent on the resulting voltage and phase-shift across the load. The most frequently used series apparatus is the Dynamic Voltage Restorer (DVR).

Shunt connected compensators are useful for cancelling out disturbances in the network current, whereas the series compensators are useful for cancelling out voltage disturbances at the load side.

The two kinds of apparatus may also be combined. The apparatus is then called a Unified apparatus, for instance a Unified Power Quality Conditioner (UPQC).

Finally, the active compensator may be combined with passive filter elements. Then the apparatus is called hybrid apparatus. Some of the compensators also have an energy storage device connected, to be able to deliver active power, and not only reactive power. In this way also voltage dips and voltage fluctuations may be compensated. Depending on the amount of energy stored, different sizes and duration of the dips can be compensated. On some occasions a shunt apparatus in connection with a series apparatus can replace the energy storage device. A Unified Voltage Controller (UVC) is an example of such an apparatus.

An overview of the different kind of apparatus used at the distribution level (CUPS) and at the transmission level (FACTS) is shown in Table 10.

Table 10. Different CUPS and FACTS apparatus (Thomsen, 1999).

Generation group 1 is the first generation converters and is based on thyristors and current source line- commutated converters

Generation group 2 is second generation converters and is based on self-commutated converters with either GTO's or IGBT's in voltage source converters.

Generation - Group	CUPS	FACTS
1 – shunt		SVC Static Var Compensator
1 – series		TCSC Thyristor Controlled Series Capacitor
On/off apparatus		
1-2 – on/off	SSB Solid State circuit Breaker SSTS Solid State Transfer Switch or STS Static TS BTS Bus Transfer Switch	
1-2 – on/off	FCL Fault Current Limiter	
Stepwise controllable apparatus		
1-2	SVR Static Voltage Regulator SSLTC Solid State Load Tap Changer	
1-2	ASVC Advanced Static Var Compensator AVC Adaptive Var Compensator	
Continuous controllable apparatus		
2 – shunt	STATCOM STATic COMpensator or STATCON STATic CONditioner AHF Active Harmonic Filter	STATCON STATic CONdenser or ASVC Advanced SVC
2 – series	DVR Dynamic Voltage Restorer SABF Series Active Blocking Filter	SSSC Static Synchronous Series Compensator PAR Phase Angle Regulator or PAC Phase Angle Controller
2 – Combined	UPQC Unified Power Quality Conditioner APLC Active Power Line Conditioner UVC Unified Voltage Controller PQM PQ-Manager, Hybrid	UPFC Unified Power Flow Controller

Oscillating transients generated by coupling of capacitors must be eliminated at the generation point by use of coupling resistors or techniques, such as synchronised coupling or passive filters have to be used because of the high frequency (Thomsen, 1999).

Table 11. Compensation apparatus for different disturbances (Thomsen, 1999).

Distortions		Apparatus	Effect
Voltage dip and sags 2.2		StatCom. DVR UPQC	Moderate Good Good
Voltage swell 2.3		StatCom DVR UPQC	Moderate Good Good
Harmonic distortion 5.2 - 5.3		AHF SABF APLC, UPQC	Filtering, good Does not block alone Good, efficient
Voltage-fluctuations 6.0		StatCom □ASVC□ DVR UPQC	Good questionable Best
Short duration inter-ruptions 2.1		StatCom DVR UPQC	UPS -function Hardly, but possible with UPS-function UPS - function
Unbalance 4.0		StatCom DVR UPQC, UVC	Moderate, problematic Good Good, difficult

4.2.6 Measures and indicators

Different types of disturbances have been described in this section. Measurements and indicators are needed to identify the nature of these phenomena. In connection with wind turbines, methods for measurement and assessment of the influence of wind turbines on the power quality are specified in (IEC 61400-21, 2000). This standard includes measures for maximum power, reactive power, voltage fluctuations and harmonics.

The following three measures related to voltage fluctuations and flicker are used:

- Flicker coefficient $c_f(\psi_k,v_a)$ – is used to characterise the flicker emission from the wind turbine in continuous operation e.g. in the PCC (Point of common coupling) without generator couplings. The flicker emission for continuous operation is defined to be:

$$P_{st} = P_{lt} = c_f\left(\psi_k, v_a\right)\frac{S_n}{S_k}$$

  where ψ_k is the grid short circuit angle and v_a is the annual mean wind speed, while S_n denotes the nominal apparent power of the wind turbine and S_k is the apparent short circuit power e.g. in the PCC. According to the standard, $c_f(\psi_k,v_a)$ is given in a table with four values of ψ_k and v_a respectively, and the value in an actual case is obtained by interpolation of ψ_k and v_a.
- Flicker step factor $k_f(\psi_k)$ – is used to characterise the flicker emission from the wind turbine arising from generator switching operations. The short term flicker emission is defined to be:

$$P_{st} = 18\cdot\left(N_{10}\right)^{0.31}\cdot k_f\left(\psi_k\right)\cdot\frac{S_n}{S_k}$$

  where N_{10} is the number of switching operations occurring during ten minutes. The long-term emission is defined to be:

$$P_{lt} = 8\cdot\left(N_{120}\right)^{0.31}\cdot k_f\left(\psi_k\right)\cdot\frac{S_n}{S_k}$$

  where N_{120} is the number of switching operations occurring during 120 minutes.
- Voltage change factor $k_u(\psi_k)$ – is used to characterise the voltage changes, which occur on switching. The relative voltage change in %, d, is defined as:

$$d = 100\cdot k_u\left(\psi_k\right)\cdot\frac{S_n}{S_k}$$

The above formulas for assessment of the influence of a wind turbine on the power quality are valid for a single wind turbine. (IEC 61400-21, 2000) also specifies methods for summation of the effect of wind turbines in a cluster, or a wind farm, taking into account the smoothing effect of the contributions from the individual wind turbines.

Another basic characteristic measure, which has been used in earlier standards, is the cut-in current factor k_i:

$$k_i = \frac{I_{max}}{I_r}$$

where I_{max} denotes the maximum current during one half period and I_r denotes reference current of the wind turbine/farm (both are rms. values). The cut-in current factor is usually used to specify an upper limit for the current at cut-in of a load (passive as well as active). The cut-in current factor k_i has been used to predict the maximum voltage change substituting $k_u(\psi_k)$ in the above equation. However, this method is conservative, because it does not take into account the influence of the impedance angle of the grid. This is particularly relevant for the cut-in of induction generators on grids with high values of short circuit impedance angle, because typically I_{max} is due to reactive power, and therefore $k_i > k_u(\psi_k)$

A widely used technique in signal analysis is to analyse a signal by its Fourier transform. This technique is especially relevant in connection to wind turbines provided with power electronic, due to the harmonics produced by the switching patterns of the applied power electronic device.

The ideal case is a sinusoidal voltage and a sinusoidal current, with a frequency of 50 Hz. In order to be able to describe deviations from the ideal case three different measures have been defined as presented below (Arrillaga et al., 2000):

- Total harmonic voltage distortion is given by:

$$THD_{U\%} = \sqrt{\sum_{h=2}^{40}\left(\frac{U_h}{U_1}\right)^2} \cdot 100\%$$

  where U_h denotes the amplitude of the h'th harmonic. A small THD_U value indicates a signal close to the ideal case. Thus, THD_U is a normalised measure of the harmonic content due to over harmonics up to and including the 40^{th} harmonic.

- Total voltage distortion factor is given by:

$$TDF_{U\%} = \frac{\sqrt{U_{rms}^2 - U_1^2}}{U_1} \cdot 100\%$$

  This includes all kinds of distortion. A small TDF_U value indicates a signal approaching the ideal case. TDF_U can be seen as a normalised measure of the energy of the sinusoidal signal content at frequencies other than 50 Hz.

- The weighted distortion factor is given by:

$$THD_w = \sqrt{\sum_{h=2}^{N}\left(h \cdot \frac{U_h}{U_1}\right)^2}$$

  The weighted distortion factor is dedicated to systems employing shunt capacitors, as it weights the higher frequencies in a manner corresponding to the frequency dependence of the current in a shunt capacitor.

4.3 Standardised Grids

The economic viability of a wind turbine investment is judged e.g. by its pay-back time. The energy production at a given site is a key parameter for this calculation – in other words, the focus is on the power curve of the wind turbine. Here the type of grid and type of wind turbine are of great importance.

In this section, standardised grids are discussed and reviewed. The focus is on how to characterise a particular grid and differentiate between it and other grids. The generic type of a grid will impose certain demands on the grid connection of a wind turbine and/or wind farm. These demands are usually defined at the point of common coupling.

4.3.1 Basic grid properties

A simple way to analyse or to characterise a grid/network is to approximate it by a first order equivalent as shown in Figure 54. If the load Z_l is displaced by a short circuit, the apparent short circuit power may be calculated as:

$$S_k = \sqrt{3} \cdot U_n \cdot I_k$$

in the case of a three phase system.

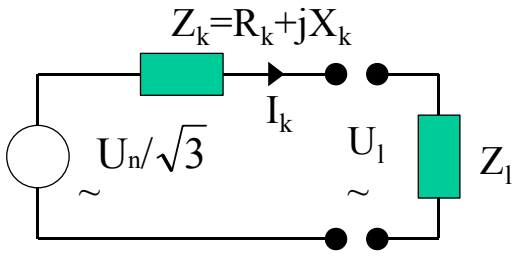

Figure 54. Simple grid equivalent.

A basic characteristic measure of a grid is the short circuit ratio (KR 111, 1998):

$$R_{sc} = \frac{S_k}{S_r}$$

where S_k denotes the short circuit power and S_r the apparent power reference of the wind turbine/farm. This ratio reflects the stiffness of a grid, i.e. a higher value of R_{sc} indicates a stiffer grid. In a sense the short circuit ratio describes the capacity of a grid compared to applied load.

Another characteristic grid measure is the short circuit angle (IEC 61400-21, 2000):

$$\psi_k = \mathrm{Arctan}\left(\frac{X_k}{R_k}\right)$$

where R_k and X_k denote the short circuit resistance and the short circuit reactance of the grid respectively, as indicated in Figure 54.

A simplified description of the load voltage at steady state conditions may be obtained by:

$$U_l = U_n - \frac{R_k \cdot P_l + X_k \cdot Q_l}{U_n}$$

where P_l is the active power production and Q_l the reactive power consumption of the load, respectively. Thus given knowledge of the grid and the load, it is possible to estimate whether or not the load voltage is within specified limits.

4.3.2 Various grid types

One way to describe a grid is by referring to a number of characteristic grid parameters. The first and most important parameters are the voltage level and the kind of source, i.e. either DC or AC. Two other characteristic parameters are the apparent short circuit power and the short circuit angle. Another way is to characterise a grid by certain properties. Examples of terms in use are:

- transmission grid
- distribution grid
- AC or DC grid
- stiff grid
- weak grid
- isolated grid

The first two properties are related to the voltage level. Issues concerning these properties were discussed in Section 4.1.

4.3.2.1 Stiff or weak grid

The properties stiff and weak are more difficult to handle in a short and precise definition. A stiff or a weak grid is not just a stiff or a weak grid, independently, since a grid could be characterised e.g. as frequency stiff and voltage weak. A frequency weak grid would influence the energy production of a fixed speed wind turbine in a less desirable manner. This has been studied in e.g. (Sørensen et al., 2000). Another problem related to the stiff/weak property is that, while a grid with a few connected wind turbines is stiff, the same grid might be characterised as weak at a higher number of connected wind turbines.

In order to assure a proper operating condition for the wind turbine and acceptable reliability and power quality for the grid, recommendations and standards have been developed for connection of wind turbine to the distribution grid. In Denmark, (KR 111, 1998) specifies the requirements for grid connection of wind turbines to the distribution system, based on the characteristics and methods specified in (IEC 61400-21, 2000).

Power quality and other issues related to grid-connected wind turbines are highlighted in a simulation study contained in three reports:

- (Jørgensen et al., 1996) with the focus on steady state voltage conditions. The influence of wind turbines on three different grids is analysed.
- (Sørensen & Kledal, 1996) with the focus on flicker. The flicker impact from both stall regulated and pitch controlled wind turbines is analysed on two different grids.

- (Vikkelsø et al., 1996) with the focus on harmonics and operating conditions of variable speed wind turbines. The distribution of harmonics is analysed for six different configurations of wind turbines on one grid.

If a project aims at installation of a wind power (or any other renewable source) on a weak grid, three options should be considered:

1. Appropriate reactive power compensation etc. of fixed speed wind turbines.
2. Use of wind turbines with controllable power output.
3. Reinforcement of the grid.

Which of these options is the right choice depends on the economics of the three options and the local planning.

4.3.2.2 Isolated grid

An isolated grid is a very ambiguous term. There are no well-defined upper or lower power limits. The term covers a variety of system types, e.g.: wind-diesel, hybrid power, stand-alone etc. The characteristics of an isolated grid are typically equivalent to those of a weak grid. (EN 50160, 1999) is the only identified standard with recommendations for isolated grids.

4.3.3 Off-shore wind farms on the transmission grid

As mentioned in Section 3.3.3, energy planning of the Danish Government has scheduled a number of offshore wind farms. According to the plan, the first two will be ready for operation in 2002 – each rated at 150 MW. By the year 2030, 50 % of the electrical energy consumption in Denmark will be supplied by wind energy.

The Danish power system operators Elkraft System and Eltra are responsible for the integration of these wind farms. Due to their rated power, they will be connected directly to the transmission grid. The specifications for connecting these wind farms are presented (Eltra, 2000).

As usual, specifications for frequencies, voltages, reactive power compensation, voltage quality and fault protection are presented. As a new item, requirements production control has been introduced (Eltra, 2000). Moreover, more stringent stability requirements and requirements for operation during grid faults have been incorporated.

In this context the requirements for production control are of great interest. Referring to (Eltra, 2000), it shall be possible to:

- control the production from the wind farm so that it does not exceed a certain MW-value, i.e. a production limit
- control the production limit by a single central signal
- control individually each wind farm
- have the control to act on the individual wind turbine
- control the production quickly, i.e. a reduction from 100% to below 20% of maximum power in less than two seconds.

Furthermore, high wind speed may not cause all the turbines to stop simultaneously.

These specifications impose new and challenging demands on the art of wind turbine design. As a new task the manufacturers must gain knowledge on how to construct and operate the local wind farm grid. This will imply development of new control strategies for park control, which can take account of the external power production demand, and of internal dispatching of wind turbines.

4.4 Power system integration

So far in the report the focus has been on single wind turbines with their drive train/power conversion system and their internal electrical layout and grid connection. In this section the focus is the integration of large amounts of wind power in a power system and the implications of that on both the wind farm and the rest of the system (transmission, generation, consumption).

In power systems with a high level of wind energy penetration it is necessary to adapt the wind turbines (or the wind farm) and the rest of the power system in order to ensure optimal operation of the combined system. Optimal operation in this context means the lowest operating cost of the complete system as well as maximum utilization of the wind energy.

The fast installation of wind turbine capacity is not the only change with a large impact on the power system. The power system and its organization is currently undergoing rapid changes as a result of both technological development and the political requirement to have a liberalized sector and a more sustainable system.

The technological development takes place in many areas such as micro combined heat and power plants (fuel cells, microturbines etc.) and pv-systems for distributed generation. Also the large development effort in hydrogen and energy storage technologies will have a large impact on the power system in the next 10-15-20 years. In this time frame the information technology will also be widely applied for control and automation of production, transmission and consumption.

Integration of wind energy therefore has to be seen both in the light of the current power system and in view of the opportunities which the future technology will open as it will be developed and implemented.

The fast implementation of wind energy in certain regions results in large regional power systems with very high wind energy penetration levels. This leads to problems for the Transmission System Operator (TSO). These problems include unit commitment, scheduling and dispatch, problems of the controllable power plants, transmission bottlenecks, voltage, angle and transient stability, large power exchanges with neighboring systems, trading problems on the power exchange and other similar problems. These problems off course exist in any power system but the impact from the wind turbines changes many of the well-known problems and therefore requires new solutions to planning, design and operation of the power system.

In order to mitigate these problems it is necessary to view the system as a whole, to exploit the possibilities that already exist in the system and to focus development activities on solutions that combine many different technologies.

Some of the main problems are the voltage control of the system, the need to be able to follow the load and the robustness of the system to faults and trips of both generation and transmission capacity.

As mentioned in Section 3.3, the connection of a wind farm to the grid has a large impact on the voltage at the point of common coupling and in an area close to that. It can also have large impact on the voltage stability due to the reactive power consumption if directly connected induction machines are used in the wind turbines (and there is no extra compensations apart from no-load consumption).

The fluctuating nature of wind power implies that wind power only in a limited way can contribute to the load following capability of the system and since the amount of power produced from more dispatchable sources is reduced there is a trade off between reduction in spinning capacity and the need to be able to cover the load given the fluctuation in the wind power production.

Arguments along the same line are valid regarding the need for the system to be able to pick up load in the case of faults in generators or the grid. In high penetration systems there is a need for the wind turbines (or wind farms) to be able to stay connected during some faults and to find (economic) solutions that enable the system to withstand such perturbations.

Many technical options exist that can be used in combination with wind energy to ease integration and to improve the value of wind energy.

One of the immediate technologies that can be utilized is implementation of wind power production prediction systems [Nielsen et al., 2001], [Giebel et al., 2001]. These have been under development for several years and they have also been installed in load dispatch centers in e.g. Denmark and Ireland, [www.predictor.dk]. The methods that are applied are both statistical and based on physical models like weather forecasts. The systems are used to predict the wind power production that will be fed into the system in the next 24-48 hours and thus to reduce the uncertainty associated with the production. The other types of generation can therefore be committed, scheduled and dispatched in a more economic way. The prediction of wind power production also improves the trading at the power exchange. Both these elements improve the value of wind power in the system.

In order to further improve the integration of wind energy by reducing the power fluctuations the recent development of large-scale power and energy storage has shown much promise. Power and energy storage in the system give many improvements to the way the power system can be operated. These possibilities are also attractive in a general power system perspective and are not linked exclusively to integration of wind power. The four main features are the buffering of energy, the peak shaving ability, the ability to contribute to black start of the grid and the improved utilization of the transmission grid. In this context, the wind power storage systems can reduce or eliminate the short-term fluctuations making it possible to reduce spinning reserve of the system. It will also make it possible to have the wind farms to contribute to the frequency control of the grid and to reduce the stress on the links in and out of the control area.

Until recently the main form of energy storage was lead-acid batteries. However, these batteries are not suited for large-scale storage applications. The main reasons are the investment costs, the maintenance requirements and the limited

and uncertain lifetime of the system, [Drouilhet & Johnson, 1997]. New types of batteries have been developed recently, and some of the most promising types are the so-called redox flow or reversible fuel cell types of storage. These types of batteries have some very desirable features. The first and foremost is the ability to independently size the power and the energy capacity of the storage. This is due to the way the system works. The power exchange happens in a cell stack in which the two electrolytes are flowing separated by a membrane that permit ions to travel from one side to the other. The electrolyte is pumped through the cell stack and is stored in tanks outside the cell stack. The power capacity of the battery is determined by the area of the membrane while the energy capacity is determined by the volume of the tanks (or rather by the volume of the electrolyte stored in the tanks). Further is the self discharge practically zero, the efficiency is high (above 80%) and the lifetime can be very long, [Hawkins, 1998]. The cost of the systems is also relatively competitive even at this stage of development and further reductions are foreseen. Commercial products already exist (from Regenesys Technologies Ltd., UK), [www.regenesys.com]. Vanadium based system are in the final development phase.

In Section 3.3 it was shown how power electronics can be used in combination with wind farms to improve the integration by reducing the impact on voltage level and fluctuations in the grid close to the wind farm. Power electronics can also be installed in central places in the grid in order to improve the capacity of the grid by dynamically controlling the voltage (Flexible AC Transmission Systems, FACTS, such as STATCOMs, DVRs, UPQCs and HVDC). Combined control of these devices will contribute to the improved integration of wind power and it will also improve the utilization of already existing transmission systems.

The predicted development of distributed power production technology will have a large impact on the operation of the system. It can be expected that a very large number of small (5-10kW) systems will be installed in houses for combined power and heat production. There will also in some areas be a rapid increase in the installed capacity of pv-systems as these systems come down in price. This will be in contrast to the trend in wind energy, where the new capacity will be very concentrated in the areas with the highest wind resources. The control of this distributed generation system will be a big challenge, but there will be many control options that eventually could utilize also in the view of integrating wind power. One of the fuels in such a system could be hydrogen.

Utilization of hydrogen also has a large perspective. Hydrogen could be produced by electrolysers that are operated during off-peak hours or in situations with a large wind power production and a low consumption. The hydrogen can then be stored until consumption rises or during peak hours to produce power to the grid. It could also be used, as mentioned above, in a system with micro CHP plants in individual houses or it can be used in transportation. In this way renewable energy can be used to produce fuel and thus contribute to a more sustainable transport sector. The scheduling of the electrolysers can significantly increase the amount of wind energy that can be integrated in the power system.

It is evident from the above, that control of the system is a crucial aspect. If the possibilities mentioned above are to be realized, it is necessary to develop the control technology and the systems, which are used to control the power system. Application of new possibilities coming from the rapid development information technology is a prerequisite if this is to be realized.

5 Summary

This report presents a survey on electrical machines and power electronic concepts for wind turbines as well as the grid integration aspects of them.

The state-of-the-art of wind turbines seen from electrical point of view includes old and new potential concepts of generators and power electronics based on technical aspects and market trends.

The chapter on generator presents the electrical machines used in wind energy conversion and identifies potential new types of machines. Starting with the classical and commercially agreed induction machine in both types, squirrel cage and wound rotor, the report focus in synchronous machines (permanent magnet and wound rotor), switched reluctance machine and transverse flux machine. Another considered candidate is the high voltage machine for power from 3MW and upward. Each machine has advantages and drawbacks.

- The squirrel cage induction machine has a very simple and reliable construction and there are no needs of special maintenance, however it has to be supplied with reactive power via the supply terminals although it.
- The wound rotor induction machine has a weak spot in the presence of the slip rings and brushes, it is more expensive than the squirrel cage machine and requires special maintenance. However, the presence of slip rings makes possible to control from outside the electrical characteristics of the rotor, by means of electric equipment.
- The synchronous machine is very attractive for direct drive applications although involve synchronous operation. The wound rotor machine is vulnerable to vibrations and the slip rings and brushes require special maintenance. The permanent magnet machine eliminates some disadvantages of the wound rotor machine, however it raises problems concerning the temperature and weight of the magnets and the fault capability.
- The switched reluctance machine and the transverse flux machine have not yet implemented in wind energy conversion systems. The switched reluctance machine has the advantages of squirrel cage induction machine regarding the simplicity and robustness of the rotor and it is suitable for low speed operation. However it requires a sophisticated power converter and control.
- The transverse flux machine offers high-values of specific torque and it is suitable for direct drive applications, although it has a large number of individual parts and special methods of manufacturing and assembly.
- Finally, the high-voltage machines manufactured currently as induction and synchronous machine offers a reduction in current, leading to lower copper losses and a possible direct connection to the grid.

The chapter on power electronics deals with two issues: power converter components for wind turbines and power electronic units for wind turbines. The first issue comprises the soft-starter, the capacitor bank, the diode rectifier and five frequency converter topologies (back-to-back PWM-VS converter, tandem converter, matrix converter, multilevel converter and resonant converter). A comparison of these converters is carried out with advantages and drawbacks for each one. As the back-to-back converter is state-of-the-art today in wind turbines it can be used as a reference in a benchmark of the other converter topologies regarding the number of the components and their ratings, the auxiliary components, the efficiency, the harmonic performances and implementation. Nevertheless, the comparison concludes and recommends further studies on

back-to-back converter, the matrix converter and the multilevel converter. Wind farms and wind power plants connected to the grid requires full control of the active- and reactive power transferred with the grid. This demand can be done by means of reactive power compensations units, power regulation and power storage unit. Examples of reactive power compensation units are SVC, ASVC and STACOM inverters. Pitch angle control is a simple and direct example of power regulation as well as dump loads and disconnection of wind turbines. Pumped storage may be an option, although further developments of batteries, fuel cells and other storage technologies must be done. HVDC could be in the future a solution for transmission of power over long distance from a number of wind power plants, both offshore and on-land. This will open new possibilities for variable speed control of wind turbines.

The chapter on grid integration presents two main aspects: power quality and demands to grid connection, and the grid classification. The disturbances in the grid are classified and described using different criteria, as typical characteristics and origin of them, in order to classify measurements results and to describe globally the Power Quality. Then, the apparatus, which may be used to enhance the Power Quality both at the distribution level and transmission level, are presented (on/off apparatus, switches, step-wise controllable apparatus, continuously controllable apparatus). Finally, standardized grids are discussed and reviewed. The focus is on how to characterize a particular grid and differentiate between it and other grids. Each generic type of a grid will impose particularly demands on the grid connection of a wind turbine, wind farm and/or wind power plant.

The report highlights a very important issue. The energy conversion system between the wind turbine and grid has to be treated in an unified way and must satisfy the grid connection demands. Since the electrical machine candidates have advantages and drawbacks as well as the power converters, it is necessary to analysis this assembly based upon some indicators as:

- Overall efficiency.
- Power flow capability.
- Range of speed operation.
- Machine weight.
- Reliability and maintenance.

Trends and further research

At present, the Danish power grid holds more than 2 GW installed wind power as well as small Combined Heat and Power Plants with a capacity of more than 1.5 GW. Both types of plants are independently controlled and do not take part in the voltage and frequency control. Furthermore, a huge expansion of wind power is planned. The power system stability limit in power systems with a high penetration of wind energy is important to identify and to improve in order to obtain the maximum value of the wind energy in the grid system.

The major investment of wind turbines will in the future be done in wind farms with hundreds of MW power capacity. In order to maintain system stability it is important that each wind farm can provide voltage and frequency control by means of power electronic systems. Furthermore, a high penetration of wind power in a power grid structure may test the limits of power stability in the grid system as well as cause power overflow in certain areas.

During the last years the wind turbines have grown in size up to 2 MW and more, and this trend in size up scaling is expected to continue.

Hence, the main challenges related to technology development are then to reduce the technical uncertainties relating to production and durability for future wind energy project all over the world, to maintain the development towards a more optimal, reliable and cost-optimized technology, to improve the power plant characteristics of the wind turbine plants (power regulations shared responsibility for power system stability etc.), develop the wind turbine technology for future applications, e.g. large highly reliable machines for offshore applications in shallow or deep waters, silent, "invisible" machines for distributed installations on land or simple, easily maintained hybrid systems for smaller, isolated communities, and to develop technology that facilitates the integration of a variable energy source into the energy system such as HVDC transmission system, energy storage technologies, power flow control, compensations units (voltage, frequency, power factor, phase imbalance etc) and production forecasting and control of the wind power plants.

Issues discussed in this report are essential for meeting these challenges. In particular the rapid development of power electronics, which offers high power handling capability at lower price per kW, can benefit both the turbine development and the integration of wind farms into the power system. Hence it is expected that the application of power electronics in wind turbine will increase further. As recommendation for further research in this area it can be mentioned:

- Study and analysis of switched reluctance machine for high-power applications in wind turbines;
- Study and analysis of transverse flux machine for high-power applications in wind turbines;
- Study and analysis of double-fed induction machine and converter optimization;
- High-voltage machine design for wind turbines;
- Optimization of back-to-back PWM-VS converter;
- Study and analysis of matrix and multilevel converter for wind turbine application;
- Identification and analysis of new power converter topologies.

As medium term recommendations for research regarding wind farms and/or wind power plants:

- Infrastructure design studies;
- Dynamic interaction between wind farm / wind power plant and grid for:
    - Normal operation;
    - Fault or transient events.
- Control concepts for wind power plant characteristics;
- Energy storage;
- HVDC connection
    - Control concepts;
    - Study of steady-state and dynamic stability.

As long-term research areas it can be mentioned:

- Grid stability;
- System optimization for wind turbine, wind farm and wind power plant;
- Global optimization based on system model;
- Standardization / committee work regarding parks and grid.

Abstract (max. 2000 characters)

This report presents a survey on generator concepts and power electronic concepts for wind turbines. The report is aimed as a tool for decision-makers and development people with respect to wind turbine manufactures, utilities, and independent system operators as well as manufactures of generators and power electronics.

The survey is focused on the electric development of wind turbines and it yields an overview on:

- State of the art on generators and power electronics.
- future concepts and technologies within generators and power electronics.
- market needs in the shape of requirements to the grid connection, and
- consistent system solutions, plus an evaluation of these seen in the prospect of market needs.

This survey on of generator and power electronic concepts was carried out in co-operation between Aalborg University and Risø National Laboratory in the scope of the research programme *Electric Design and Control*.

Descriptors INIS/EDB

ELECTRIC GENERATORS; ELECTRICAL EQUIPMENT; POWER TRANSMISSION; REVIEWS; WIND TURBINES

Available on request from Information Service Department, Risø National Laboratory,
(Afdelingen for Informationsservice, Forskningscenter Risø), P.O.Box 49, DK-4000 Roskilde, Denmark.

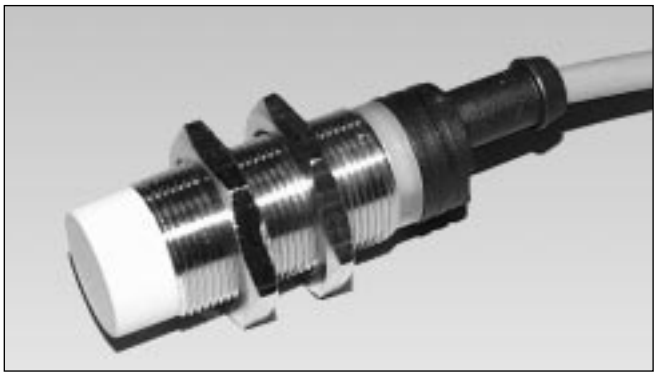
Proximity Sensors Inductive
Stainless Steel Housing
Types EI, DC, M 18, High Noise Protection

CARLO GAVAZZI



- **Stainless steel housing, cylindrical**
- **Diameter: M 18**
- **Short version**
- **Sensing distance: 8 mm**
- **Power supply: 10 to 40 VDC**
- **Output: Transistor PNP, make switching**
- **Protection: Short-circuit and reverse polarity**
- **LED-indication for output ON**
- **2 m cable**

Product Description

Proximity switch in M18 housing. Short version in standard stainless steel housing. Made after Euronorm EN 50 080. Excellent protection against electromagnetic disturbances.

Ordering Key

EI 1808 PPOS 1531X

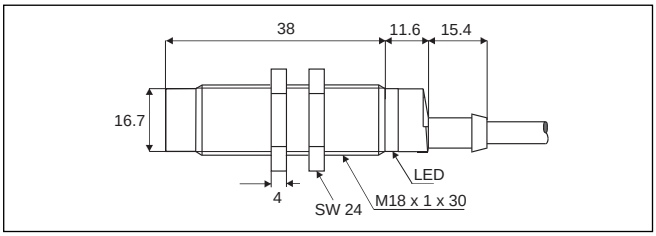
- **Type: Inductive Sensor**
- **Housing diameter (mm)**
- **Rated operating dist. (mm)**
- **Output type**
- **Housing material**
- **Special number**

Type Selection DC Type, Cable

Housing diameter	Body style	Rated operating dist. (S_n)	Ordering no. Transistor PNP Make switching (NO)
M 18	Short	8 mm [1]	**EI 1808 PPOS 1531X**

[1] For non-flush mounting in metal

Dimensions



Specifications

Rated operational volt. (U_e) (U_B)	12 to 36 VDC 10 to 40 VDC (ripple included)
Ripple	≤ 10%
Rated operational current (I_e) Continuous	≤ 200 mA
No-load supply current (I_o)	Output ON: < 6.5 mA Output OFF: < 2.7 mA
Voltage drop (U_d)	≤ 2 VDC at max. load
Protection	Reverse polarity, short-circuit, transients
Transient voltage	≤ 700 V/0.5 J
EMC	Approved according to EN 50 080, EN 50 081
Power ON delay	< 10 ms
Frequency of operating cycles (f)	400 Hz
Indication for output ON	LED, yellow
Assured operating dist. (S_a)	$0 \le S_a \le 0.81\ S_n$
Repeat accuracy (R)	≤ 5%
Hysteresis (H) (Differential travel)	1 to 15% of sensing distance
Effective operating dist. (S_r)	$0.9 \times S_n \le S_r \le 1.1 \times S_n$
Usable operating dist. (S)	$0.9 \times S_r \le S_u \le 1.1 \times S_r$

Ambient temperature	
Operating	-25° to +70°C (-13° to +158°F)
Storage	-30° to +80°C (-22° to +176°F)
Degree of protection	IP 67 (Nema 1, 3, 4, 6, 13)
Housing material	
Body	Stainless steel (1.4301)
Front	Grey thermoplastic polyester
Back	Black polyester
Connection	5 m, 3 x 0.3 mm², grey PVC,oil proof
Weight (cable excluded)	20 g
Tightening torque	27.5 Nm
CE-marking	Yes

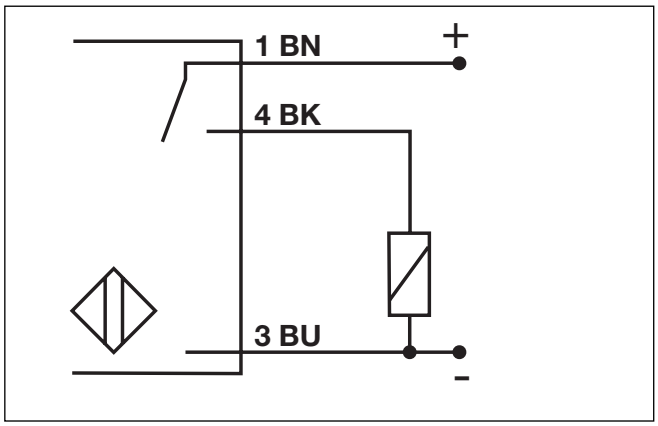
Power Supplies

Power supplies VDC: > SS 130/140.
Power supplies with amplifier relays: > SV 190.

Installation Hints

To avoid interference from inductive voltage/ current peaks, separate the prox. switch power cables from any other power cables, e.g. motor, contactor or solenoid cables	*Relief of cable strain*	*Protection of the sensing face*	*Switch mounted on mobile carrier*
	 The cable should not be pulled	 A proximity switch should not serve as mechanical stop	 Any repetitive flexing of the cable should be avoided

Wiring Diagram



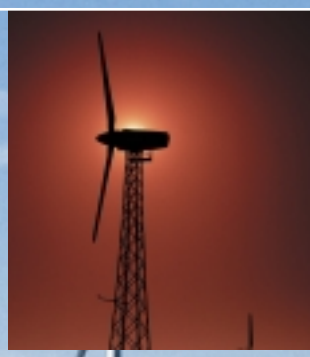
WindCon by SKF

Condition Monitoring System for Wind Turbines

Our Experience - Your Advantage

SKF

All about Performance



In recent years modern wind turbine generators have grown to become true power plants. Plants that create sufficient energy to contribute to our modern way of life and plants that generate a profit for their owners and operators. The energy they deliver is clean and inexhaustible.

To achieve all of this, the giant rotor blades must be kept turning while downtime must be reduced to a minimum.

SKF WindCon System

With the SKF WindCon System a new era of machine and system monitoring has arrived to take wind generated energy to even higher levels of performance and reliability. SKF is a world leader in Condition Monitoring and preventive maintenance systems. Using these experiences, SKF has developed a tailored, reliable monitoring system for the Wind Energy market; called The SKF WindCon System.

The SKF WindCon System enables the operator to:

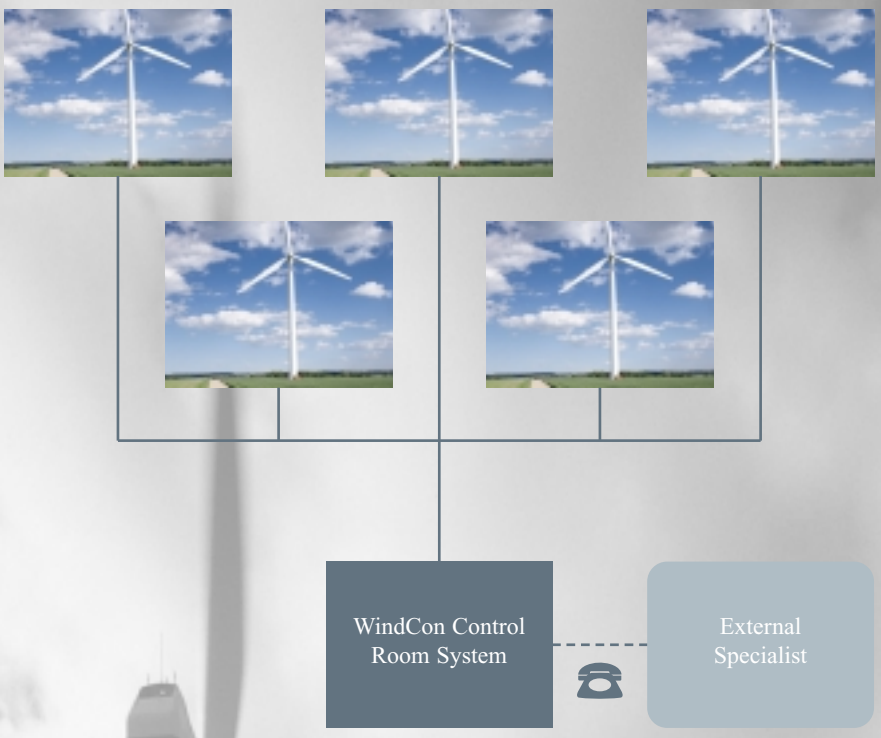
- Improve overall uptime of the wind turbine
- Enhance maintenance timing and efficiency
- Reduce the overall maintenance cost
- Detect small problems before they lead to major breakdowns
- Gather statistical data to investigate component and system trends

The SKF WindCon System provides the operator with the complete overview of the wind energy park and its mechanical condition every day – every hour – every minute.

On present and future offshore installations, the cost of simply getting to the wind turbines will be considerable, and weather conditions may make it impossible to get there during certain seasons. It is therefore of the utmost importance that the necessary measures are planned and carried out when you get there. The SKF WindCon System will equip operators with the knowledge they need in order to maximise every opportunity to carry out normal or urgent maintenance. Also the statistical data provided offers operators and manufacturers a unique possibility to analyse, learn and improve wind turbine uptime and future designs.

SKF

The Reliability Network



The SKF WindCon System is specially developed to meet the tough demands of the offshore wind turbine market, and can of course operate onshore as well.

All of SKF's extensive experience with various Condition Monitoring Applications has been used to create an optimal solution for Wind Energy Monitoring. As a result the key features of the SKF WindCon System are:

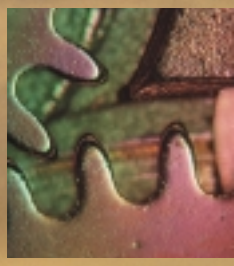
- Robustness
- Flexibility
- Easy-to-use
- State of the art analysis tools
- Experienced support from the global SKF organisation

The system can be divided into three levels:

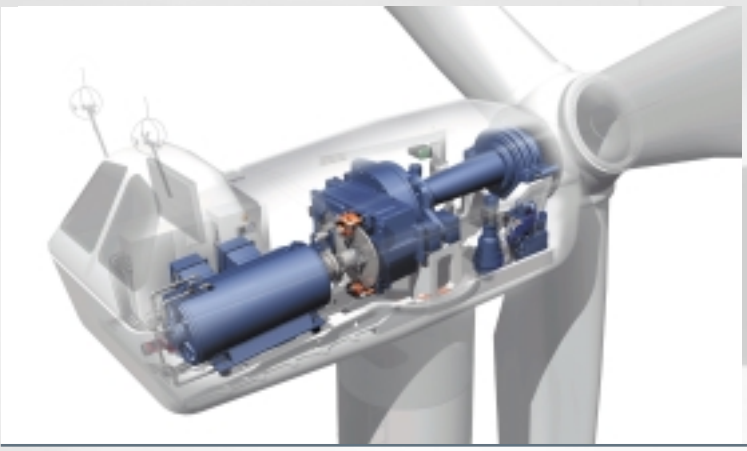
In the nacelle: Every wind turbine is fitted with the Intelligent Monitoring Unit (***i*MU**). The ***i*MU** collects data continuously from accelerometers, displacement sensors, temperature probes or other transducers (up to16 channels). Analyses are made locally, alarms checked, data stored and key data is transmitted to operator control room.

Control Room: The control room can be located anywhere convenient to the wind turbine operator. The software will monitor and store the data from the ***i*MU**'s around the clock. This central unit can be connected to several wind turbines via a TCP/IP network

Specialist hotline: Whenever questions concerning the monitored wind turbines arise, external specialists can access the system via a remote monitoring link. These specialists can be the wind turbine manufacturer or it can be an SKF Reliability Systems expert.



Robust Hardware



The Intelligent Monitoring Unit (***i*MU**) in the nacelle is fully self-supporting and does not make use of any rotating storage medium; data is stored in flash memory. The unit is very robust and fulfils the Heavy Industrial EMC norms and lightning protection requirements (railway requirements have been used as a base).

The ***i*MU** has a unique built-in hardware auto-diagnostic system which continuously checks all sensors, cabling, and electronics for any faults, signal interruption, shortcuts or power failure. Any malfunctions trigger an alarm, and in the case of system power failure the system will automatically restart when the power returns.

The ***i*MU** can be configured remotely using a graphical easy-to-use interface of the ProCon supervisory and analysis system.

The ***i*MU** offers 16 different channels to which multiple measurement points can be connected. Various types of sensors, signal and measurement configurations can be configured via the ProCon software. A typical wind turbine installation can be configured as follows:

- Main bearing 1 channel
- Transmission 4 channels
- Generator 2 channels
- Tachometer 1 channel

In addition other monitoring points may be added, e.g.:

- Tower / structure vibration
- Blade vibration
- Oil temperature
- Oil pressure
- Oil quality
- Generator temperature

SKF

Intelligent
Software

The WindCon control room system-software ProCon is running on a PC equipped with Windows 95/98/2000/NT®. This platform provides a solid foundation for networking and security protection.

All system text may be read in the user's native language. The software can even be adapted to display a customer logo. The ProCon system has Knowledge Based System features built-in which allows automatic root-cause analysis, such as:

- Unbalance
- Alignment error
- Shaft bending
- Failing couplings
- Mechanical looseness
- Faulty/weak foundations
- Bearing condition (Sleeve- and roller bearings)
- Damage on gear wheels
- Electrical problems
- Resonance problems

Based on the experience gained, the features can easily be extended with additional specific features such as Tower Vibration, Blade Vibration etc. Remote access to the system can be achieved through a phone line or the Internet.

SKF Reliability Systems

The business unit SKF Reliability Systems is uniquely equipped to help customers gain significant profits from increased productivity and maintenance-related cost-savings associated with equipment reliability.

SKF's knowledge of rotating equipment begins at the component level and extends to an in-depth understanding of the technologies and activities required to improve manufacturing processes. Our knowledge is based on nearly 100 years of application experience and technical research, while our expertise in condition monitoring adds to our service offering's overall value. This unique blend of capabilities and competences differentiates SKF from any other maintenance/reliability provider in the market.

The span of SKF Reliability Systems' every day tasks vary from mounting a single bearing on to a shaft, to making Integrated Maintenance Solutions (IMS) including commitment towards costumers based on uptime, production, equipment availability etc. Elements of tasks undertaken are:

- Vibration measurements and analysis
- Bearing failure analysis
- Mounting and dismounting services
- Application review and modification
- Customised training

The SKF Reliability Systems Team consists of highly skilled engineers and technicians with experience from almost any type of mechanical application around the world. The global presence enables SKF Reliability Systems to supply you with professional service in a fast and cost effective way no matter where.

The support offered to you by SKF WindCon System can be anything between a traditional hotline service to a complete contract on the monitoring of several wind turbines or parks. The important issue is; you will find the support and the know-how that you need within the SKF organisation – worldwide.

Revisioni

Le edizioni dei cataloghi che subiscono revisioni, riportano al centro in basso delle pagine che hanno subito delle modifiche, il relativo ultimo indice di revisione. L'elenco delle pagine interessate alle relative revisioni è a pag.224.
L'indice di revisione del catalogo è riportato nella IVa di copertina in basso al centro.

Revisions

For catalogue editions that include revised material, the latest relevant revision index is shown at bottom centre of the modified pages. The list of pages with revisions is shown on page 224. The index of catalogue revisions appears at bottom centre of back cover page.

Änderungen

Der Änderungstatus ist auf jedem Blatt unten, in der Mitte enthalten. Auf Seite 224 ist eine Übersicht der berichtigten Seiten enthalten. Die Änderung des Katalogs ist auf der letztch. Seite des Einbands unten in der Mitte siclitlich.

Révisions

Les éditions des catalogues qui subissent des révisions présentent au centre, du bas des pages ayant subi des modifications, le dernier indice de révision. La liste des pages concernées par les révisions se trouve page 224. L'indice de révision du catalogue se trouve à la IVème page de couverture en bas au centre.

1.0 INTRODUZIONE

In questo catalogo la TRASMITAL BONFIGLIOLI presenta la sua gamma di riduttori epicicloidali modulari serie 300.

Questa serie è stata ampliata ed arricchita di nuove grandezze disponibili, miglioramenti tecnici apportati e dall' estensione della modularità totale fino alle grandezze superiori. Tale caratteristica costruttiva si traduce in una migliore flessibilità produttiva interna, nella possibilità di avere in tempi brevi prodotti nelle grandezze ed esecuzioni richieste, sia direttamente dall'azienda che dalle filiali appartenenti alla organizzazione di vendita BONFIGLIOLI localizzate in numerosi paesi del mondo.

I riduttori sono verificati secondo i seguenti standard:

ISO DP 6336 per gli ingranaggi
ISO 281 per i cuscinetti

1.0 INTRODUCTION

This catalogue presents TRASMITAL BONFIGLIOLI's range of Series 300 modular planetary gearboxes.

The range has been expanded and integrated with new sizes, technical improvements and enhanced modularity right through to the larger sizes. This feature signifies greater flexibility in internal production to ensure quick availability of products in the sizes and types requested either directly from the company or from the many affiliates belonging to the BONFIGLIOLI sales network in various countries around the world.

The gearboxes are tested in conformity with the following stan-dards:

ISO DP 6336 for gears
ISO 281 for bearings

1.0 EINFÜHRUNG

In diesem Katalog stellt die TRASMITAL BONFIGLIOLI seine Angebotsreihe an modularen Planetengetrieben der Serie 300 vor.

Diese Serie wurde weiter ausgebaut und durch neue, nun zur Verfügung stehende Baugrößen bereichert. Darüber hinaus wurden hier technische Verbesserungen angetragen und die Gesamt-modularität bis zu den oberen Baugrößen hin erweitert. Diese Konstruktionsmerkmale lassen sich in eine bessere Flexibilität der internen Produktivität, in die Möglichkeit schnell Produkte in den gewünschten Größen und Ausführungen, sowohl direkt von der Firma selbst, als auch über eine der zahlreichen, zur Organisation der BONFIGLIOLI gehörenden Filialen, die in ebenso zahlreichen und weltweit verbreite- ten Ländern erhalten zu können, übersetzen.

Die Getriebe werden den folgenden Normen gemäß geprüft:

ISO DP 6336 für Zahnräder
ISO 281 für Lager

1.0 INTRODUCTION

Avec ce catalogue TRASMITAL BONFIGLIOLI présente sa gamme de réducteurs épicycloïdaux modulaires série 300.

Elle a été développée et enrichie quant à la disponibilité de nouvelles tailles, l'apport d'améliorations techniques aussi bien qu'à l'extension de la modularité globale jusqu'aux tailles supérieures. Cette caractéristique de construction se traduit dans une flexibilité productive interne plus importante, dans la possibilité d'obtenir, sous de courts délais, les produits ayant les tailles et les exécutions nécessaires, tant de manière directe de l'entreprise, qu'à travers les nombreuses filiales appartenant à l'organisation de vente BONFIGLIOLI, établies dans plusieurs pays du monde.

Les réducteurs sont vérifiés selon les normes suivantes:

ISO DP 6336 pour les engrenages
ISO 281 pour les roulements

2.0 CARATTERISTICHE

La serie 300 è una gamma di riduttori epicicloidali multimpiego azionabili da motori idraulici ed elettrici.
Le caratteristiche di base sono:

- 14 grandezze
- coppie in uscita fino a 540.000 Nm
- potenze trasmissibili fino a 450 kW
- rapporti da 1:3.5 a 3000
- costruzione modulare
- esecuzione:
  - in linea
  - angolare (con primo stadio realizzato con coppia conica Gleason)
- da 1 a 4 stadi di riduzione
- versioni in uscita per montaggio con flangia, con piede, pendolare.
- alberi in uscita: con linguetta, scanalati, femmina scanalati, cavi cilindrici per montaggio pendolare con giunto ad attrito.
- predisposizioni motore in entrata per:
  motori elettrici, secondo IEC forma B5
  motori idraulici dei principali costruttori e secondo SAE J744C
- alberi veloci in entrata
- motoriduttori con:
  - motori elettrici IEC
  - motori idraulici orbitali TRASMITAL MG
- freni idraulici negativi di stazionamento per utilizzo con motori idraulici
- accessori per alberi uscita:
  -flange
  -pignoni
  -barre scanalate
  -giunti ad attrito

Altre caratteristiche costruttive sono:

– elevato rapporto coppia trasmissibile/dimensioni d'ingombro
– elevata capacità a sopportare carichi radiali e assiali sugli alberi di uscita grazie all'utilizzo, sulle versioni H, di cuscinetti a rulli conici
– elevati rendimenti
– collegamenti fra gli organi interni tramite profili scanalati, non utilizzo di linguette
– stadi di riduzione con portaplanetari flottanti per ottenere la massima ripartizione dei carichi fra gli ingranaggi planetari
– carcasse in ghisa sferoidale.

2.0 SPECIFICATIONS

The 300 series consist of a range of multi-purpose planetary gearboxes that can be operated by either hydraulic or electric motors.
Basic features are:

- 14 sizes
- output torque up to 540,000 Nm
- transmissible power up to 450 kW
- ratios from 3.5:1 to 3000:1
- modular design
- versions:
  - in-line
  - right angle (first stage with bevel gear pair Gleason)
- reduction stages ranging from 1 to 4
- with flange-mounted, foot-mounted and shaft-mounted output
- output shafts with keyway, splined, splined hollow shafts, hollow shafts for shaft-mounting with shrink disc
- input adaptors for:
  electric motors to IEC standards design B5
  hydraulic motors by major manufacturers and according to SAE J744C
- high speed shafts
- gearmotors with:
  - electric motors IEC
  - hydraulic orbital motors by TRASMITAL MG
- negative hydraulic parking brakes for operation by hydraulic motors
- output shaft accessories:
  - flanges
  - pinions
  - splined bars
  - shrink discs

More design features:

– high ratio of transmissible torque to overall dimensions
– high radial and axial load capacity of output shafts thanks to tapered roller bearings fitted on the H versions
– high efficiency
– inner parts are connected using grooved sections instead of tabs
– planetary gears of reduction stages mounted to floating holders to ensure maximum load distribution among planetary gears
– housing made of spheroidal cast iron.

2.0 KONSTRUKTIONS-MERKMALE

Die Serie 300 ist eine Reihe an vielseitig einsetzbaren Planetengetrieben, die von Hydraulik- oder Elektromotoren angetrieben werden können.
Ihre Gundmerkmale sind:

- 14 Baugrößen
- Abtriebsdrehmomente bis zu 540.000 Nm
- Antriebsleistungen bis zu 450 kW
- Übersetzungsverhältnisse von 1:3,5 bis 3000
- Modularbauweise
- Ausführung:
  - linear
  - auf Winkel (erste Stufe mit Kegelradpaarung realisiert)
- von 1 bis 4 Untersetzungstufen
- Abtriebsversionen für Montage mit Flansch, mit Fuß, in Aufsteckversion)
- Abtriebswellen: mit Passfeder, Vielkeil, Vielkeilhohlwelle, zylindrischer Hohlwelle für Schrumpfscheibenmontage.
- Vorbereitet für Antriebsmotor:
  Elektromotoren, gemäß IEC Form B5
  Hydraulikmotoren der bedeutensten Hersteller und gemäß SAE J744C
- Schnelle Wellen am Antrieb
- Getriebemotoren mit:
  Elektromotoren IEC
  orbitale Hydraulikmotoren der TRASMITAL MG
- hydraulische Abstellbremsen für Steuerung durch Hydraulikmotoren
- Zubehör für Abtriebswellen:
  - Flanschen
  - Ritzel
  - Keilstäbe
  - Schrumpfscheiben

Andere Konstruktionsmerkmale lassen sich folgendermaßen zusammenfassen:

– hohes übertragbares Drehmoment/Verhältnis zu den Aussenmaßen
– hohe Wirkungsgrade
– Verbindungen zwischen den inneren Organen mittels Nutprofilen, es werden keine Passfedern verwendet
– Untersetzungstufen mit schw immenden Planetenradträger zur Belastungsverteilung auf die Planetenrädern
– Gehäuse aus Sphäroguss.

2.0 CARACTERISTIQUES

La série 300 est une gamme de réducteurs épicycloïdaux polyvalents, qui peuvent être actionnés par des moteurs hydrauliques et électriques.
Les principales caractéristiques sont:

- 14 tailles
- couples en sortie jusqu'à 540.000 Nm
- puissances transmissibles jusqu'à 450 kW
- rapports de 1:3,5 à .3000
- construction modulaire
- exécution:
  - linéaire
  - angulaire (premier étage réalisé avec couple conique)
- de 1 à 4 étages de réduction
- versions en sortie pour assemblage avec bride, patte, ou pendulaire
- arbres de sortie: avec clavette; cannelés; femelle cannelés; creux cylindriques pour assemblage pendulaire avec frette de serrage
- raccordements à l'entrée pour les moteurs suivants:
  moteurs électriques, selon CEI forme B5
- moteurs hydrauliques des marques principales et conformes à SAE J744C
- arbres rapides d'entrée
- motoréducteurs avec :
  - moteurs électriques CEI
  - moteurs hydrauliques orbitaux TRASMITAL MG
- freins hydrauliques négatifs de stationnement pour commande avec moteurs hydrauliques
- accessoires pour arbre de sortie:
  - brides
  - pignons
  - barres cannelées
  - joints d'accouplement à friction

D'autres caractéristiques de construction sont :

– rapport de couple transmissible élevé / dimensions d'encombrement
– capacité élevée à supporter les charges radiales et axiales sur les arbres de sortie, grâce à l'utilisation, sur les versions H., de roulements à rouleaux coniques
– rendements élevé
– raccordements entre les organes intérieurs par le biais de profils cannelés, et non pas de clavettes
– étages de réduction avec porte-planétaires flottants pour obtenir la maxime répartition des charges dans le train d'engrenages épicycloïdaux
– carter en fonte G.S..

R_{x2}	[N]	Carico radiale nominale in uscita riduttore ricalcolato rispetto a diversi punti di applicazione del carico	Rated radial load at gearbox output re-calculated with respect to different load application points	Nachrechnung der Nenn-Radialkräfte auf die Abtriebswelle des Getriebes bei verschiedenen Angriffspunkten der Kraft	Charge radiale nominale à la sortie du réducteur recalculée par rapport à différents points d'application de la charge
t_a	[°C]	Temperatura ambiente	Ambient temperature	Umgebungstemperatur	Température ambiante
V	[cm^3]	Cilindrata motore idraulico	Hydraulic motor displacement	Hubraum - Hydraulikmotor	Cylindrée moteur hydraulique
V_c	[cm^3]	Cilindrata motore idraulico (di calcolo)	(Theoretical) Hydraulic motor displacement	Hubraum - Hydraulikmotor (kalkuliert)	Cylindrée moteur hydraulique (de calcul)
X	[mm]	Distanza di applicazione del carico dallo spallamento albero	Load application distance from shaft shoulder	Abstand des Kraftangriffspunktes vom Wellenansatz	Distance d'application de la charge par rapport à l'épaulement de l' arbre
ηd		Rendimento dinamico	Dynamic efficiency	Dinamische Virkungsgrad	Rendement dynamique
Z		Frequenza di avviamento	Frequency of starts	Anlaßfrequenz	Frequence de démarrage

Simbolo riferito ai pesi dei riduttori.

Symbol referring to weight of gearboxes.

Symbol für das Gewicht der Getriebe.

Symbole se référant aux poids des réducteurs.

Le colonne contrassegnate da questo simbolo indicano i numeri di pagina dove sono riportate le dimensioni.

Columns marked with this symbol indicate the reference page showing dimensions.

Die mit diesem Symbol gekennzeichneten Spalten geben die Nummern der Seiten mit den Maßangaben.

Les colonnes portant ce symbole indiquent les numéros de page où sont mentionnées les dimensions.

Questo simbolo riporta un numero che rappresenta il numero di pagina di riferimento.

This symbol identifies reference page number.

In diesem Symbol wird eine Nummer angegeben, die für die entsprechende Bezugsseite steht.

Cette image comporte un chiffre représentsant le numéro de page de référence.

Questi simboli evidenziano il punto di montaggio degli accessori.

These symbols identify the mounting positions of accessories.

Durch diese Symbole werden die Montage punkte für die Zubehörteile hervorgehoben.

Ces images montrent la position de montage des accessoires.

Le parti in nero di questi simboli evidenziano la collocazione delle entrate dei riduttori.

These symbols identify the position of gearbox input (black-filled areas).

Die durch die schwarze Farbe hervorgehobenen Teile, stellen die Antriesseiten der Getriebe dar.

Les parties noires de ces images montrent l’emplacement des entrées des réducteurs.

Il simbolo della chiave associato ad un numero indica la coppia di serraggio delle viti del giunto ad attrito.

The number associated with the wrench symbol indicates the tightening torque for friction coupling screws.

Das an eine Nummer gebundene Schlüsselsymbol steht für den Anzugsmoment der Schrauben der Reibeverbindung.

L’image de la clé associée à un numéro signale le couple de serrage des vis du joint à frottement.

Freno negativo a dischi multipli.

Negative multidisc brake.

Negative Lamellenbremse.

Frein multidisques négatif.

Predisposizione motore idraulico.

Hydraulic motor connection.

Eingangsflansch für Hydraulikmotor.

Adaptation pour moteur hydraulique.

Coperchio per flangiatura in ingresso standard.

Cover for standard input flanging.

Deckel für Antriebsflansche, Standardausführung.

Couvercle pour bridage d’ une entrée standard.

Esecuzione in linea.

Inline units.

Koaxialgetriebe.

Exécution coaxiale.

Esecuzione angolare.

Right angle units.

Winkelgetriebe.

Exécution angulaire.

INFORMAZIONI GENERALI

I paragrafi che seguono riportano una serie di informazioni sugli elementi indispensabili per la scelta e il corretto utilizzo dei motoriduttori.

5.0 COPPIA IN USCITA

5.1 Coppia di riferimento
M_2 [Nm]

E' un valore di coppia in uscita indicativo per una rapida individuazione della classe di prestazione di ogni grandezza base di riduttore.

5.2 Coppia nominale
M_{n2} [Nm]

E' la coppia nominale trasmissibile in uscita dal riduttore con carico continuo uniforme, fattore di servizio f_s=1, per diversi valori fissati del fattore di durata ($n_2 \cdot h$).
I valori di M_{n2} sono verificati secondo i seguenti standard:
ISO DP 6336 per gli ingranaggi
ISO 281 per i cuscinetti.

5.3 Coppia massima
M_{2max} [Nm]

E' il valore di coppia in uscita sopportabile sopportabile dal riduttore in condizioni statiche o fortemente intermittenti.
(Inteso come coppia di punta di carico istantaneo o come coppia di avviamento sotto carico).

5.4 Coppia richiesta
M_{r2} [Nm]

Rappresenta la coppia richiesta dall'applicazione e dovrà sempre essere uguale o inferiore alla coppia in uscita nominale M_{n2} del riduttore scelto.

5.5 Coppia di calcolo
M_{c2} [Nm]

E' il valore di coppia da utilizzare per la selezione del riduttore considerando la coppia richiesta M_{r2} e il fattore di servizio f_s (tab. A3) ed è dato dalla formula:

dove M_{n2} è il valore corrispondente al fattore di durata ($n_2 \cdot h$) caratteristico dell'applicazione.

6.0 POTENZA

6.1 Potenza in entrata
P_1 [kW]

La potenza P_1 indicata nelle tabelle dati tecnici di ogni grandezza di riduttore, è quella trasmissibile in entrata in maniera intermittente o continua alle seguenti condizioni:

Velocità in ingresso	n_1
Durata teorica	1000 h
Fattore di servizio	f_s=1

GENERAL INFORMATION

The following paragraphs contain information on essential elements for selection and correct use of gearmotors.

5.0 OUTPUT TORQUE

5.1 Reference torque
M_2 [Nm]

Indicative output torque to easily establish the performance class for each gearbox basic size.

5.2 Nominal torque
M_{n2} [Nm]

Torque transmitted at output at uniform continuous load, service factor f_s=1 for different fixed values of the life factor ($n_2 \cdot h$).
The M_{n2} values are tested in conformity with the following standars:
ISO DP 6336 for reduction units
ISO 281 for bearings.

5.3 Maximun torque
M_{2max} [Nm

It is the output torque that the reduction unit can withstand in static or highly intermittent conditions. (It is considered as instantaneous load peak torque or starting torque under load).

5.4 Required torque
M_{r2} [Nm]

This is the torque corresponding to application requirements. It must always be equal to or less than rated output torque M_{n2} of the selected gearbox.

5.5 Calculated torque
M_{c2} [Nm]

Torque value to be used for selecting the gearbox, considering required torque M_{r2} and service factor f_s (tab. A3), and is obtained by formula:

where M_{n2} is the value for the specific application taking into consideration the life factor ($n_2 \cdot h$).

6.0 POWER

6.1 Input rated power
P_1 [kW]

Power P_1 indicated in the specification tables for each gearbox size is either the intermittent or continuous power which can be transmitted at the gearbox input under the following conditions:

input speed	n_1
theoretical duration	1000 h
service factor	f_s=1

ALLGEMEINE INFORMATIONEN

Die folgenden Abschnitte enthalten eine Reihe von Informationen über die Aspekte, die im Hinblick auf die Wahl und dem sachgemäßen Betrieb von Getriebemotoren unbedingt zu berücksichtigen sind.

5.0 ABTRIEBSMOMENT

5.1 Bezugsdrehmoment
M_2 [Nm]

Ist ein indikativer Wert eines Abtriebdrehmoments, der ein schnelles Auffinden der Leistungsklasse jeder Getriebegrundbaugröße ermöglicht.

5.2 Nenndrehmoment
M_{n2} [Nm]

Ist das vom Getriebe am Abtrieb übertragbare Nenndrehmoment bei einer gleichmäßigen Dauerbelastung, Betriebsfaktor f_s = 1, für verschiedene festgelegte Werte des Dauerfaktors ($n_2 \cdot h$).
Die Werte M_{n2} werden den folgenden Normen gemäß geprüft:
ISO DP 6336 für Zahnräder
ISO 281 für Lager.

5.3 Maximales Drehmoment
M_{2max} [Nm]

Stellt den Wert des Abtriebdrehmoments dar, mit dem das Getriebe in statischen oder Bedingungen mit häufigen Schaltungen belastet werden kann. (Wird als augenblicklicher Spitzendrehmoment oder als Anlaßdrehmoment unter Last verstanden).

5.4 Verlangtes Drehmoment
M_{r2} [Nm]

Dies ist das von der Anwendung verlangte Drehmoment, das stets kleiner oder gleich dem Nenn-Abtriebsmoment M_{n2} des gewählten Getriebes sein muß.

5.5 Soll-Drehmoment
M_{c2} [Nm]

Ist der Drehmomentenwert, der für die Wahl des getriebemotors unter Berücksichtigung des erforderlichen Drehmoments M_{r2} und des Betriebsfaktors f_s (tab. A3) verwendet wird. Er wird von folgender Formel gegeben:

wo M_{n2} der Wert ist, der dem Dauerfaktor ($n_2 \cdot h$) entspricht, der für die Applikationsart charakteristisch ist.

6.0 LEISTUNG

6.1 Leistung Antriebswelle
P_1 [kW]

P_1 Die in den Tabellen der technischen Daten für jede Getriebegröße angegebene Leistung P_1 entspricht der Leistung, die unter den folgenden Bedingungen im Antrieb kontinuierlich oder im Schaltbetrieb übertragbar ist:

Antriebsdrehzahl	n_1
Theoretische Dauer:	1000 stunden
Betriebsfaktor	f_s=1

INFORMATIONS GENERALES

Les paragraphes qui suivent présentent une série d'informations sur les éléments indispensables pour le choix et l'utilisation correcte des motoréducteurs.

5.0 COUPLE EN SORTIE

5.1 Couple de référence
M_2 [Nm]

Est une valeur de couple en sortie indicative pour une identification rapide de la classe de performance pour chaque taille de base de réducteur.

5.2 Couple nominal
M_{n2} [Nm]

Est le couple nominal transmissible à la sortie du réducteur avec une charge uniforme et continue, facteur de service f_s=1, pour différentes valeurs fixées du facteur de durée ($n_2 \cdot h$).
Les valeurs de Mn2 sont vérifiées selon les normes suivantes:
ISO DP 6336 pour les engrenages
ISO 281 pour les roulements.

5.3 Couple maximal
M_{2max} [Nm]

C'est la valeur de couple en sortie que le réducteur peut supporter dans des conditions statiques ou de forte intermittence (considérée en tant que couple de pointe de charge instantanée ou couple de démarrage en charge).

5.4 Couple requis
M_{r2} [Nm]

Il représente le couple requis par l' application et devra toujours être inférieur ou égal au couple en sortie nominal M_{n2} du réducteur choisi.

5.5 Couple de calcul
M_{c2} [Nm]

C'est la valeur de couple à utiliser pour la sélection du réducteur en considérant le couple requis M_{r2} et le facteur de service f_s (tab. A3); elle résulte de la formule suivante:

$$M_{c2} = M_{r2} \cdot f_s < M_{n2} \qquad (1)$$

où M_{n2} représente la valeur correspondant au facteur de durée ($n_2 \cdot h$) caractéristique de l'application.

6.0 PUISSANCE

6.1 Puissance en entrée
P_1 [kW]

Comme indiqué aux tableaux des données tecniques, pour chaque taille de réducteur, la puissance P_1 est transmissible en entrée de manière intermittente ou continue aux conditions suivantes:

vitesse d'entrée	n_1
durée théorique	1000 heures
facteur de service	f_s=1

Occorre che sia sempre verificata la formula:

Check that the formula here below is always satisfied:

Die folgende Formel muß immer erfüllt werden:

Il faut toujours vérifier la formule suivante:

$$P_1' \cdot fs \leq P_1 \qquad (2)$$

6.2 Potenza in uscita P_2 [kW]

Questo valore rappresenta la potenza trasmessa all'uscita del riduttore. Si può calcolare con le seguenti formule:

6.2 Output power P_2 [kW]

This value is the power transmitted at gearbox output. It can be calculated with the following formulas:

6.2 Leistung Abtriebswelle P_2 [kW]

Dieser Wert repräsentiert die an der Abtriebswelle des Getriebes übertragene Leistung. Dieser Wert kann folgendermaßen berechnet werden:

6.2 Puissance en sortie P_2 [kW]

Cette valeur représente la puissance transmise à la sortie du réducteur. On peut la calculer avec les formules suivantes:

$$P_2 = P_1 \cdot \eta_d \qquad (3)$$

$$P_2 = \frac{M_{r2} \cdot n_2}{9550} \qquad (4)$$

7.0 POTENZA TERMICA P_t [kW]

E' il valore che indica il limite termico del riduttore (riferirsi alle tabelle dei dati tecnici relative alle varie grandezze di riduttori) ed è la potenza trasmissibile in servizio continuo con velocità n_1 in ingresso di 1500 min^{-1} ad una temperatura ambiente di 20°C senza ricorrere ad un raffreddamento ausiliario.
Per un tipo di servizio caratterizzato da una breve durata di funzionamento e da un tempo di sosta sufficientemente lungo da consentire il raffreddamento del gruppo, la potenza termica acquista scarsa rilevanza per cui può non essere tenuta in considerazione.
Con temperatura ambiente diversa da 20°C, con servizio intermittente e con velocità n_1 in ingresso diversa da 1500 min^{-1} è possibile calcolare il valore di P_t in base al fattore termico f_t ed al fattore di velocità f_v riportati nella tabella (A1).
Verificare che sia sempre soddisfatta la relazione.

7.0 THERMAL POWER P_t [kW]

This value indicates the gearbox's thermal capacity (refer to the technical data concerning the gearboxes under consideration) and is the power that can be transmitted under continuous duty at an input speed n_1 of 1500 min^{-1} at an ambient temperature of 20°C without using a supplementary cooling device.
For a duty cycle with short operating periods and sufficiently long pauses to allow the unit to cool, thermal power is not particularly important and therefore it does not need to be taken into consideration.
At an ambient temperature other than 20°C under intermittent duty conditions and with an input speed n1 other than 1500 min^{-1} it is possible to calculate the P_t value according to the thermal factor f_t and the speed factor f_v, shown in table (A1)
Make sure that the following condition is always satisfied.

7.0 THERMISCHE GRENZLEISTUNG P_t [kW]

Dieser Wert gibt die thermische Grenzleistung des Getriebes an (nehmen Sie hierzu Bezug auf die technischen Daten der verschiedenen Getriebegrößen) und die bei einem Dauerbetrieb übertragbaren Leistung bei einer Antriebsdrehzahl n_1 von 1500 min^{-1} bei einer Umgebungstemperatur von 20°C ohne Zusatzkühlung an.
Bei Dauerbetrieb, der durch kurze Betriebszeiten und für die Abkühlung der Baugruppe ausreichend lange Aussetzzeiten gekennzeichnet ist, hat die Wärmegrenzleistung nur geringe Bedeutung und kann deshalb vernachlässigt werden. Bei einer von den 20°C abweichenden Umgebungstemperatur, im Schaltbetrieb und bei einer von 1500 min^{-1} abweichenden Antriebsdrehzahl n_1, kann der Wert P_t unter Zugrundlage des Wärmefaktors f_t und des Drehzahlfaktors f_v, Werte die in der Tabelle (A1) wiedergegeben werden, berechnet werden.
Überprüfen, ob folgendes Verhältnis eingehalten wird.

7.0 PUISSANCE THERMIQUE P_t [kW]

C'est la valeur qui indique la limite thermique du réducteur et c'est la puissance transmissible en service continu avec vitesse n_1 en entrée, de 1500 min^{-1}, à une température ambiante de 20°C sans recourir à un refroidissement auxiliaire.
Pour un type de service caractérisé par une durée de fonctionnement brève et par un temps de pause suffisamment long pour permettre le refroidissement du groupe, la puissance thermique ne revet qu'une faible importance et peut par conséquent,ne pas être prise en considération.
Avec température ambiante autre que 20°C, en service intermittent, et avec vitesse n_1 en entrée autre que 1500 min^{-1}, on peut calculer la valeur de P_t sur la base du facteur thermique f_t et du facteur de vitesse f_v indiqués sur le tableau (A1).
Vérifier que la relation suivante est toujours respectée.

$$P_{r1} \leq P_t \cdot f_t \cdot f_v \qquad (5)$$

(A1)

f_t					
ta max. [°C] ta max. [°C] ta max. [°C] ta maxi. [°C]	Servizio continuo Continuous duty Dauerbetrieb Service continu	Servizio intermittente / Intermittent duty / Aussetzbetrieb / Service intermittent Rapporto di intermittenza % (I) / Cyclic duration factor % (I) Relative Einschaltdauer % (I) / Rapport d'intermittence % (I)			
		80	60	40	20
10	1.2	1.3	1.6	1.8	2

n_1	f_v
750	1.5
950	1.2
1500	1
2000	0.7

Il rapporto di intermittenza (I)% è dato dal rapporto fra il tempo di funzionamento a carico t_f e il tempo totale ($t_f + t_r$), con t_r = tempo di riposo, espresso in percentuale:

The intermittance factor (I)% is obtained from the ratio between operating time under load t_f and total time ($t_f + t_r$), where rest time t_r, expressed as a percentage:

Die relative Einschaltdauer (I) % ist das Verhältnis aus der Betriebsdauer unter Last t_f und der Gesamtbetriebszeit ($t_f + t_r$), mit t_r= Ruhetemperatur, ausgedrückt in Prozent:

Le rapport d'intermittence (I)% est donné par le rapport entre la durée de fonctionnement en charge t_f et le temps total ($t_f + t_r$) avec t_r = temps de repos, exprimé en pour cent:

$$I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (6)$$

N.B. I valori di potenza termica indicati nelle tabelle tecniche relative ad ogni grandezza, si riferiscono alle esecuzioni senza freno negativo a dischi multipli.
In caso di applicazioni con freni, interpellare la nostra organizzazione di vendita.

NOTE: The thermal power values indicated in the selection charts for each size apply to the versions without negative multidisc brake.

For the versions fitted with brakes, please contact our sales organization.

MERKE: Die in den technischen Tabellen für jede Baugröße angegebenen Werte der Wärmeleistung, beziehen sich auf die Versionen ohne Mehrfachscheiben- Negativbremse.
Bei Applikationen mit Bremsen, müssen Sie sich erst mit unserem Verkaufsnetz in Verbindung setzen.

N.B. Les valeurs de puissance thermique, indiquées aux tableaux techniques relatifs à chaque taille, concernent des exécutions sans frein négatif multidisque.
En cas d'application avec frein, contacter notre organisation de vente.

8.0 RENDIMENTO

8.1 Rendimento dinamico η_d

E' dato dal rapporto fra la potenza in uscita P_2 e quella in entrata P_1 secondo la relazione:

8.0 EFFICIENCY

8.1 Dynamic efficiency η_d

Obtained from the ratio of output power P_2 to input power P_1 according to the following equation:

8.0 WIRKUNGSGRAD

8.1 Dynamischer Wirkungsgrad η_d

Er ist gegeben durch das Verhältnis der Abtriebsleistung P_2 zur Antriebsleistung P_1:

8.0 RENDEMENT

8.1 Rendement dynamique η_d

Il est donné par le rapport entre la puissance en sortie P_2 et celle en entrée P_1:

$$\eta_d = \frac{P_2}{P_1} \qquad (7)$$

Il suo valore dipende dalla potenza trasmessa, dalla velocità, dal rapporto, dalla temperatura e dalla viscosità dell'olio.
I valori max. di rendimento sono riportati nella tabella (A2) seguente.

Its value is a function of the trasmitted power, the speed, the reduction ratio and oil temperature and viscosity.
The maximum efficiency values are shown in the table (A2) below.

Sein Wert hängt von der übertra genen Leistung, der Drehzahl, dem Übersetzungsverhältnis und der Temperatur, darüber hinaus von der Öltemperatur ab.
Die Werte des max. Wirkungsgrads werden in der in Folge angeführten Tabelle (A2) angegeben.

Sa valeur dépend de la puissance transmise, de la vitesse, du rapport et de la température, ainsi que viscosité, de l'huile.
Les valeurs max. de rendement sont indiquées sur le tableau (A2) suivant.

(A2)

N° stadi / N° stages / Anz. Stufen / Nombre d'étages de réduction			
L1	**L2 - R2**	**L3 - R3**	**L4 - R4**
0.97	0.94	0.91	0.88

9.0 RAPPORTO DI RIDUZIONE i

E il rapporto fra la velocità d'entrata e d'uscita del riduttore.

9.0 REDUCTION RATIO i

This is the ratio of gearbox input speed to gearbox output speed.

9.0 ÜBERSETZUNG i

Ist das Verhältnis zwischen Antriebs- und Abtriebsdrehzahl des Getriebes.

9.0 RAPPORT DE REDUCTION i

Est le rapport entre la vitesse d'entrée et de sortie du réducteur.

$$i = \frac{n_1}{n_2} \qquad (8)$$

10.0 VELOCITÀ ANGOLARE

10.1 Velocità in entrata n_1 [min^{-1}]

E' la velocità del motore di azionamento nel caso in cui questo sia collegato direttamente in asse al riduttore. Oppure quella risultante sempre dal motore e da eventuali rapporti di trasmissione nel caso di azionamento indiretto, ad esempio con cinghie.

La velocità in ingresso non deve mai superare i valori indicati nelle tabelle dati tecnici dei riduttori.

Per funzionamento in continuo in applicazioni industriali è raccomandabile non superare la velocità di 1750 min^{-1}.

10.0 ANGULAR SPEED

10.1 Input speed n_1 [min^{-1}]

Refers to the speed of motor if motor is directly connected to gearbox. In the case of an indirect drive, this value is the speed of the motor divided by the transmission ratio of the indirect drive accessory (belt, chain, etc.).

Input speed should exceed the values indicated in the tables on gearbox technical features.

As for continuous operation in industrial applications, we recommend that speed of 1750 min^{-1} be never exceeded.

10.0 DREHZAHL

10.1 Drehzahl Antriebswelle n_1 [min^{-1}]

Ist die Geschwindigkeit des Antriebsmotors, wenn dieser direkt auf Achse mit dem Getriebe verbunden ist. Kann aber auch die Geschwindigkiet darstellen, die sich immer aus dem Motor und aus eventuellen Übersetzungsverhältnissen im Fall eines indirekten Antriebs ergibt, z.B. bei einem Riemenantrieb.

Die Antriebsgeschwindigkeit darf die in den Tabellen der Getriebe angebenen Werte nie überschreiten.

Bei einem Dauerbetrieb im industriellen Einsatz wird empfohlen, die Geschwindigkeit von 1750 min^{-1} nicht zu überschreiten.

10.0 VITESSE ANGULAIRE

10.1 Vitesse d' entrée n_1 [min^{-1}]

C'est la vitesse du moteur d'entraînement, au cas où celui-ci serait directement accouplé au réducteur de manière axiale. Ou bien la vitesse débouchant toujours du moteur, et des rapports de transmission éventuels, en cas d'entraînement indirect par exemple par courroies.

La vitesse en entrée ne doit jamais dépasser les valeurs indiquées aux tableaux des données techniques des réducteurs.

En cas de fonctionnement en continu pour des applications industrielles, on préconise de ne pas dépasser la vitesse de 750 min^{-1}.

10.2 Velocità in uscita n_2 [min^{-1}]

E' in funzione della velocità in entrata n_1 e del rapporto di riduzione i secondo la relazione:

10.2 Output speed n_2 [min^{-1}]

Calculated from input speed n_1 and transmission ratio i according to the following equation:

10.2 Abtriebsdrehzahl n_2 [min^{-1}]

Sie ist abhängig von der Antriebsdrehzahl n_1 und der Übersetzung i nach folgender Gleichung:

10.2 Vitesse en sortie n_2 [min^{-1}]

Elle varie en fonction de la vitesse d'entrée n_1 et du rapport de reduction i selon l'équation:

$$n_2 = \frac{n_1}{i} \qquad (9)$$

11.0 FATTORE DI SERVIZIO f_s

E' un fattore che definisce il tipo di applicazione. Tiene conto con sufficiente approssimazione della variabilità del carico a cui è sottoposto il riduttore per un determinato tipo di servizio. Tiene conto anche del tipo di azionamento del riduttore, con motore elettrico, idraulico ecc.

La tabella (A3) dà una indicazione per la scelta del fattore di servizio più opportuno in funzione del tipo di applicazione e del tipo di motore di azionamento

11.0 SERVICE FACTOR f_s

Factor depending on the application type. This factor takes into consideration (with sufficient approximation) load variations which the gearbox may undergo for a specific type of duty. It also takes into consideration the selected type of the drive unit, e.g. electric or hydraulic motor and so on.

Table (A3) gives indications for the service factor to be selected according to the application and operation type.

11.0 BETRIEBSFAKTOR f_s

Ist ein Faktor, der die Art der Applikation definiert. Er berücksichtigt, mit einer ausreichenden Annäherung, die Belastungschwankungen, denen das Getriebe bei einer bestimmen Betriebsart unterliegt. Berücksichtigt auch die Antriebsart der Getriebe, d.h. mittels Elektromotor, hydraulischem Motor, usw.

Die Tabelle (A3) gibt einen Anhaltspunkt für die Auswahl des, im Hinblick auf die Applikation und dem Betrieb angemessenen Betriebsfaktors.

11.0 FACTEUR DE SERVICE f_s

C'est un facteur définissant le type d'application. Il prend en compte, avec une approximation satisfaisante, la variabilité de la charge à laquelle le réducteur est soumis, pour un genre de service donné. Il considère également le type d'entraînement du réducteur, avec moteur électrique, hydraulique, etc.

Le tableau (A3) donne une indication pour le choix du facteur de service qui convient davantage au genre d'application et de fonctionnement.

(A3)

Fattori di servizio / Service factors / Betriebsfaktoren / Facteurs de service

Natura del carico Type of load Belastungsart Nature de la charge	Tipo di azionamento Type of drive unit Antriebsart Type d'entrainement	N° avviamenti /h Number of starts/hour Schaltungen/Std. N.bre démarrages/h

	Mot. endotermico / Endothermic engine / Endotermischer Motor /Moteur endothermique	2.00	—	—	—	—

12.0 FATTORE DI DURATA (F_{h1}, F_{h2})

E' un fattore derivato dal prodotto della velocità angolare in entrata n_1 o in uscita n_2 per le ore di effettivo funzionamento h, esclusi i tempi di sosta.

12.0 LIFE FACTOR (F_{h1}, F_{h2})

Factor resulting by multiplying angular speed at input (n_1) or output (n_2) by actual operating working hours h, break times excluded.

12.0 DAUERFAKTOR (F_{h1}, F_{h2})

Ist ein vom Ergebnis aus der Drehzahl im Antrieb n_1 oder am Abtrieb n_2 für die effektiven Betriebsstunden h, die Stillstandszeiten ausgenommen, abgeleiteter Faktor.

12.0 FACTEUR DE DUREE (F_{h1}, F_{h2})

C'est un facteur découlant du résultat de la vitesse angulaire en entrée n_1 ou en sortie n_2 multipliée par les heures de service effectif h, le temps d'arrêté tout exclus.

$$F_{h1} = (n_1 \cdot h) \qquad (10)$$

$$F_{h2} = (n_2 \cdot h) \qquad (11)$$

Il fattore di durata è direttamente proporzionale al numero di rotazioni che compie il riduttore nella sua intera durata di servizio.

Life factor is directly proportional to gearbox rpms during the whole duty time

Der Dauerfaktor steht proportional direkt zur Anzahl der Umdrehungen, die das Getriebe in seiner gesamten Betriebsdauer durchläuft.

Le facteur de durée est indirectement proportionnel au nombre de rotations que le réducteur accomplit dans la durée de service globale.

13.0 SCELTA

Per selezionare correttamente un riduttore o un motoriduttore è necessario disporre di alcuni dati fondamentali sintetizzati nella tabella (A4).
Una copia di questa può' essere inviata alla nostra Organizzazione di vendita per la ricerca della selezione del riduttore più' idoneo al tipo di applicazione.

13.0 SELECTION

Some essential data are necessary for a proper gearbox or gearmotor selection as indicated in Table (A4).

Fill in the table and send a copy to our Technical Service Department which will select the most suitable gearbox for your application requirements.

13.0 ANTRIEBSAUSWAHL

Um ein Getriebe oder einen Getriebemotor in korrekter Weise auswählen zu können, muß man über einige grundsätzliche Daten verfügen. Daten, die auf der Tabelle (A4) zusammengefaßt werden.
Eine Kopie dieser Tabelle kann an unsere Verkaufsorganisation gesendet werden, um in dieser Weise gemeinsam die Wahl des für die jeweilige Applikationsart geeignetsten Getriebes treffen zu können.

13.0 SELECTION

Pour le bon choix du réducteur ou du motoréducuteur il faut disposer de certaines données fondamentales, comme résumées au tableau (A4).
Un exemplaire de celui-ci peut être envoyé à notre Organisation de vente, afin de réaliser une sélection de réducteur qui s'adapte le mieux au genre d'application.

N.B: Tab. (A4)

(*) La distanza X_{1-2} è quella compresa fra il punto di applicazione della forza e la battuta dell'albero (se non indicata, si considererà la forza agente sulla mezzeria della sporgenza dell'albero).

(•) + = compressione
– = trazione

N.B.

I criteri di scelta e i dati tecnici riportati in questo catalogo non sono validi per tutte le applicazioni, come ad esempio impianti di sollevamento, dove il riduttore funziona come organo di sicurezza verso persone e/o cose.
In questi casi la selezione del riduttore deve essere fatta con criteri specifici, ed eventualmente in accordo alle vigenti norme di sicurezza, per cui è necessario interpellare l'Organizzazione di vendita TRASMITAL BONFIGLIOLI.

13.1 Scelta del tipo di riduttore

a) In base al tipo di applicazione definire:
- Fattore di servizio f_s (tab A3)
- La durata di funzionamento richiesta h
- Il tipo di azionamento idraulico, elettrico, altro

b) Con il valore della coppia richiesta in uscita M_{r2}, determinare la coppia di calcolo:

$$M_{c2} = M_{r2} \cdot f_s \qquad (12)$$

c) Con la durata richiesta h e la velocità di uscita n_2 calcolare il fattore di durata:

$$F_{h2} = (n_2 \cdot h) \qquad (13)$$

d) Calcolare il rapporto di riduzione richiesto:

$$i = \frac{n_1}{n_2} \qquad (14)$$

e) Selezionare la grandezza del riduttore che con il rapporto più vicino a quello calcolato soddisfi la seguente condizione:

$$M_{c2} \leq M_{n2} \qquad (15)$$

con / with / mit / avec

$$Fh_2 \leq (n_2 \cdot h) \qquad (16)$$

dove M_{n2} e F_{h2} sono riportati sulle tabelle dati tecnici di ogni grandezza di riduttore.

N.B: Table (A4)

(*) Distance X_{1-2} is between force application point and shaft shoulder (if not indicated the force exerted on the mid-point of the shaft extension will be considered).

(•) + = compression
– = traction

NOTE:

The selection criteria and specifications reported in this catalogue are not valid for any applications, including those where the gearbox is to serve as a safety device preventing injury to persons or damage to objects, as is the case with hoisting equipment.
For these applications, however, the gearbox should be selected following specific criteria and in accordance with any safety rules in force. Fir this reason, we recommend that you seek advice from TRASMITAL BONFIGLIOLI sales organization.

13.1 Gearbox selection

a) Determine the following according to the required application:
- Service factor f_s (tab. A3)
- required gearbox working life h
- required drive unit (hydraulic, electric or others)

b) Define the calculated torque with the required output torque M_{r2}:

$$M_{c2} = M_{r2} \cdot f_s \qquad (12)$$

c) Calculate the life factor with required working life h and output speed n_2.:

$$F_{h2} = (n_2 \cdot h) \qquad (13)$$

d) Calculate the required reduction ratio:

$$i = \frac{n_1}{n_2} \qquad (14)$$

e) Select gearbox size which, having a reduction ratio close to the calculated value, which satisties the following:

$$M_{c2} \leq M_{n2} \qquad (15)$$

con / with / mit / avec

$$Fh_2 \leq (n_2 \cdot h) \qquad (16)$$

where M_{n2} and F_{h2} are indicated in the tables on technical features for each gearbox size.

N.B: Tab. (A4)

(*) Der Abstand X_{1-2} ist der Abstand vom Kraftangriffspunkt zum Wellenansatz (wenn nicht anders angegeben, wird davon ausgegangen, daß die Kraft auf der Mitte des Wellenendes angreift).

(•) + = Druck
– = Zug

MERKE:

Die Auswahlkriterien und die technischen Daten, die in diesem Katalog aufgeführt werden, sind nicht für alle Applikationsarten gültig, wie z.B. an Hebeanlagen, wo das Getriebe die Funktion eines Sicherheitsorgans im Hinblick auf den Personen- und/oder Sachschutz hat.
In diesen Fällen muß die Getriebewahl unter Anwendung spezifischer Kriterien und eventuell in Übereinstimmung mit den Sicherheitsnormen erfolgen. Es ist daher erforderlich, daß Sie sich diesbezüglich mit einer Verkaufsstelle der TRASMITAL BONFIGLIOLI in Verbindung setzen.

13.1 Wahl des Getriebetyps

a) In Basis auf die Applikationsart muß folgendes bestimmt werden:
- Betriebsfaktor f_s (tab. A3)
- Die erforderliche Betriebsdauer h
- Die Antriebsart - hydraulisch, elektrisch, o.a.

b) Mit dem Wert des am Abtrieb M_{r2} erforderlichen Drehmoments das Soll-Drehmoment bestimmen:

$$M_{c2} = M_{r2} \cdot f_s \qquad (12)$$

c) Mit der erforderlichen Dauer h und der Abtriebsdrehzahl n_2, den Dauerfaktor kalkulieren:

$$F_{h2} = (n_2 \cdot h) \qquad (13)$$

d) Das erforderliche Übersetzungsverhältnis kalkulieren:

$$i = \frac{n_1}{n_2} \qquad (14)$$

e) Die Getriebebaugröße, die mit ihrem Übersetzungsverhältnis dem soeben kalkulierten Wert am nächsten kommt und die folgende Bedingung einhält, wählen:

$$M_{c2} \leq M_{n2} \qquad (15)$$

con / with / mit / avec

$$Fh_2 \leq (n_2 \cdot h) \qquad (16)$$

wo M_{n2} und F_{h2} auf den, zu jeder Getriebegröße gehörenden Tabellen der technischen Daten wiedergegeben werden.

N.B: Tab. (A4)

(*) La distance X_{1-2} est celle comprise entre le point d'application de la force et l'épaulement de l'arbre (si non precisée l'on considerera la force agissant au milieu de la saillie de l'arbre).

(•) + = compression
– = traction

N.B.

Les critères de sélection et les données techniques indiqués dans ce catalogue ne sont pas valables pour toutes les applications, telles que les équipements de levage, où le réducteur a fonction d'organe de sécurité vis-à-vis du personnel et des matériels.

Dans ces cas, la sélection du réducteur doit être faite avec des critères spécifiques, et, s'il y a lieu, en conformité avec les règles de sécurité en vigueur; c'est pourquoi il faut consulter l'organisation de vente TRASMITAL BONFIGLIOLI.

13.1 Seléction type de réducteur

a) Sur la base du type d'application il faut définir:
- Facteur de service f_s (tab. A3)
- Durée de fonctionnement nécessaire h
- Type d'entraînement hydraulique, électrique, ou autres.

b) Avec la valeur du couple nécessaire en sortie M_{r2} déterminer le couple de calculation:

$$M_{c2} = M_{r2} \cdot f_s \qquad (12)$$

c) Avec la durée nécessaire h et la vitesse de sortie n_2 calculer le facteur de durée:

$$F_{h2} = (n_2 \cdot h) \qquad (13)$$

d) Calculer le rapport de réduction nécessaire:

$$i = \frac{n_1}{n_2} \qquad (14)$$

e) Sélectionner la taille du réducteur qui, avec le rapport le plus proche à celui calculé, puisse satisfaire à la condition suivante:

$$M_{c2} \leq M_{n2} \qquad (15)$$

con / with / mit / avec

$$Fh_2 \leq (n_2 \cdot h) \qquad (16)$$

où M_{n2} et F_{h2} ont été indiquées aux tableaux de données techniques de chaque taille de réducteur.

Nel caso di applicazioni caratterizzate da variazioni notevoli della coppia richiesta M_{r2} e della velocità n_2 una selezione più appropriata può essere fatta considerando una coppia richiesta equivalente data da:

In case of applications in which the required torque M_{r2} and speed n_2 vary within a wide range, best selection could be an equivalent required torque given by:

Bei Applikationen, die sich durch erhebliche Variationen des erforderlichen Drehmoments M_{r2} und der Drehzahl n_2 kennzeichnen, kann eine angemessenere Lösung unter Berücksichtigung eines erforderlichen gleichwertigen Drehmoments, gefunden werden. Sie wird von folgenden Berechnungen gegeben:

En cas d'applications caractérisées par des variations importantes du couple necessaire M_{r2} et de la vitesse n_2, une seléction appropriée peut être établie en considérant un couple nécessaire équivalent découlant de :

$$M_{r2} = \sqrt[4]{\frac{(n_2 \bullet h)_A \bullet M_A{}^4 + (n_2 \bullet h)_B \bullet M_B{}^4 + (n_2 \bullet h)_C \bullet M_C{}^4 + ...}{(n_2 \bullet h)_A + (n_2 \bullet h)_B + (n_2 \bullet h)_C + ...}} \qquad (17)$$

riferita a:

referred to:

bezogen auf:

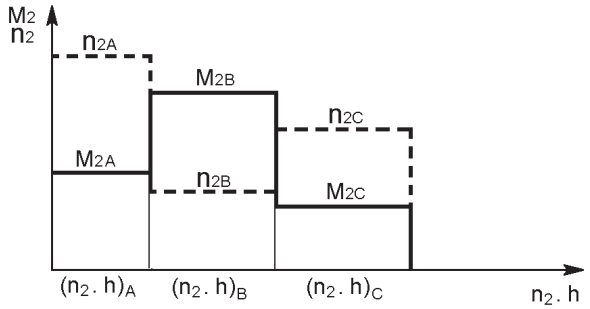
(A5)



e calcolando il fattore di durata Fh con:

and calculating the life factor Fh with:

und durch ein Kalkulieren des Dauerfaktors Fh mit:

en calculant le facteur de durée Fh par:

$$Fh_{calc} = (n_2 \cdot h)_A + (n_2 \cdot h)_B + (n_2 \cdot h)_C + ... \qquad (18)$$

Seguire poi la stessa procedura indicata con d); e).

Then follow the same procedure as specified in d) and e).

Dann die unter d.) und e.) aufgeführte Vorgangsweise befolgen.

Adopter par la suite la même procédure indiquée par d); e).

14.0 **VERIFICHE**

Effettuata la corretta selezione si raccomanda di procedere alle seguenti verifiche:

a) Potenza termica

Assicurarsi che la potenza termica del riduttore, indicata nelle tabelle dati tecnici abbia un valore uguale o maggiore alla potenza richiesta dall'applicazione secondo la relazione (5) a pag. 9, in caso contrario selezionare un riduttore di grandezza superiore oppure provvedere ad applicare un sistema di raffreddamento ausiliario (vedi cap. 45 a pag. 220).

b) Coppia massima

Verificare che la coppia massima (intesa come coppia di punta di carico istantaneo o come coppia di avviamento sotto carico) non superi il valore di M_{2max} ammesso dal riduttore.
(Riferirsi alle tabelle dei dati tecnici relative alle varie grandezze de riduttori).

14.0 **VERIFICATION**

After selecting the drive units, please check the following:

a) Thermal power

Make sure that the thermal power of the gearbox (shown in the tables in the chapters dealing with the gear unit series captioned) is equal to or greater than the the power required by the application according to equation (5) on page 9. If this condition is not respected, select a larger gearbox or apply a forced cooling system (see chap. 45 at a page 220).

b) Maximum torque

Make sure that the maximum torque (considered as instantaneous load peak torque or starting torque under load) does not exceed the M_{2max} value that the gearbox can withstand.
(Refer to the technical data tables concerning the gearboxes sizes.)

14.0 **PRÜFUNGEN**

Nach Wahl des Getriebemotors folgende Prüfungen ausführen:

a) Thermische Grenzleistung

Sicherstellen, daß die Wärme-grenzleistung des Getriebes, die in den Tabellen in den Kapiteln über die betreffenden Getriebeserien angegeben ist, größer oder gleich der verlangten Leistung ist, die von der Anwendung nach Gleichung (5) auf S. 9 verlangt wird. Andernfalls ein größer dimensioniertes Getriebe wählen bzw. ein Zwangskühlsystem vorsehen Siehe Abschnitt 45, Seite 220).

b) Max. Drehmoment

Überprüfen, ob das maximale Drehmoment (als augenblicklicher Spitzendrehmoment oder als Anlaßdrehmoment unter Last verstanden) den seitens des Getriebes zulässigen Wert M_{2max} auch nicht überschreitet. (Nehmen Sie diesbezüglich Bezug auf die Tabelle der rechnischen Daten, welche die verschiedenen Getriebegrößen anführen).

14.0 **VERIFICATIONS**

Après avoir effectué une sélection correcte des motorisations, nous conseillons de proceder aux vérifications suivantes:

a) Puissance thermique

S'assurer que la puissance thermique du réducteur, indiquée dans les tableaux repris dans les chapitres relatifs à la série de réducteurs concernée, ait une valeur supérieure ou égale à la puissance requise par l'application selon l'équation (5) page 9. Dans le cas contraire, sélectionner un réducteur de taille supérieure ou bien prevoir un système de refroidissement forcé (voir par. 45 à page 220).

b) Couple maximum

Vérifier que la couple maximal (considéré en tant que couple de pointe de charge instantanée ou couple de démarrage en charge) ne dépasse pas la valeur de M_{2max} admise par le réducteur (se reporter aux tableaux des données techniques concernant les différentes tailles de réducteurs).

c) Carichi radiali

Verificare che i carichi radiali agenti sugli alberi di entrata e uscita risultino inferiori o uguali a quelli indicati nelle relative tabelle caratteristiche o diagrammi di ogni grandezza di riduttore.

Nel caso in cui la verifica non sia soddisfatta cambiare versione uscita riduttore per quelle grandezze dove è previsto, oppure cambiare grandezza riduttore o sopportare con altri mezzi il carico.

Per effettuare la verifica procedere come segue:

determinare i carichi radiali R_{c1} in entrata e R_{c2} in uscita.

c) Radial loads

Check that radial loads exerted on input and output shafts are lower than or equal to values indicated in the tables on gearbox technical features or charts for each gearbox size.

In case they are grater the indicated value, change either gearbox output version, gearbox size or system bearing arrangement.

To check proceed as follows:

define radial loads R_{c1} at input and R_{c2} at output.

c) Radialkräfte

Überprüfen, ob die auf die Antriebs- und Abtriebswellen einwirkenden Radialkräfte unter den Werten, die in den entsprechenden Tabellen der technischen Eigenschaften oder in den Diagrammen für jede Getriebebauform angegeben werden liegen, oder gleichwertig sind.
Erhält man bei dieser Kontrolle ein negatives Ergebnis muß man die Abtriebsversion des Getriebes für diese Baugrößen, wo diese Möglichkeit vorgesehen ist ändern, die Getriebebaugröße wechseln, oder die Last durch anderweitige Mittel stützen.
Für die Durchführung dieser Kontrolle geht man wie folgt vor: die Radialkräfte R_{c1} am Antrieb und R_{c2} am Abtrieb bestimmen.

c) Charges radiales

Veiller à ce que les charges radiales, appliquées sur les arbres rapides et lents, soient inférieures ou égales aux charges indiquées sur les tableaux caractéristiques ou les diagrammes de chaque taille de réducteur.

Au cas où la vérification serait négative, changer la version de sortie réducteur, pour les tailles qui le prévoient, ou changer la taille du réducteur ou encore supporter la charge par d'autres moyens.

Pour effectuer la vérification procéder comme suit:

déterminer les charges radiales R_{c1} en entrée et R_{c2} en sortie.

$$R_{c1-2} = \frac{2000 \cdot M_{c1-2} \cdot K_2}{d} \qquad (19)$$

dove:

Mc_{1-2} Coppia di calcolo in entrata e uscita (Nm)

d Diametro dell'organo montato sull'albero: (mm) puleggia, ingranaggio, corona per catena

Kr Fattore di sollecitazione per carico radiale con i seguenti valori:

Corona per catena	1
Ingranaggio	1.25
Puleggia per cinghia	1.5-2.5

in which:

Mc_{1-2} Input and output calculated torque (Nm)

d Diameter of the part fitted onto the shaft (mm) pulley, gear or chain crown

Kr Stress factor for radial load with following values

Chain crown	1
Gear	1.25
Belt pulley	1.5-2.5

wo:

Mc_{1-2} Berechnungsdrehmoment im Antrieb und Abtrieb (Nm)

d Durchmesser des auf die Welle montierten Organs (mm) Riemenscheibe, Zahnrad, Kettenkranz

Kr Beanspruchungsfaktor für Radialkraft mit den folgenden Werten:

Kettenkranz	1
Zahnrad	1.25
Riemenscheibe für Riemen	1.5-2.5

où:

Mc_{1-2} Est le couple de calculation en entrée et sortie (Nm)

d Est le diamètre de l'organe monté sur l'arbre: (mm) poulie, engrenage, coronne de chaîne

Kr Est le facteur de contrainte pour charge radiale avec les valeurs suivantes :

Pignon à chaîne	1
Engrenage	1.25
Poulie de courroie	1.5-2.5

Definire la posizione assiale X del carico sull'albero, entrare con tale valore nel diagramma indicante il carico sopportabile dal riduttore R_{x1}, R_{x2} e verificare sia soddisfatta la seguente relazione:

Define the trust load position X onto shaft. Check this value with the chart indicating the load R_{x1} and R_{x2} bearable by the gearbox. Check that the following is satisfied:

Die Axialposition X der an der Welle anliegenden Last definieren und durch einen Vergleich dieses Werts auf dem Diagramm, welches die vom Getriebe R_{x1}, R_{x2} tragbare Last angibt, nachprüfen, ob das folgende Verhältnis gegeben ist:

Définir la position axiale X de la charge sur l'arbre, introduire cette valeur dans le diagramme indiquant la charge supportable par le réducteur R_{x1}, R_{x2} et vérifier que le rapport suivant est respecté:

$$R_{c1-2} \leq Rx_{1-2} \cdot fh \qquad (20)$$

dove fh_{1-2} sono i fattori correttivi carichi radiali e assiali da ricavare in funzione del fattore di durata F_{h1}, F_{h2} richiesto.

where fh_{1-2} the radial and thrust load corrective factor depending on the required life factor F_{h1} and F_{h2}.

wo fh_{1-2} den Korrekturfaktor der Radial und Axialkräfte darstellt, der im Bezug auf den geforderten Dauerfaktor F_{h1}, F_{h2} zu erarbeiten ist.

où fh_{1-2} sont les facteurs de correction des charges radiales et axiales à rechercher en fonction du facteur de durée F_{h1}, F_{h2} nécessaire.

d) Carichi assiali

Provvedere a verificare il carico assiale, quando presente sull'albero di uscita, in maniera analoga alla verifica relativa al carico radiale.

Deve essere soddisfatta la seguente relazione:

d) Thrust loads

Check the thrust load, when exerted onto the output shaft, as specified for the radial load.

The following should be satisfied:

d) Axialkräfte

In einer, der im Hinblick auf die Kontrolle der Radialkräfte analogen Vorgangsweise, die Kontrolle der Axialkraft, falls an der Abtriebswelle anliegend, vornehmen.

Das folgende Verhältnis muß gegeben sein:

d) Charges axiales

Vérifier la charge axiale, si existante sur l'arbre lent, pareillement à la vérification concernant la charge radiale.

La condition suivante doit être respectée :

$$\pm A_{c2} \leq \pm A_{n2} \cdot fh_2 \qquad (21)$$

Quando è presente un carico assiale combinato ad un carico radiale per una opportuna verifica interpellare la nostra Organizzazione di vendita.

When a thrust load is combined with an axial load contact our Sales Dept. for a proper checking procedure.

Ist jedoch eine Axialkraft gemeinsam mit einer Radial-kraft vorhanden, müssen Sie sich für die Prüfung an unsere Verkaufsorganisation wenden.

En cas de charge axiale combinée avec une charge radiale, pour une vérification appropriée consulter notre Organisation de Vente.

15.0 SCELTA DEL MOTORE

Motore elettrico

a) Dalla coppia M_{r2}, conoscendo n_2 e il rendimento dinamico η_d, ricavare la potenza in entrata:

$$P_{r1} = \frac{M_{r2} \cdot n_2}{9550 \cdot \eta_d} \quad [kW] \qquad (22)$$

La tabella (A2) a pag. 10 riporta i valori di rendimento η_d relativi ai vari stadi di riduzione dei riduttori della serie 300.

b) Selezionare nelle tabelle dati tecnici motori una grandezza con potenza nominale tale da soddisfare:

$$P_{r1} \leq P_n \qquad (23)$$

Preferibilmente scegliere motori a 4 poli o superiori.

Se non diversamente indicato, la potenza P_n dei motori riportata a catalogo si riferisce al servizio continuo S1.
Per i motori utilizzati in condizioni diverse da S1, sarà necessario identificare il tipo servizio previsto con riferimento alle Norme CEI 2-3/IEC 34-1.
In particolare, per i servizi da S2 a S8 e per le grandezze motore uguali o inferiori a 132, è possibile ottenere una maggiorazione della potenza rispetto a quella prevista per il servizio continuo, pertanto la condizione da soddisfare sarà:

$$\frac{P_{r1}}{f_m} \leq P_n \qquad (24)$$

Il fattore di maggiorazione f_m è ricavabile dalla tabella (A6).

15.0 HOW TO SELECT THE MOTOR

Electric motor

a) n_2 and dynamic efficiency η_d are known, calculate input power based on torque M_{r2} as follows:

Table (A2) on page 10 reports the values of efficiency η_d related to the different reduction stages of the gearboxes of series 300.

b) Look up the motor selection charts and select a size with such rated power to satisfy this condition:

4-pole motors and over should be preferred.

Unless otherwise specified, power P_n of motors indicated in the catalogue refers to continuous duty S1.
For motors used in conditions other than S1, the type of duty required by reference to CEI 2-3/IEC 34-1 Standards must be mentioned.
For duties from S2 to S8 in particular and for motor frame 132 or smaller, extra power can be obtained with respect to continuous duty power, consequently the following condition must be satisfied:

The increased power factor f_m can be obtained from table (A6).

15.0 WAHL DES MOTOR

Elektromotor

a) Da man n_2 und den dynamischen Wirkungsgrad η_d kennt, kann man aus dem Drehmoment M_{r2} nun die Antriebsleistung errechnen:

Die Tabelle (A2), Seite 10, führt die Werte des Wirkungsgrads η_d im Bezug auf die verschiedenen Untersetzungsstufen der Getriebe der Serie 300 auf.

b) In den Tabellen mit den technischen Motordaten eine Größe mit einer solchen Nennleistung wählen, welche die folgende Anforderung befriedigt:

Vorzugsweise sollten jedoch Motoren mit 4 oder mehr Polen ausgewählt werden.

Wenn nicht anders angegeben, bezieht sich die im Katalog angegebene Leistung P_n der Motoren auf Dauerbetrieb S1. Bei Motoren, die unter anderen Bedingungen als S1 eingesetzt werden, muß die vorgesehen Betriebsart unter Bezug auf die CEI-Normen 2-3/IEC 34-1 bestimmt werden.
Insbesondere kann man für die Betriebsarten S2 bis S8 (und für Motorbaugrößen gleich oder niedriger als 132) eine Überdimensionierung der Leistung, relativ zu der für den Dauerbetrieb vorgesehenen Leistung erhalten; die zu erfüllende Bedingung ist dann:

Der Überdimensionierungs-faktor f_m kann der Tabelle (A6) entnommen werden.

15.0 CHOIX DU MOTEUR

Moteur électrique

a) En connaissance de n_2 et de η_d rendement dynamique, calculer la puissance à l'entrée au couple M_{r2}:

Le tableau (A2) à la page 10 montre les valeurs de rendement η_d concernant les différents étages de réduction des réducteurs série 300.

b) Sélectionner au tableau données techniques des moteurs une taille avec puissance nominale capable de satisfaire à:

Choisir de préférence des moteurs à 4 pôles ou supérieurs.

Sauf indication contraire la puissance P_n des moteurs indiquée dans le catalogue se réfère à un service continu S1.
Pour les moteurs utilisés dans des conditions différentes du service S1, il sera nécessaire d'identifier le type de service prévu en se référant aux normes CEI 2-3/IEC 34-1.
En particulier, pour les services de type S2 à S8 ou pour les tailles de moteurs égales ou superieures à 132 il est possible d'obtenir une majoration de la puissance par rapport à celle prévue pour le service continu. Par conséquent, la condition à satisfaire sera:

Le facteur de majoration f_m peut être obtenu en consultant le tableau (A6).

(A6)

	SERVIZIO / DUTY / BETRIEB / SERVICE						
	S2			**S3***			**S4 - S8**
	Durata del ciclo / Cycle duration [min] Zyklusdauer / Durée du cycle [min]			Rapporto di intermittenza / Cyclic duration factor (I) Relative Einschaltdauer / Rapport d'intermittence (I)			Interpellarci Please contact us Rückfrage Nous contacter
	10	**30**	**60**	**25%**	**40%**	**60%**	
f_m	1.35	1.15	1.05	1.25	1.15	1.1	

* La durata del ciclo dovrà comunque essere uguale o inferiore a 10 minuti; se superiore interpellare la nostra organizzazione di vendita.
Rapporto di intermittenza:

$$I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (25)$$

t_f = tempo di funzionamento a carico costante
t_r = tempo di riposo

* Cycle duration, in any event, must be 10 minutes or less.If it is longer, please contact our technical service department.

Intermittence ratio:

t_f = operating time at constant load
t_r = rest time

* Die Zyklusdauer muß in jedem Fall kleiner oder gleich 10 min sein; wenn sie darüber liegt, unseren technisch- en Kundendienst zu Rate ziehen.
Relative Einschaltdauer:

t_f = Betriebszeit mit konstanter Belastung
t_r = Aussetzzeit

* La durée du cycle devra être égale ou inférieure à 10 minutes. Si supérieure, contacter notre service technique.

Rapport d'intermittence:

t_f = temps de fonctionnement à charge constante
t_r = temps de repos

Per servizi diversi da S_1, con un numero rilevante di inserzioni/ora si dovrà tener conto di un fattore Z (determinabile con le indicazioni riportate nel capitolo dei motori) il quale definisce il numero massimo di avviamenti specifico per l'applicazione in oggetto.

For duties other than S_1 with considerable number of starts per hour, factor Z must be considered (it is ascertained by using the information in the motors chapter). Factor Z defines the maximum number of starts for the application under consideration.

Bei von dem S_1 abweichenden Betriebsarten mit einer bedeutenden Anzahl an Schaltungen/Stunde muß man den Faktor Z (mittels der, im Kapitel der Motoren angeführten Angaben bestimmbar) berücksichtigen, der eine spezifische max. Anzahl an Anlässen für die betreffende Applikation festlegt.

Pour les services différents de S_1, avec un nombre important d'insertions/heure, il faudra prendre en considération un facteur Z (déterminé à l'aide des informations reportées dans le chapitre des moteurs) qui définit le nombre maximum de démarrages spécifique pour l'application concernée.

Motore idraulico

– In funzione dell'applicazione definire il tipo di motore idraulico scegliendolo dalla tabella (A7) di primo orientamento.

Hydraulic motor

– Determine hydraulic motor type according to the application, choosing from the options given in guidance table (A7).

Hydraulikmotor

– Im Hinblick auf die Applikationsart, muß nun in der Anhaltspunkttabelle (A7) der entsprechende Hydraulikmotor gewählt werden.

Moteur hydraulique

– D'après l'application, définir le type de moteur hydraulique en le choisissant du tableau (A7) de première orientation.

(A7)

Tipo d'impiego Duty Einsatzart Genre d'utilisation	Leggero Light Leicht Léger		Medio Medium Mittel Moyen		Pesante Heavy Schwer Intensif	
Pressione p [bar] Pressure p [bar] Druck p [bar] Pression p [bar]	<175		175 - 200		200 - 450

– Con i dati caratteristici di ingresso del riduttore:
coppia in entrata M_{r1} [Nm]
velocità in entrata n_1 [min^{-1}]
e con la pressione p [bar] ammessa dal circuito idraulico determinare la cilindrata del motore idraulico con la seguente formula:

– Based on the specifications of gearbox input:
input torque M_{r1} [Nm]
input speed n_1 [min^{-1}]
and on allowed pressure p [bar] for the hydraulic circuit, calculate the displacement of the hydraulic motor by formula:

– Anhand der charakteristischen Daten des Getriebeantriebs:
Antriebsdrehmoment M_{r1} [Nm]
Antriebsdrehzahl n_1 [min^{-1}]
und mit dem vom hydraulischen Kreislauf zugelassenen Druckwert p [bar], den Hubraum des Hydraulikmotors, unter Anwendung der folgenden Formel, bestimmen:

– Avec les données caractéristiques à l'entrée du réducteur :
couple en entrée Mr_1 [Nm]
vitesse en entrée n_1[min^{-1}]
et avec la pression p [bar] admise dans le circuit hydraulique, déterminer la cylindrée du moteur hydraulique par la formule: suivante:

$$V_c = \frac{20 \bullet \pi \bullet M_{r1}}{p \bullet \eta mh} \text{ [cm}^3\text{]} \qquad (26)$$

dove ηmh è il rendimento meccanico idraulico del motore (tab. A7).

where ηmh is the hydraulic mechanical efficiency of the motor (tab. A7).

wobei ηmh den mechanisch-hydraulischen Wirkungsgrad des Motors darstellt (tab. A7).

où ηmh représente le rendement mécanique-hydraulique du moteur (tab. A7).

– Selezionare una grandezza di motore che abbia una cilindrata V tale che:

– Select a motor size with displacement V that satisfies the following condition:

– Einen Motor mit einer Baugröße wählen, der über folgenden Hubraum V verfügt:

– Sélectionner une taille de moteur ayant une telle cylindrée V que :

$$V_c \leq V \qquad (27)$$

– Calcolare la portata necessaria per alimentare il motore idraulico

– Calculate the flow required for the hydraulic motor

– Die für die Versorgung des Hydraulikmotors erforderliche Förderleistung berechnen:

– Calculer le débit nécessaire pour alimenter le moteur hydraulique

$$Q_1 = \frac{V \bullet n_1}{\eta_v \bullet 1000} \text{ [l/min]} \qquad (28)$$

dove ηv è il rendimento volumetrico.
Per motori idraulici orbitali di produzione TRASMITAL BONFIGLIOLI consultare il relativo capitolo del presente catalogo.
Per altri tipi di motori idraulici consultare le loro relative documentazioni tecniche.

where ηv is volumetric efficiency.
For hydraulic orbital motors by TRASMITAL BONFIGLIOLI, please see the relevant chapter in this catalogue. For other types of hydraulic motors, see the relevant technical literature.

wo ηv für den volumetrischen Wirkungsgrad steht.
Im Bezug auf die orbitalen Hydraulikmotoren aus der Produktion TRASMITAL BONFIGLIOLI, das entsprechende Kapitel im vorliegenden Katalog konsultieren. Bezüglich anderer Hydraulikmotortypen, verweisen wir auf deren jeweilige Unterlagen.

où ηv représente le rendement volumétrique.
Pour les moteurs hydrauliques orbitaux de production TRASMITAL BONFIGLIOLI, consulter le chapitre correspondant de ce catalogue. Pour d'autres types de moteurs hydrauliques consulter la documentation techniques y rattachée.

16.0 INSTALLAZIONE

E' molto importante per l'affidabilità e il buon funzionamento del riduttore o motoriduttore rispettare alcune norme per la sua corretta installazione.
Le norme qui riportate hanno valore per una prima indicazione per la installazione del riduttore o motoriduttore.
Per provvedere ad una effettiva e corretta installazione attenersi al Manuale di installazione uso e manutenzione dei riduttori della serie 300 fornibile dalla nostra Organizzazione di Vendita.

Riportiamo in breve le norme da seguire:

a) Fissaggio:

- Appoggiare il riduttore a una struttura sufficientemente rigida, con superfici di accoppiamento piane lavorate di macchina utensile.
- Le superfici di accoppiamento, specialmente per riduttori montati con flangia e con alberi in uscita femmina scanalati, devono risultare entro precise tolleranze geometriche (vedi manuale).
- Per alcune grandezze di riduttori, in applicazioni con elevati carichi radiali in uscita, è raccomandato il montaggio a flangia eseguito per utilizzare i doppi diametri di centraggio di cui tali riduttori sono provvisti. Vedi parte "Carichi sugli alberi" per le diverse grandezze di riduttori.
- Verificare che il riduttore sia previsto per la posizione di montaggio richiesta come illustrato nella tabella (A8) a pag. 24.
- Fissare il riduttore con viti di classe di resistenza 8.8 o superiore serrandole ai valori di coppia di serraggio indicati nelle relative tabelle.
  Per coppie massime trasmesse maggiori od uguali al 70% della coppia M_{2max} indicata e con frequenti inversioni del moto, utilizzare viti in classe minima di resistenza 10.9.
  Alcune grandezze di riduttori prevedono oltre il fissaggio con viti, anche spine. Inserire le spine di cui i riduttori sono provvisti, nella struttura sulla quale il riduttore viene installato per una lunghezza almeno pari a 1,5 il valore del loro diametro.

16.0 INSTALLATION

Observing a few rules for correct installation is essential to the reliable and proper operation of the gearbox or gear motor.
The rules set out here are intended as a preliminary guide to selecting gearbox or gear motor.
For effective and proper installation, follow the instructions given in the Installation, use and maintenance manual for the gearboxes of series 300 available from our Sales Organization.

Following is a brief outline of installation rules:

a) Fastening:

- Place gearbox on a surface providing adequate rigidity. Mating surfaces should be machined and flat.
- Mating surfaces must be within definite geometric tolerances (see manual). This is especially true of flange-mounted gearboxes with splined hollow shafts.
- In applications that involve high radial loads at the output end, flange mounting is recommended for some gearbox sizes as this mounting makes use of the double pilot diameters provided on these gearboxes. See section "Loads on shafts" for the different gearbox sizes.
- Make sure the gearbox is suitable for the required mounting position (check with table A8 on page 24).
- Use screws of resistance class 8.8 and over to secure the gearbox. Torque up screws to the figures indicated in the relevant tables.
  With transmitted output torque greater than or equal to 70% of the indicated M2max torque, and with frequent movement reversals, use screws with minimum resistance 10.9.
  Some gearbox sizes can be fastened using either screws or pins. If a pin is used, the length of pin seated in the frame the gearbox is being installed to should be at least 1.5 times pin diameter.

16.0 INSTALLATION

Im Hinblick auf die Zuverlässigkeit und eine gute Betriebsweise des Getriebes oder des Getriebemotors ist es besonders wichtig, für deren korrekten Einbau Kenntnis über einige Richtlinien zu haben.
Die hier in Folge angeführten Normen sind eine erste Anleitung für die Auswahl des Getriebes oder des Getriebemotors.
Um eine effektive und korrekt erfolgte Installation zu erhalten, muß man sich an das Anleitungs- und Instandhaltungshandbuch der Getriebe der Serie 300 halten. Dieses Handbuch ist bei unserer Verkaufsorganisation erhältlich.

Wir möchten Ihnen hier nur kurz die zu befolgenden Normen anführen:

a) Befestigung:

- Das Getriebe auf einer ausreichend starken Stuktur mit flachen und mittels Werkzeugmaschinen bearbeitenen Passungsflächen ablegen.
- Die Passungsflächen, besonders für die mit Flansch und Keilabtriebswellen montierten Getriebe, müssen innerhalb bestimmter geometrischer Toleranzen liegen (siehe Hand -buch).
- Bei einigen Baugrößen, bei Applikationen mit hoher auf dem Abtrieb einwirkender Radialkraft, wird die Montageweise mit Flansch empfohlen, wodurch die doppelten Zentrierdurchmesser, mit denen die Getriebe ausgestattet sind, verwendet werden können. Im Bezug auf die unterschiedlichen Baugrößen der Getriebe, siehe Abschnitt "Auf Wellen einwirkende Kräfte ".
- Unter Bezugnahme auf die Tabelle (A8) prüfen auf Seite 24, ob das Getriebe auch für die erforderliche Montagestellung geeignet ist.
- Das Getriebe mit Schrauben der Widerstandsklasse 8.8 oder einer höheren Klasse befestigen, dabei auf die in den jeweiligen Tabellen angegebenen Anzugsmomente bringen.
  Für zu übertragene Maximaldrehmomente, die höher als 70% des angegebenen Werts M2max oder diesem Prozentsatz gleich kommen und im Fall von häufigen Schaltungen sind Schnecken aus der Klasse der min. Widerstandsgrads 10.9 zu verwenden.
  Einige Getriebebaugrößen sehen ausser der Befestigung durch die Schrauben, auch Stifte vor. Dazu die Stifte, mit denen die Getriebe ausgestattet sind, über eine Länge von mindestens gleich 1,5 des Werts ihres Durchmesser, in die Stuktur einstecken, auf die das Getriebe installiert werden soll.

16.0 INSTALLATION

Il est très important pour la fiabilité et le bon fonctionnement du réducteur ou motoréducteur, de respecter certaines règles pour son installation correcte.
Les règles indiquées n'ont qu'une valeur indicative orientation pour le choix du réducteur ou motoréducteur. Pour effectuer la parfaite installation définitive, respecter les consignes d'installation, utilisation et entretien des réducteurs de la série 300, qui peuvent être livrées par notre Organisation de Vente.

Voici brièvement les règles qu'il faut suivre:

a) Fixation:

- Faire en sorte que le réducteur repose sur un bâti suffisamment rigide avec des surfaces d'accouplement planes et usinées à la machine-outil.
- Les surfaces d'accouplement, spécialement pour les réducteurs avec bride d'assemblage et arbres de sortie femelle cannelés, doivent respecter des tolérances géométriques bien précises (voir catalogue).
- Pour certaines tailles de réducteur, dans des applications avec des charges radiales élevées à la sortie, on préconise un montage avec bride, afin d'utiliser le doubles diamètres de centrage, dont ces réducteurs sont pourvus. Se reporter à la section "Charges sur les arbres" pour les différentes tailles de réducteurs.
- Veiller à ce que le réducteur convienne à la position de montage nécessaire, ainsi qu'au tableau (A8) à la page 24, le montre.
- Fixer le réducteur avec des vis d'un degré de résistance 8.8 ou supérieur en les serrant aux valeurs de couple de serrage indiquées sur les tableaux correspondants.
  Pour des couples maximaux transmis plus importants ou équivalents à 70% du couple M2max indiqué, et en cas d'inversions fréquentes du mouvement, utiliser des vis dans une classe minimale de résistance 10.9.
  Certaines tailles de réducteurs prévoient une fixation tant par vis que par goupilles. Introduire les goupilles, livrées avec les réducteurs, dans le bâti sur lequel le réducteur sera installé pour une longueur au moins égale à 1,5 de la valeur de leur diamètre.

b) Collegamenti

– Fissare gli organi di collegamento in entrata ed uscita al riduttore evitando di battere con martello o equivalenti. Utilizzare per l'inserimento degli organi viti di servizio e i fori filettati presenti negli alberi. Prima di montare gli organi di collegamento avere cura di pulire gli alberi eliminando grassi o protettivi eventualmente presenti.

– Montaggio motori idraulici.
Avere cura nel montaggio dell'O-ring di tenuta fra flangia motore e flangia in ingresso riduttore. Montare il motore idraulico prima di mettere l'olio lubrificante nel riduttore.

– Collegamento freno idraulico.
Utilizzare un circuito idraulico che assicuri l'apertura del freno immediatamente prima della partenza del motoriduttore e la chiusura dopo che questo sia arrestato. Verificare che durante le fasi di motoriduttore fermo la pressione nella linea idraulica di apertura freno sia zero.

– Versi di rotazione.
Nei collegamenti dei motori al circuito elettrico o idraulico in funzione dei loro versi di rotazione, tenere presente che tutti i riduttori, sia in esecuzione in linea che angolare hanno versi di rotazione concordi fra entrata e uscita. Per altre indicazioni relative ai collegamenti di motori elettrici e idraulici vedi le parti specifiche su questo catalogo pag.171.

c) Verniciatura

– Utilizzare vernici compatibili con la vernice di fondo presente sui riduttori, vedi condizioni di fornitura pag.21.
Durante la verniciatura proteggere gli anelli di tenuta presente sugli alberi.
La vernice li può fare essiccare causando perdite d'olio.

b) Connections

– Secure the connection parts to gearbox input and output. Do not tap them with hammers or similar tools. To insert these parts, use the service screws and threaded holes provided on the shafts. Be sure to clean off any grease or protectants from the shafts before fitting any connection parts.

– Fitting hydraulic motors.
Be careful of the O ring between motor flange and gearbox input flange when assembling. Install the hydraulic motor before filling lube oil into the gearbox.

– Connecting the hydraulic brake.
The hydraulic circuit should be such to ensure that brake is released instants before gearbox starts and applied after gearbox has stopped. Check that pressure in the hydraulic line for brake release is at zero whenever gearbox is stopped.

– Direction of rotation
Motors are connected to the suitable electric or hydraulic circuit according to their direction of rotation. When performing these connections, bear in mind that all gearboxes, whether in the in-line or right angle design, have the same direction of rotation both at input and output. For more details of the connection of electric and hydraulic motors, see relevant sections in this catalogue on page 171.

c) Painting

– Use paints compatible with the primer applied to the gearbox, see supply conditions on page 21.
Before painting, protect the seal rings installed on the shafts.
Contact with paint may deteriorate the seals with subsequent oil leakage.

b) Anschlüsse

– Die Anschlußteile zum Getriebeantrieb und -abtrieb befestigen, dabei ein Einklopfen mittels Hammer oder ähnlichen Gegenständen vermeiden. Beim Einführen der Teile sind Serviceschrauben und die auf den Wellen vorhandenen Gewindebohrungen zu verwenden. Vor dem Montieren der Verbindungsteile müssen die Wellen durch eine entsprechende Reinigung von Fett und eventuell vorhandenen Schutzmitteln befreit werden.

– Montage der Hydraulikmotore.
Der Montage des O-Dichtrings zwischen dem Motorflansch und dem Antriebsflansch am Getriebe muß besondere Aufmerksamkeit zugewendet werden. Vor dem Einfüllen des Schmieröls in das Getriebe, ist der Motor zu montieren.

– Anschluß der hydraulischen Bremse Hierbei ist ein Hydraulikkreislauf zu verwenden, der eine unmittelbare Öffnung der Bremse, noch vor dem Anlauf des Getriebemotors und nach dessen Halt, eine Schließung sichern kann. Es ist zu überprüfen, daß während der Phasen, in denen der Getriebemotor stillsteht, der Druck in der hydraulischen Leitung für die Bremsöffnungsfunktion gleich Null ist.

– Drehrichtungen
Die Drehrichtung an der Abtriebswelle ist bei allen Getrieben, sowohl bei linear als auch bei Winkelgetrieben, gleich mit der Eingangsdrehrichtung des Hydro-oder Elektromotors. Im Bezug auf weitere Anleitungen für die Anschlüsse von Elektro- und Hydraulikmotoren, verweisen wir auf die entsprechenden Abschnitte in diesem Katalog. Siehe dazu Seite 171.

c) Lackierung

– Es müssen Lackarten verwendet werden, die mit der bereits am Getriebe verwendeten Grundierung kompatibel sind. Siehe dazu auch die Seite 21 angeführten Lieferbedingungen. Während des Lackiervorgangs sind die auf der Welle angeordneten Dichtringe in angemessener Weise zu schützen.
Der Lack kann zum Austrocknen dieser Ringe führen, was letztendlich zu Ölverlusten führen würde.

b) Raccordements

– Fixer les éléments de raccordement en entrée et en sortie du réducteur. N'utilisez pas de marteaux, ni d'outils afin de frapper. Pour l'introduction des organes, utiliser les vis correspondantes et les trous taraudés existant sur les arbres.
Avant le montage des éléments de raccordement, prendre soin de nettoyer les arbres, en éliminant, si besoin est, les graisses ou agents protecteurs.

– Montage des moteurs hydrauliques.
Prendre soin de monter le joint torique entre la bride moteur et la bride à l'entrée du réducteur. Installer le moteur hydraulique avant de mettre l'huile lubrifiant dans le réducteur.

– Utiliser un circuit hydraulique assurant une ouverture du frein juste avant le démarrage du motoréducteur et une fermeture après sa mise à l'arrêt. Veiller à ce que, lors des phases d'arrêt du motoréducteur, le circuit hydraulique d'ouverture frein soit totalement dépressurisé.

– Sens de rotation.
Lors d'un raccordement de moteurs au circuit électrique ou hydraulique, en fonction de leurs sens de rotation, il faut tenir compte que tous les réducteurs, en exécution alignée aussi bien qu'angulaire, aient des sens de rotation concordants en entrée et en sortie.
Pour d'autres indications concernant les raccordements des moteurs électriques et hydrauliques, voir les sections s'y rattachant de ce catalogue à la page 171.

c) Peinture

– Utiliser des peintures compatibles avec la couche de fond déjà existant sur les réducteurs, se reporter aux conditions de livraison à la page 21.
En cours de peinture, protéger les bagues à lévres des arbres.
La peinture peut les sécher trop et des fuites d'huile peuvent en découler.

d) Lubrificazione

– Prima della messa in funzione riempire il riduttore d'olio lubrificante del tipo raccomandato (vedi lubrificazione a pag.25) fino al raggiungimento del previsto livello verificabile dall'apposito tappo o livello visivo di cui ogni riduttore è provvisto in relazione alla posizione di montaggio stabilita.

d) Lubrication

– Before start-up, fill the gearbox with the recommended lube oil (see lubrication on page .25) up to correct level. Level is checked through the suitable plug or sight glass provided on each gearbox depending on designated mounting position.

d) Schmierung

– Vor der Inbetriebnahme muß das Getriebe solange mit dem empfohlenen Schmieröl (siehe "Schmierung" auf Seite .25) gefüllt werden, bis der vorgesehene Ölpegel erreicht wurde. Dieser Pegel ist über den entsprechenden Verschluß oder über das Schauauge, über welches jedes Getriebe je nach festgelegten Montagestellung verfügt, feeststellbar.

d) Lubrification

– Avant la mise en service, remplir le réducteur avec l'huile lubrifiante conseillée (voir lubrification à la page 25) jusqu'à atteindre le niveau prévu par rapport à la position de montage établie vérifier à travers le bouchon, ou niveau visible, dont chaque réducteur est équipé.

17.0 **MANUTENZIONE**

Controllare il serraggio dei bulloni dopo 50 ore di lavoro.

Effettuare il primo cambio olio circa dopo 100 – 150 ore di lavoro. Successivamente effettuare il cambio ogni 2000 – 3000 ore a seconda degli impieghi o almeno una volta all'anno.

E' buona norma comunque controllare il livello una volta al mese per funzionamento intermittente o più frequentamente per funzionamento in continuo e aggiungere olio se necessario.

17.0 **MAINTENANCE**

Check the tightness of mounting bolts after the initial 50 hours of operation.

Change the oil first after 100 – 150 hours operation.
Subsequently, change the oil every 2000 – 3000 hours operation depending on application.
Alternatively change oil once a year.

Check the oil level in the gearbox every month and top up as necessary

17.0 **WARTUNG**

Schrauben nach 50 Betriebsstunden auf festen Sitz prüfen .

Ersten Ölwechsel nach zirka 100 – 150 Betriebsstunden durchführen. Anschließend alle 2000 - 3000 oder mindestens einmal jährlich einen Ölwechsel durchführen (je nach Einsatzbereich).

Es sollte jedoch bei Aussetzbetrieb einmal monatlich und bei Dauerbetrieb häufiger der Ölstand kontrolliert werden.
Falls notwendig, Öl nachfüllen.

17.0 **ENTRETIEN**

Controler le serrage des vis et boulons, aprés 50 heures de travail.

Effectuer la première vidange du lubrifiant, aprés 100 – 150 heures de travail. Ultérieurement, effectuer une vidange toutes les 2000 – 3000 heures, selont les applications, ou au minimum une fois par an.

Toutefois, il est conseillé de controler le niveau d'huile une fois par mois, en cas de fonctionnement intermittent, plus souvent en cas de service continu, et de faire l'appoint si nécessaire.

18.0 **STOCCAGGIO**

Il corretto stoccaggio dei prodotti ricevuti richiede l'esecuzione delle seguenti attività:

a) Escludere aree all'aperto, zone esposte alle intemperie o con eccessiva umidità.

b) Interporre sempre tra il pavimento ed i prodotti, pianali lignei o di altra natura, atti ad impedire il diretto contatto col suolo.

c) Per periodi di stoccaggio superiori ai 60 giorni, le superfici interessate agli accoppiamenti quali flange, alberi e giunti, devono essere protette con idoneo prodotto antiossidante (Mobilarma 248 od equivalente).

d) Per periodi di stoccaggio previsti superiori ai 6 mesi, i prodotti devono essere oggetto delle seguenti attività:

d1)Ricoprire le parti lavorate esterne e quelle di accoppiamento con grasso atto ad evitare ossidazioni.

d2)Posizionare i riduttori con il tappo di sfiato nella posizione più alta e riempirli di olio.
I riduttori, prima del loro utilizzo, dovranno essere riempiti con la corretta quantità e tipo di lubrificante previsto.

18.0 **STORAGE**

Observe the following instructions to ensure correct storage of delivered products:

a) Do not store outdoors, in areas exposed to weather or with excessive humidity.

b) Always place boards in wood or other material between floor and products, to avoid direct contact with the floor.

c) For storage periods of over 60 days, all machined surfaces such as flanges, shafts and couplings must be protected with a suitable anti-oxidation product (Mobilarma 248 or equivalent product).

d) The following measures must be taken in respect of products for which the expected storage period exceeds 6 months:

d1)Cover outer machined parts and mating parts with grease to avoid oxidation.

d2)Position the gearboxes with the breather plug up and fill them with oil.
Before use, the gearboxes should be filled with the proper amount of lubricant of the recommended type.

18.0 **LAGERUNG**

Die korrekte Lagerung der Antriebe erfordert folgende Vorkehrungen:

a) Die Produkte nicht im Freien lagern und nicht in Räumen, die der Witterung ausgesetzt sind, oder eine hohe Feuchtigkeit aufweisen.

b) Die Produkte nie direkt auf dem Boden, sondern auf Unterlagen aus Holz oder einem anderen Material lagern.

c) Bei Lagerzeiten von mehr als 60 Tagen die Oberflächen für die Verbindung, wie Flansche, Wellen oder Kupplungen mit einem geeigneten Oxidations-schutzmittel behandeln (Mobilarma 248 oder ein äquivalentes Mittel).

d) Bei Lagerzeiten von mehr als 6 Monaten müssen folgende Vorkehrungen getroffen werden:

d1)Die bearbeiteten Außenteile und die Passflächen mit Oxydationschutzfett abdecken.

d2)Die Getriebe mit der Entlüftungsschraube in die oberste Position ausgerichtet montieren, dann mit Öl auffüllen.
Die Getriebe müssen vor ihrem Einsatz mit der richtigen Menge des vorgesehenen Schmiermittels aufgefüllt werden.

18.0 **STOCKAGE**

Un stockage correct des produits reçus nécessite de respecter les règles suivantes:

a) Exclure les zones à ciel ouvert, les zones exposées aux intempéries ou avec humidité excessive.

b) Interposer dans tous les cas entre le plancher et les produits des planches de bois ou des supports d'autre nature empêchant le contact direct avec le sol.

c) Pour les périodes de stockage supérieures à 60 jours, les surfaces concernées par les liaisons telles que les brides, les arbres et les accouplements doivent être protégées avec un produit antioxydant spécial (Mobilarma 248 ou équivalent).

d) Pour les périodes de stockage prévues supérieures à 6 mois, les produits doivent être objet des contrôles suivants:

d1)Recouvrir les parties extérieures usinées et les éléments d'accouplement avec de la graisse contre l'oxydation.

d2)Positionner les réducteurs avec le bouchon reniflard le plus haut possible et les remplir d'huile.
Avant utilisation, les réducteurs doivent être remplis de la quantité et du type de lubrifiant préconisés.

19.0 CONDIZIONI DI FORNITURA

I riduttori vengono forniti come segue:

a) già predisposti per essere installati nella posizione di montaggio come definito in fase di ordine;

b) **senza olio lubrificante ed internamente protetti con un film d'olio usato per il collaudo finale (tipo IP IDEX OIL SAE 10W20)**;

c) verniciati con vernice di fondo antiossidante all'acqua di colore grigio (tipo Idrayon Primer-Ral 7042/C441).
Le superfici di accoppiamento non sono verniciate.
La verniciatura finale è a cura del cliente;

d) collaudati secondo specifiche interne;

e) appositamente imballati;

f) provvisti di dadi e bulloni per montaggio motori elettrici versione IEC o motori idraulici;

19.0 SUPPLY CONDITIONS

Gearboxes are supplied as follows:

a) ready for installation in the mounting position specified on order;

b) **dry; inner parts are protected by a film of the oil used for final testing (type IP IDEX OIL SAE 10W20);**

c) painted with antioxidant water primer in the colour grey (type Idrayon Primer-Ral 7042/C441).
Mating surfaces are not painted.
Final coat is to be applied by the Customer;

d) tested to in-house specifications;

e) suitably packed;

f) complete with mounting nuts and bolts for IEC electric motors or hydraulic motors;

19.0 LIEFERBEDINGUNGEN

Die Getriebe werden wie folgt geliefert.

a) bereits für die Installation in der Einbaulage gemäß Auftrag bereit.

b) **ohne Schmieröl und innen mit einem Öl, das für die Endabnahmeprüfung verwendet wurde, überzogen (Typ IP IDEX OIL SAE 10W20).**

c) mit einer grauen, vor Oxydation durch Wasser schützenden Grundlackierung überzogen (Typ Idrayon Primer Ral 7042/C441).
Die Verbindungsflächen sind nicht lackiert.
Die Endlackierung geht zu Lasten des Kunden.

d) gemäß werksinterner Spezifikationen geprüft.

e) in angemessener Weise verpackt.

f) mit Muttern und Schrauben für die Montage an Elektromotoren der Version IEC oder Hydraulikmotoren ausgestattet.

19.0 CONDITIONS DE LIVRAISON

Les réducteurs sont livrés comme suit:

a) déjà adaptés pour l'installation dans la position d'assemblage définie en cours de commande;

b) **sans huile lubrifiante et protégés à l'intérieur avec un film d'huile utilisée lors de l'essai final (type IP IDEX OIL SAE 10W20);**

c) peints avec une couche de fond de protection antioxydant à l'eau, de coloris gris (type idrayon Primer-Ral 7042/C441).
Les surfaces d'accouplement ne sont pas peintes.
La peinture de finition doit être réalisée par le client;

d) essayés d'après les spécifications internes;

e) dûment emballés;

f) pourvus d'écrous et de boulons pour l'assemblage aux moteurs électriques, version CEI, ou moteurs hydrauliques;

21.0 POSIZIONI DI MONTAGGIO

Per la completa definizione della forma costruttiva del motoriduttore o del riduttore selezionato, definire la posizione di montaggio rispetto al suolo secondo la tabella (A8) e l'orientamento dell'angolare.

(A8)

Riduttori in linea ed angolari

21.0 MOUNTING POSITION

For a proper designation of the geared motor or gearbox, mounting position please refer to the table (A8) to determine mounting position and right angle unit arrangement.

Inline and right angle gearboxes

21.0 MONTAGEPOSITIONEN

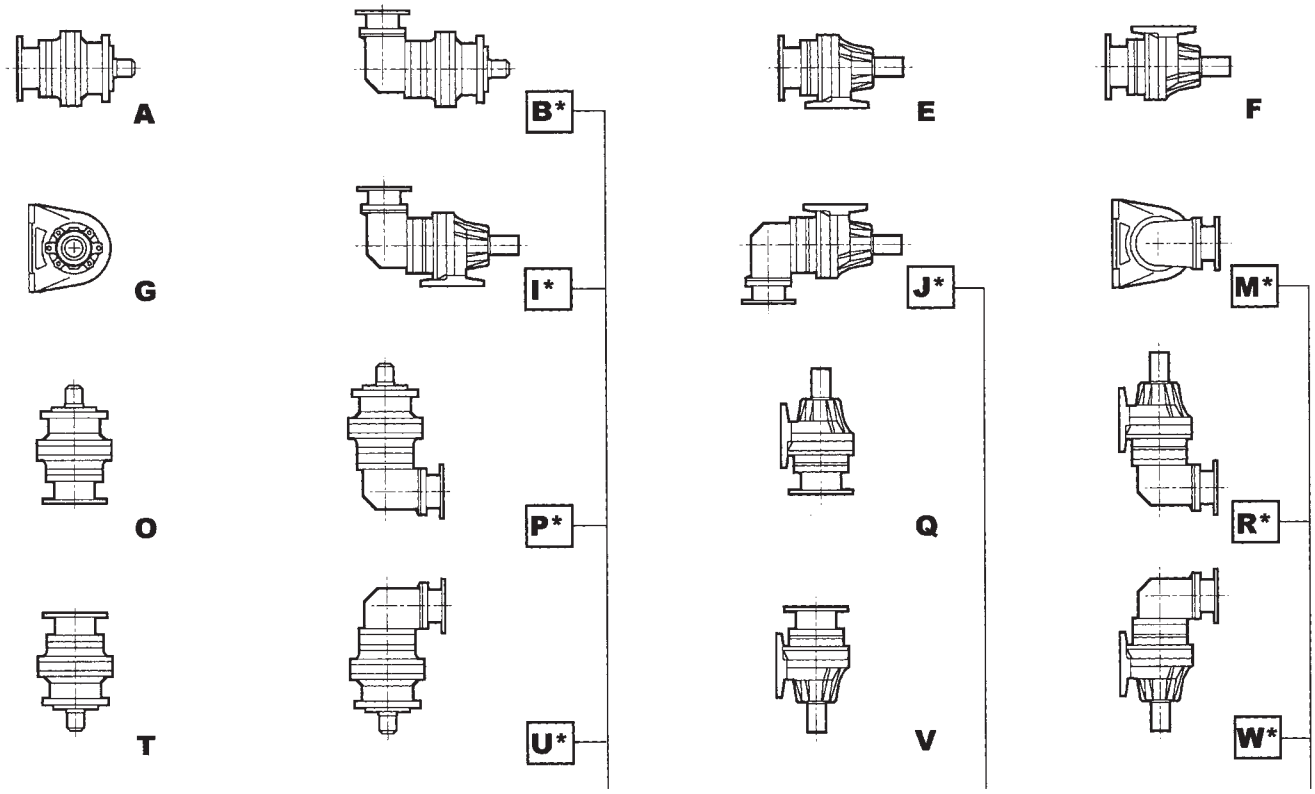
Für die vollständige Definition der Bauform des Getriebemotors oder des gewählten Getriebes ist die Montagestellung gegenüber dem Boden gemaß der Tabelle (A8) und der Ausrichtung des Winkelstücks festzulegen.

Coaxiale und rechtwinklige Untersetzungsgetriebe

21.0 POSITION DE FONCTIONNEMENT

Pour une définition complète de la forme de construction, du motoréducteur ou réducteur sélectionné, préciser la position de montage par rapport au sol, d'après les tableaux (A8) et l'orientation de coude.

Réducteurs coaxiaux et a rénvoi d'angle

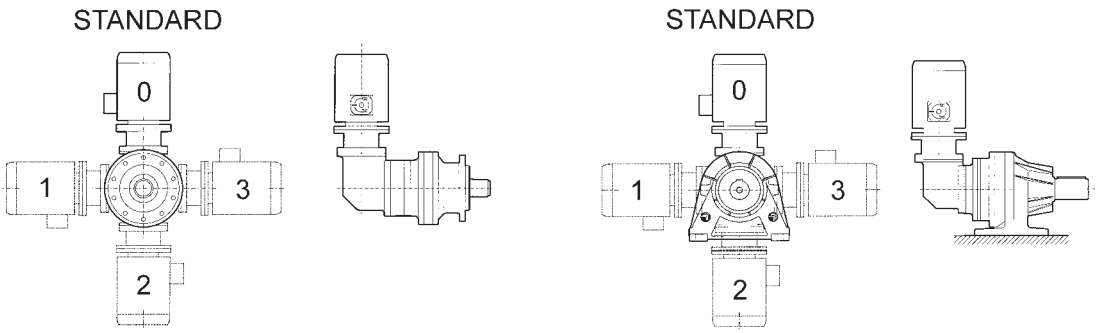


* Per tutti i riduttori con angolare, oltre alla posizione di montaggio, specificarel'orientamento dell'asse dell'ingresso secondo lo schema seguente

* For all gearboxes with right angle unit, in addition to the mounting position, please specify the arrangement of the input axis according to the diagram below.

* Für alle Winkelgetriebe, muß über die Montagestellung hinaus, auch die Ausrichtung der Antriebsachse, dem folgenden Schema gemaß, spezifiziert werden.

* Pour tous les réducteurs avec renvoi d'angle, en plus de la position de montage spécifier l'orientation de l'axe d'entrée suivant le schéma suivant.



22.0 LUBRIFICAZIONE
(prima della messa in funzione)

Tutti i riduttori prevedono una lubrificazione a bagno d'olio. Nelle posizioni di montaggio che prevedono i riduttori con un asse verticale, dove lo sbattimento dell'olio durante il funzionamento non sarebbe sufficente a garantire la corretta lubrificazione dei cuscinetti superiori, vengono adottati adeguati sistemi di lubrificazione.

22.0 LUBRICATION
(prior to start-up)

All gearboxes are oil-bath lubricated. For applications calling for gearboxes with a vertically positioned axis, in which oil coverage during operation would not be sufficient to ensure correct lubrication of upper bearings, suitable life lubrication systems are used.

22.0 SCHMIERUNG
(vor der inbetriebnahme)

Alle Getriebe weisen eine Ölbadschmierung auf. Werden die Getriebe mit vertikaler Achse eingebaut, so daß nicht gewährleistet werden kann, daß das Öl während des Betriebs des Getriebes auch die oberen Lager ordnungsgemäßschmiert, werden entsprechende Dauerschmierungen vorgesehen.

22.0 LUBRIFICATION
(avant mise en route)

Tous réducteurs prevoient une lubrification en bain d'huile. Dans les positions de montage qui prévoient les réducteurs avec axe vertical, où le barbotage de l'huile pendant le fonctionnement serait insuffisant pour garantir une lubrification correcte des paliers supérieurs, l'on adopte des systè-mes appropriés de graissage à vie.

Prima della messa in opera immmettere la giusta quantità di lubrificante scegliendo la viscosità nella tabella (A9). A tal proposito i riduttori sono muniti dei tappi di carico, livello e scarico olio.

Al fine di predisporre il corretto orientamento dei tappi, per una adeguata lubrificazione, chiediamo di precisare sempre la posizione di montaggio desiderata.

Nella tabella (A9) sono riportate le marche più diffuse di lubrificazione con i tipi di oli consigliati per applicazioni normali.

- Per funzionamenti particolari dove sono richiesti speciali requisiti, interpellare il nostro servizio tecnico.
- La temperatura max. del lubrificante in esercizio continuo non deve superare gli 85°C.
- Tutti i riduttori vengono forniti senz'olio, ma predisposti con tappi di carico, scarico e livello.
- La quantità d'olio indicate per i vari tipi di riduttori sono indicative, il riempimento esatto deve essere fatto controllando il livello.
- Nel caso in cui la potenza trasmessa superi quella termica, occorrerà una circolazione d'olio (vedi cap.45 a pag. 220).

Before start-up, fill the gearbox with the correct quantity of oil, selecting the viscosity level as per table (A9). These gearboxes are provided with oil filling, level and drain plugs.
For a proper plug positioning for adequate lubrication, please always specify the required mounting position.

The table (A9) lists the most common brands of lubricant and the types recommended for normal applications.

- Note: For applications with special operating conditions, consult the factory with complete information.
- Oil temperature must not exceed 85°C.
- Units are delivered without oil but with filling, draining and oil level plugs correctly positioned.
- The oil capacities indicated for the various types of unit are indicative only. Check the oil level plug to ensure the correct amount of oil.
- Should transmitted power exceed the thermal capacity of the unit forced lubrication must be provided (see chap.45 at page 220).

Vor der Inbetriebnahme muß die entsprechende Schmiermittelmenge eingefüllt werden. Die hierzu jeweils erforderlichen Viskositätswerte können der Tabelle (A9) entnommen werden. Für diesen Füllvorgang wurden die Getriebe mit Verschlüssen für das Einfüllen, Nachfüllen und den Ablaß des Öls ausgestattet.
Um die Verschlüsse für eine angemessene Schmierung in korrekter Weise auszurichten zu können, empfehlen wir Ihnen, immer die gewünschte Montageposition anzugeben.

In der Tabelle (A9) sind die be-kanntesten Marken von Schmier- mitteln mit den empfohlenen Ölen für normale angeführt Einsatz.

- Im Falle von speziellen Einsatzbereichen, bei denen besondere Anforderungen vonnöten sind, wenden Sie sich bitte an unsere technische Abteilung.
- Die maximale Temperatur des Schmiermittels bei Dauerbetrieb darf 85°C nicht überschreiten.
- Sämtliche Untersetzungsgetriebe werden ohne Öl geliefert, sind und mit einer Ölfüll-Ölablaß-und Ölstandschraube versehen.
- Die für die verschiedenen Typen von Untersetzungsgetrieben angegebenen Füllmengen sind Richtwerte. Die Befüllung erfolgt über die Kontrolle des Ölstandes.
- Sollte die übertragene Leistung die thermische Leistung übersteigen, so wird eine Ölumwälz-ung erforderlich (Siebe Abschmitt 45, Seite 220).

Avant la mise en service, introduire la quantité exacte de lubrifiant choisissant la viscosité du tableau (A9). Les réducteurs sont pourvus à cet effet de bouchon de remplissage, jauge de niveau et élément de vidange huile.
Dans le but de réaliser une mise en place exacte des bouchons, pour une lubrification appropriée, il est conseillé de spécifier toujours la position de montage souhaitée.

Sur le tableau (A9), ont été reportées les marques les plus répandues de lubrifiants avec les types conseillés, pour des applications normales.

- Pour des applications dans des conditions de fonctionnement particuliéres, consulter nos Services Techniques.
- La température maxi du lubrifiant, en fonctionnement continu, ne doit pas dépasser 85°C.
- Tous les réducteurs sont livrés sans huile, mais équipés de bouchons de remplissage, de vidange, et de niveau.
- Les quantités d'huile, précisées pour les divers types de réducteurs, sont indicatives, le remplissage exact devant être effectué en contrôlant le niveau.
- Dans le cas où la puissance transmise dépasserait la puissance thermique, il sera necessaire de prévoir une circulation d'huile (voir par.45 à page 220).

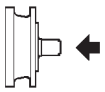
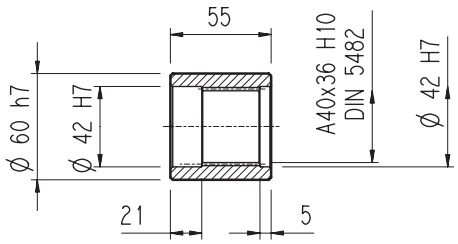
Naben / Manchons lisses a cannelure interieure

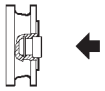


MOA

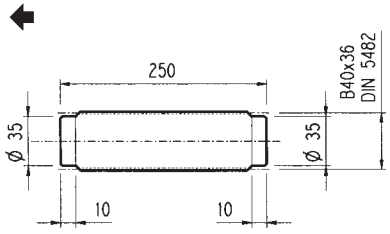


Materiale : Acciaio 16CrNi4
Material : Steel 16CrNi4
Material : Stahl 16CrNi4
Màterial : Acier 16CrNi4

Barre scanalate / Splined bars
Vielkeilwellen / Barre cannelée

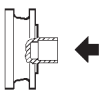


BOA

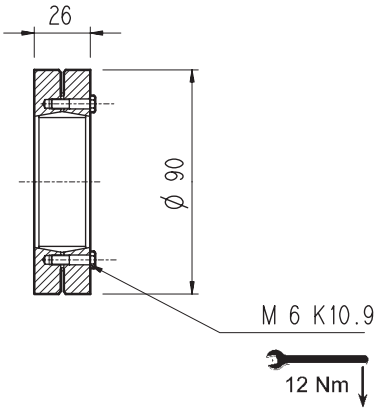


Mat. acciaio 18NiCrMo5 UNI 5331 da cementare e temprare 50-55 HRC
Case hardening steel 18NiCrMo5 UNI 5331
must be case hardened 50-55 HRC
Material: Einsatzstahl 18NiCrMo5 UNI 5331
muss einsatzgehärtet werden 50-55 HRC
Acier 18 NiCrMo5 UNI 5331 doit être cémenté trempé 50-55 HRC

Giunto ad attrito / Shrink disc
Schrumpfscheibe / Frette de serrage



GOA



300L - 300R

Carichi radiali ed assiali ammissibili sull'albero lento per un valore di $Fh_2 : n_2 \cdot h = 10\,000$

Permissible radial and axial loads on output shaft with Fh_2 $n_2 \cdot h = 10\,000$

An der Ausgangswelle zulässige Radiallasten und Axialkräfte für einen Wert von Fh_2 $n_2 \cdot h = 10\,000$

Charges radiales et axiales admises sur l'arbre lent pour une valeur de $Fh_2 : n_2 \cdot h = 10\,000$

Carichi radiali ed assiali ammissibili sull'albero lento per un valore di $Fh_2 : n_2 \cdot h = 10\,000$

Permissible radial and axial loads on output shaft with Fh_2 $n_2 \cdot h = 10\,000$

An der Ausgangswelle zulässige Radiallasten und Axialkräfte für einen Wert von Fh_2 $n_2 \cdot h = 10\,000$

Charges radiales et axiales admises sur l'arbre lent pour une valeur de $Fh_2 : n_2 \cdot h = 10\,000$

24.0 FRENI IDRAULICI NEGATIVI A DISCHI MULTIPLI

DESCRIZIONE

Sono freni statici di sicurezza, in quanto l'azione frenante è sviluppata quando la pressione idraulica di comando è nulla, mentre quando questa raggiunge i valori minimi per lo sbloccaggio, l'azione frenante cessa. Applicati in entrata ai riduttori, costituiscono un gruppo unico e compatto con essi. Si adottano in tutte quelle applicazioni dove è assolutamente necessario arrestare e tenere bloccata la trasmissione anche sotto l'azione di coppie esterne.

Applicabili in:

- argani
- rotazione torrette
- freni di parcheggio su macchine semoventi
- applicazioni industriali

24.0 NEGATIVE MULTIDISC BRAKE

DESCRIPTION

TRASMITAL's fail-safe parking brake is an oil immersed multidisc unit on the input side of the gearbox. The brake is operated when ther is no hydraulic pressure and is released when the minimum release pressure is applied.
Use of parking brake is necessary whenever the driven system must be kept at standstill even under external forces and/or torques.

Applications:

- winches
- slewing drives
- parking brake on mobile equipment
- general industrial applications

24.0 HYDRAULISCH BELÜFTETE LAMELLEN-BREMSEN

BESCHREIBUNG

Hierbei handelt es sich um Sicherheits- und Haltebremsen, bei denen die Bremswirkung eintritt, wenn der hydraulische Regeldruck gleich Null ist. Sobald der min. Öffnungsdruck erreicht wird, täßt die Bremswirkung nach. Die Bremse wird am Getriebeeingang angebracht und bildet zusammen mit dem Getriebe eine kompakte Einheit. Eine Bremse sollte dann vorgesehen werden, wenn ein Anhalten des Getriebes unbedingt notwendig ist auch bei äußerer Drehmomenteinwirkung.

Einsatzfälle:

- Winden
- Drehwerke
- als Parkbremse bei Fahrzeugen
- Industrieanwendungen

24.0 FREINS HYDRAULIQUES NEGATIFS

DESCRIPTION

Il s'agit de freins de sécurité dans la mesure oú l'action de freinage intervient lorsque la pression de commande est nulle, et à l'inverse lorsqu'elle atteint une valeur minimum pour le déblocage, l'action de freinage cesse. Appliqués à l'entrée des réducteurs, ils constituent, ensemble, un groupe unique et compact. Ils s'adaptent dans toutes les applications oú il est absolument nécessaire d'arrêter et de maintenir bloquée la transmission, même sous l'action de couples extérieurs.

Applications:

- Treuils
- Rotation tourelles
- Freins de parking sur équipements mobiles
- Applications industrielles

25.0 ENTRATE PER MOTORI IDRAULICI

Tutte le grandezze sono predisponibili in ingresso per motori idraulici.
I tipi di predisposizioni disponibili sono indicati nelle pagine seguenti.
Gli orientamenti standard (A) delle flange attacco motore, sono indicati negli schemi seguenti, considerando il punto di vista dal lato ingresso sul riduttore.

25.0 INPUTS FOR HYDRAULIC MOTORS

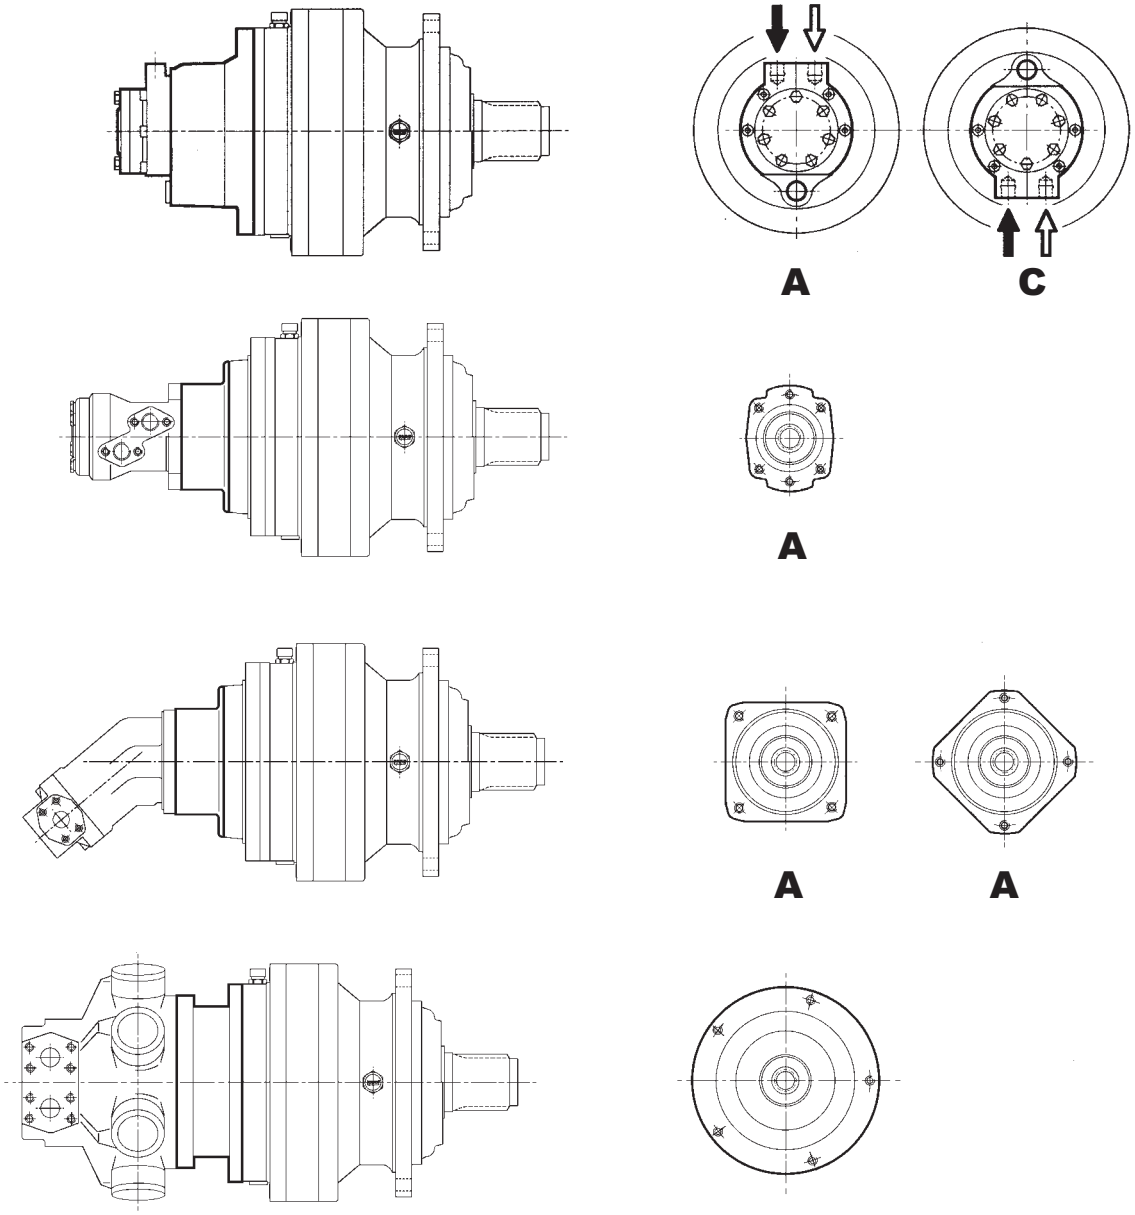
All sizes can be supplied with hydraulic motor input flanges.
The available motor adaptors are shown in the following pages.
The standard orientations (A) of the motor flanges are shown in the following scheme, taking into consideration the input side of the gearbox.

25.0 ANTRIEBE FÜR HYDRAULISCHE MOTOREN

Alle Baugrößen sind vorbereitet für den Antrieb hydraulischer Motoren.
Die Anbaumöglichkeiten sind auf den folgenden Seiten angegeben.
Die Standardorientierungen (A) der Motorflanschen werden in dem folgenden Schema angegeben, bei Ansicht auf die Eintriebsseite des Getriebes.

25.0 ENTREES POUR MOTEURS HYDRAULIQUES

Toutes les tailles sont prevues à l'entrée pour accouplement moteurs hydrauliques.
Les types de prédispositions disponibles sont indiqués dans les page suivantes.
Les orientations standard (A) des brides accouplement moteur sont indiquées ci-dessous, en considerant le point de vue du côté entrée sur le réducteur.



Codici indicativi degli altri orientamenti:

B: + 90° (senso orario)
C: + 180° (senso orario)
D: + 270° (senso orario)

Identification codes of other arrangements:

B: + 90° (clockwise)
C: + 180° (clockwise)
D: + 270° (clockwise)

Anhaltsnummern der anderweitigen Ausrichtungsmöglichkeiten:

B: + 90° (im Uhrzeigersinn)
C: + 180° (im Uhrzeigersinn)
D: + 270° (im Uhrzeigersinn)

Codes indicatifs des autres orientations:

B: + 90° (sens horaire)
C: + 180° (sens horaire)
D: + 270° (sens horaire)

26.0 MOTORI IDRAULICI

Presentazione

I riduttori serie 300 sono fornibili completi di motori idraulici MG prodotti dalla TRASMITAL BONFIGLIOLI

Le forme e dimensioni di tali motori sono definiti per ottenere la massima integrazione con il riduttore ottenendo cosi motoriduttori con ottime caratteristiche di compattezza ed economicità.

26.0 HYDRAULIC MOTORS

General features

Gearboxes belonging to the series 300 can be supplied complete with MG hydraulic motors man-ufactured by TRASMITAL BONFIGLIOLI.

These motors were designed to provide compact and energy efficient gearmotors.

26.0 HYDRAULIKMOTOREN

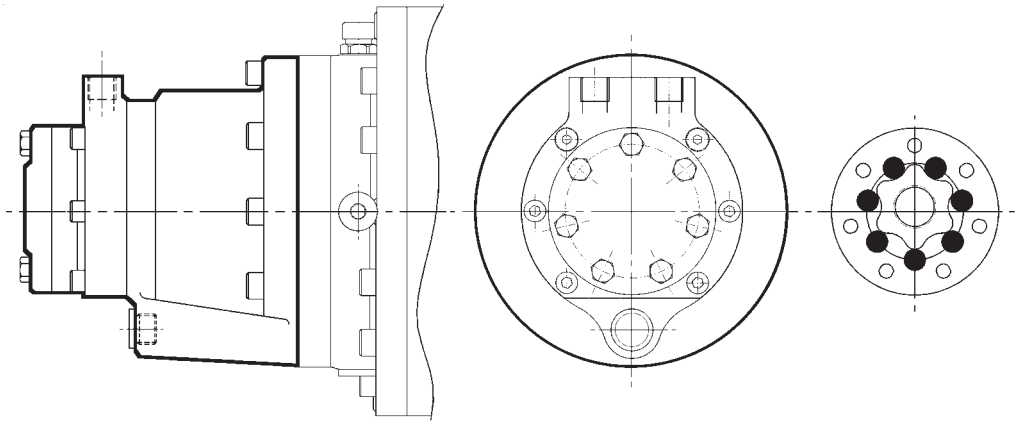
Vorstellung

Die Getriebe der Serie 300 können komplett mit den von der TRASMITAL BONFIGLIOLI hergestellten MG-Hydraulikmotoren geliefert werden. Diese integrierten Hydraulikmotore sind eine optimale Lösung in Bezug auf Kompaktheit und Wirtschaftlichkeit.

26.0 MOTEURS HYDRAULIQUES

Présentation

Les réducteurs série 300 peuvent être livrés équipés de moteurs hydrauliques MG fabriqués par TRASMITAL BONFIGLIOLI.
Les formes et les dimensions de ces moteurs sont établies dans le but d'obtenir une intégration optimale avec le réducteur, pour aboutir à des motoréducteurs avec des caractéristiques de compacité et rentabilité excellentes.



Motori idraulici MG

Caratteristiche costruttive:

- Sistema orbitale, con rulli fra rotore e statore GEROLER®
- Distributore sull'albero d'uscita.
- Cilindrate da 50 a 250 cm^3
- Pressione max 175 bar
- Portata max 48 lt/min
- Rendimenti elevati
- Possibilità di avere il freno idraulico nella stessa dimensione d'ingombro
- Comando freno interno direttamente dal motore, senza la necessità di valvole e circuiti esterni

MG hydraulic motors

Design characteristics:

- Orbit system with GEROLER® rollers between rotor and stator
- Distributor on output shaft
- Displacements from 50 to 250 cm^3
- Max. pressure 175 bar
- Max. flow rate 48 lt/min
- High efficiency
- Hydraulic brake can be included in the motor overall dimensions
- Inner brake directly controlled by the motor with no valves or outer circuits required

Hydraulikmotoren MG

Baumerkmale:

- Orbitalsystem, mit Rollen zwischen Rotor und Stator GEROLER®
- Wegeventil auf Abtriebswelle
- Hubraum von 50 bis 250 cm^3
- Max. Druck 175 bar
- Max. Förderleistung 48 lt/min
- Höhere Wirkungsgrade
- Möglichkeit, eine hydraulische Bremse bei gleichen Abmessungen zu integrieren
- Bremssteuerung erfolgt intern direkt über den Motor, ohne einen Einsatz von Ventilen und äußeren Kreisläufen

Moteurs hydrauliques MG

Caractéristiques de construction:

- Système orbital, avec rouleaux entre rotor et stator GEROLER®
- Distributeur sur l'arbre lent
- Cylindrées 50 à 250 cm^3
- Pression max. 175 bar
- Débit max. 48 l/min.
- Rendements élevés.
- Possibilité d'obtenir le frein hydraulique avec les mêmes dimensions d'encombrement.
- Frein intérieur commandé directement par le moteur, sans l'exigence de clapets ni de circuits extérieurs

28.0 CARATTERISTICHE TECNICHE

28.1 Cilindrata V [cm^3]

E' il volume geometrico generato ad ogni giro, corrispondente al volume teorico di olio idraulico necessario per fare ruotare l'albero motore di un giro.

28.2 Pressione p [bar]

E' la pressione idraulica a cui viene sottoposto il motore nel suo funzionamento.

28.3 Portata Q [l / min]

E' il flusso di olio idraulico che attraversa il motore nel suo funzionamento.

28.4 Rendimento totale η_t

E' il rendimento totale del motore idraulico dato dal prodotto:

28.5 Rendimento meccanico-idraulico ηmh

Rappresenta il rapporto fra coppia effettiva e coppia teorica all'albero motore.
Dipende dalle perdite interne dovute ad attriti meccanici e perdite di pressione del fluido idraulico, è dato dalla formula:

28.0 TECHNICAL FEATURES

28.1 Displacement V [cm^3]

Geometrical volume produced as a result of each motor rotation corresponding to the theoretical volume of hydraulic oil necessary for a rotation of the driving shaft.

28.2 Pressure p [bar]

Hydraulic pressure applied to the motor when running.

28.3 Flow rate Q [l / min]

Hydraulic oil flow through the motor when running.

28.4 Efficiency η_t

Total efficiency of the hydraulic motor given by:

28.5 Mechanical-hydraulic efficiency ηmh

This is the ratio of actual torque to theoretical torque at the driving shaft.
Value depending on inner losses due to mechanical friction as well as hydraulic fluid pressure losses, calculated as follows:

28.0 TECHNISCHE EIGENSCHAFTEN

28.1 Hubraum V [cm^3]

Ist das geometrische Volumen, welches bei jeder Umdrehung gerzeugt wird und dem theoretischen Volumen des Hydrauliköls, welches für eine Umdrehung der Antriebswelle erforderlich ist, entspricht.

28.2 Druck p [bar]

Ist der hydraulische Druck, dem der Motor während seines Betriebs unterliegt.

28.3 Förderleistung Q [l / min]

Ist der Fluß des Hydrauliköls, der den Motor während dessen Betriebs durchquert.

28.4 Wirkungsgrad η_t

Ist der Gesamtwirkungsgrad des hydraulischen Motors, der sich aus der folgenden Formel ergibt:

28.5 Mechanischer-hydraulischer Wirkungsgrad ηmh

Ist das Verhältnis zwischen effektivem und theoretischem Drehmoment an der Antriebswelle.
Hängt von den, durch mechanische Reibung erzeugten Verlusten und Druckverlusten der Hydraulikflüssigkeit ab und ergibt sich aus der folgenden Formel:

28.0 CARACTERISTIQUES TECHNIQUES

28.1 Cylindrée V [cm^3]

Il s'agit du volume géométrique créé à chaque tour, correspondant au volume théorique en huile hydraulique nécessaire pour faire avancer l'arbre moteur d'un tour.

28.2 Pression p [bar]

Il s'agit de la pression hydraulique à laquelle le moteur en service est soumis.

28.3 Débit Q [l / min]

Il s'agit de l'écoulement d'huile hydraulique traversant le moteur en service.

28.4 Rendement η_t

Il s'agit du rendement total du moteur hydraulique découlant du produit de:

$$\eta_t = \eta mh \cdot \eta v \qquad (29)$$

28.5 Rendement mécanique-hydraulique ηmh

Représente le rapport entre couple efficace et couple Théorique à l'arbre moteur.
Dépend des pertes intérieures dues à des frottements mécaniques et chutes de pression du fluide hydraulique, il découle de la formule:

$$\eta mh = \frac{2\pi \cdot 10 \cdot M}{(pA - pB) \cdot V} \qquad (30)$$

28.6 **Rendimento volumetrico** ηv

Rappresenta il rapporto fra velocità effettiva e velocità teorica del motore.
Dipende dal trafilamento interno del motore fra i volumi in alta e bassa pressione, è dato dalla formula:

28.6 **Hydraulic efficiency** ηv

This is the ratio of motor actual speed to motor theoretical speed.

Value depending on the motor inner blow-by between high and low pressure volumes. This value is given by the following formula:

28.6 **Volumetrischer Wirkungsgrad** ηv

Ist das Verhältnis zwischen effektiver und theoretischer Drehzahl des Motors.
Hängt von den inneren Verlusten des Motors zwischen den Volumen im Hoch- und Niederdruck ab. Er ergibt sich aus der folgenden Formel:

28.6 **Rendement volumétrique** ηv

Répresente le rapport entre vitesse réelle et vitesse théorique du moteur.
Dépend du débordement à l'intérieur du moteur entre les volumes de haute et basse pression; il découle la formule:

$$\eta v = \frac{n \bullet V}{Q \bullet 1000} \qquad (31)$$

28.7 **Velocità angolare n** [min^{-1}]

E' la velocità di rotazione del motore idraulico, è dato dalla formula:

28.7 **Angular speed n** [min^{-1}]

Hydraulic motor rotation speed. Value resulting from the following formula:

28.7 **Drehzahl n** [min^{-1}]

Ist die Drehgeschwindigkeit des Hydraulikmotors und wird von der folgenden Formel gegeben:

28.7 **Vitesse angulaire n** [min^{-1}]

Est la vitesse de rotation du moteur hydraulique, elle est le résultat de la formule :

$$n = \frac{Q \bullet 1000}{V} \bullet \eta v \qquad (32)$$

28.8 **Coppia M** [Nm]

E' la coppia effettiva che riesce a trasmettere il motore idraulico, è data dalla formula:

28.8 **Torque M** [Nm]

Actual torque transmitted by the hydraulic motor. Value given by the following formula:

28.8 **Drehmoment M** [Nm]

Tatsächliches Drehmoment des Hydraulikmotors ergibt sich aus folgender Formel:

28.8 **Couple M** [Nm]

Est le couple effectif que le moteur hydraulique est en mesure de transmettre; il découle de la formule :

$$M = \frac{(p\,A - p\,B) \bullet V}{2\pi \bullet 10} \bullet \eta mh \qquad (33)$$

TIPO / TYPE / TYP / TYPE

30.0 SCELTA

La cilindrata V del motore idraulico deve essere scelta insieme al riduttore.

Nota la coppia di uscita da trasmettere dal riduttore M_{r2} e la sua velocità n_2 si procede come segue:

- Fissare il valore della pressione di comando del motore pA-pB ≤ 175 bar.
- Calcolare il valore della cilindrata equivalente Veq del motoriduttore con la formula:

30.0 DISPLACEMENT SELECTION

Displacement V of the hydraulic motor should be selected together with the gearbox.

Once the output torque and speed n_2 for the gearbox Mr_2 is known, proceed as follows:

- Define the control pressure value pA-pB ≤ 175 bar for the motor.
- Calculate the gearbox displacement value called Veq with the following formula:

30.0 AUSWAHL

Die Auswahl des Hubraums V des Hydraulikmotors muß gemeinsam mit der Getriebewahl getroffen werden.

Ist das vom Getriebe M_{r2} zu übertragende Abtriebsdrehmoment und die entsprechende Drehzahl n_2 bekannt, geht man folgendermaßen vor:

- Den Wert des Steuerdrucks des Motors pA-pB ≤ 175 bar festlegen.
- Den Wert des gleichwertigen Hubraums Veq des Getriebemotors unter Anwendung der folgenden Formel berechnen:

30.0 CHOIX

Le choix de la cylindrée V du moteur hydraulique doit s'accompagner au choix du réducteur.

Une fois qu'on a établi le couple de sortie à transmettre par le réducteur M_{r2} et sa vitesse n_2, il faut procéder comme suit:

- Fixer la valeur de pression de commande du moteur pA-pB ≤ 175 bar.
- Calculer la valeur de la cylindrée équivalente Veq du motoréducteur par la formule:

$$Veq = \frac{2\pi \bullet 10 \bullet M_{r2}}{(pA - pB) \bullet \eta mh \bullet \eta d} \ [cm^3] \qquad (34)$$

dove per ηmh fissare inizialmente 0,85;

η_d: rendimento dinamico riduttore fissare 0.94.

- Calcolare il valore della portata Q necessaria per alimentare il motore idraulico con la formula:

where ηmh, for example, is equal to 0.85;

η_d: gearbox dynamic efficiency, consider 0.94.

- Calculate the value for flow rate Q, necessary for feeding the hydraulic motor, with the following formula:

wo für ηmh, z.B. 0,85 festgelegt werden muß;

η_d: dynamischen Wirkungsgrad des Getriebes auf 0.94 festlegen.

- Den Wert der für die Versorgung des Hydraulikmotors erforderlichen Förderleistung Q, unter Anwendung der folgenden Formel, kalkulieren:

pour ηmh, on peut fixer par ex. 0,85;

η_d: rendement dynamique réducteur fixer 0.94.

- Calculer la valeur du débit Q, nécessaire pour alimenter le moteur hydraulique, avec la formule :

$$Q = \frac{n_2 \bullet Veq}{1000 \bullet \eta v} \ [l/min] \qquad (35)$$

dove per ηv fissare inizialmente 0,90.

- In base alle prestazioni richieste M_{r2} ed n_2 scegliere la grandezza del riduttore (vedi a pag. 29).
- Entrare nel diagramma (A15) del motoriduttore con il valore di cilindrata equivalente v_{eq} e scegliere contemporaneamente:
  - il motore che soddisfi le condizioni di p int e Q richieste.
  - Il valore indicativo di i, tenendo presente che questo venga ottenuto con il minimo numero di stadi di riduzione, così da ottenere un motoriduttore con il costo più basso e con dimensioni compatte.

  Con il valore di M_2 ed il valore indicativo di i, procedere alla selezione ed alla verifica del riduttore secondo quanto indicato nel cap. 14.

where ηv, for example is equal to 0.90.

- Select the gearbox size with M_{r2}. See gearbox selection on page 29.
- Look up the diagram (A15) for the gearmotor with equivalent displacement value v_{eq} and select:
  - a motor that fulfils the p int. and Q requirements and at the same time
  - the indicative value of reduction ratio i. Please consider that ratio should be obtained with as few reduction stages as possible, to save on gearmotor costs and contain dimensions.

  Once you have determined the value of M_2 and the indicative value of i, select the gearbox and check your selection as indicated in chapt. 14.

wo für ηv, z.B. 0,90 festgelegt werden muß.

- Die Baugröße des Getriebes mit M_{r2} wählen. Siehe dazu "Wahl des Getriebes" auf Seite 29.
- Das Diagramm (A15) des Getriebemotors mit äquivalentem Hubraumwert v_{eq} zur Hand nehmen und gleichzeitig folgendes wählen:
  - denjenigen Motor, der die Bedingungen des geforderten p int. und Q int. erfüllt.
  - den Anhaltswert des Untersetzungsverhältnis i, wobei berücksichtigt werden muß, daß dieser mit einer Mindestzahl an Untersetzungsstufen verwirklicht wird, um so den kostengünstigsten Getriebemotor in einem kompakten Maß zu erhalten.

  Mit dem Wert M_2 und dem Anhaltswert i, kann man nun die entsprechende Wahl treffen und das Getriebe gemäß der Angaben im Kap.14 überprüfen.

ou pour ηv il faut fixer par exemple 0,90.

- Choisir la taille du réducteur avec M_{r2}. Se reporter à la sélection du réducteur à la page 29.
- Entrer dans le diagramme (A15) du motoréducteur avec la valeur de cylindrée équivalente Veq et choisir parallèlement:
  - le moteur satisfaisant aux conditions de p. int. et Q int nécessaires;
  - la valeur indicative du rapport de réduction I, compte tenu que cela est réalisé avec un nombre d'étages de réduction minimum, de manière à obtenir un réducteur ayant un coût aussi bas que possible et une dimension compacte.

  Avec la valeur de M_2 et la valeur indicative de i, procéder à la sélection et à la vérification du réducteur suivant les indications du chapitre14.

31.0 VERIFICHE

Verificare poi che i valori di pressione, portata, rendimenti trovino corrispondenza con quelli riportati sulla Tab. (A16) dei dati tecnici motori.

31.0 CHECKING

Check that pressure, efficiency and flow rate values correspond with values indicated in Table (A16) on motor technical features.

31.0 ÜBERPRÜFUNGEN

Daraufhin ist zu überprüfen, ob die Werte des Drucks, der Förderleistung, der Wirkungsgrade, mit den auf der Tabelle der technischen Motordaten (A16) eingetra genen Werten übereinstimmen.

31.0 VERIFICATIONS

Vérifier ensuite que les valeurs de pression, débit, rendements correspondent aux indications du Tableau (A16) des données techniques moteurs.

35.0 INSTALLAZIONE

In aggiunta alle norme relative alla installazione del riduttore, vedi pag. 18, è raccomandato seguire le seguenti norme per l' installazione del motore idraulico.

a) Collegamento al circuito idraulico

I motori possono essere collegati sia a circuiti del tipo chiuso che aperto.
Nel caso di circuito aperto la elettrovalvola o distributore di comando può essere sia di tipo a centro chiuso che aperto.

35.0 INSTALLATION

Further to standards on gearbox installation, refer to page 18, comply with the following hydraulic motor installation instructions:

a) Connection to the hydraulic circuit

Motors can be connected either to closed or open circuits.
In case of an open circuit, solenoid valve or control distributor can be of the closed or open center type.

35.0 INSTALLATION

Zusätzlich zu den Normen für die Vorgangsweise bei der Installation des jeweiligen Getriebes, siehe Seite 18, wird empfohlen, die auch folgenden Anweisungen für die Installation des Hydraulikmotors zu befolgen.

a) Anschluß an den hydraulischen Kreislauf

Die Motoren können, sowohl an geschlossene, als auch an offene Kreisläufe verwendet werden.
Handelt es sich um einen offenen Kreislauf kann das Elektroventil oder das Steuerwegeventil, sowohl vom Typ mit geschlossener Mitte, als auch mit offener Mitte sein.

35.0 INSTALLATION

En plus des règles concernant l'installation du réducteur, voir page 18, on préconise de suivre les instructions ci-dessous pour l'installation du moteur hydraulique.

a) Raccordement au circuit hydraulique

Les moteurs peuvent être raccordés à des circuits de type fermé aussi bien qu'ouvert.
En cas de circuit ouvert, l'électrovanne, ou distributeur de commande, peut être de type tant à centre fermé qu'ouvert.

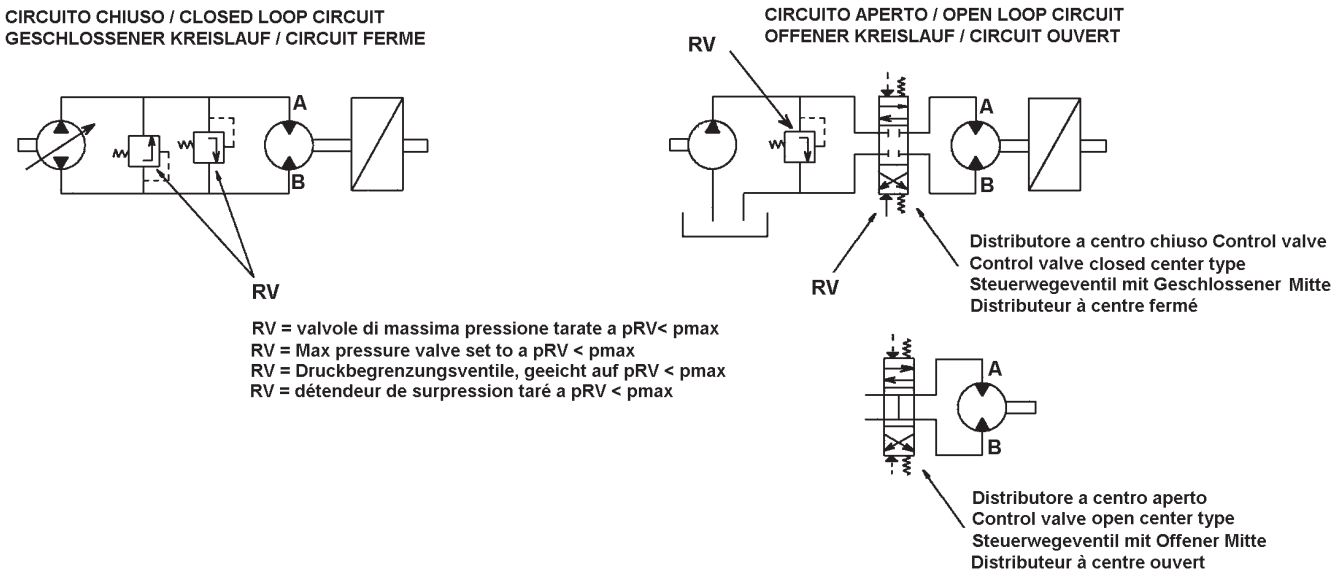
Occorre che nel ramo del circuito corrispondente alla mandata del motore idraulico sia sempre montata una valvola di massima pressione tarata ad un valore non superiore al valore p_{int} ammesso sul motore idraulico. Vedi schemi idraulici (A20).

The hydraulic motor delivery side should always have a max. pressure valve set to a value not exceeding the p_{int} value allowed for the hydraulic motor. See hydraulic diagrams (A20).

Es ist erforderlich, daß am Zweig des Kreislaufs, gegenüber der Druckleitung des Hydraulikmotors immer ein Druckbegrenzungsventil montiert ist, welches auf einen Wert geeicht ist, der den am Hydraulikmotor zulässigen Wert von p_{int} nicht überschreitet. Siehe Hydraulikpläne (A20).

Il y a lieu que la portion de circuit, correspondant à l'alimentation du moteur hydraulique, soit toujours équipée d'un détendeur de surpression taré à une valeur pas supérieure à p_{int} maximale admise sur le moteur hydraulique. Voir schémas hydrauliques (A20).

(A20)



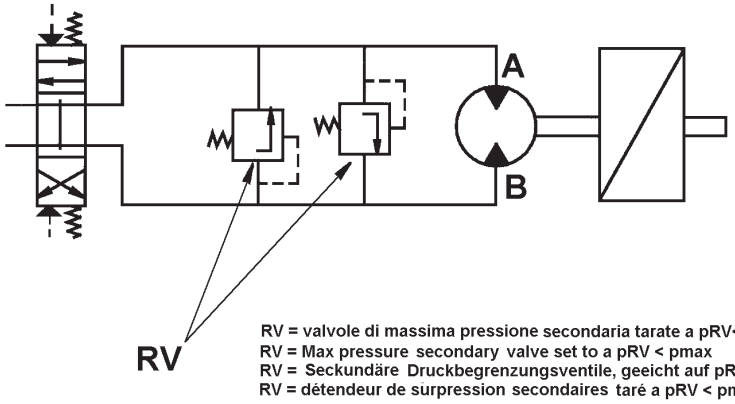
Nel caso in cui questo non sia possibile in quanto il circuito deve comandare altri azionamenti a pressione più' elevata e/o nel caso cui si abbia un distributore a centro chiuso ed il motore aziona organi ad elevato momento d'inerzia occorre montare valvole di massima pressione secondarie il più' vicino possibile al motore.
Vedi schema (A21).

If not possible, because the circuits control other devices needing a higher pressure and/or a closed center control valve is fitted and the motor controls parts with a high moment of inertia, max. pressure secondary valves should be as close as possible to the motor.
See diagram (A21).

Ist dies nicht möglich, weil der Kreislauf noch andere, unter höheren Druck stehende Antriebe steuern muß und/oder in dem Fall, daß kein Wegeventil mit geschlossener Mitte zur Verfügung steht und der Motor Organe mit einem erhöhten Trägheitsmoment antreibt, muß man so nahe wie möglich am Motor sekundäre Druckbegrenzungsvenitle montieren. Siehe Schema (A21).

Si cela n'est pas possible, du fait que le circuit doit commander d'autres entraînements, ayant une pression plus élevée, et/ou qu'il y a un distributeur à centre fermé et le moteur actionne des organes, ayant un moment d'inertie élevé, il faut monter des détendeurs de surpression secondaires, le plus près du moteur.
Voir schéma (A21).

(A21)



b) Collegamento foro di drenaggio T

In esecuzione standard i motori vengono forniti senza foro di drenaggio. In questo caso il motore è provvisto di drenaggio interno. Questo soddisfa la maggioranza delle applicazioni dove il funzionamento è intermittente e la pressione media di comando è inferiore al 50% della pressione sopportabile dal motore.
Quando il funzionamento è in continuo o intermittente con una percentuale di funzionamento maggiore del 50% e la pressione media di comando è superiore al 50% della pressione, occorre richiedere il motore in esecuzione con drenaggio esterno e collegare il foro di drenaggio T al serbatoio.

b) Connection of drain hole T

Standard motors are supplied with no drain hole. In this case, the motor has an internal drain system.
This meets most application requirements with intermittent duty and average control pressure under 50% of the max. pressure bearable by the motor.
In continuous or intermittent duty with operation percentage over 50% and average control pressure over 50% of the max. pressure, motor should be ordered in the external drain version and the drain hole T should be connected to the tank.

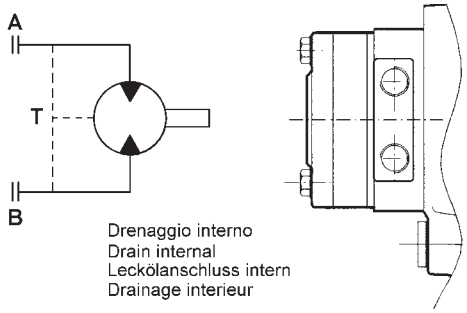
b) Anschlüsse an der Drainagebohrung T

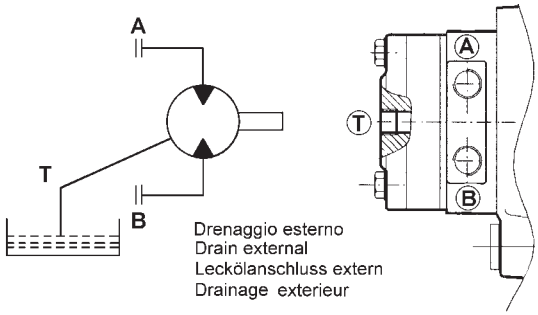
In der Standardausführung werden die Motoren ohne Drainagebohrung geliefert. Diese Lösung reicht bei den meisten Applikationsfällen, bei denen ein Schaltbetrieb verwendet wird und der mittlere Steuerdruck unter den 50% des max. vom Motor tragbaren Drucks liegt, aus.
Handelt es sich um einen Dauer- oder einen Schaltbetrieb mit einem Betriebsprozentsatz über 50% und der mittlere Steuerdruck liegt über 50% des Drucks, muß man eine Motorausführung mit einer Außendrainage anfordern und die Drainagebohrung T dann mit dem Tank verbinden.

b) Raccordement orifige de purge T

L'exécution standard des moteurs ne prévoit pas d'orifice de purge.
Dans ce cas le moteur est dépourvu de purge intérieure.
Cela satisfait à la plupart des applications où le fonctionnement est intermittent et la pression moyenne de commande est inférieure à 50% de la pression maximale admise pour le moteur .
Si le fonctionnement est continu ou intermittent, avec un pourcentage de fonctionnement supérieur à 50% et la pression moyenne de commande est supérieure à 50% de la pression, il faut commander le moteur dans la variante avec purge extérieure et raccorder l'orifice de purge T au réservoir.

(A22)





c) Comando freno

Nel caso in cui il motoriduttore sia dotato di freno, il motore può essere in due esecuzioni: B02P oppure P01S.
Nella esecuzione B02P, il comando del freno è interno, diretto dal motore.
Nella esecuzione P01S, occorre un ramo ausiliario per il comando del freno.
Vedere lo schema seguente (A23).

c) Brake control

For gearmotors equipped with brakes, there are two motor versions available, i.e. the B02P or P01S executions.
In the B02P version, the motor has an in-built, direct brake control system.
In the P01S version, an auxiliary branching is required to control the brake.
See the following diagram (A23).

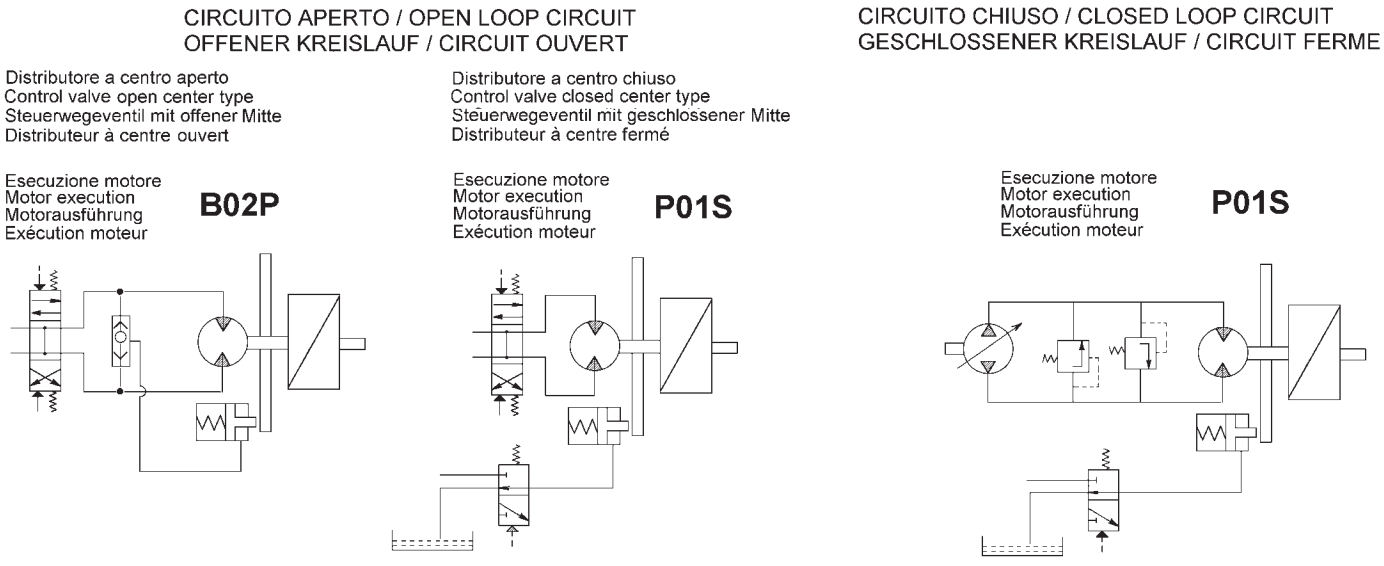
c) Bremssteuerung

Ist der Getriebemotor mit einer Bremse ausgestattet, können zwei Motorausführungen verwendet werden: B02P oder P01S.
Bei der Ausführung B02P liegt die Bremssteuerung im Inneren und wird vom Motor gesteuert.
Bei der Ausführung P01S ist für die Bremssteuerung eine Hilfsüberzweigung erforderlich.
Siehe dazu folgendes Schema (A23).

c) Commande frein

Au cas où le motoréducteur serait équipé de frein, le moteur pourra avoir deux exécutions: B02P ou P01S.
Dans l'exécution B02P, la commande du frein est à l'intérieur, derrière le moteur.
Dans l'exécution P01S, il faut disposer d'une branche auxiliaire pour la commande du frein. Voir schéma suivant (A23).

(A23)



d) Tipo olio idraulico

E' raccomandato l'uso di olio idraulico minerale con viscosità ISO VG 46 (46 Cst a t = 40°C).
E' raccomandabile che la temperatura dell'olio sia compresa fra +30 °C e + 70 °C.

d) Hydraulic oil

Use hydraulic mineral oil with viscosity ISO VG 46 (46 Cst at t = 40°C).
It is recommended the oil temperature should be between +30°C and +70°C.

d) Hydrauliköltyp

Es wird der Einsatz von Mineralhydrauliköl mit einem Viskositätsgrad ISO VG 46 (46 Cst bei t = 40°C) empfohlen.
Die Öltemperatur sollte zwischen +30°C und +70°C liegen.

d) Type d'huile hydraulique

On préconise d'utiliser de l'huile hydraulique minérale avec viscosité ISO VG 46 (46 Cst à t = 40°C).
On préconise que le domaine de température de l'huile soit compris entre +30 °C et + 70 °C.

e) Filtraggio

Per assicurare un funzionamento affidabile del motore ed una sua durata è estremamente importante che il circuito idraulico sia dotato di filtro con capacità filtrante tale da assicurare un grado di pulizia dell'olio secondo grado:

grado 9 NAS 1638
grado 6 SAE
grado 18/15 SO DIS 4406

e) Oil filtering

For reliable motor operation and long life, it is important that the hydraulic circuit has a filter for a proper oil filtering according to the following degree:

degree 9 NAS 1638
degree 6 SAE
degree 18/15 SO DIS 4406

e) Filtrierung

Um einen zuverlässigen Betrieb des Motors und eine lange Lebensdauer zu gewährleisten, ist es besonders wichtig, daß der hydraulische Kreislauf mit einem Filter ausgestattet ist, der eine Filtrierleistung bieten, die einen Ölreinigungsgrad gemäß folgender Angaben sichert Grad:

Grad 9 NAS 1638
Grad 6 SAE
Grad 18/15 SO DIS 4406

e) Filtrage

Pour assurer un fonctionnement fiable du moteur, ainsi que sa longévité, il est extrêmement important que le circuit hydraulique soit équipé de filtre, ayant une capacité de filtration en mesure d'assurer un niveau de propreté de l'huile conforme aux degres suivants:

degré 9 NAS 1638
degré 6 SAE
degré 18/15 SO DIS 4406

37.0 CARATTERISTICHE GENERALI

37.1 Programma di produzione

I motori elettrici asincroni trifase del programma di produzione della BONFIGLIOLI RIDUTTORI sono previsti nelle forme costruttive base IMB5, IMB14 e loro derivate con le seguenti polarità: 4, 6.
Nel presente catalogo sono evidenziate inoltre le caratteristiche tecniche dei motori in versione integrata.

37.2 Normative

I motori descritti in questo catalogo sono costruiti in accordo alle Norme ed unificazioni applicabili evidenziate nella tabella (A24).

37.0 GENERAL CHARACTERISTICS

37.1 Production range

The asynchronous three-phase electric motors of BONFIGLIOLI RIDUTTORI's production, are available in basic designs IMB5 and IMB14 and derived versions, with the following polarities: 4, 6.
The technical characteristics of compact version motors are also supplied in this chapter.

37.2 Standards

The motors described in this catalogue are manufactured to the applicable standards shown in table (A24).

37.0 ALLGEMEINE EIGENSCHAFTEN

37.1 Produktprogramm

Die Dreiphasen-Asynchronmotoren aus dem Produktprogramm von BONFIGLIOLI RIDUTTORI gibt es in den Grundbauformen IMB5, IMB14 und deren Ableitungen mit folgenden Polzahlen: 4, 6.
Im vorliegenden Katalog sind außerdem die technischen Eigenschaften der Motoren in Kompaktausführung hervorgehoben.

37.2 Normen

Die in diesem Katalog beschriebenen Motoren sind in Übereinstimmung mit den in der Tabelle (A24) angegebenen einschlägigen Normen und Vereinheitlichungsrichtlinien konstruiert worden.

37.0 CARACTERISTIQUES GENERALES

37.1 Programme de production

Les moteurs électriques asynchrones triphasés du programme de production de BONFIGLIOLI RIDUTTORI sont prévus dans les formes de construction de base IMB5, IMB14 et leur dérivés avec les polarités suivantes: 4, 6.
Dans le présent catalogue sont également mises en évidence les caractéristiques techniques des moteurs en version compacte.

37.2 Réglementations

Les moteurs décrits dans ce catalogue sont construits en accord avec les Normes et standardisations applicables mises en évidence dans le tableau (A24).

(A24)

Titolo / Title / Titel / Titre	CEI	IEC
Prescrizioni generali per macchine elettroniche rotanti General requirements for rotating electrical machines Allgemeine Vorschriften für umlaufende elektrische Maschinen Prescriptions générales pour machines électriques tournantes	CEI 2 - 3	IEC 34 - 1/83
Marcatura dei terminali e senso di rotazione per macchine elettriche rotanti Terminal markings and direction of rotation of rotating machines Kennzeichnung der Anschlußklemmen und Drehrichtung von umlaufenden elektrischen Maschinen Définitions des bornes et sens de rotation pour machines électriques tournantes	CEI 2 - 8	IEC 34 - 8
Metodi di raffreddamento delle macchine elettriche Methods of cooling for electrical machines Verfahren zur Kühlung von elektrischen Maschinen Méthodes de refroidissement des machines électriques	CEI 2 - 7	IEC 34 - 6
Dimensioni e potenze nominali per macchine elettriche rotanti Dimensions and output ratings for rotating electrical machines Auslegung der Nennleistung von umlaufenden elektrischen Maschinen Dimensions, puissances nominales pour machines électriques tournantes	UNEL 13113 - 71 13117 - 71 13118 - 71	IEC 72
Classificazione dei gradi di protezione delle macchine elettriche rotanti Classification of degree of protection provided by enclosures for rotating machines Klassifizierung der Schutzart von umlaufenden elektrischen Maschinen Classification des degrés de protection des machines électriques tournantes	CEI 2 - 16	IEC 34 - 5
Limiti di rumorosità Noise limits Geräuschgrenzwerte Limites de bruit	CEI 2 - 24	IEC 34 - 9
Sigle di designazione delle forme costruttive e dei tipi di installazione Classification of type of construction and mounting arrangements Abkürzungen zur Kennzeichnung der Bauform und der Einbaulagen Sigles de dénomination des formes de construction et des types d'installation	CEI 2 - 14	IEC 34 - 7
Tensione nominale per i sistemi di distribuzione pubblica dell'energia elettrica a bassa tensione Rated voltage for low voltage mains power. Nennspannung für öffentliche NS-Stromverteilungssysteme Tension nominale pour les systèmes de distribution publique de l'énergie électrique en basse tension	CEI 18 - 6	IEC 38
Grado di vibrazione delle macchine elettriche Vibration level of electric machines. Schwingstärke bei elektrischen Maschinen Degré de vibration des machines électriques	CEI 2 - 23	IEC 34 - 14

I motori corrispondono inoltre alle Norme straniere adeguate alle IEC 34-1 e riportate nella tabella (A25).

The motors also comply with foreign standards adapted to IEC 34-1 as shown in table (A25).

Die Motoren entsprechen außerdem den an die IEC-Norm 34-1 angepaßten ausländischen Normen, die in Tabelle (A25) genannt werden.

En outre, les moteurs correspon-dent aux Normes étrangères adaptées aux IEC 34-1 indiquées dans le tableau (A25).

I motori gr. 63-132, M4-M3 costruiti in accordo alle Norme Canadesi sono certificati CSA, vengono forniti con targhetta speciale CSA e sono previsti con ingresso cavi NPT secondo CSA STANDARD C22-2 N° 0.5
Dimensioni e caratteristiche a richiesta.

The motors size 63-132, M4-M3, manufactured according to the Canadian Rules are CSA certified, are supplied with special CSA name plate and are equipped with NPT cable input according to CSA STANDARD C22-2 Nr. 0.5
Dimensions and features upon request.

Die gemäß den Canada Richtlinien hergestellten Motoren gr. 63-132, M4-M3 sind CSA bescheinigt, werden mit CSA Sondernamenschild geliefert und sind mit NPT Kabeleintritt gemäß CSA STANDARD C22-2 NR. 0.5 ausgestattet.
Abmessungen un Eigenschaften auf Anfrage.

Les moteurs type 63-132, M4-M3 construits selon les Normes Canadiennes, sont certifiés CSA et sont fournis avec des plaquesmarques spéciales CSA; il sont prévus pour entrée de câbles NPT selon CSA STANDARD C22-2 N° 0.5
Dimensions et carattéristiques sur demande.

Direttive CEE 73/23 (LVD) e CEE 89/336 (EMC).

I motori delle serie BN sono corrispondenti ai requisiti delle Direttive CEE 73/23 (Direttiva Bassa Tensione) e CEE 89/336 (Direttiva Compatibilità Elettromagnetica) e provvisti in targa della marcatura CE.

Directives EEC 73/23 (LVD) and EEC 89/336 (EMC).

Motors of the BN series comply with requirements of Directive EEC 73/23 (Low Voltage Directive) and EEC 89/336 (Electromagnetic Compatibility Directive) and bear the CE mark.

Richtlinie EWG 73/23 (LVD) und EWG 89/336 (EMC).

Die motoren der Serie BN entsprechen den Anforderungen der Richtlinie EWG 73/23 (Richtlinie - Niedrigspannung) und der Richtlinie 89/336 (Richtlinie - elektromagnetische Kompaktibilität) und verfügen über das CE-Zeichen.

Directive CEE 73/23 (LVD) et CEE 89/336 (EMC).

Les moteurs de la série BN répondent aux conditions requises par les Directives CEE 73/23 (Directive Basse Tension) et CEE 89/336 (Directive compatibilité Electromagnétique), la marque CE est présente sur la plaquette signalétique.

In particolare per quanto riguarda la Direttiva EMC, la costruzione risulta in accordo alle Norme:

BN	EN 50081-1
	EN 50082-2
BN-FA	EN 50081-1
	EN 50082-2
BN-FD	EN 50081-2
	EN 50082-2

In particular, as far as Directive EMC is concerned, they are manufactured in compliance with the following standard:

BN	EN 50081-1
	EN 50082-2
BN-FA	EN 50081-1
	EN 50082-2
BN-FD	EN 50081-2
	EN 50082-2

IN Hinblick auf die Richtlinie EMC, stimmt die Konstruktion insbesonder mit den folgenden Normen überein:

BN	EN 50081-1
	EN 50082-2
BN-FA	EN 50081-1
	EN 50082-2
BN-FD	EN 50081-2
	EN 50082-2

Plus particulièrement, en ce qui concerne la Directive EMC, la fabrication répond aux Normes:

BN	EN 50081-1
	EN 50082-2
BN-FA	EN 50081-1
	EN 50082-2
BN-FD	EN 50081-2
	EN 50082-2

Se è richiesta la conformità alla Norma EN 50081-1, i motori con freno FD devono essere corredati di opportuno filtro capacitivo in ingresso al raddrizzatore (opzione CF).
I motori risultano inoltre conformi a quanto previsto dalle Norme IEC 204-1 "Equipaggiamento elettrico delle macchine".

If compliance with standard EN 50081-1 is required, motors with brake FD must have a capacitive filter at rectifier inlet (option CF).
Furthermore, motors are in compliance with requirements of Standard IEC 204-1 "Electric equipment of machines".

Wird auch die Übereinstimmung mit der Norm EN 50081-1 verlangt, müssen die Motoren mit einer FD-Bremse am Eingang zum Gleichrichter (Option CF) mit einem angemessenen kapazitiven Filter ausgestattet werden.
Die Motoren resultieren darüber hinaus als mit den Normen IEC 204-1 "Elektrische Ausrüstung der Maschinen" konform.

Si la comformité à la Norme EN 50081-1 est nécessaire, les moteurs avec frein FD doivent être équipés de filtre capacitif à l'entrée du redresseur (option CF).
De plus, les moteurs sont conformes aux normes IEC 204-1 "Equipment électrique des machines".

37.3 **Tolleranze**

Secondo le Norme sono ammesse le tolleranze indicate nella tabella (A26) sulle grandezze garantite.

37.3 **Tolerances**

According to Standards, the tolerances shown in table (A26) referring to guaranteed sizes, are permitted.

37.3 **Toleranzen**

Die Normen lassen die in Tabelle (A26) genannten Toleranzen bei den garantierten Größen zu.

37.3 **Tolérances**

Selon les Normes, les tolérances indiquées dans le tableau (A26) sont admises sur les tailles garanties.

38.1 Note motori

1)
- TENSIONE - FREQUENZA
Da indicare sempre. Tensioni standard come descritto al par. 30.5.1.

- GRADO DI PROTEZIONE
Protezione IP56 (IP55 per autofrenanti) a richiesta.

- CLASSE DI ISOLAMENTO
Classi di isolamento H a richiesta.

2) TIPO DI FRENO
Disponibile, a richiesta, freno FA (freno c.a.).
Se non specificato il freno è omesso.

3) COPPIA FRENANTE
Valori standard come riportato nelle tabelle dati motore.
Altre coppie a richiesta (vedi tab. C23 - tipo FD, per tipo FA veditab. C27).

4) TIPO DI ALIMENTATORE
Da indicare solo per freni FD.
A richiesta, per i freni FD02, FD03, FD53, FD04, FD14, FD05, FD15, può essere fornito il raddrizzatore SB.

5) ALIMENTAZIONE FRENO

Freni tipo FD
Tensione alimentazione come descritto al parag. 6.2.
Per alimentazione freno separata indicare:
a) il valore di tensione richiesto seguito da **SA** (p.e. 290SA);
b) nel caso di alimentazione diretta del freno in c.c. indicare il valore di tensione seguito da **SD** (p.e. 24SD); in questo caso il raddrizzatore è escluso dalla fornitura.
Freni tipo FA
Tensione alimentazione come descritto al par. 30.6.3.
Per alimentazione freno separata indicare il valore di tensione seguito da **SA** (p.e. 290SA).

Se non specificati espressamente, i dati previsti nei campi sopra indicati saranno assunti corrispondenti alla versione standard a catalogo.

38.1 Notes on motors

1)
- VOLTAGE - FREQUENCY
To be always specified when special voltages are required. Standard voltage as per par. 30.5.1.

- PROTECTION CLASS
IP56 protection class upon request (IP55 for brake motors).

- INSULATION CLASS
Isolation class H upon request.

2) BRAKE TYPE
FA brake (a.c. brake) also available on request.
Brake omitted if brake type not specified.

3) BRAKE TORQUE
Standard values as in the motor data table.
Upon requiest are available other torques (for FD type see table C23, for FA type see table C27)

4) RECTIFIER TYPE
To be indicated only for brakes type FD.
Upon request for brakes FD02, FD03, FD53, FD04, FD14, FD05, FD15, the rectifier SB can be supplied.

5) BRAKE SUPPLY

Brakes type FD.
Power supply as described at paragraph 6.2.
For external power supply, it must be stated:
a) the voltage value required followed by **SA** (e.g. 290SA);
b) in case of direct power supply of d.c. brake, state the voltage value followed by **SD** (e.g. 24SD); in this case the rectifier will be not supplied.
Brakes type FA.
Power supply as described at paragraph 30.6.3.
For external power supply, state the voltage value followed by **SA** (e.g. 290SA).

If not specified, the data as above will be understood as the ones corresponding to the standard catalogue version.

38.1 Anmerkungen zu den Motoren

1)
-SPANNUNG - FREQUENZ
Ist immer anzugeben. Standardspannungen wie in Abschnitt 30.5.1 beschrieben

- SCHUTZART
Auf Anfrage IP56 (IP55 für Bremsmotoren) lieferbar.

-ISOLIERSTOFFKLASSE
Isolierstoffklasse H auf Anfrage lieferbar.

2) BREMSENTYP
Lieferbar auf Anfrage auch Bremse FA (Drehstrombremse).
Wenn nicht anders angegeben, fehlt die Bremse.

3) BREMSMOMENT
Standardwerte können aus den Datenblättern entnommen werden.
Andere Momente sind auf Anfrage verfügbar für Typ FD (siehe Tabelle C23, für Typ FA, siehe Tabelle C27).

4) GLEICHRICHTERTYP
Ist nur für Bremse Typ FD anzugeben.
Auf Anfrage für Bremsen Typ FD02, FD03, FD53, FD04, FD14, FD05, FD15, kann das Gleichrichtertyp SB geliefert werden.

5) BREMSSPANNUNGS-VERSORGUNG
Bremstyp FD.
Spannungsversorgung ist im Abschnitt 6.2 angegeben.
Für getrennte Spannungsversorgung, sind anzugeben:
a) den angefragten Spannungswert, gefolgt von **SA** (z.B. 290SA);
b) im Fall von direkten Spannungsversorgung von G.S.-Bremsen, muß man den Spannungswert gefolgt von **SD** angeben(z.B. 24SD); in diesem Fall erfolgt die Lieferung ohne Gleichrichter.
Bremstyp FA.
Spannungsversorgung ist im Abschnitt 30.6.3.
Für getrennte Spannungsversorgung, muß man den Spannungswert gefolgt von **SA** angeben(z.B. 290SA).

Wenn nicht angegeben, werden die obengenannten Daten als Standardausführung wie im Katalog verstanden.

38.1 Remarques moteurs

1)
- TENSION - FREQUENCE
A préciser dans tous les cas quand des tensions ou fréquences sont demandées. Tensions standard comme indiqué au par. 30.5.1.

- DEGRE DE PROTECTION
Protection IP56 (IP55 pour moteurs freins) sur demande.

- CLASSE D'ISOLATION
Classes d'isolation H sur demande.

2) TYPE DE FREIN
Frein FA (frein c.a.) egalement disponible, sur demande.
Si non spécifié, le frein est omis.

3) COUPLE DE FREINAGE
Valeurs standard comme indiqué dans les tableaux des caractéristiques moteurs.
Couples différents sur demande (voir tableau C23, type FD, pour type FA voir tableau C27).

4) TYPE D'ALIMENTATEUR
A préciser seulement pour type FD.Sur demande, pour les freins FD02, FD03, FD53, FD04, FD14, FD05, FD15, il est possible de fournir le redresseur SB.

5) ALIMENTATION DU FREIN

Freins type FD
Tension d'alimentation comme définie au paragraphe 6.2.
Pour une alimentation separée du frein, indiquer:
a) la valeur de tension requise suivie de **SA** (ex. 280SA);
b) dans le cas d'une alimentation directe du frein en courant continue indiquer la valeur de tension à la suite de **SD** (EX. 24 SD); dans ce cas le redresseur est exclu de la fourniture.
Frein type FA
tension d'alimentation comme définie au paragraphe 30.6.3.
Pour une alimentation du frein separée indiquer la valeur de tension à la suite de **SA** (ex. 290SA).

En l'absence de précision, les caracteristiques prévues dans le domaine ci-dessus indiqué seront celles prévues du catalogue pour la version standard.

30.3.2 Opzioni motori

AA, AC, AD
Posizione angolare leva di blocco freno rispetto alla posizione morsettiera visto lato ventola.
Posizione standard = 90° orari
AA = 0°, AC = 180°, AD = 90° antiorari.

CF
Filtro capacitivo (solo per freni FD).

D3
No. 3 sonde bimetalliche (in accordo alle classe di isolamento).

E3
No. 3 Termistori PTC (in accordo alla classe di isolamento).

E6
No. 3 Termistori di intervento in accordo alla classe di isolamento + No. 3 termistori di allarme in accordo alla classe inferiore a quella di isolamento (es: F + B o H + F).

F1
Volano per avviamento progressivo (escluso BN160 - BN280.

H1
Riscaldatori anticondensa.
Alimentazione standard 230V ± 10%.

30.3.2 Motor options

AA, AC, AD
Angular position of the brake release lever with respect to the terminal box position loocking from fan side.
Standard position = 90° clockwise.
AA = 0°, AC = 180°, AD = 90° counterclockwise.

CF
Capacitive filter (only for brake FD).

D3
No. 3 bimetallic thermostates (according to the insulation class).

E3
No. 3 thermistors PTC (according to the insulation class).

E6
No.3 switching thermistors according to the insulation class + No. 3 alarm thermistors according to the the class lower than the insulation class (f.e.: F+B or H+F).

F1
Flywheel for soft start (excluding BN160 - BN 280).

H1
Anti-condensate heaters.
Standard voltage 230V ± 10%.

30.3.2 Optionen Motoren

AA, AC, AD
Geben die Lage des Bremslüfterhebels zum Klemmenkasten an. Standard ist 90° im Uhrzeigersinn beim Ansehen der Lüfterradseite.
AA = 0°, AC = 180°, AD=90° entgegen dem Uhrzeigersinn.

CF
Kapazitiver Filter (nur für Bremse FD).

D3
3 Bimetallfühler (gemäß der Isolierstoffklasse).

E3
3 Kaltleiterthermistoren PTC (gemäß der Isolierstoffklasse).

E6
3 Thermistoren wie für E3 gemäß Isolierstoffklasse + 3 Thermistoren zur Alarmmeldung. Ansprechtemperatur entspricht der nächst niedrigen Isolierstoffklasse (z.B.: F+B oder H+F).

F1
Schwungrad zum sanften Anfahren (schließt BN160 - BN280).

H1
Wicklungsheizung.
Standardspannung 230 V ± 10%.

30.3.2 Options moteurs

AA, AC, AD
Position angulaire du levier de déblocage du frein par rapport à la position de la boîte à borne en regardant du côté du ventilateur.
Position standard = 90° sens horaire.
AA = 0°, AC = 180°, AD = 90° sens anti-horaire.

CF
Filtre capacitif (seulement pour frein FD).

D3
3 sondes bimétalliques (selon les classes d'isolation.

E3
3 thérmistances PTC (selon les classes d'isolation).

E6
3 thérmistances d'intervention selon les classes d'isolation + 3 thérmistances d'alarme selon la classe inférieure à celle d'isolation (ex. F+B ou H+F).

F1
Volant pour démarrage progressif (exclue BN160 - BN280)

H1
Réchauffeurs anticondensation.
Alimentation standard 230 V ± 10%.

M3
Morsettiera a 9 morsetti (Escluso gr. 71).

PN
Potenza a 60 Hz corrispondente alla potenza normallizzata a 50 Hz.

PS
Doppia estremità d'albero (esclude opzione RC e U1).

PT
Motore standard 220/380 - 50 Hz alimentato a 220/380 - 60 Hz (con declassamento di coppia).

RC
Tettuccio parapioggia (esclude opzione PS).

RV
Bilanciamento rotore in grado di vibrazione R.

TP
Tropicalizzazione.

U1
Servoventilazione (esclude opzione PS).

M3
Terminal box: 9 terminals. (Sizes 71 excluded).

PN
60 Hz power corresponding to the normalised 50 Hz power.

PS
Double shaft extension (excluding RC and U1 options).

PT
Standard motor 220/380V - 50 Hz supplied at 220/380V - 60 Hz (with torque derating).

RC
Rain canopy (excluding option PS).

RV
Rotor balancing in vibration class R.

TP
Tropicalization.

U1
Servoventilation (excluding option PS).

M3
Klemmkasten mit 9 Klemmen. (Mit Ausnahme von Baugröße 71).

PN
Die 60 Hz- Leistung wird an 50 Hz Normleistung angegliechen.

PS
Zweites Wellenende (schließt die Optionen RC und U1 aus).

PT
Der standardmäßig an 220/380V - 50 Hz zu betreibenden Motor wird mit der Leistung bei 220/380V- 60 Hz getrieben.

RC
Schutzdach (schließt Option PS aus).

RV
Läufer in Vibrationsgrad R ausgewuchtet.

TP
Tropenfestigkeit.

U1
Fremdbelüftung (schließt Option PS aus).

M3
Boîte à bornes (9 bornes). (Exclu taille 71).

PN
Puissance à 60 Hz correspondante à la puissance normalisée à 50 Hz.

PS
Double extrémité d'arbre (à l'exclusion de l'option RC et U1).

PT
Moteur standard 220/380- 50 Hz alimenté à 220/380 - 60 Hz (avec déclassement de couple).

RC
Capot de protection antipluie (exclu option PS).

RV
Equilibrage rotor avec degré de vibration R.

TP
Tropicalisation.

U1
Servo-ventilateur (option PS exclue).

39.0 CARATTERISTICHE MECCANICHE

39.1 FORME COSTRUTTIVE

I motori serie IEC sono previsti nelle forme costruttive indicate in tabella (C4) secondo le Norme CEI 2-14/ IEC 34-7.

Le forme costruttive sono le seguenti:

IM B5 (base)
IM V1, IM V3 (derivate)

I motori in forma costruttiva IM B5 possono essere installati nelle posizioni IM V1 e IM V3.
In questi casi, sulla targa del motore sarà indicata la forma costruttiva base IM B5.
Nelle forme costruttive dove il motore assume una posizione verticale con albero in basso, si consiglia di richiedere l'esecuzione con tettuccio parapioggia (da prevedere sempre nel caso di motori autofrenanti).
Tale esecuzione, prevista nelle opzioni, va richiesta espressamente in fase di ordine in quanto non è prevista nella versione base.

39.0 MECHANICAL CHARACTERISTICS

39.1 VERSIONS

IEC motors are available in the design versions indicated in table (C4) in line with Standards CEI 2-14/IEC 34-7.

The design range comprises:

IM B5 (basic)
IM V1, IM V3 (derived)

IM B5 design motors can be installed in positions IM V1 and IM V3.
In such cases, the basic design IM B5 is indicated on the motor name plate.
In design versions with a vertically located motor and shaft downwards, it is recommended to request the rain canopy (always necessary for brake motors). This facility, included in the options, should be specified when ordering as it is not part of the basic version.

39.0 MECHANISCHE EIGENSCHAFTEN

39.1 BAUFORMEN

Die Motoren der Serie IEC weisen die in der Abbildung (C4) angegebene Bauform gemäß den Normen CEI 2-14/IEC 34-7 auf.

Die Bauformen sind:

IM B5 (Grundmodell)
IM V1, IM V3 (Ableitungen)

Die Motoren mit der Bauform IM B5 können mit den Einbaulagen IM V1 und IM V3 eingebaut werden.
In diesen Fällen ist auf dem Leistungsschild des Motors die Bauform IM B5 angegeben.
Bei Bauformen mit vertikaler Lage des Motors und nach unten gerichteter Welle wird die Aus-führung mit Regenschutzabdeckung empfohlen (bei Brems- motoren stets vorzusehen). Dieses wahlweise Zubehör muß ausdrücklich zum Zeitpunkt der Bestellung verlangt werden, da es bei der Grundausführung nicht vorgesehen ist.

39.0 CARACTERISTIQUES MECANIQUES

39.1 FORMES DE CONSTRUCTION

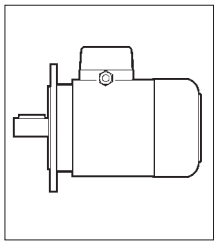
Les moteurs série IEC sont prévus dans les formes de construction indiquées sur le tableau (C4) selon les normes CEI 2-14/IEC 34-7.

Les formes de construction sont les suivantes:

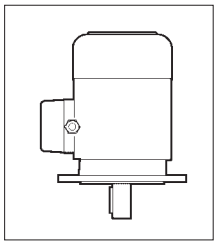
IM B5 (base)
IM V1, IM V3 (dérivées)

Les moteurs en forme de construction IM B5 peuvent être installés dans les positions IM V1 et IM V3.
Dans ces cas, la forme de construction base IM B5 sera indiquée sur la plaque du moteur. Dans les formes de construction où le moteur présente une position verticale avec arbre vers le bas, nous conseillons de demander l'exécution avec capot de protection contre la pluie (à prévoir toujours dans le cas de moteurs freins).
Cette exécution, prévue dans les options, doit être expressément demandée en phase de commande étant donné qu'elle n'est pas prévue dans la version de base.

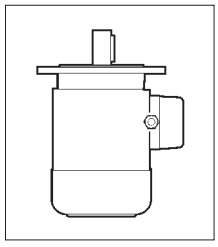
(A27)



IM B5



IM V1



IM V3

39.2 Grado di protezione

I motori sono previsti nella soluzione standard con un grado di protezione IP55 (IP54 per autofrenante) in accordo alle Norme CEI 2-16 / IEC 34-5.
Su richiesta possono essere forniti con grado di protezione aumentato IP56 (IP55 per autofrenante).
Per installazione all'aperto i motori debbono essere protetti dall'irraggiamento diretto e, nel caso di montaggio in posizione verticale con l'albero in basso, è necessario prevedere il tettuccio di protezione.

39.3 Ventilazione

I motori sono raffreddati mediante ventilazione esterna (IC 411 secondo CEI 2-7 / IEC 34-6) e sono provvisti di ventola radiale in plastica che funziona in entrambi i sensi di rotazione.
L'installazione deve assicurare una distanza minima dalla calotta copriventola alla parete in modo da non avere impedimenti all'ingresso aria e permettere la possibilità di eseguire l'opportuna manutenzione del motore e, se previsto, del freno.
Su richiesta è possibile prevedere una ventilazione forzata indipendente (IC 416). Questa soluzione consente di aumentare il fattore di utilizzo del motore nel caso di alimentazione da inverter e funzionamento a giri ridotti (vedi par. 30.7.3 per maggiori dettagli).

39.4 Senso di rotazione

E' possibile il funzionamento di entrambi i sensi di rotazione.
Con collegamento dei morsetti U1,V1,W1 alle fasi di linea L1,L2,L3 si ha rotazione oraria vista dal lato accoppiamento, mentre la marcia antioraria si ottiene scambiando fra loro due fasi.

39.5 Rumorosità

I valori di rumorosità, rilevati secondo il metodo previsto dalle Norme ISO 1680, sono contenuti entro i livelli massimi previsti dalle Norme CEI 2-24 / IEC 34-9.

39.6 Vibrazioni ed equilibratura

Tutti i motori sono equilibrati con mezza linguetta e rientrano nei limiti di intensità di vibrazione previsti dalle Norme CEI 2-23 / IEC 34-14.
Per particolari esigenze di silenziosità potrà essere previsto, a richiesta, un'esecuzione antivibrante in grado ridotto (R).
La tabella (A28) riporta i valori della velocità efficace di vibrazione per equilibratura normale (N) e ridotta (R).

39.2 Protection class

Motors are supplied standard with IP55 protection class (IP54 for brake motors) to CEI standards 2-16 / IEC 34-5.
On request, motors can be supplied with a higher protection class IP56 (IP55 for brake motors).
For outdoor installation, motors must be protected from direct sunlight and if mounted vertically with shaft downwards, the rain canopy must be provided.

39.3 Ventilation

The motors are cooled by external ventilation (IC 411 to CEI 2-7 / IEC 34-6) and are equipped with a plastic fan working in both directions.
The motors must be installed allowing sufficient space between fan cowl and nearest wall to ensure free air intake and allow access for maintenance on motor and brake, if supplied.
Independent, forced air ventilation (IC 416) can be supplied on request.
This solution enables to increase the motor duty factor when driven by an inverter and operating at reduced speed (for further details, refer to paragraph 30.7.3)

39.4 Direction of rotation

Rotation is possible in both directions. If terminals U1, V1, and W1 are connected to line phases L1,L2 and L3, clockwise rotation (looking from drive end) is obtained. For counterclockwise rotation, switch two phases.

39.5 Noise

Noise levels, measured using the method prescribed by ISO 1680 Standards, are within the maximum levels specified by Standards CEI 2-24 / IEC 34-9.

39.6 Vibrations and balancing

All rotors are balanced with half key and fall within the vibration class N, as specified by Standard CEI 2-23 / IEC 34-14.
If a particular low noise level is required, upon requeset, a reduced degree antivibration version (R) is available.
Table (A28) shows the effective vibration speed values for standard (N) and reduced (R) balancing.

39.2 Schutzart

Die Motoren verfügen in der Standardausführung gemäß den Normen CEI 2-16 und IEC 34-5 über die Schutzart IP55 (IP54 bei Bremsmotoren).
Auf Wunsch können sie auch mit Schutzart IP56 (IP55 für Brems-motoren) geliefert werden.
Bei Installation im Freien müssen die Motoren vor direkter Sonneneinstrahlung geschützt und, wenn bei vertikaler Einbaulage und Welle nach unten, mit einer Schutzabdeckung versehen werden.

39.3 Lüftung

Die Motoren sind eigenbelüftet (IC 411 gemäß CEI 2-7 / IEC 34-6) und verfügen über ein Radiallüfterrad aus Kunststoff, das in beiden Drehrichtungen arbeiten kann.
Bei der Installation muß sichergestellt werden, daß die Lüfterrad-abdeckung soweit von der Wand entfernt ist, daß der Lufteintritt nicht behindert wird, und daß der Motor und (falls vorhanden) die Bremse problemlos gewartet werden können.
Auf Wunsch können die Motoren mit Fremdbelüftung geliefert werden (IC 416). Diese Lösung ermöglicht das Motorbetriebsfaktor zu erhöhen, wenn vom Frequenzumrichter gesteuert und zu niedrigen Geschwindigkeit betrieben (siehe Abschnitt 30.7.3 für weitere Informationen).

39.4 Drehrichtung

Der Betrieb in beiden Drehrichtungen ist möglich.
Schließt man die Klemmen U1, V1, W1 an die Phasen L1, L2, L3 an, dreht sich der Motor im Uhrzeigersinn (von der Verbindungsseite her betrachtet); die Drehung im Gegenuhrzeigersinn erhält man, indem man zwei Phasen vertauscht.

39.5 Geräuschpegel

Die mit der von der ISO-Norm 1680 vorgesehenen Methoden gemessenen Lärmstärkewerte liegen innerhalb der gemäß den Normen CEI 2-24 und IEC 34-9 zulässigen Höchstgrenzen.

39.6 Schwingungen und Ausgleich

Alle Rotoren werden durch einen halben Federkeil ausgeglichen und fallen somit unter die, von den Normen CEI 2-23 / IEC 34-14 vorgesehenen Scwingungsgradgrenzen.
Bei besonderen Anforderungen an die Laufruhe kann auf Anfrage eine schwingungsdämpfende Ausführung in der reduzierten Klasse (R) geliefert werden.
Die tabelle (A28) führt die Effektivwerte der Schwingungsgeschwindigkeit für einen normalen (N) und reduzierten (R) Ausgleich auf.

39.2 Degré de protection

Les moteurs sont prévus dans la version standard avec un degré de protection IP55 (IP54 pour moteur frein) conformément aux normes CEI 2-16 / IEC 34-5.
Sur demande, ils peuvent être fournis avec un degré de protection supérieur IP56 (IP55 pour moteurs freins). Pour l'installation à ciel ouvert, les moteurs doivent être protégés du rayonnement direct et dans le cas de montage en position verticale, avec l'arbre en bas, il est nécessaire de prévoir un capot de protection.

39.3 Ventilation

Les moteurs sont refroidis à l'aide d'une ventilation extérieure (IC 411 selon CEI 2-7, IEC 34-6) et sont dotés d'un ventilateur à ailettes en plastique qui fonctionne dans les deux sens de rotation.
L'installation doit assurer une distance minimum entre le capot de protection du ventilateur et la paroi afin de permettre une bonne circulation de l'air et rendre plus aisé l'entretien du moteur et si prévu, du frein.
Sur demande, il est possible de prévoir une ventilation forcée indépendante (IC 416).
Cette solution permet d'augmenter le facteur d'utilisation du moteur en cas d'alimentation, via un variateur de fréquence, et pour un fonctionnement à faible vitesse (voir paragraphe 30.7.3 pour plus de détails).

39.4 Sens de rotation

Un fonctionnement dans les deux sens de rotation est possible. Avec raccordement des bornes U1, V1,W1 aux phases de ligne L1, L2,L3, on a la rotation dans le sens des aiguilles d'une montre vue du côté liaison alors que le sens inverse s'obtient en intervertissant les deux phases entre elles.

39.5 Niveau de bruit

Les valeurs relevées selon la méthode prévue par les normes ISO 1680 sont situées sous les niveaux maximums prévus par les normes CEI 2-24 / IEC 34-9.

39.6 Vibrations et équilibrage

Tous les rotors sont équilibrès avec une demi languette et rentrent dans les limites d'intensité de vibration prévues par les Normes CEI 2-23 / IEC 34/14.
En cas d'exigences particulière concernat le niveau de bruit, sur demande, il est possible de réaliser une exécution anti-vibrante, de degré réduit (R).

Le tableau (A28) indique les valeurs de la vitesse efficace de vibration pour un équilibrage normal (N) et rèpduit (R).

(A28)

Grado di vibrazione Vibration degree Schwingungsklasse Degré de vibration	Velocità di rotazione n (min^{-1}) Rotation speed n (min^{-1}) Drehungsgeschwindigkeit n (min^{-1}) Vitesse de rotation n (min^{-1})	Limiti della velocità di vibrazione (mm/s) Limits of the vibration velocity (mm/s) Grenzen der Schwingungsgeschwindigkeit (mm/s) Limites de la vitesse de vibration (mm/s)		
		71 - 132	**160 - 225**	**250 - 180**
N	600 - 1800 >1800 - 3600	1.8 1.8	1.8 2.8	2.8 4.5
R	600 - 1800 >1800 - 3600	0.71 1.12	1.12 1.8	1.8 2.8

I valori si riferiscono a misure con motore liberamente sospeso e funzionamento a vuoto.

Values refer to measures with freely suspended motor and void-operation.

Die Werte beziehen sich auf die Abmessungen mit stehendem Motor, ohne Getriebe und Leerlauf.

Les valeurs se réfèrent à des mesures avec moteur librement suspendu et fonctionnement à vide.

39.7 **Tolleranze dimensionali**

L'estremità d'albero, la linguetta e la flangia hanno dimensioni e tolleranze secondo CEI-UNEL 13502, CEI-UNEL 13501, IEC 72.
Le estremità d'albero sono provviste di foro filettato in testa secondo UNI 3221, DIN 332.
I motori vengono forniti con linguetta inserita.
La tabella (A29) riporta le tolleranze relative ai componenti dei motori elettrici BONFIGLIOLI RIDUTTORI.

39.7 **Tolerances**

Dimensions and tolerances of shaft ends, keys and flanges are according to CEI-UNEL 13502, CEI-UNEL 13501, IEC 72.
The shaft ends are supplied with tapped hole on the head according to UNI 3221, DIN 332.
The motors are supplied with key.
Table (A29) shows tolerances for components of BONFIGLIOLI RIDUTTORI electric motors.

39.7 **Toleranzen**

Die Wellenende-,Feder-und Flanschabmessungen und -toleranzen sind gemäß CEI-UNEL 13502, CEI-UNEL 13501, IEC 72.
Die Wellenenden sind mit Gewindebohrung auf den Kopf gemäß UNI 3221, DIN 332 geliefert.
Die Motoren werden mit Federkeil geliefert.
Die Tabelle (A29) zeigt die Toleranzen der Komponenten der Elektromotoren von BONFIGLIOLI RIDUTTORI.

39.7 **Tolérances**

Le bout d'arbre, la clavette et la bride ont les dimensions et les tolérances selon CEI-UNEL 13502, CEI-UNEL 13501, IEC 72.
Les bouts d'arbre sont prévus avec trous taraudés selon UNI 3221, DIN 332.
Les moteurs sont fournis avec clavette montée.
Le tableau (A29) présente les tolérances relatives aux composants des moteurs électriques BONFIGLIOLI RIDUTTORI.

(A29)

Componenti / Components / Komponenten / Composants	Dimensioni / Dimensions Abmessungen / Dimensions		Tolleranza / Tolerance Toleranz / Tolérance
Estremità albero / Shaft extension / Wellenende / Extrémité arbre	**D - DA**	ø 14 – 28	**j6**
		ø 38 – 48	**k6**
		ø 55 – 100	**m6**
Linguetta / Key / Federkeil / Clavette	**F - FA**		**h9**
Flangia / Flange / Flansch / Bride	**N**	< ø 250	**j6**
		≥ ø 250	**h6**

39.8 **Morsettiera motore**

La scatola coprimorsettiera è prevista di serie con un bocchettone pressacavo. La morsettiera principale è a sei morsetti per collegamento con capicorda. All'interno della scatola è previsto un morsetto per il conduttore di protezione.
Le dimensioni dei perni di attacco sono riportate nella tabella (A30).
Nel caso di motori autofrenanti, il raddrizzatore per l'alimentazione del freno è fissato all'interno della scatola e provvisto di adeguati morsetti di collegamento.
Eseguire i collegamenti secondo gli schemi riportati all'interno della scatola coprimorsetti o nei manuali d'uso.

39.8 **Motor terminal box**

The terminal box is provided as standard with one cable gland.
The main terminal board has six terminals for connection to the lead-in wire.
A terminal for the protective conductor is provided inside the box.
Terminals dimensions are listed in table (A30).
For brake motors, the brake rectifier is fitted inside the box and has adequate connecting terminals.
All connections must be carried out according to the diagrams inside the terminal box or in the instruction manuals.

39.8 **Motorklemmenkasten**

Der Klemmkasten verfügt serienmäßig über eine Kabeldurch-führung. Die Hauptklemmleiste hat 6 Klemmen für den Anschluß mit Kabelschuhen. Im Innern des Klemmenkasten befindet sich eine Klemme für den Schutzleiter.
Die Abmessungen der Auschüsse sind in Tabelle (A30) angegeben.
Bei den Bremsmotoren befindet sich auch der mit den erforderlichen Anschlußklemmen ausgestattete Gleichrichter für die Stromversorgung der Bremse im Klemmenkasten.
Die Anschlüße müssen gemäß den Diagrammen im Klemmkasten oder in den Betriebsanwiesungen durchgeführt werden.

39.8 **Bornier moteur**

Le couvercle du bornier est prévu de série avec un presseétoupe de fixation du câble. Le bornier principal prevoit six bornes pour raccordement avec cosses. Dans le boîtier se trouve une borne pour le conducteur de protection. Les dimensions des axes de fixation sont reportées dans le tableau (A30).
Dans le cas de moteurs freins, le redresseur pour l'alimentation du frein est fixé à l'intérieur du boîtier et est doté de bornes spéciales de raccordement.
Effectuer les connexions selon les schémas indiqués à l'intérieur du bornier, ou dans les manuels d'utilisation.

39.9 Ingresso cavi

Nell'esecuzione standard, l'ingresso dei cavi è previsto secondo le dimensioni e le disposizioni indicate nella tabella (A31):

39.9 Cable entry

In the standard version, cable entry is provided according to the dimensions and locations shown in table (A31):

39.9 Kabeldurchführung

Bei der Standardausführung ist die Kabeldurchführung wie in Tabelle (A31) angegeben angeordnet und dimensioniert:

39.9 Entrée câbles

Dans l'exécution standard, l'entrée des câbles est prévue selon les dimensions et les dispositions indiquées dans le tableau (A31):

(A31)

39.10 Cuscinetti

I cuscinetti previsti sono del tipo radiale a sfere con lubrificazione permanente precaricati assialmente.
I tipi utilizzati sono indicati nelle tabella (A32). La durata nominale a fatica L_{10h} dei cuscinetti, in assenza di carichi esterni applicati è superiore a 40.000 ore calcolata secondo ISO 281.

39.10 Bearings

Life lubricated radial ball-bearings are supplied.
The types in use are indicated in table (A32).
Fatigue life of bearings L_{10h}, in the absence of external loads, is in excess of 40,000 hours calculated to ISO 281.

39.10 Lager

Bei den Lagern handelt es sich um Radialkugellager mit Dauerschmierung.
Die verwendeten Typen sind in den Tabelle (A32) angegeben.
Die Lebensdauer der Lager bei einer Beanspruchung L_{10h} ist, sofern keine externen Kräfte wirken, über 40.000 Stunden (Berechnung gemäß ISO 281).

39.10 Roulements

Les roulements prévus sont du type radial à billes avec lubrification permanente.
Les types utilisés sont indiqués dans les tableau (A32).
La résistance à la déformation L_{10h} des roulements en absence de charges extérieures appliquées est supérieure à 40.000 heures calculée selon ISO 281.

40.0 CARATTERISTICHE ELETTRICHE

40.1 Tensione

I motori a una velocità di grandezza inferiore a 160 e i motori da M2 a M4 sono previsti nell'esecuzione normale per tensione nominale 230V Δ / 400V Y, 50 Hz con tolleranza di tensione ± 10% (escluso i tipi M3LC4 e M3LC6).
Per i tipi 160 - 280 la tensione standard è 400 Δ / 690 Y 50 Hz ± 10%.
I motori sono quindi adatti per funzionamento sulla rete di distribuzione europea con tensione in accordo alla pubblicazione IEC 38 (Eurotensione).

40.0 ELECTRIC CHARACTERISTICS

40.1 Voltage

Single polarity motors of IEC are provided in the normal version for voltage values 230V Δ /400V Y, 50 Hz with voltage tolerance of ± 10% (not including types M3LC4 and M3LC6).
Standard voltage for types 160 - 280 is 400Δ / 690 Y 50 Hz ± 10%.
Therefore motors are right to operate on the European voltage distribution net according to IEC 38 (Eurovoltage).

40.0 ELEKTRISCHE EIGENSCHAFTEN

40.1 Spannung

Die eintourigen Motoren müssen in der Standardausführung mit einer Spannung von 230 V Δ / 400 V Y, 50 Hz mit einer Toleranz von ± 10% gespeist werden (Type M3LC4 und M3LC6 ausgenommen).
Für die Typen 160 - 280 die Standardspannung folgende 400 Δ / 690 Y 50 ± 10%.
Darüber hinaus sind die Motoren geeignet für Spannungsbereiche gemäß IEC38 (Eurospannung) zu arbeiten.

40.0 CARACTERISTIQUES ELECTRIQUES

40.1 Tension

Les moteurs à polarité unique de taille CEI sont prévus dans l'exécution normale pour tension 230V Δ / 400V Y, 50 Hz avec tolérance de tension ± 10% (sauf les types M3CL4 et M3LC6).
Pour les types 160 - 280 la tension standard est 400 Δ / 690 Y 50 Hz ± 10%.
Les moteurs sont donc adaptés pour un fonctionnement sur le reseau électrique Européen avec tension en accord aux publications CEI 38 (Tension Européenne).

In targa sono indicati oltre alla tensione nominale i campi di funzionamento consentiti p.e.:
220 - 240V Δ
380 - 415V Y, 50 Hz.
In accordo alle Norme CEI 2-3, IEC 34-1 i motori possono funzionare alle tensioni sopra indicate con tolleranza del ± 5%.
Per funzionamento ai limiti di tolleranza la temperatura può superare di 10 K il limite previsto dalla classe di isolamento adottata.
In targa vengono indicati inoltre i valori corrispondenti al funzionamento a 60 Hz (p.e. 460Y, 60 Hz) ed il relativo campo di tensione:
440 - 480VY, 60 Hz.

(esclusi autofrenanti FD)

Per i motori autofrenanti con freno tipo FD le tensioni standard sono:
- grandezze 71 - 132, M2 - M4
220V - 240V Δ
380V - 415V Y, 50 Hz
con tensione di alimentazione freno 230V ± 10%.
- grandezze 160 - 280
380 - 415V Δ ,50 Hz
con tensione di alimentazione freno 400V ± 10%.

La tabella (A33) riporta le tensioni previste per i motori.

The plate indicates the rated voltage and the allowed operating fields as well, e.g.:
220-240V Δ
380-415V Y/50 Hz.
According to rules CEI 2-3, IEC 34-1 the motors can operate with the above mentioned voltages with tolerances of ± 5%.
For running at the tolerance limits, the temperature can exceed of 10 K the limit foreseen by the insulation class used.
Moreover on the name plate are indicated the values corresponding to the 60 Hz operating (i.e. 460 Y, 60 Hz) and the relevant voltage field, 440 - 480VY, 60 Hz.

(brake FD excluded)

Standard voltages for brake motors with brake type FD are the following:
- size 71 - 132, M2 - M4
220V - 240V Δ
380V - 415V Y, 50 Hz
with a brake power supply of 230V ± 10%.
- size 160 - 280
380V - 415V Δ ,50 Hz
with a brake power supply of 400V ± 10%.

Table (A33) indicates relevant motor voltages.

Auf dem Schild werden über die Nennspannung hinaus, auch die zulässigen Ansprechbereiche angegeben, z.B.:
220-240V Δ
380-415V Y/50 Hz.
Gemäß den Normen CEI 2-3, IEC 34-1 können die Motoren auf die oben genannten Spannungen mit Toleranzen von ± 5% arbeiten.
Bei Betrieb an den Spannungsgrenzen, kann die Temperatur bis zum 10K die für die verwendeten Isolierstoffklasse angegebenen Grenze überschreiten.
Darüber hinaus wird auf den Typensschild die dem 60 Hz-Betrieb entsprechenden Werte angegeben (d.h. 460 Y, 60 Hz) und das entsprechende Spannungsfeld, 440-480VY, 60 Hz.

(ausschließlich die selbstbremseden Versionen FD).

Für die selbstbremsenden Motoren mit dem Bremsetyp FD sind die Standardspannungen die folgende: - Baugrößen 71 - 132, M2 - M4
220V - 240V Δ
380V - 415V Y /50 Hz
mit Bremsspannungsversorgung von 230V ± 10%.
- Baugrößen 160 - 280
380V - 415V Y/50 Hz
mit Bremsspannungsversorgung von 400V ± 10%.

Die tabelle (A33) fürth die für die Motoren vorgesehenen Spannungen auf.

Outre la tension nominale, les plages de fonctionnement permises sont indiquées sur la plaquette signalètique, à savoir:
220-240V Δ
380-415V Y/50 Hz.
Selon les normes CEI 2-3, IEC 34-1 les moteurs peuvent fonctionner aux tension indiquées ci-dessus avec une tolérance de ± 5%.
Pour un fonctionnement à la limite de tolérance, la température peut dépasser les 10K, la limite prevue de la classe d'isolation choisie.
Sur la plaque marque sont de plus indiqués les valeurs correspondantes au fonctionnement en 60 Hz (ex.460Y, 60 Hz) et la relative plage de tension:
440 - 480VY, 60 Hz.

(à l'exclusion autofreinants FD)

En ce qui concerne les moteurs autofreinants avec frein de type FD, les tensions standard sont les suivantes:
- tailles 71 - 132, M2 - M4
220V - 240V Δ
380V - 415V Y /50 Hz
avec tension d'alimentation du frein 230V ± 10%.
- taille 160 - 280
380V - 415V Y /50 Hz
avec tension d'alimentation du frein 400V ± 10%.

La tableau (A33) indique les tensions prévues pour les moteurs.

(A33)

Motore / Motor / Motor / Moteur	Tensione / Voltage (± 10%) Spannung / Tension	Esecuzione avvolgimento / Winding type Wicklungsart / Exécution bobinage
71 - 132	230 Δ / 400Y, 50 Hz. 460Y 60Hz	Standard
160 -280	400 Δ / 690Y 50Hz 460 Δ 60 Hz	Standard
100 - 132	400 Δ / 690Y 50Hz 460 Δ 60 Hz	A richiesta

Nella tabella (A34) sono indicati i vari tipi di collegamenti previsti per i motori in funzione della polarità.

In the table (A34) are to be found the several connection types foreseen for motors.

Auf die Tabelle (A34) werden die verschiedenen für die Motoren vorgesehenen Anschlußtypen angegeben.

Dans le tableau (A34) sont indiqués les differents types de connexion prevus pour les moteurs.

(A34)

Motore / Motor / Motor / Moteur	Poli / Pole / Polig / Pôles	Collegamento avvolgimento / Winding connection Wicklungsanschlußß / Connexion du bobinage
71 - 280	4, 6	Δ / Y

I motori a singola polarità richiesti con tensione nel campo 200≤V≤346V sono realizzati con avvolgimento collegato a triangolo (p.e. richiesto 200V, esecuzione 200Δ/346Y V); per i tipi 71 - 132, M1 - M4 con tensioni V≥346V il collegamento è a stella (p.e. 400V, fornito 230Δ/400Y V), mentre per le grandezze 160 - 250, l'esecuzione standard e' a triangolo (p.e. richiesto 400V, fornito 400Δ/690Y V).

Per l'alimentazione dell'eventuale freno fare riferimento ai paragrafi 41.2 e 41.3

Single poles motors, with voltage 200≤V≤346V have delta-connected windings (e.g. 200V required, 200Δ/346Y V supplied). Motor size 71-132, M1 - M4 with voltage V≥346V have a connection of the star type (e.g. 400V required, 200Δ/346Y V supplied), whereas motor sizes 160 - 250 has a standard delta connection (e.g. 400V required, 400Δ/690Y V supplied).

As for brake power supply, refer to paragraph 41.2 and 41.3

Die einpoligen Motoren, die mit einer Spannung im Bereich von 200≤V≤346V angefordert werden, werden mit einer Wicklung mit Dreiecksschaltung verwirklicht (werden z.B. 200V gefordert, erhäit man die Ausführung 200Δ/346Y V); für die Typen 71-132, M1 - M4 mit Spannungen V≥346V hat man eine Sternschaltung (z.B. 400V, geliefert wird 230Δ/400Y V), während die Standardausführung für die Baugrößen 160 - 250, die Dreiecksschaltung ist (z.B. 400V gefordert, geliefert wird 400Δ/690Y V).

Für die Versorgung der eventuell vorhandenen Bremse, ist Bezug auf den Par. 41.2 und 41.3.

Les moteurs à simple polarité avec tension comprise dans la plage 200V-346V sont réalisés avec un bobinage braché en triangle (ex.requis 200V, execution 200Δ/346Y V; pour les types 71-132, M1-M4, avec des tension V≥346V le branchement est en étoille (ex. 400V, fourni 230Δ/400Y V)tandis que pour la tailles 160 - 250, l'exécution standard set en triangle (ex. 400V, fourni 400Δ/690Y V).

En ce qui concerne l'alimentation de léventuel frein, se référer au paragraphe 41.2 et 41.3

40.2 **Frequenza**

I motori ad una velocità nell'esecuzione standard riportano in targa oltre alle tensioni del funzionamento a 50 Hz il campo di tensione 440 - 480V 60 Hz (escluso motori autofrenanti con freno FD) con potenza aumentata di circa il 20%
La potenza di targa dei motori a 60Hz corrisponde a quanto riportato nella tabella (A35) seguente:

40.2 **Frequency**

In the name plate of single poles motors, standard version, besides the operating voltages at 50 Hz is also stated the voltage field 440 - 480V 60 Hz (except for brake motors with brake type FD) with an increased power of about 20%.
The power in the name plate of 60 Hz motors corresponds to the following table (A35):

40.2 **Frequenz**

Bei eintourigen Motoren in der Standardausführung wird außer den 50 Hz-Betriebsspannungen auch den Spannungsfeld 440 - 480V 60 Hz angegeben (mit Ausnahme von Bremsmotoren mit Bremsentyp FD) mit einer erhöhten Leistung von ungefähr 20%.
Die Leistung auf das Namenschild von 60 Hz-Motoren entspricht den Daten aus der folgenden Tabelle (A35):

40.2 **Fréquence**

Les moteurs à une vitesse en exécution standard reportent sur la plaque marque en plus des tension du fonctionnement à 50 Hz la plage de tension 440 - 480V 60 Hz (moteurs freins avec frein FD exclus) avec puissance augmentée de 20% env.
La puissance sur la plaque marque des moteurs à 60 Hz correspond à celle indiquée au tableau (A35) suivant:

(A35)

Se la potenza richiesta a 60 Hz corrisponde alla potenza normalizzata a 50 Hz specificare in designazione l'opzione PN.
I motori avvolti per frequenza 50 Hz possono essere utilizzati in reti a 60 Hz secondo quanto riportato in tabella (A36).

If the required 60 Hz power corresponds to the normalized 50 Hz power, when designing it is necessary to specify the option PN.
Motors with windings suitable for 50 Hz can be used with 60 Hz supply nets according to the values shown in table (A36).

Wenn die angefragte 60 Hz-Leistung der normierten 50 Hz-Leistung entspricht, geben bei der Bezeichnung das Option PN an.
Die Motoren mit einer Wicklung für eine Frequenz von 50 Hz können entsprechend den Angaben von Tabelle (A36) an Netze mit 60 Hz angeschlossen werden.

Si la puissance requise à 60 Hz correspond à la puissance normalisée à 50 Hz on devra indiquer l'option PN.
Les moteurs bobinés pour fréquence 50 Hz peuvent être utilisés sur réseau à 60 Hz selon les indications du tableau (A36).

Per i motori con alimentazione da rete 220/380V 60 Hz e potenza relativa a 50 Hz, possono essere impiegati i motori normali (escluso motori a doppia polarità ed autofrenanti FA) accettando sovratemperature superiori e applicando i declassamenti riportati in tabella (A36); specificare in ordine l'opzione PT.

For motors with net power supply 220/380V 60 Hz and relevant 50 Hz power, standard motors can be used (except for double polarity motors and FA brake motors) accepting higher temperatures rises and applying the derating values as in table (A36); when ordering the option PT must be specified.

Für die Motoren mit Netzspannungsversorgung 220/380V 60 Hz und entsprechende 50 Hz-Leistung können die Standardmoto-ren verwendet werden (mit Ausnahme von polumschaltbaren Motoren und Bremsmotoren Typ FA), unter Annahme von höheren Temperatursteigerungen und bei Anwendung von der auf die Tabelle (A36) angegebenen Deklassierungen; bei der Bestellung muß das Option PT angegeben werden.

Pour les moteurs alimentés sur le réseau 220/380 60 Hz avec puissance correspondante à 50 Hz, des moteurs normaux peuvent être employés (moteurs à deux polarités et freins FA exclus) en acceptant des élévations de température supérieures et en appliquant les déclassements indiqués au tableau (A36); on devra indiquer l'option PT à la commande.

40.3 **Potenza nominale**

Le tabelle dei dati tecnici del catalogo riportano le caratteristiche funzionali a 50 Hz in condizioni ambientali standard secondo le Norme CEI 2-3 / IEC 34-1 (temperatura 40 °C e altitudine <1000 m s.l.m.).
I motori possono essere impiegati ad altitudini superiori e temperature comprese tra 40 °C e 60 °C applicando i declassamenti di potenza indicati nelle tabelle (A37) e (A38).

40.3 **Rated power**

The catalogue selection charts show technical data at 50 Hz under standard environmental conditions to CEI 2-3 / IEC 34-1 Standards (ambient temperature 40 °C and altitude <1000 m a.s.l.).

The motors can be used at higher altitudes and in the temperature range 40°C - 60°C by applying the derating factors indicated in tables (A37) and (A38).

40.3 **Nennleistung**

Die Betriebsdatentabellen des Katalogs enthalten die technischen Daten bei einer Frequenz von 50 Hz bei normalen Umgebungsbedingungen gemäß den Normen CEI 2-3 und IEC 34-1 (Temperatur 40°C und Höhe <1000 m ü.d.M.). Die Motoren können in größeren Höhen und bei Temperaturen zwischen 40°C und 60°C betrieben werden, wenn man die in den Tabellen (A37) und (A38) angegebenen Rückstufungen anwendet.

40.3 **Puissance nominale**

Les tableaux fonctionnels du catalogue présentent les caractéristiques techniques à 50 Hz dans des conditions ambiantes standard selon les normes CEI 2-3, IEC 34-1 (température 40°C et altitude <1000 m).
Les moteurs peuvent être employés à des altitudes supérieures et à des températures comprises entre 40°C et 60°C en appliquant les déclassements de puissance indiqués dans les tableaux (A37) et (A38).

(A37)

I coefficienti di potenza per variazione d'altitudine si riferiscono a temperatura ambiente compresa tra 30 e 40 °C.
Quando è richiesto un declassamento del motore superiore al 15%, contattare il ns. servizio tecnico.

The power coefficients for altitude variation refer to an ambient temperature between 30 and 40°C.
When is required a motor derating higher than 15%, contact our customers'assistance department.

Die Leistungskoeffizienten zur Höheänderung beziehen sich auf einer Umweltstemperatur zwischen 30 und 40°C.
Wenn eine Motordeklassierung höher als 15% gefragt ist, wir bitten um Rückfrage.

Les coefficients de puissance pour une variation d'altitude se réfènt à une température ambiente comprise entre 30° et 40 °C. Si un déclassement du moteur supérieur à 15% est requis, on devra contacter notre service technique.

40.4 Classe d'isolamento

I motori descritti in questo catalogo impiegano materiali isolanti (filo smaltato, isolanti di superfice, tipo d'impregnazione) in classe F o H.
L'accurata scelta dei componenti del sistema isolante consente l'impiego dei motori in climi tropicali ed in presenza di vibrazioni normali.
Per applicazioni in presenza di forti aggressivi chimici o elevata umidità contattare il ns. servizio tecnico.

40.4 Insulation class

The motors described in this catalogue use insulating materials (painted wire, surface insulation treatments, impregnation type) to Class F or H.
An accurate selection of insulation material allows use of motors in tropical climates at normal vibration level.
For applications in environments pervaded by very aggressive chemical elements or with high humidity, contact our technical service department.

40.4 Isolierstoffklasse

Die in diesem Katalog beschriebenen Motoren sind mit Isolierstoffen (Emaildraht, Oberflächenisolierungen, Typ der Imprägnierung) der Klasse F oder H.
Die sorgfältige Wahl der Komponenten des Isoliersystems gestattet den Betrieb der Motoren auch in tropischen Klimazonen.
Für Anwendungen in aggressiven oder abrasive Umgebungen oder mit hoher Luftfeuchte (90%) unseren Technischen Kundendienst zu Rate ziehen.

40.4 Classe d'isolation

Les moteurs décrits dans ce catalogue utilisent des matériaux isolants (fil émaillé, isolants de surface, type d'imprégnation) en classe F ou H.
Le choix soigné des composants du système d'isolation permet d'utiliser les moteurs dans des climats tropicaux et en présence de vibrations normales.
Pour les applications en présence de fortes agressions chimiques et de degré d'humidité élevé, contacter notre service technique.

40.5 Tipo di servizio

Se non indicato diversamente,la potenza dei motori riportata a catalogo si riferisce al servizio continuo S1.
Per i motori utilizzati in condizioni diverse da S1 sarà necessario identificare il tipo di servizio previsto con riferimento alle Norme CEI 2-3 / IEC 34-1.
In particolare, per i servizi S2 ed S3, è possibile ottenere una maggiorazione della potenza termica rispetto a quella prevista per il servizio continuo secondo quanto indicato nella tabella (A39) valida per motori ad una velocità. Per motori a doppia polarità interpellare il nostro servizio tecnico.

40.5 Type of duty

Unless otherwise indicated, the power of motors specified in the catalogue refers to continuous duty S1.
For motors used under conditions other than S1, the type of duty required must be specified with reference to CEI 2-3/IEC 34-1 Standards.
In particular, for duties S2 and S3, power can be increased with respect to continuous duty power according to data in table (A39) applicable to single speed motors. For double polarity motors, contact our technical service department.

40.5 Betriebsart

Sofern nicht anders angegeben, bezieht sich die im Katalog angegebene Motorleistung auf den Dauerbetrieb S1.
Bei den Motoren, die für eine andere Betriebsart als S1 vorgesehen sind, muß man die Betriebsart unter Bezugnahme auf die Normen CEI 2-3/IEC 34-1 identifizieren.
Insbesondere kann man für die Betriebsarten S2 und S3 nach der für Motoren mit einer Drehzahl. Gültigen Tabelle (A39) eine Überdimensionierung der Leistung für den Dauerbetrieb im Vergleich zur vorgesehenen Betriebsart erreichen. Für polumschaltbaren Motoren, bitte Rückfrage.

40.5 Type de service

Sauf indication contraire, la puissance des moteurs reportée dans le catalogue se réfère au service continu S1.
Pour les moteurs utilisés dans des conditions différentes de S1, il sera nécessaire d'identifier le type de service prévu en se réferant aux normes CEI 2-3/IEC34-1.
En particulier, pour les services S2 et S3, il est possible d'obtenir une majoration de la puissance par rapport à celle prévue pour le service continu selon ce qui est indiqué dans le tableau (A39) valable pour les moteurs à une vitesse. Pour les moteurs à double polarité, contacter notre service technique.

(A39)

	Servizio / Duty / Betriebsart / Service						
	S2			S3 *			S4 - S9
	Durata del ciclo (min) Cycle duration (min) Zyklusdauer (min) Durée du cycle (min)			Rapporto di intermittenza (I) Cyclic duration factor (I) Relative Einschaltdauer (I) Rapport d'intermittence (I)			Interpellarci Please contact us Rückfrage Nous contacter
	10	30	60	25%	40%	60%	
f_m	1.35	1.15	1.05	1.25	1.15	1.1	

* La durata del ciclo dovrà comunque essere uguale o inferiore a 10 minuti; se superiore interpellare il nostro servizio tecnico.

Rapporto di intermittenza:

$$I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (1)$$

t_f = tempo di funzionamento a carico costante
t_r = tempo di riposo

Servizio di durata limitata S2

Caratterizzato da un funzionamento a carico costante per un periodo di tempo limitato, inferiore a quello richiesto per raggiungere l'equilibrio termico, seguito da un periodo di riposo di durata sufficiente a ristabilire, nel motore, la temperatura ambiente.

Servizio intermittente periodico S3:

Caratterizzato da una sequenza di cicli di funzionamento identici, ciascuno comprendente un periodo di funzionamento a carico costante ed un periodo di riposo. In questo servizio, la corrente di avviamento non influenza la sovratemperatura in modo significativo.

* Cycle duration must, in any event, be equal to or less than 10 minutes; if this time is exceeded, please contact our technical service department.

Intermittence ratio:

$$.I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (1)$$

t_f = operating time at constant load
t_r = rest time

Limited duration duty S2

This type of duty is characterized by operation at constant load for a limited time, which is shorter than the time required to reach thermal equilibrium, followed by a rest period of sufficient duration to re-establish ambient temperature in the motor.

Periodical intermittent duty S3:

This type of duty is characterized by a sequence of identical operation cycles, each including a constant load operation period and a rest period.
For this type of duty, the starting current does not significantly influence overtemperature.

* Die Zyklusdauer muß in jedem Fall kleiner oder gleich 10 Minuten sein. Wenn sie darüber liegt, unseren Technischen Kundendienst zu Rate ziehen.

Relative Einschaltdauer:

$$I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (1)$$

t_f = Betriebszeit mit konstanter Last
t_r = Aussetzzeit

Kurzzeitbetrieb S2

Betrieb mit konstanter Last für eine begrenzte Zeit, die unter der Zeit liegt, die zum Erreichen des thermischen Gleichgewichts benötigt wird, gefolgt von einer Aussetzzeit, die so lang ist, daß der Motor wieder auf die Umgebungstemperatur abkühlen kann.

Periodische Einschaltsdauer S3:

Betrieb mit aufeinanderfolgenden identischen Betriebszyklen, die alle einen kurzzeitigen Betrieb mit konstanter Belastung und eine Aussetzzeit einschließen.
Bei dieser Betriebsart beeinflußt der Anlaufstrom die Übertemperatur nicht in signifikanter Weise.

* La durée du cycle devra être inférieure ou égale à 10 minutes. Si supérieure, contacter notre service technique.

Rapport d'intermittence:

$$I = \frac{t_f}{t_f + t_r} \cdot 100 \qquad (1)$$

t_f = temps de fonctionnement à charge constante
t_r = temps de repos

Service de durée limitée S2

Caractérisé par un fonctionnement à charge constante pour une période de temps limitée, inférieure à celle necessaire pour atteindre l'équilibre thermique, suivie par une période de repos de durée suffisante pour rétablir, dans le moteur, la température ambiante.

Service intermittent périodique S3

Caractérisé par une séquence de cycles de fonctionnement identiques, comprenant chacun une période de fonctionnement à charge constante et une période de repos. Dans ce service, le courant de démarrage n'influence pas l'excès de température de façon significative.

40.6 Frequenza massima di avviamento Z

Nelle tabelle dei dati tecnici motori è indicata la max frequenza di inserzione a vuoto Z_0 con I = 50% riferita alla versione autofrenante. Questo valore definisce il numero max di avviamenti orari a vuoto che il motore può sopportare senza superare la max temperatura ammessa dalla classe di isolamento F.

Nel caso pratico di motore accoppiato ad un carico esterno con potenza assorbita P_r, massa inerziale J_c e coppia resistente media durante l'avviamento M_L, il numero di avviamenti ammissibile si può calcolare in modo approssimato con la seguente formula:

$$Z = \frac{Z_0 \cdot K_c \cdot K_d}{K_J} \qquad (2)$$

dove:

$K_J = \frac{J_m + J_c}{J_m}$ = fattore di inerzia

$K_c = \frac{M_a - M_L}{M_a}$ = fattore di coppia

K_d = fattore di carico vedi tabella (A40)

40.6 Maximum starting frequency Z

The motor selection charts include the max. no-load starting frequency Z_0 with intermittence of I=50% referred to the brake version. This number defines the maximum number of no-load starts acceptable to the motor without exceeding the maximum temperature permitted according to insulation class F.

To give a practical example, a motor coupled to an external load with absorbed power P_r, moment of inertia of masses J_c and load torque during start M_L, the number of permitted starts can be calculated approximately using the following formula:

$$Z = \frac{Z_0 \cdot K_c \cdot K_d}{K_J} \qquad (2)$$

where:

$K_J = \frac{J_m + J_c}{J_m}$ =inertia factor

$K_c = \frac{M_a - M_L}{M_a}$ = torque factor

K_d = load factor see table (A40)

40.6 Maximale Schaltungshäufigkeit Z

In den Tabellen mit den Technischen Daten der Motoren ist die maximale Schaltungshäufigkeit im Leerlauf Z_0 bei relativer Einschaltdauer I = 50% bezüglich auf die Bremsausführung. Dieser Wert definiert die maximale Anzahl von Anfahrten im Leerlauf pro Stunde, die der Motor ertragen kann, ohne die durch die Isolierstoffklasse F festgelegte maximal zulässige Temperatur zu überschreiten.
Im praktischen Fall eines mit einer externen Last verbundenen Motors mit einer Leistungsauf-nahme von P_r, Trägheitsmasse J_c und mittlerem Gegenmoment während des Anfahrens von M_L kann die zulässige Anzahl Anfahrten mit folgender Formel approximativ berechnet werden:

$$Z = \frac{Z_0 \cdot K_c \cdot K_d}{K_J} \qquad (2)$$

wobei gilt:

$K_J = \frac{J_m + J_c}{J_m}$ = Trägheitsfaktor

$K_c = \frac{M_a - M_L}{M_a}$ =Drehmomentsfaktor

K_d = Lastfaktor siehe Tabelle (A40)

40.6 Fréquence maximum de démarrage Z

Dans les tableaux des caractéristiques techniques des moteurs se trouve la fréquence maximum d'insertion à vide Z_0 avec intermittence I = 50% référée à la version frein. Cette valeur définit un nombre maximum de démarrages horaires à vide que le moteur peut supporter sans dépasser la température maximum admise par la classe d'isolation F.

Dans le cas pratique de moteur accouplé à une charge extérieure avec puissance absorbée P_r, masse inertielle J_c et couple résistant moyen pendant le démarrage M_L, le nombre de démarrages admissible peut se calculer de façon approximative avec la formule suivante:

$$Z = \frac{Z_0 \cdot K_c \cdot K_d}{K_J} \qquad (2)$$

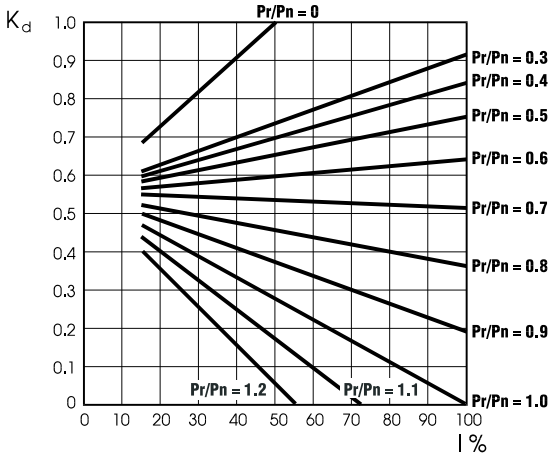
où:

$K_J = \frac{J_m + J_c}{J_m}$ = facteur d'inertie

$K_c = \frac{M_a - M_L}{M_a}$ = facteur de couple

K_d = facteur de charge voir tableau (A40)

(A40)



Con il numero di avviamenti così ottenuto si dovrà in seguito verificare che il massimo lavoro di frenatura sia compatibile con la capacità termica del freno W_{max} indicata nelle tabelle (A47-A51).

Having thus obtained the number of starts, next you must check that the maximum braking work is compatible with the brake's thermal capacity W_{max} indicated under tables (A47-A51).

Auf Grundlage der so berechneten Anzahl Schaltungen muß man dann prüfen, ob die maximale Bremsarbeit mit der Wärmegrenzleistung der Bremse W_{max} kompatibel ist, die in die Tabellen (A47-A51) angegeben ist.

Avec le nombre de démarrages ainsi obtenu, il faudra ensuite vérifier que le travail maximum de freinage soit compatible avec la capacité thermique du frein W_{max} indiquée dans le tableaux (A47-A51).

41.0 MOTORI ASINCRONI AUTOFRENANTI

Generalità

L'esecuzione autofrenante prevede l'impiego di freni a pressione di molle alimentati in c.c. (tipo BN71 - 160FD) o in c.a. (tipo BN71 - 132FA).

41.0 BRAKE MOTORS

General information

The brake version foresees the use of d.c. (type BN71 - 160FD) or a.c. (type BN71 - 132FA) spring pressure brakes.

41.0 BREMSMOTOREN

Allgemeines

Bei Bremsmotoren sind als Bremse Federdruckbremse vorgesehen, die mit Gleichstrom (Typ BN71 - 160FD) oder mit Drehstrom (Typ BN71 - 132FA) geliefert werden.

41.0 MOTEURS ASYNCHRONES FREINS

Généralités

L'exécution avec frein prevoit l'utilisation de freins à pression de ressort alimentés en c.c. (type BN71 - 160FD) ou en c.a. (type BN71 - 132FA).

Il freno funziona secondo il principio di sicurezza, ossia interviene in seguito all'azione delle molle quando il motore viene disinserito oppure in mancanza di tensione.
Le caratteristiche elettriche e meccaniche (escluso dimensioni d'ingombro) corrispondono a quelle dei motori trifasi.

Le caratteristiche salienti sono:

- Coppie frenanti dimensionate sulla coppia nominale del motore e regolabili modificando il tipo e/o il numero di molle (freni FD) o agendo sui grani di compressione delle molle (tipo FA).
- Disco freno con doppia guarnizione d'attrito (materiale a bassa usura privo di amianto).
- Leva di sblocco meccanico con ritorno automatico per le operazioni manuali (a richiesta).
- Elemento elastico di compensazione per assorbire le vibrazioni meccaniche durante la rotazione.
- Protezione antipolvere (6,7) ed anello V-ring (5) sull'albero motore come illustrato nella tabella (C19).
- Trattamento anticorrosivo di tutte le superfici del freno.
- Isolamento bobina toroidale in classe F.

The brake operates according to a safety concept: it is activated by the springs when the motor is switched off or in the event of power failure.
The electric and mechanical characteristics (excepting overall dimensions) are as for three-phase motors.

Main characteristics:

- Braking torques settled according to motor rated torque and adjustable by modifying type and/or quantity of springs.
- Brake disk with double friction lining (low wear, asbestos-free material).
- Mechanical hand release lever with self re-engaging facility for manual operations (on request).
- Compensation spring to absorb mechanical.
- Dust protection (6,7) and V-ring (5) on motor shaft (IP 55 on request), table (C19).
- Anti-corrosion treatment on all brake surfaces.
- Toroidal coil insulated to class F.

Die Bremse arbeitet nach dem Prinzip der Sicherheitsbremse, d.h. sie greift nach Betätigung der Federn ein, wenn der Motor ausgeschaltet wird, bzw. wenn der Strom ausfällt. Die elektrischen und mechanischen Eigenschaften (mit Ausnahme der Außenmaße) entsprechen denen von Drehstrommotoren.

Die wichtigsten Eigenschaften sind:

- Bremsmomente ausgelegt in Abhängigkeit vom Nenndrehmoment des Motors; regulierbar durch Modifikation der Art oder der Anzahl der Federn.
- Bremsscheibe mit doppeltem Bremsbelag (Material mit geringem Verschleiß und ohne Asbest).
- Hebel zum mechanischen Lösen der Bremse mit automatischer Rückstellung fürmanuelle Aktivitäten (auf Anfrage).
- Elastisches Ausgleichselement für die Aufnahme der mechanischen Schwingungen während der Drehung.
- Staubschutz (6,7) und V-Ring (5) auf der Antriebswelle (IP55 auf Wunsch), Abbildung (C19).
- Korrosionbeständige Oberflächenbehandlung aller Oberflächen der Bremse.
- Isolierung der Ringspule der Klasse F.

Le frein fonctionne selon le principe de sécurité c'est-à-dire qu'il intervient à la suite de l'action des ressorts lorsque le moteur est deconnectéou bein en l'absence de tension.
Les caractéristiques électriques et mécaniques (sauf dimensions d'encombrement) correspondent à celles des moteurs triphasés.

Les principales caractéristiques sont:

- couples de freinage dimensionnés en fonction du couple nominal du moteur et réglables en modifiant le type et/ou le nombre des ressorts.
- Disque de frein avec double garniturer de friction (matériau à faible usure sans amiante).
- Levier de déblocage mécanique avec retour automatique pour les opérations manuelles (sur demande).
- Elément élastique de compensation pour absorber les vibrations mécaniques durant la rotation.
- Protection anti-poussière (6,7) et bague V-ring (5) sur l'arbre moteur (IP 55 sur demande), tableau (C19).
- Traitement anticorrosion de toutes les surfaces du frein.
- Isolation bobine torique en classe F.

41.1 **Freno**

Costruzione e funzionamento

La costruzione prevista sullo scudo posteriore del motore come illustrato nelle tabelle (C18) (C19) è costituita da:

1 elettromagnete che contiene la bobina toroidale fissato con tre viti allo scudo lato ventola del motore; tre molle di precarico realizzano il posizionamento assiale

2 ancora mobile con smusso per alloggiamento della guaina parapolvere

3 disco freno libero assialmente e collegato all'albero del mozzo trascinatore

4 molle di spinta dell' ancora mobile
s

In caso di mancanza di tensione, l' ancora mobile, spinta dalle molle del freno, blocca il disco freno tra la superficie dell'ancora stessa e lo scudo motore.

Quando la bobina viene eccitata, l'attrazione magnetica dell'àncora mobile vince la reazione elastica delle molle e sblocca il freno.

41.1 **Brake**

Construction and operation

Installed on motor rear shield as shown in tables (C18) and (C19) and consisting of:

1 electro-magnet containing the toroidal coil, secured with three screws on the rear shield fan side; three preloaded springs ensure axial positioning.

2 mobile armature plate preset for dust protection elements assembly.

3 axially independent brake disk connected to the shaft by the trailinghub

4 braking springs

In case of a power cut, as the armature plate is pushed by the brake springs, it engages the brake disk between the armature plate surface and the motor shield.

When the coil is energized, the mobile armature plate magnetic attraction overcomes the elastic reaction of the springs thus releasing the brake.

41.1 **Bremse**

Konstruktionsform und Funktionsweise

Anordnung auf dem hinteren Schild des Motors wie in den Abbildungen (C18) und (C19) angegeben. Konstruktion aus:

1 Elektromagnet, der die Ringspule enthält und mit drei Schrauben am Schild auf der Lüfterradseite des Motors befestigt ist; drei Federn zum Vorspannen sorgen für die axiale Positionierung.

2 Beweglicher Anker mit Fase für die Aufnahme der Staubschutzdichtung.

3 Axial frei bewegliche Bremsscheibe, die an der Welle mit der Mitnehmernabe befestigt ist.

4 Schubfedern des beweglichen Ankers.

Bei fehlender Spannung blockiert der bewegliche Anker, der von den Bremsfedern geschoben wird, die Bremsscheibe zwischen der Oberfläche des Ankers selbst und dem Motorschild.

Wenn die Spule versorgt wird, wird die magnetische Kraft des beweglichen Ankers die elastische Reaktion der Federn winnen und wird die Bremseauflösen.

41.1 **Frein**

Construction et fonctionnement

Construction prévue sur le couvercle postérieur du moteur comme illustré dans les tableaux (C18) et (C19)et constituée par:

1 électro-aimant contenant la bobine torique, fixé avec trois vis au couvercle côté ventilateur du moteur. Trois ressorts de précharge réalisent le positionnement axial.

2 armature mobile avec chanfrein pour logement de la gaine de protection contre la poussière.

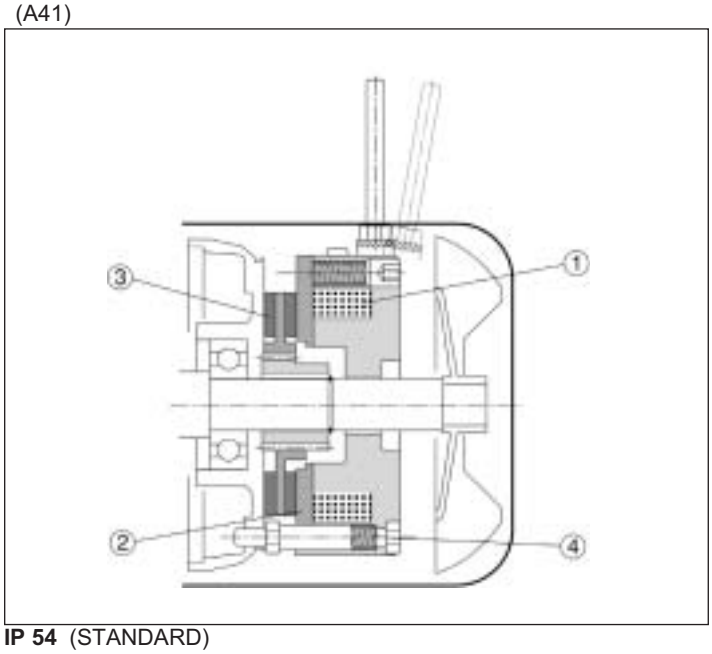
3 disque de frein libre axialement, relié à l'arbre par le moyeu d'entraînement.

4 ressorts de poussée de l'armature mobile.

En cas d'absence de tension, l'armature mobile, poussée par les ressorts du frein, bloque le disque du frein entre la surface de l'armature et le couvercle moteur.

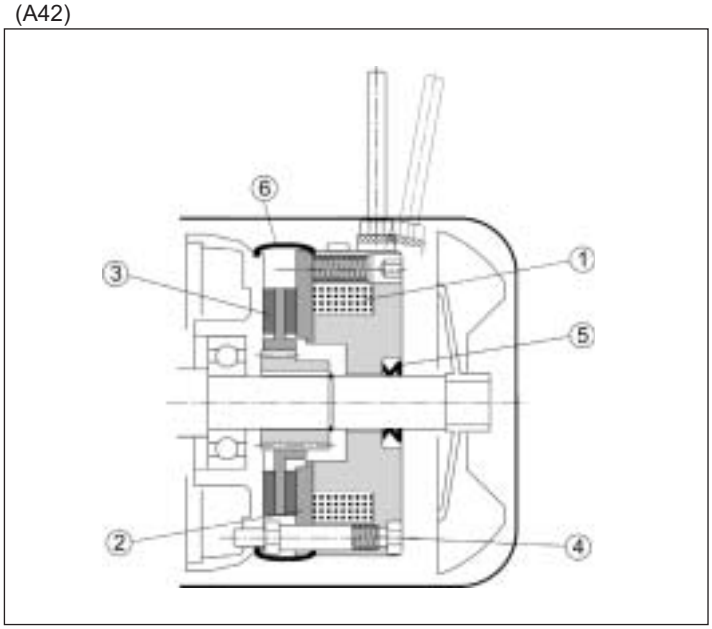
Lorsque la bobine est excitée, l'attraction magnétique de l'armature mobile compense l'action des ressorts et débloque le frein.

(A41)



IP 54 (STANDARD)

(A42)



IP 55 (OPTIONAL)

41.2 **Freno tipo FD**

Alimentazione freno

L'alimentazione della bobina freno in c.c. è prevista per mezzo di opportuno raddrizzatore.
Il raddrizzatore nell'esecuzione base è fissato alla scatola coprimorsetti e già collegato alla bobina del freno.
La tensione del raddrizzatore-bobina freno è coordinata all'alimentazione motore (tensione di fase o stellata del motore) e, per motori ad una velocità, il collegamento alla morsettiera motore è realizzato in fabbrica. In questo caso la tensione del freno può essere omessa.
La tensione standard è 230 V ± 10% 50/60 Hz.
Il raddrizzatore è del tipo a diodi a semplice semionda (Vc.c. = 0,45 Vc.a.).
Per i freni FD02, FD03, FD53, FD04, FD14, FD05, FD15, è previsto di serie il raddrizzatore tipo NB (disponibile a richiesta il tipo SB), tensione max. d'impiego 500 V c.a.
Per i freni FD55, FD56, FD06, FD06S, FD07 è previsto di serie il raddrizzatore tipo SB a controllo elettronico dell'eccitazione (tensione d'impiego 200 V < V < 440 V c.a. Quest' ultima soluzione, che consente tempi di sblocco del freno ridotti, è realizzata sovraeccitando l'elettromagnete nei primi istanti d'inserzione passando poi alla tensione nominale a distacco freno avvenuto.

L'impiego del raddrizzatore tipo SB è sempre da prevedere nei casi di:

a) elevato numero di interventi orari

b) tempi di sblocco freno ridotti

c) elevate sollecitazioni termiche del freno.

Per la protezione del raddrizzatore, della bobina e dei contatti contro le sovratensioni di manovra, sono previsti di serie dei varistori.

41.2 **FD brake**

Brake power supply

All motors have a rectifier secured to the terminal box and connected to brake coil.
Rectifier-brake coil voltage is combined with motor power supply (phase voltage) and for single speed motors, the connection to the motor terminal box is carried out at the factory.
Standard voltage is 230 V ± 10% 50/60Hz for sizes 71-132 and 400 V ± 10% for size 160.
A diode, single half-wave rectifier is used (V.d.c. = 0.45 V.a.c.).

The NB rectifier (SB available on request) is a standard device for brakes FD02, FD03, FD53, FD04, FD14, FD05 and FD15; the maximum operating voltage is 500V a.c..
The SB rectifier type with electronic energizing control is a standard device for brakes FD55, FD56, FD06, FD06S and FD07; the operating voltage is 200V < V < 440V a.c.
This solution, ensuring rapid brake release, entails over-energizing the electro-magnet for a few moments at power-up, and changing to rated voltage after brake release.

The SB rectifier should always be used in the following situations:

a) high number of starts/stops

b) short brake release times

c) high temperature generated on brake.

Varistors are used to protect rectifier, coil and contacts against excess voltage during operation.

41.2 **Bremstyp FD**

Stromversorgung der Bremse

Der Motor ist stets mit einem Gleichrichter ausgestattet, der im Klemmkasten befestigt und mit der Spule der Bremse verbunden ist.
Die Spannung der Bremsengleichrichterspule ist mit Motorversorgung (Sternspannung des Motors) und bei hohen Geschwindigkeits motoren wird der Anschluß dem Motorklemmkasten in der Fabrik durchgeführt. In diesem Fall kann die Bremsspannung wegfallen. Die Standardspannung ist 230 V ± 10% - 50/60 Hz für die Baugröße 71-132 und für Baugröße 160 ist 400 V ± 10%.
Der Gleichrichter ist in Einwegschaltung ausgeführt (V Gleichstrom: 0.45 V Wechselstrom).
Bei den Bremsen vom Typ FD02, FD03, FD53, FD04, FD14, FD05 und FD15 ist serienmäßig ein Gleichrichter vom Typ NB vorgesehen (auf Wunsch Typ SB lieferbar); die max. Betriebsspannung ist 500V W.S.
Bei den Bremsen vom Typ FD55, FD56, FD06, FD06S und FD07 ist serienmäßig ein Gleichrichter vom Typ SB mit elektronischer Schnellerregung vorgesehen; die Betriebsspannung ist 200V < V < 440V W.S.
Diese Lösung, die sehr kurze Ansprechzeiten der Bremse erlaubt, wird verwirklicht, indem der Elektromagnet in der ersten Einschaltphase übererregt wird und nach erfolgter Öffnung der Bremse nur noch mit Nennspannung gespeist wird.
Die Verwendung des Gleich-richters vom Typ SB ist in folgenden Fällen stets vorzusehen:

a) hohe Schalthäufigkeit;

b) kurze Bremsansprechzeiten;

c) hohe thermische Belastung der Bremse.

Zum Schutz des Gleichrichters, der Spule und der Kontakte zum Schutz von Schaltüberspannungen sind einige Varistoren vorge-

41.2 **Freins type FD**

Alimentation frein

Le moteur est toujours doté d'un redresseur fixé dans la boîte à borne et relié à la bobine du frein.
La tension du redresseur-bobine frein est coordonnée à l'alimentation moteur (tension de phase ou en étoile du moteur). Pour moteur mono-vitesse, le raccordement à la boîte à borne est réalisé en usine. Dans ce cas, la tension du frein peut être omise. La tension standard est de 230 V ± 10% 50/60 Hz por la taille 71-132 et 400 V ± 10% pour la taille 160.
Le redresseur est du type à diodes à mono alternance (Vcc = 0.45 Vca).
Pour les freins FD02, FD03, FD53, FD04, FD14, FD05, FD15, le redresseur type NB est prévu en série (le type SB est disponible sur demande), tension maxi d'utilisation 500V en courant alternatif.
Pour les freins, FD55, FD56, FD06, FD06S, FD07, le redresseur type SB à contrôle électronique de l'excitation (tension d'utilisation 200V < V < 440V en courant alternatif) est prévu en série.
Cette solution, qui permet des durées de déblocage du frein réduites, est réalisée en surexcitant l'électro-aimant dans les premiers instants d'insertion, en passant ensuite à la tension nominale lorsque le déblocage du frein est intervenu.
L'emploi du redresseur type SB est toujours à prévoir dans les cas de:

a) nombre élevé d'interventions horaires

b) temps de déblocage frein réduits

c) contraintes thermiques élevées du frein.

Pour la protection du redresseur, de la bobine et des contacts contre les surtensions de manoeuvre, des varistors sont prévus en série.

Collegamenti

Per i motori a semplice polarità in esecuzione normale il collegamento del raddrizzatore alla morsettiera motore viene eseguito in fabbrica.
Per i motori a 2 velocità e per alimentazione freno separata prevedere il collegamento al raddrizzatore secondo la tensione freno indicata nella targhetta motore.

Le tabelle (A43), (A44), (A45), (C23) riportano gli schemi di collegamento del freno.

Wiring

For single polarity motors, connection of the rectifier to terminal-box is carried out in-house.
For 2-speed motors and for separate brake supply, the brake voltage indicated on the motor name plate shall be used.

The brake wiring diagrams are shown in tables (A43), (A44), (A45), and (C23).

Anschlüsse

Bei eintourigen Motoren wird der Gleichrichter werkseitigim Motorklemmkasten angeschlossen.
Bei den polumschaltbaren Motoren mit separater Stromversorgung der Bremse ist der Anschluß entsprechend der auf dem Motorleistungsschild angegeben Nennspannung vorzusehen.

Die Abbildungen (A43), (A44), (A45) und (C23) zeigen die Pläne für den Anschluß der Bremse.

Branchements

Pour les moteurs à simple polarité, le branchement du redresseur au bornier moteur est réalisé en usine.
Pour les moteurs à deux vitesses et pour l'alimentation frein séparée, prévoir le branchement selon la tension indiquée sur la plaque d'identification moteur.

Les tableaux (A43), (A44), (A45), (C23) présentent les schémas de branchement du frein.

41.3 **Freno tipo FA**

Alimentazione freno

Nei motori ad una velocità in esecuzione normale, l'alimentazione della bobina freno è derivata direttamente dalla morsettiera motore; in questo caso la tensione del freno può essere ommessa dalla designazione.
Per i motori a doppia polarità e per motori ad una velocità con alimentazione separata è prevista una morsettiera ausiliaria per il collegamento del freno.
Per questa esecuzione il valore di tensione freno dovrà sempre essere indicato in designazione.
La tensione di alimentazione standard è 230 Δ / 400 Y V, 50 Hz.
A richiesta sono disponibili tensioni speciali nel campo 24 - 690V, 50 - 60 Hz.

Collegamenti

Per i motori con alimentazione freno derivata dall'alimentazione motore, i collegamenti alla morsettiera corrispondono a quanto indicato nella tabella (A49)

41.3 **Brake type FA**

Brake power supply

In standard single speed motors, the brake coil power supply comes directly from the motor terminal board, in this case the brake voltage can be omitted in the designation.
For double polarity motors and for single speed motors with separate power supply, an auxiliary terminal board for the brake connection is provided. In this case the brake voltage value must be always indicated in the designation. The standard power supply voltage is 230 Δ /400YV, 50 Hz.
Upon request are available special voltages in the range 24-690V, 50-60 Hz.

Connections

For motors with brake power supply coming from the motor terminal board, the table (A49) are performed.

41.3 **Bremstyp FA**

Stromversorgung der Bremse

In den eintourigen Motoren - Standardausführung - kommt die Stromversorgung der Bremsenspule direkt aus dem Motorklemmkasten; in diesem Fall kann die Bremsversorgung nich in der Bezeichnung angegeben werden.
Für Polumschaltbaren Motoren und für eintourigen Motoren mit Fremdversorgung ist ein Hilfs-klemmkasten für den Bremsenanschluß vorgesehen.
Für solche Ausführung muß der Bremsspannungswert immer in der Bezeichnung angegeben werden.
Die Standardversorgungspannung ist 230 Δ /400YV, 50 Hz.
Auf Anfrage sind Sonderspannungen im Feld 24-690V, 50-60 Hz verfügbar.

Anschlüsse

Für die Motoren mit Stromversorgung der Bremse, die aus der Motorstromversorgung kommt, sind die Anschlüsse des Klemmenkastens aus der Tabelle (A49) zu nehmen.

41.3 **Freins type FA**

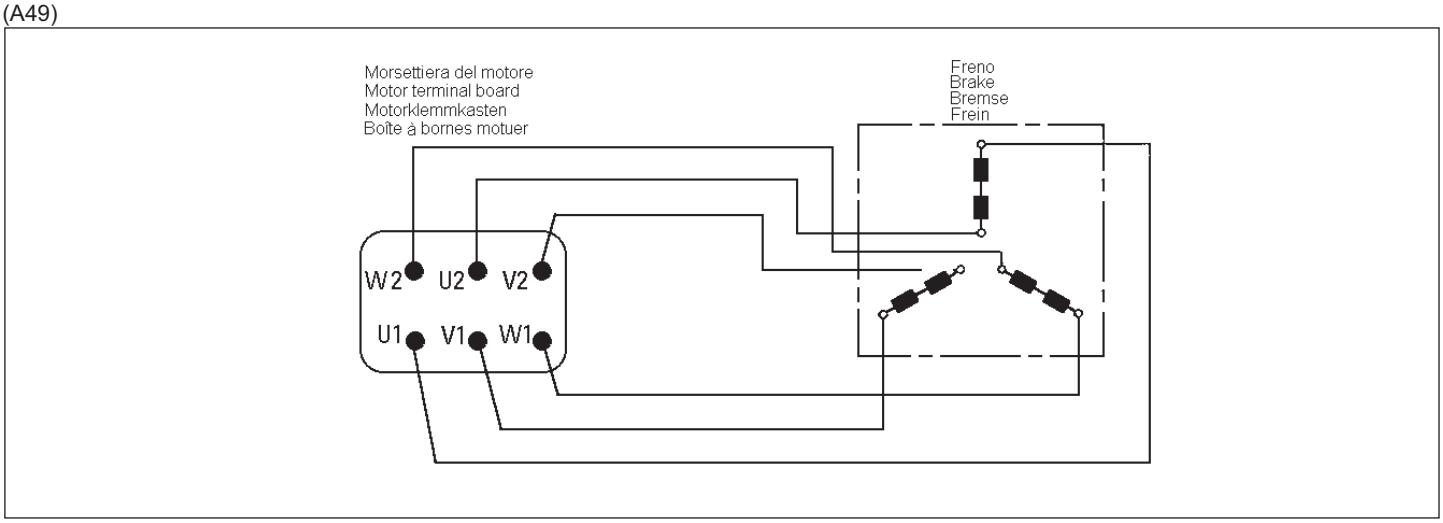
Alimentation frein

Dans les moteurs mono-vitasse en exécution normale, l'alimentation de la bobine du frein est dérivée de la boîte à bornes du moteur. Dans ce cas, il n'est pas nécessaire de signaler la tension du frein en phase de définition.
Pour les moteurs à double polarité et les moteurs à une seule vitesse, avec alimentation séparée, il est prévu une boîte à bornes auxiliaire pour le branchement du frein.
Pour cette exécution, la valeur de la tension du frein devra toujours être indiquée lors de la définition du moteur.
La tension d'alimentation stan-dard est 230 Δ /400YV, 50 Hz.
Les tensions spéciales sont possibles sur demande, dans la plage 24-690V, 50-60 Hz.

Branchements

Pour les moteurs avec alimentation du frein dérivée de l'alimentation moteur, les branchements â la boîte â bornes correspondent aux indications du tableau (A49).

(A49)



Nel caso di alimentazione separata, le connessioni del freno sono derivate alla morsettiera ausiliaria come indicato in tabella (A50)

In case of separate power supply, the brake connections comes from the auxiliary terminal board as shown in table (A50).

Im Fall von Fremdversorgung kommen die Bremsanschlüsse aus dem Hilfsklemmkasten, wie die Tabelle (A50) zeigt.

Pour les moteurs avec alimentation du frein dèrivèe de l'alimentation moteur, les branchements à la boîte à bornes correspondent aux indications du tableau (A50).

(A50)

P_b = absorption du frein à 20°C

42.0 ESECUZIONI SPECIALI

30.7.1 Protezioni termiche

Oltre alla protezione garantita dall'interruttore magnetotermico, i motori possono essere provvisti di sonde termiche incorporate per proteggere l'avvolgimento da eccessivo riscaldamento dovuto (p.es.) a scarsa ventilazione o servizio intermittente.
Questa protezione dovrebbe sempre essere prevista per motori servoventilati (IC416).

Sonde termiche a termistori (E3, E6)

Sono dei semiconduttori che presentano una rapida variazione di resistenza in prossimità della temperatura nominale di intervento.
L'andamento della caratteristica R= f (T) è normalizzato dalle Norme DIN 44081, IEC 34-11.

Questi sensori presentano il vantaggio di avere ingombri ridotti, un tempo di risposta molto contenuto e, dato che il funzionamento avviene senza contatti, sono completamente esenti da usura.
In genere vengono impiegati termistori a coefficiente di temperatura positivo denominati anche "resistori a conduttore freddo" PTC.

A differenza delle sonde termiche bimetalliche, non possono intervenire direttamente sulle correnti delle bobine di eccitazione e devono pertanto essere collegati ad una speciale unità di controllo (apparecchio di sgancio) da interfacciare alle connessioni esterne.
Con questa protezione vengono inseriti tre PTC, collegati in serie, nell'avvolgimento con terminali disponibili in morsettiera ausiliaria.

Sonde termiche bimetalliche (D3)

I protettori di questo tipo contengono all'interno di un involucro un disco bimetallico che, raggiunta la temperatura nominale di intervento, commuta i contatti dalla posizione di riposo.
Con la diminuzione della temperatura, il disco e i contatti riprendono automaticamente la posizione di riposo.
Normalmente si impiegano tre sonde bimetalliche in serie con contatti normalmente chiusi e terminali disponibili in una morsettiera ausiliaria.

42.0 SPECIAL EXECUTIONS

40.1 Thermal protective devices

In addition to the standard protection provided by the magneto-thermal cut-out device, motors can be supplied with built-in thermal probes to protect windings against overheating caused, for example, by inadequate ventilation or by an intermittent duty.
This additional protection should always be specified for servo-ventilated motors (IC416).

Thermistors (E3, E6)

These are semi-conductors having rapid resistance variation when they are close to the rated intervention temperature.
Variations of the R = f(T) characteristic are specified under DIN 44081, IEC 34-11 Standards.

These elements have several advantages: compact dimensions, rapid response time and,being contact-free, absolutely no wear.
Positive temperature coefficient thermistors are normally used (also known as PTC "cold conductor resistors").

Contrary to bimetallic thermostates, they cannot directly intervene on currents of energizing coils, and must therefore be connected to a special control unit (triggering apparatus) to be interfaced with the external connections.
Thus protected, three PTCs connected in series are installed in the winding, the terminals of which are located on the auxiliary terminal-board.

Bimetallic thermostates (D3)

These types of protective devices contain a bimetal disk inside a housing. When the rated temperature is reached, the disk switches the contacts from their initial rest position.
As temperature falls, the disk and contacts automatically return to rest position.
Three bimetallic thermostates connected in series are usually employed, with normally closed contacts. The terminals are located on an auxiliary terminalboard.

42.0 SONDERAUSFÜHRUNGEN

40.1 Thermische Schutzeinrichtungen

Abgesehen von den Motorschutzschaltern mit thermischem und elektromagnetischem Auslöser können die Motoren mit integrierten Temperaturfühlern zum Schutz der Wicklung vor Überhitzung z.B. wegen unzureichender Lüftung oder Aussetzbetriebs ausgestattet werden.
Diese Schutzeinrichtung muß bei fremdbelüfteten Motoren stets vorgesehen werden (IC416).

Temperaturfühler und Thermistoren (E3, E6)

Hierbei handelt es sich um Halbleiter, die eine schnelle Änderung des Widerstands in der Nähe der Nennansprechtemperatur zeigen.
Der Verlauf der Kennlinie R = f(T) ist durch die DIN-Normen 44081 und IEC 34-11 festgelegt.

Diese Sensoren haben folgende Vorteile: sie weisen geringe Außenmaße und eine äußerst kurze Ansprechzeit auf und sind vollkommen verschleißfrei, da sie berührungslos arbeiten.

Im allgemeinen werden Thermistoren mit positivem Temperaturkoeffizienten verwendet, die auch als "Kaltleiter" (PTC-Widerstände) bezeichnet werden.
Im Unterschied zu Bimetall-Temperaturfühlern können sie nicht direkt auf die Erregungsströme der Spulen wirken, sondern müssen an eine spezielle Steuereinheit (Auslösegerät) angeschlossen werden, die mit den externen Anschlüssen kompatibel ist.
Mit dieser Schutzeinrichtung werden drei in Reihe geschaltete PTC-Widerstände in die Wicklung eingesetzt, deren Endanschlüsse an einer Zusatzklemmleiste verfügbar sind.

Bimetall-Temperaturfühler (D3)

Diese Schutzeinrichtungen bestehen aus einer Kapsel, in der sich eine Bimetallscheibe befindet, die bei Erreichen der Nennansprechtemperatur anspricht.
Nach Absenkung der Temperatur geht der Schaltkontakt automatisch in Ruhestellung zurück.
Normalerweise werden drei in Reihe geschaltete Bimetallfühler mit Öffnern verwendet, deren Endverschlüsse an einer Zusatzklemmleiste verfügbar sind.

42.0 EXECUTIONS SPECIALES

40.1 Protections thermiques

Outre la protection garantie par l'interrupteur magnétothermique, les moteurs peuvent être équipés de sondes thermiques incorporées pour protéger le bobinage contre une surchauffe excessive due par exemple à une ventilation insuffisante ou un service intermittent.
Cette protection devrait toujours être prévue pour les moteurs servoventilés (IC416).

Sondes thermométriques (E3, E6)

Ce sont des semiconducteurs qui présentent une variation rapide de résistance à proximité de la température nominale d'intervention.
L'évolution de la caractéristique R = f(T) est défini par les Normes DIN 44081, IEC 34-11.

Ces capteurs présentent l'avantage d'avoir des encombrements réduits, un temps de réponse très bref et, du fait que le fonctionnement a lieu sans contact, il sont exempts d'usure.

En général, on utilise des thermistors à coefficient de température positif dénommés également "résistors à conducteur froid" PTC.
Contrairement aux sondes thermiques bimétalliques, ils ne peuvent intervenir directement sur les courants des bobines d'excitation et doivent par conséquent être reliés à une unité spéciale de contrôle (appareil de déconnection) à interfacer aux connexions extérieures.
Avec cette protection, trois sondes, reliées en série, sont insérées dans le bobinage avec extrémités disponibles dans le bornier auxiliaire.

Sondes thermiques bimétalliques (D3)

Les protecteurs de ce type contiennent, dans une enveloppe interne, un disque bimétallique qui, lorsque la température nominale d'intervention est atteinte, commute les contacts de la position de repos.
Avec la diminution de la température, le disque et les contacts reprennent automatiquement la position de repos.
Normalement, on utilise trois sondes bimétalliques en série avec contacts normalement fermés et extrémités disponibles dans un bornier auxiliaire.

42.2 **Riscaldatori anticondensa** (H1)

I motori funzionanti in ambienti molto umidi e/o in presenza di forti escursioni termiche, possono essere equipaggiati con una resistenza anticondensa.
L'alimentazione è prevista da una morsettiera ausiliaria e la tensione standard è 230V c.a. ± 10% monofase; le potenze sono indicate nella tabella (C29).

42.2 **Anti-condensate heaters** (H1)

Motors operating in extremely humid environments and/or at a wide temperature range can be supplied with an anti-condensate heater.
Power is supplied via an auxiliary terminal-board, standard voltage is 230 V.a.c. ± 10% single-phase; power specifications are shown in table (C29).

42.2 **Wicklungsheizung** (H1)

Die Motoren, die in Umgebungen mit hoher Luftfeuchte und der großen Temperaturschwankungen betrieben werden, können mit einem Kondenswasserschutz-Heizelement ausgestattet werden.
Die Stromversorgung wird über eine Zusatzklemmleiste mit einer einphasigen Standardspannung von W.S. 230 V ± 10% bewerkstelligt; die Leistungen sind in Tabelle (C29) angegeben.

42.2 **Réchauffeurs anticondensation** (H1)

Les moteurs fonctionnant dans des milieux très humides et/ou en présence de fortes excursions thermiques, peuvent être équipés de résistance anticondensation.
L'alimentation est prévue par un bornier auxiliaire et la tension standard est de 230V c.a. ± 10% monophasée. Les puissances sont indiquées dans le tableau (C29).

(C29)

Tipo Motor type	Potenza Power [W]	Motortyp Moteur type	Leistung Puissance [W]
BN 80	10	**BN 80**	10
BN 90 - 100	25	**BN 90 - 100**	25
BN 112 - 132	25	**BN 112 - 132**	25
BN 160	50	**BN 160**	50

Importante !
Durante il funzionamento del motore la resistenza anticondensa non deve mai essere inserita.

Important !
While motor is running, the anti-condensate heater must be switched off.

Wichtig!
Während des Betriebs des Motors darf das Heizelement nie eingeschaltet werden.

Important!
Pendant le fonctionnement du moteur, la résistance anti-condensation ne doit jamais être branchée.

42.3 **Servoventilazione(U1)**

A partire dalla grandezza BN71 i motori possono essere forniti con ventilazione assiale indipendente.
Il raffreddamento è realizzato da un ventilatore installato all'interno della calotta copriventola, con alimentazione indipendente
(220/240 V 50/60 Hz per grandezza 71 - 100 ,
230/400 V 50/60 Hz per 112 - 132).
A richiesta può essere applicato un encoder o una dinamo tachimetrica.
La tabella (A53) riporta le variazioni dimensionali (ΔL_1 e ΔL_2) del motore servoventilato.

42.3 **Servo-ventilation** (U1)

Starting from size BN71, the motors can be supplied with independent axial ventilation.
Cooling is by an independently powered fan mounted inside the fan cover
(220V/240V 50/60 Hz for sizes 71 - 100,
230/400 V 50/60 Hz for 112 - 132).

An encoder or tacho-generator can be fitted on request.
Table (A53) shows dimension variations (ΔL_1 and ΔL_2) of the servo-ventilated motor.

42.3 **Fremdbelüftung** (U1)

Ab der Baugrösse BN71 können die Motoren mit einem Fremdlüfter geliefert werden.
Die Kühlung erfolgt durch einen Ventilator, der unter der Lüfterradkappe angeordnet ist und über eine unabhängige Stromversorgung verfügt.
(220/240 V - 50/60 Hz für Größen 71 - 100,
230/400 V - 50/60 Hz für 112 - 132).
Auf Wunsch kann ein Encoder oder ein Tacho-Dynamo installiert werden.
Tabelle (A53) zeigt die Maßänderungen (ΔL_1 und ΔL_2) des fremdbelüfteten Motors.

42.3 **Servoventilation** (U1)

A partir de la taille BN71, les moteurs peuvent être équipés d'une ventilation axiale indépendante.
Le refroidissement est réalisé par un ventilateur installé à l'intérieur de la calotte cache-ventilateur, avec alimentation indépendante.
(220/240 V - 50/60 Hz pour taille 71 - 100,
230/400V 50/60 Hz pour 112 - 132).
Sur demande, on peut appliquer un encodeur ou une dynamo tachymétrique.
Le tableau (A53) présente les variations dimensionnelles (ΔL_1 et ΔL_2) du moteur servoventilé.

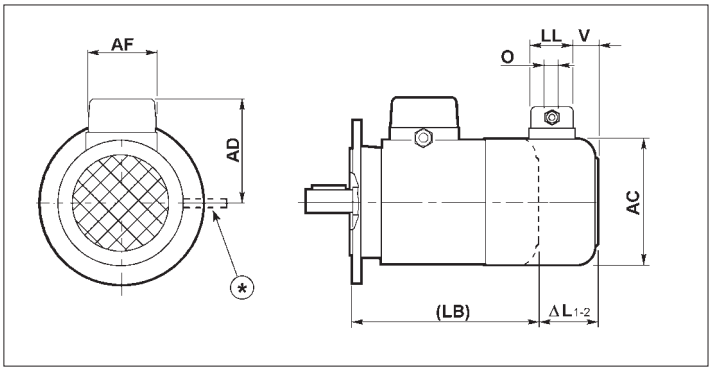
(C32)



Legenda:

ΔL_1 = Variazione dimensionale rispetto alla dimensione LB dei motori trifase normali
ΔL_2 = Variazione dimensionale rispetto alla dimensione LB dei motori autofrenanti

* N.B. Nei motori autofrenanti con leva di sblocco, la leva verrà collocata lateralmente.

Per grandezza BN160 interpellare il ns. servizio tecnico

Key:

ΔL_1 = Dimensional variation with respect to dimension LB of normal three-phase motors
ΔL_2 = Dimensional variation with respect to dimension LB of brake motors.

* N.B. In brake motors with a hand release lever, the lever is side located.

Contact our Technical Service Dept. for size BN160.

Zeichenerklärung:

ΔL_1 = Maßänderung im Vergleich zum Maß LB der normalen Drehstrommotoren
ΔL_2= Maßänderung im Vergleich zum Maß LB der Bremsmotoren.

*P.S. bei den Bremsmotoren mit Bremslüfthebel wird der Hebel seitlich angebracht

Im Bezug auf die BN160 bitten wir Sie sich an unseren technischen Kunddendienst zu werden.

Légende:

ΔL_1 = Variation dimensionnelle par rapport à la dimension LB des moteurs triphasés normaux
ΔL_2 = variation dimensionnelle par rapport à la dimension LB des moteurs frein.

*N.B. Pour les moteurs freins avec levier de déblocage, le levier sera placé latéralement.

En ce qui concerne la taille BN160, contacter notre service technique.

42.4 Tettuccio parapioggia (RC)

Questa protezione viene applicata al motore quando esso è montato con albero in basso per proteggerlo dall'ingresso di corpi solidi e dallo stillicidio.
Deve essere richiesta in fase di ordine in quanto non prevista nella versione base.
La tabella (A54) riporta il massimo ingombro del tettuccio parapioggia.

42.4 Rain canopy (RC)

This rain canopy is applied to the motor when mounted with the shaft downwards in order to provide a protection against solid bodies and dripping water.
The rain canopy must be specified when ordering as it is not a supplied item for standard motors. Table (A54) shows the overall dimensions of the rain canopy.

42.4 Schutzdach (RC)

Diese Schutzvorrichtung wird am Motor angebracht, wenn der Motor mit der Welle nach unten montiert wird und von Feststoffen und Tropfwasser geschützt werden muß.
Die Abdeckung muß bei Bestellung angefordert werden, da der Motor in der Standardausführung nicht darüber verfügt. In Tabelle (A54) sind die maximalen Außenmaße der Regenschutzabdeckung angegeben.

42.4 Capot de protection anti-pluie (RC)

C'est une protection qui est appliquée au moteur lorsque ce dernier est monté avec arbre vers bas pour le proteger contre la pénétration de corps solides ou de la stillation.
Il doit être demandé au moment de la commande étant donné que le moteur standard ne le prevoit pas. Le tableau (A54) présente l'encombrement maximum du capot de protection anti-pluie.

* Se è prevista l'alimentazione separata del freno la morsettiera avrà le dimensioni riportate a pag. 219 (BN_B5FD).

* In case of separate brake power supply, the terminal board will have the same dimensions as at page 219 (BN_B5FD).

* Wenn die Fremdstromversorgung der Bremse vorgesehen ist, wird das Klemmkasten die gleiche Abmessungen wie auf Seite 219 (BN_B5FD).

* En cas d'alimentation séparée du frein, la boîte à bornes aura les dimensions reportées page 219 (BN_B5FD).

45.0 SISTEMI AUSILIARI DI RAFFREDDAMENTO

Qualora la potenza meccanica trasmessa sia superiore a quella termica trasmissibile (vedi tabelle dati tecnici riduttori), è possibile fornire il riduttore corredato di centralina di raffreddamento.

45.0 SUPPLEMENTARY COOLING SYSTEMS

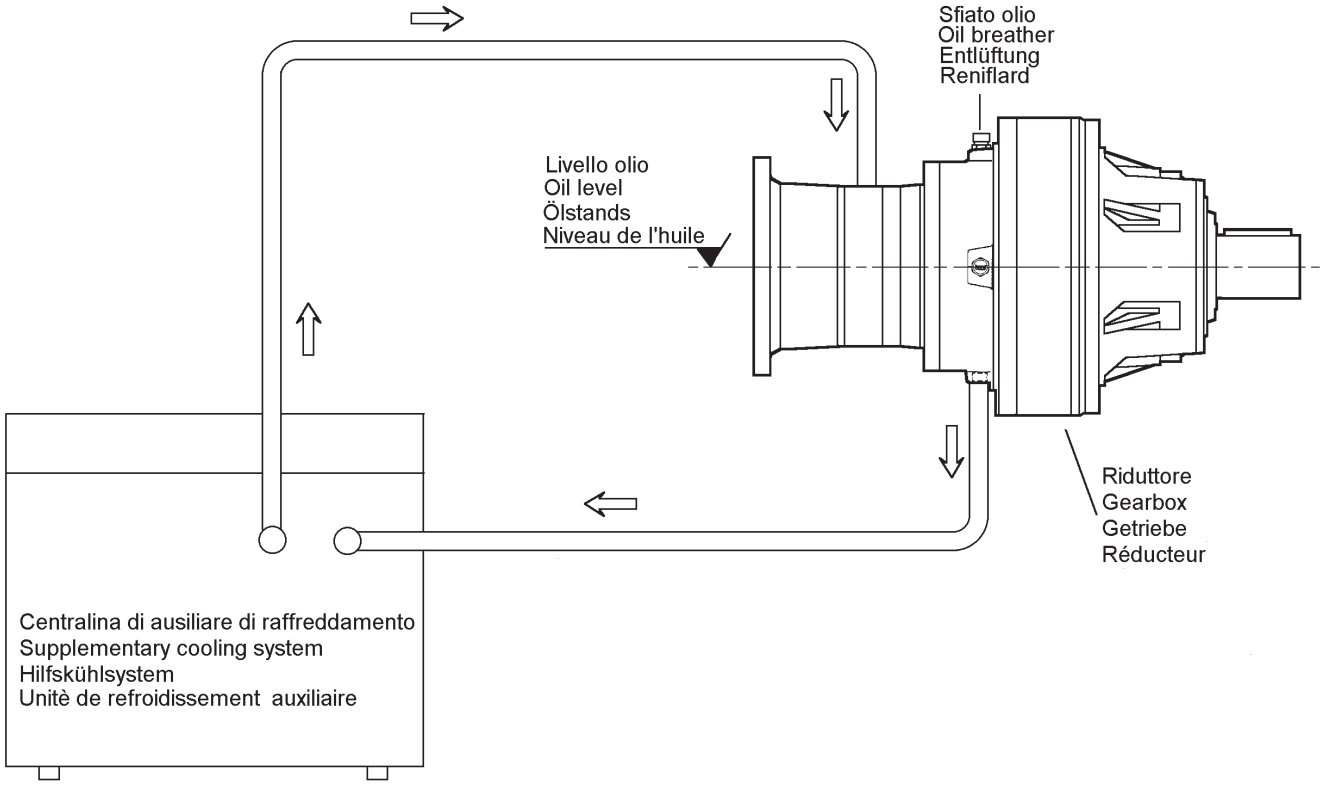
In the event transmitted mechanical power is higher than transmissible thermal power (see tables of gearbox specifications), gearboxes are available complete with a cooling system.

45.0 HILFSKºHLSYSTEME

Sollte die übertragende mechanische Leistung über der übertragbaren Wärmeleistung liegen (siehe Tabelle mit technischen Getriebedaten), ist die Lieferung eines, mit einem Kühlsystem ausgestatteten Get-

45.0 SYSTEMES AUXILIAIRES DE REFROIDISSEMENT

Au cas où la puissance mécanique transmise serait supérieure à celle thermique transmissible (confronter tableaux données techniques réducteurs), il est possible de d'équiper le réducteur d'une unité de refroidis-



Le centraline autonome di raffreddamento sono unità composte da uno scambiatore di calore aria-olio, una motopompa, un filtro dell'olio da raffreddare, un elettroventilatore ed un impianto elettrico comprendente la protezione termica dei motori elettrici.
Caratteristica delle centraline è il basso livello di rumorosità.

These separate cooling systems are made up of an air-oil heat exchanger, a motor pump, a filter for warm oil and an electric system that incorporates an overload cutout for electric motors.
A special feature of these cooling systems is their low noise.

Die autonomen Kühlsysteme sind Einheiten, die sich aus einem Luft-Öl-Wärmeaustauscher, einer Motorpumpe, einem Filter für das zu kühlende Öl, einem Elektroventilator und einer elektrischen Anlage, welche den Wärmeschutz der Elektromotoren enthält, zusammensetzen.

Les unités indépendantes de refroidissement sont des sous-ensembles se composant d'un échangeur de chaleur air/huile, d'une motopompe, d'un filtre pour l'huile à refroidir, d'un électroventilateur et d'un système électrique incluant une protection thermique des moteurs électriques.
Cette unité est caractérisée par un bas niveau de nuisance sonore.

45.1 Dati tecnici

45.1 Technical data

45.1 Technische daten

45.1 Donn¢e techniques

		CR1	CR2	CR3
Potenza assorbita Power absorbtion Leistungsaufn Puissance absorbée	[kW]	0.25	0.63	1
Portata pompa Pumpflow Pumpeausflussmenge Débit de pompe	[l/min]	9	25	40
Portata aria Air flow Luftausflussmenge Débit d'air	[m^3/h]	600	1000	3000
Livello di rumorosità a 1 metro Level of noise at 1 mt. Geräuschpegel Niveau sonore à 1 in1 mètre	[dB(A)]	67	71	76
Peso Weight Gewicht Poids	[Kg]	28	40	63

45.2 **Criteri di scelta**

Nota la potenza da trasmettere P e verificato che questa sia superiore alla potenza termica Pt, calcolare la potenza da smaltire Ps con la formula:

45.2 **Selection criteria**

Power P to be transmitted is known. Once you have determined that it is higher than thermal power Pt, calculate excess power Ps using this formula:

45.2 **Auswahlkriterien**

Hat man einmal die Date der zu übertragenden Leistung P zur Verfügung stehen und überprüft, ob diese über der Wärmeleistung Pt liegt, muß man die Überleistung Ps unter Anwendung der folgenden Formel berechnen:

45.2 **Critères de sélection**

La puissance P à transmettre connue, et une fois vérifié que celle-ci est supérieure à la puissance thermique Pt, calculer la puissance à éliminer Ps par la formule :

$$Ps = 0.1 \cdot (P - Pt) \qquad (38)$$

Selezionare la grandezza della centralina sul diagramma (A55) in funzione della temperatura ambiente ta (20° - 40°C).
Verificare che la centralina sia installabile sul riduttore selezionato (vedi tabella A56).
In caso contrario, contattare la ns. rete di vendita.

Select cooling system size in chart (A55) according to ambient temperature ta (20° - 40°C).
Check that the cooling system you have selected will fit the gearbox (see table A56).
If this is not the case, contact our sales organization.

Die Größe des Systems auf dem Diagramm (A55) in Anbetracht der Umgebungstemperatur ta (20° - 40°C) auswählen.
Überprüfen, ob die Zentrale auch auf dem ausgewählten Getriebe installierbar ist (siehe Tabelle A56).
Ist dies nicht der Fall, müssen Sie sich mit unserem Verkaufsnetz in Verbindung setzen.

Sélectionner la taille de l'unité sur le diagramme (A55), se rapportant à la température ambiante (20° - 40°C).
Veiller à ce que l'unité puisse être installée sur le réducteur sélectionné (voir tableau A56).
Vice versa, contacter notre réseau de vente.

BONFIGLIOLI

Bonfiglioli: Specific Solutions for Power Transmission and Motion Control

Product diversification, process automation and quality have enabled Bonfiglioli to play a leading role in the industry. Bonfiglioli policy focuses on integrated solutions, competence and innovative technology as key factors, indispensable to ensure customer satisfaction, with production striving for the highest quality standards.

Bonfiglioli product range meets the toughest and most advanced requirements for Industrial Process, Automation and for Mobile Equipment.
Such market segments are covered through the following Product Lines:

BONFIGLIOLI RIDUTTORI Helical, Bevel and Worm Gearmotors and Gear Units

BONFIGLIOLI TRASMITAL Planetary Gearmotors and Gear Units

BONFIGLIOLI VECTRON AC drives

Always Towards the Best Wind

Bonfiglioli has been involved in the development of wind energy for a long time.
Bonfiglioli products are used in the latest state-of-the-art wind turbines to control such significant functions like yaw and pitch drives.
700T series planetary speed reducers are appreciated by a number of leading wind turbine manufacturers thanks to their advanced technical features.

Torque Range
8.000 ... 180.000 Nm

Gear Ratios
600 ... 2000

Key Features
Flange mounted
Output shaft: splined or with integral pinion
Rugged construction
High torque capacity
Output shafts supported by heavy duty bearings

Applicable AC motors
Compact motors and brake motors, M series
IEC motors and brake motors, BN series

Main Brake Motor Features
DC and AC type

Main Motor Options
Thermistors and thermostates sensors

Quality has Always Been the Distinctive Trait of Bonfiglioli

Total quality for customer satisfaction: this is the underlying concept of the Bonfiglioli philosophy. The Bonfiglioli Quality System applies to all the activities conducted in all production sites. This synergical approach translates into a common Quality Management throughout the Company, which ensures that every process is carried out according to the ISO 9001 : 2000 standards.

For Bonfiglioli, this involved significant changes in all areas of the company, as well as substantial investments. By achieving the ISO 9001 : 2000 certification, the Bonfiglioli facilities proved their ability to design, produce and guarantee a quality product.

The Bonfiglioli Group can flaunt the European record scored by its division, who were the first to obtain a quality system certification from two different internationally acknowledged authorities, members of Sincert: Det Norske Veritas and TÜV.

M1 - PROGRAMMA DI PRODUZIONE

Questo catalogo descrive i motori asincroni trifase in bassa tensione di produzione BONFIGLIOLI RIDUTTORI.
I motori sono del tipo chiuso con ventilazione esterna e rotore a gabbia per l'utilizzo in ambienti industriali.

M1 - PRODUCTION PLANNING

This catalogue discusses low-voltage three-phase asynchronous motors manufactured by BONFIGLIOLI RIDUTTORI.
Motors are the enclosed type with outer fan and cage-type rotor for use in industrial environments.

M1 - PRODUKTIONSPROGRAMM

In diesem Katalog werden die unter Niederspannung arbeitenden asynchronen Drehstrommotoren der Produktion von BONFIGLIOLI RIDUTTORI näher beschrieben. Hierbei handelt es sich um geschlossene Motoren mit Eigenbelüftung und einem Käfigrotor für den industriellen Einsatz.

M1 - PROGRAMME DE PRODUCTION

Ce catalogue décrit les moteurs asynchrones triphasés en basse tension produits par BONFIGLIOLI RIDUTTORI.
Les moteurs sont du type fermé avec ventilation extérieure et rotor à cage pour l'utilisation dans des milieux industriels.

M2 - NORMATIVE

I motori sono costruiti in accordo alle Norme CEI/EN ed IEC applicabili, riportate in tabella.

M2 - REFERENCE STANDARDS

Motors are manufactured in accordance with applicable CEI /EN and IEC standards, listed in the table.

M2 - NORMEN

Die Motoren wurden in entsprechend der Normen CEI /EN und IEC, die in der nachstehenden Tabelle angegeben sind, gefertigt:

M2 - NORMES

Les moteurs sont fabriqués dans le respect des Normes CEI /EN et IEC applicables indiquées dans le tableau.

(01)

Titolo / *Title* / Titel / *Titre*	**CEI**	**IEC**
Prescrizioni generali per macchine elettriche rotanti *General requirements for rotating electrical machines* Allgemeine Vorschriften für umlaufende elektrische Maschinen *Prescriptions générales pour machines électriques tournantes*	**CEI EN 60034-1**	**IEC 60034-1**
Marcatura dei terminali e senso di rotazione per macchine elettriche rotanti *Terminal markings and direction of rotation of rotating machines* Kennzeichnung der Anschlußklemmen und Drehrichtung von umlaufenden elektrischen Maschinen *Définitions des bornes et sens de rotation pour machines électriques tournantes*	**CEI 2-8**	**IEC 60034-8**

Direttive CEE 73/23 (LVD) e CEE 89/336 (EMC)

I motori della serie BN sono conformi ai requisiti delle Direttive CEE 73/23 (Direttiva Bassa Tensione) e CEE 89/336 (Direttiva Compatibilità Eletromagnetica), e riportano in targa la marcatura CE. Per quanto riguarda la Direttiva EMC, la costruzione è in accordo alle Norme CEI EN 60034-1 sez. 12, EN 50081, EN 50082.

I motori con freno FD, se corredati dell'opportuno filtro capacitivo in ingresso al raddrizzatore (variante **CF**), rientrano nei limiti di emissione previsti dalla Norma EN 50081- "Compatibilità elettromagnetica - Norma Generica sull'emissione - Parte 1: Ambienti residenziali, commerciali e dell'industria leggera".

I motori soddisfano inoltre le prescrizioni della Norma CEI EN 60204-1 "Equipaggiamento elettrico delle macchine".

È responsabilità del costruttore o dell'assemblatore dell'apparecchiatura che incorpora i motori come componenti garantire la sicurezza e la conformità alle direttive del prodotto finale.

Directives 73/23/ EEC (LVD) and 89/336/ EEC (EMC)

BN motors meet the requirements of Directives 73/23/EEC (Low Voltage Directive) and 89/336/EEC (Electromagnetic Compatibility Directive) and their name plates bear the CE mark. As for the EMC Directive, construction is in accordance with standards CEI EN 60034-1 Sect. 12, EN 50081, EN 50082.

*Motors with FD brakes, when fitted with the suitable capacitive filter at rectifier input (option **CF**), meet the emission limits required by Standard EN 50081-1 "Electromagnetic compatibility - Generic Emission Standard - Part 1: Residential, commercial and light industrial environment".*

Motors also meet the requirements of standard CEI EN 60204-1 "Electrical equipment of machines".

The responsibility for final product safety and compliance with applicable directives rests with the manufacturer or the assembler who incorporate the motors as component parts.

Richtlinien EWG 73/23 (LVD) und EWG 89/336 (EMC)

Die Motoren der Serie BN entsprechen den Anforderungen der Richtlinien EWG 73/23 (Richtlinie - Niederspannung) und CEE 89/336 (Richtlinie – elektromagnetische Kompatibilität) und sind mit dem CE-Zeichen ausgestattet. Im Hinblick auf die Richtlinie EMC entspricht die Konstruktion den Normen CEI EN 60034-1, Abschn. 12, EN 50081, EN 50082.
Die Motoren mit dem Bremstyp FD fallen, falls mit dem entsprechenden kapazitiven Filter am Eingang des Gleichrichters ausgestattet (Option **CF**), unter die Emissionsgrenzwerte, die von der Norm EN 50081-1 " Elektromagnetische Kompatibilität – Allgemeine Norm für Emissionen – Teil 1: Wohngebiete, Handels- und Leichtindustriezonen" vorgesehen werden".
Die Motoren entsprechen darüber hinaus den von der Norm CEI EN 60204-1 "Elektrische Maschinenausstattung" gegebenen Vorschriften.

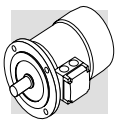
Es liegt in der Verantwortung des Herstellers oder des Monteurs der Anlage, in der die Motoren als Komponenten montiert werden, die Sicherheit und die Übereinstimmung mit den Richtlinien des Endprodukts zu gewährleisten.

Directives CEE 73/23 (LVD) e CEE 89/336 (EMC)

Les moteurs de la série BN sont conformes aux conditions requises par les Directives CEE 73/23 (Directive Basse Tension) et CEE 89/336 (Directive Compatibilité Electromagnétique), et le marquage CE est indiqué sur la plaquette signalétique. En ce qui concerne la Directive EMC, la fabrication répond aux Normes CEI EN 60034-1 Sect. 12, EN 50081, EN 50082.
*Les moteurs avec frein FD, s'ils sont équipés du frein capacitif approprié en entrée du redresseur (option **CF**), rentrent dans les limites d'émission prévues par la Norme EN 50081-1 "Compatibilité électromagnétique - Norme Générique sur l'émission – Partie 1: Milieux résidentiels, commerciaux et de l'industrie légère".*

Les moteurs répondent aussi aux prescriptions de la Norme CEI EN 60204-1 "Equipement électrique des machines".

Le fabricant ou le monteur de la machine qui comprend les moteurs comme composant est responsable et doit se charger de garantir la sécurité et la conformité aux directives du produit final.



M3 - TOLLERANZE

Secondo le Norme CEI EN 60034-1 sono ammesse le tolleranze qui indicate per le grandezze garantite:

M3 - TOLERANCES

Allowed tolerances for guaranteed parameters in accordance with standards CEI EN 60034-1 are indicated in the table below:

M3 - TOLERANZEN

Den Normen CEI EN 60034-1 entsprechend sind für die angegebenen Werte folgende Toleranzen zulässig:

M3 - TOLERANCES

Selon les Normes CEI EN 60034-1 les tolérances indiquées ci-dessous sont admises pour les tailles garanties :

-0.15 (1 - η) P ≤ 50 kW	Rendimento	*Efficiency*	Wirkungsgrad	*Rendement*
-(1 - cosφ) /6 min 0.02 max 0.07	Fattore di potenza	*Power factor*	Leistungsfaktor	*Facteur de puissance*
± 20% (*)	Scorrimento	*Slip*	Schlupf	*Glissement*
+ 20%	Corrente a rotore bloccato	*Locked rotor current*	Strom bei blockiertem Läufer	*Courant à rotor bloqué*
-15% + 25%	Coppia a rotore bloccato	*Locked rotor torque*	Drehmoment bei blockiertem Läufer	*Couple à rotor bloqué*
-10%	Coppia max	*Max. torque*	Max. Drehmoment	*Couple max*

(*) ± 30% per motori con P_n < 1 kW *(*) ± 30% for motors with P_n < 1 kW* (*) ± 30% für Motoren mit P_n < 1 kW *(*) ± 30% pour moteurs avec P_n < 1 kW*

M3.1 - TOLLERANZE GEOMETRICHE

L'estremità d'albero, la linguetta e la flangia hanno dimensioni e tolleranze secondo EN 50347, IEC 60072-1, CEI-UNEL 13501.
Le estremità d'albero sono previste di foro filettato in testa secondo UNI 9321, DIN 332.
I motori sono sempre forniti con linguetta inserita nella sede.
La tabella seguente riporta le tolleranze previste per le diverse parti:

M3.1 - GEOMETRIC TOLERANCES

Dimensions and tolerances of shaft end, key and flange are in accordance with EN 50347, IEC 60072-1, CEI-UNEL 13501.
Shaft ends feature an axial threaded hole in accordance with UNI 3221, DIN 332 and a key inserted in the suitable keyway.
The following table reports the tolerances for the different parts:

M3.1 - GEOMETRISCHE TOLERANZEN

Die Wellenenden, der Federkeil und der Flansch entsprechen im Hinblick auf ihre Maße und Toleranzen den NormenrEN 50347, IEC 60072-1 und CEI-UNEL 13501. Die Wellenenden sind an ihrer Stirnseite mit einer Gewindebohrung gemäß UNI 3221, DIN 332 versehen und werden mit einem in seinen Sitz eingefügten Federkeil geliefert. In der nachstehenden Tabelle werden für die verschiedenen Teile die entsprechenden Toleranzen angegeben:

M3.1 - *TOLERANCES GEOMETRIQUES*

L'extrémité de l'arbre, la clavette et la bride présentent des dimensions et tolérances selon EN 50347, IEC 60072-1, CEI-UNEL 13501. Les extrémités d'arbre sont dotées d'orifice fileté en tête, selon UNI 3221, DIN 332 ainsi que la clavette introduite dans le logement. Le tableau suivant indique les tolérances prévues pour les différentes pièces :

(03)

Componente / *Component* **Komponente / *Composant***	Dimensioni / *Dimensions* Abmessungen / *Dimensions*		Tolleranza / *Tolerance* Toleranz / *Tolérance*
Estremità albero / *Shaft end* Wellenende / *Extrémité arbre*	**D - DA**	∅ 11 - 28	**j6**
		∅ 38 - 48	**k6**
		∅ ≥ 55	**m6**
Linguetta / *Key* Federkeil / *Clavette*	**F - FA**		**h9**
Flangia / *Flange* Flansch / *Bride*	**N**	∅ < 250	**j6**
		∅ ≥ 250	**h6**

M3.2 - RUMOROSITÀ

I valori di rumorosità, rilevati secondo il metodo indicato dalle Norme ISO 1680, sono contenuti entro i livelli massimi previsti dalle Norme CEI EN 60034-9.

M3.2 - NOISE LEVEL

Noise levels measured using the method specified by standard ISO 1680 are within the maximum limits required by standards CEI EN 60034-9.

M3.2 - GERÄUSCHPEGEL

Der Geräuschpegel wurde entsprechend der in der Norm ISO 1680 angegeben Methode gemessen und liegt innerhalb der max. Werte, die von der Norm CEI EN 60034-9 vorgeschrieben werden.

M3.2 - NIVEAU DE BRUIT

Les valeurs du niveau de bruit, mesurées selon la méthode indiquées par les Normes ISO 1680 sont contenues dans les limites maximums prévues par les Normes CEI EN 60034-9.

M4 - SENSO DI ROTAZIONE

È possibile il funzionamento dei motori in entrambi i versi di rotazione. Con collegamento dei morsetti U1, V1, W1 alle fasi di linea L1, L2, L3 si ottiene la rotazione oraria, osservando l'albero dal lato accoppiamento. La marcia antioraria si ottiene scambiando fra loro due fasi.

M4 - ***DIRECTION OF ROTATION***

Motors may operate in both directions of rotation. When the terminals U1, V1, W1 are connected to the line phases L1, L2, L3, the motor will run in a clockwise direction as viewed from the coupling end. Counter clockwise rotation is obtained by swapping two phases.

M4 - DREHRICHTUNG

Die Motoenr können in beiden Drehrichtungen betrieben werden. Schließt man die Klemmen U1, V1, W1 an die Phasen L1, L2, L3 an, dreht sich der Motor, mit Sicht auf die Motorwelle her betrachtet, im Uhrzeigersinn. Eine Drehrichtungsumkehr gegen den Uhrzeigersinn erhält man durch das Wechseln von zwei Phasen.

M4 - SENS DE ROTATION

Le fonctionnement des moteurs dans les deux sens de rotation est possible. Avec raccordement des bornes U1, V1, W1 aux phases de ligne L1, L2, L3 on obtient la rotation dans le sens des aiguilles d'une montre, en observant l'arbre côté accouplement. Intervertir deux des phases pour obtenir la rotation dans le sens inverse des aiguilles d'une montre.

M5 - CUSCINETTI

I cuscinetti previsti sono del tipo radiale a sfere, precaricati assialmente, e dotati di carica di grasso per lubrificazione permanente.
La durata nominale a fatica L_{10h} in assenza di carichi esterni applicati all'albero e montaggio orizzontale è superiore a 40.000 ore.
I tipi utilizzati sono indicati nella tabella seguente:

M5 - BEARINGS

Axially pre-loaded radial ball bearings, lubricated for life with the grease.
Nominal fatigue life L_{10h} ~ 40,000 hours assuming no overhung load on the shaft, and mounting position horizontal.
The types of bearings in use are listed in the table below:

M5 - LAGER

Bei den verwendeten Lagern handelt es sich um axial vorgespannte Radialkugellager mit einer für die Dauerschmierung ausgelegten Fettfüllung.
Der Nennwert der Ermüdungsdauer L_{10h} ohne auf die Welle einwirkenden Kräften und bei horizontaler Montage liegt bei über 40.000 Stunden:

M5 - ROULEMENTS

Les roulements prévus sont du type radial à billes, préchargés du point de vue axial et remplis de graisse pour une lubrification permanente.
La durée nominale à la fatigue L_{10h}, en l'absence de charges externes appliquées à l'arbre et avec un montage horizontal, est supérieure à 40.000 heures :

M6 - OPERATIVITÀ STANDARD

M6.1 - TENSIONE

I motori a singola polarità sono previsti, nell'esecuzione standard, per tensione nominale 230/400V Δ/Y (o 400/690 V Δ/Y per le grandezze da BN160 e BN 200) 50 Hz con tolleranza ± 10% (Eurotensione).
I motori sono idonei per funzionamento sulla rete di distribuzione europea con tensione in accordo alla pubblicazione IEC 60038.
In targa sono indicati oltre alla tensione nominale, i campi di funzionamento consentiti, p.e. 220-240V Δ /380-415V Y, 50 Hz.
In accordo alla Norma CEI EN 60034-1, i motori possono funzionare alle tensioni sopra indicate con tolleranza del ± 5% (Zona A).
Per funzionamento ai limiti della tolleranza la temperatura può superare di 10 K il limite previsto dalla classe di isolamento adottata.

M6 - STANDARD OPERATION

M6.1 - VOLTAGE

Standard single-speed motors are designed to operate from a rated voltage 230/400V Δ/Y (or 400/690V Δ/Y for frame sizes BN 160 through BN 200) 50 Hz, with ± 10% tolerance (Eurovoltage).
Motors are suitable for operation with European power mains with voltage in accordance with publication IEC 60038.
Besides rated voltage, the name plate reports allowed operating ranges, e.g. 220-240V Δ /380-415V Y, 50Hz. In accordance with standard CEI EN 60034-1, motors may operate at the above mentioned voltages with ± 5% tolerance (Zone A).
In operation at tolerance limits, temperature may exceed the temperature limit required by the adopted insulation class by 10 K.

M6 - STANDARDVERSORGUNG

M6.1 - SPANNUNG

Die einpoligen Motoren sind in der Standardausführung für eine Nennspannung von 230/400V Δ/Y (oder 400/690V Δ/Y für die Baugrößen von BN 160 bis BN 200) 50 Hz, mit einer Toleranz ± 10% (Euro-Spannung) ausgelegt.
Diese Motoren eignen sich für einen Betrieb im Europäischen Versorgungsnetz mit einer Spannung, die den in der Veröffentlichung IEC 60038 angegebenen Werten entspricht. Auf dem Typenschild werden über die Nennspannung hinaus, auch die zulässigen Toleranzbereiche angegeben, z.B. 220-240V Δ /380-415V Y, 50 Hz. In Übereinstimmung mit der Norm CEI EN 60034-1 können die Motoren unter den o.g. Spannungswerten mit einer Toleranz von ± 5% (Bereich A) arbeiten. Bei einem Betrieb an den Toleranzgrenzen kann die Temperatur die vorgesehene Isolationsklasse um 10 K überschreiten.

M6 - CONDITIONES OPERATIVES

M6.1 - TENSION

Les moteurs à simple polarité sont prévus, dans l'exécution standard, pour une tension nominale de 230/400V Δ/Y (ou 400/690V Δ/Y pour les tailles de BN 160 à BN 200) 50 Hz, avec une tolérance de ± 10% (Eurotension). Les moteurs sont adaptés pour fonctionner sur le réseau de distribution européen avec une tension correspondant aux indications de la norme CEI 60038.
Sur la plaque signalétique sont indiquées, outre la tension nominale, les plages de fonctionnement autorisées, par ex. 220-240V Δ /380-415V Y, 50 Hz. En accord avec la norme CEI EN 60034-1, les moteurs peuvent fonctionner aux tensions susmentionnées avec une tolérance de ± 5% (Zone A). Pour un fonctionnement aux limites de la tolérance, la température peut dépasser de 10 K la limite prévue pour la classe d'isolation adoptée.

(05)

	V_{mot} ± 10% 3 ~		Esecuzione *Configuration* Ausführung *Execution*
BN 56 ... BN 132	230/400 V Δ /Y 460 V Y	50 Hz 60 Hz	Standard
BN 160 ... BN 200	400/690 V Δ /Y 460 V Δ	50 Hz 60 Hz	Standard
BN 100 ... BN 132	400/690 V Δ /Y 460 V Δ	50 Hz 60 Hz	A richiesta, senza sovrapprezzo *At request, carries no extra charge* Auf Anfrage, ohne Aufpreis *Sur demande, sans majoration de prix*

I motori a doppia polartà sono previsti per alimentazione standard 400V / 50 Hz; tolleranze applicabili secondo CEI EN 60034-1.
Nella tabella (06) sono indicati i collegamenti previsti in funzione della polarità:

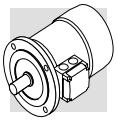
Switch-pole motors are designed to operate from 400V - 50 Hz standard power supply. Applicable tolerances are in accordance with standard CEI EN 60034-1. The table (06) reports the required connections depending on the number of poles:

Die polumschaltbaren Motoren sind für eine Standardversorgung von 400V – 50 Hz ausgelegt; Toleranzen gelten gemäß CEI EN 60034-1. In der Tabelle (06) werden in Abhängigkeit von den jeweiligen Polzahlen die Wicklungsanschlüsse angegeben:

Les moteurs à double polarité sont prévus pour une alimentation standard 400V – 50 Hz ; tolérances applicables selon la norme CEI EN 60034-1. Les branchements prévus en fonction de la polarité sont indiqués sur le tableau (06) :

(06)

	Poli *Number of poles* Polzahl *Nombre de poles*	Collegamento avvolgimento *Winding connection* Wicklungsanschluß *Connexion du bobinage*
BN 63 … BN 200	2,4,6,8	Δ /Y
	2/4, 4/8	Δ / YY (Dahlander)
	2/6, 2/8, 2/12, 4/6	Y / Y (due avvolgimenti *Two windings* Zwei wicklungen *Deux bobinage*)



M6.2 - FREQUENZA

I motori della serie BN sono previsti per essere normalmente utilizzati su reti a 50 Hz o 60 Hz.

M6.2 - FREQUENCY

The motors of the BN series may operate under 50 or 60 Hz supply.

M6.2 - FREQUENZ

Die Motoren der Serie BN können mit 50 Hz oder 60 Hz betrieben werden.

M6.2 - FREQUENCE

Les moteurs de la série BN peuvent être normalement utilisés sur des réseaux en 50 Hz ou 60 Hz.

M6.3 - TEMPERATURA AMBIENTE

Le tabelle dati tecnici del catalogo riportano le caratteristiche funzionali a 50Hz, per le condizioni di installazione previste dalle Norme CEI EN 60034-1 (temperatura compresa tra -15 °C e +40 °C ed altitudine ≤ 1000 m s.l.m.).
I motori possono essere impiegati con temperature comprese tra 40 °C e 60 °C applicando i declassamenti di potenza indicati nella tabella (07):

M6.3 - AMBIENT TEMPERATURE

Catalog rating charts report operating characteristics at 50 Hz, under installation conditions as specified by standards CEI EN 60034-1 (temperature between -15 °C and + 40 °C and altitude above sea level ≤ 1000 m).
Motors may be used at ambient temperatures between 40°C and 60°C as long as the derating factors listed in the table (07) are applied:

M6.3 - UMGEBUNGSTEMPERATUR

Die im Katalog enthaltenen Tabellen geben die Betriebsdaten bei 50 Hz für die Einbaubedingungen gemäß den Normen CEI EN 60034-1 (Temperatur zwischen -15 °C und + 40 °C und Höhe ≤ 1000 m ü. M.) an.
Die Motoren können auch bei Temperaturen zwischen 40°C und 60°C eingesetzt werden, in diesem Fall müssen jedoch die in der Tabelle (07) angegebenen Leistungsreduzierungen beachtet werden:

M6.3 - TEMPERATURE AMBIANTE

Les tableaux des caractéristiques techniques du catalogue indiquent les caractéristiques de fonctionnement à 50 Hz, pour les conditions d'installation prévues par les normes CEI EN 60034-1 (température comprise entre -15 °C et + 40 °C à une altitude de ≤ 1000 m). Les moteurs peuvent être utilisés à des températures comprises entre 40°C et 60°C en appliquant les déclassements de puissance indiqués dans le tableau (07) :

(07)

Temperatura ambiente / *Ambient temperature* Umgebungstemperatur / *Température ambiante* [°C]	40°	45°	50°	55°	60°
Potenza ammissibile in % della potenza nominale *Permitted power as a % of rated power* Zulässige Leistung in % der Nennleistung *Puissance admissible en % de la puissance nominale*	100%	95%	90%	85%	80%

Quando è richiesto un declassamento del motore superiore al 15%, contattare il ns. Servizio Tecnico.

When the applicable derating factor for the motor exceeds 15%, please contact our Technical Service Dept.

Ist eine Rückstufung des Motors von mehr als 15% erforderlich, setzen sie sich bitte mit unserem Technischen Kundendienst in Verbindung.

En cas de nécessité d'un déclassement du moteur supérieur à 15%, contacter notre Service Technique.

M7 - FUNZIONAMENTO A 60 Hz

I motori della serie BN possono essere normalmente utilizzati anche su reti a 60 Hz.
Ad esclusione dei motori autofrenanti in c.c., tipo BN_FD, nella targa dei motori, oltre alle tensioni a 50 Hz, sono riportati i valori corrispondenti al funzionamento a 460 V - 60Hz, ed il relativo campo di tensione 440-480V.

M7 - 60 Hz OPERATION

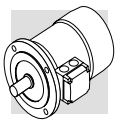
BN motors may also operate with 60 Hz power mains.
Except for DC brake motors type BN_FD, motor name plate reports 50 Hz voltage ratings, as well as the values for operation at 460 V - 60Hz and the corresponding voltage range 440-480V.

M7 - BETRIEB BEI A 60 Hz

Die Motoren der Serie BN können normalerweise auch in Stromnetzen mit 60 Hz Frequenz eingesetzt werden.
Mit Ausnahme der Bremsmotoren mit Gleichstromes vom Typ BN_FD, werden auf dem Typenschild der Motoren über die Angabe der Spannungen bei 50 Hz auch die Werte angegeben, die einem Betrieb bei 460 V - 60Hz entsprechen. Darüber hinaus kann man diesem Schild den entsprechenden Spannungsbereich 440-480V entnehmen.

M7 - FONCTIONNEMENT A 60 Hz

Les moteurs de la série BN peuvent aussi être normalement utilisés sur des réseaux à 60 Hz.
A l'exception des moteurs frein en c.c., type BN_FD, sur la plaque signalétique des moteurs, outre la tension à 50 Hz, sont indiqués les valeurs correspondant au fonctionnement à 460 V - 60Hz ainsi que la plage de tension relative 440-480V.



In corrispondenza dell' alimentazione 460V-60 Hz la targa del motore riporta valori di potenza aumentata di circa il 20% (non applicabile ai motori autofrenanti con freno in c.c., tipo BN_FD). La potenza nominale di targa, a 60 Hz, è quella riportata nella tabella (08) seguente:

For 460V-60 Hz power supply, the power ratings reported in the motor name plate are about 20% higher (does not apply to DC brake motors type BN_FD). Name plate rated power for operation with 60 Hz power mains is as reported in the table below (08):

Bei einer Spannungsversorgung mit 460V-60 Hz werden auf dem Typenschild etwa 20% höhere Leistungswerte angegeben (gilt nicht für die Bremsmotoren mit Gleichstrombremse vom Typ BN_FD). Der nachstehenden Tabelle (08) können Sie die auf dem Typenschild angegebene Nennleistung bei 60 Hz entnehmen:

En face de l'alimentation 460V-60 Hz la plaque signalétique du moteur indiquent les valeurs de puissance majorée d'environ 20% (non applicable aux moteurs frein avec frein en c.c., type BN_FD). La puissance nominale indiquée sur la plaque, à 60 Hz, est celle figurant dans le tableau (08) suivant :

(08)

	Pn [kW]

Per i motori a doppia polarità con frequenza di alimentazione 60Hz l'incremento di potenza previsto, rispetto a quanto riportato nelle tabelle dati tecnici a 50 Hz, è circa del 15%.
I motori ad una velocità con avvolgimento standard, se utilizzati su reti a 60 Hz e tensioni come riportato in tabella (09), presentano variazioni delle grandezze principali come nel seguito descritto:

For switch-pole motors operating with 60 Hz input frequency, the power increase factor over 50 Hz ratings is in the order of 15%.
Key parameter variations for single-pole motors with standard winding operating with 60 Hz power mains at the voltage ratings reported in the table (09) are reported below (variations expressed as percentages):

Für die polumschaltbaren Motoren mit einer Spannungsversorgung von 60 Hz beträgt die Leistungserhöhung im Vergleich zu den Angaben in der Tabelle der sich auf 50 Hz beziehenden technischen Daten ungefähr 15%.
Für die einpoligen Motoren mit Standardwicklung die in Versorgungsnetzen mit 60 Hz und mit Spannungen gemäß Tabelle (09) eingesetzt werden, gelten die folgenden Werte:

Pour les moteurs à double polarité avec fréquence d'alimentation 60 Hz l'augmentation de puissance prévue, par rapport aux indications des tableaux des caractéristiques techniques à 50 Hz, est d'environ 15%.
Les moteurs à une vitesse avec bobinage standard, lorsqu'ils sont utilisés sur des réseaux à 60 Hz et des tensions comme indiqué dans le tableau (09), présentent des variations des valeurs principales en pourcentage comme indiqué ci-dessous :

(09)

50 Hz	**60 Hz**			
V	**V**	**Pn**	**Mn, Ma/Mn**	**n [min^{-1}]**
230/400 Δ /Y	220 - 240 Δ 380 - 415 Y	1	0.83	1.2
400/690 V Δ /Y	380 - 415 Δ			
230/400 V Δ /Y	265 - 280 Δ 440 - 480 Y	1.15	1	1.2
400/690 V Δ /Y	440 - 480 Δ			
230/400 V Δ /Y	265 - 280 440 - 480 Y	1.15	1	1.2
400/690 V Δ /Y	440 - 480 Δ			

I freni, se presenti, dovranno sempre essere alimentati come riportato in targa.

Brakes, if fitted, must always be supplied as specified on the name plate.

Die Bremsen, falls vorhanden, müssen immer wie gezeicht auf dem Typenschild versorgt werden.

Si présents, les freins doivent toujours être alimentés indiquée sur la plaque signalétique.

PN

L'opzione consente di avere sulla targa del motore il valore di potenza normalizzata a 50 Hz, anche quando è specificata l'alimentazione a 60 Hz.

With this option, motor name plate includes 50 Hz normalized power information even when motor is designated for operation with 60 Hz power mains.

Diese Option ermöglicht es auf dem Typenschild des Motors den Wert der auf 50 Hz genormten Leistung angeben zu können, auch wenn eine Spannungsversorgung bei 60 Hz erfolgt.

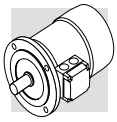
L'option permet d'avoir sur la plaque signalétique du moteur la valeur de puissance normalisée à 50 Hz, même lorsque l'alimentation à 60 Hz est spécifiée.

Per alimentazioni a 60 Hz con le tensioni 230/460V e 575V l'opzione PN viene applicata di default.

For 60 Hz supplies along with voltages 230/460V and 575V the PN option is applied by default.

Die Option PN ist immer dabei mit 60 Hz und Spannungsversorgung 230/460V und 575V 60 Hz.

Pour alimentations à 60 Hz avec tensions 230/460V et 575V l'option PN est appliqué de default.



M7.1 - MOTORI PER USA E CANADA

M7.1 - MOTORS FOR USA AND CANADA

M7.1 - MOTOREN FÜR DIE USA UND KANADA

M7.1 - MOTEURS POUR ETATS-UNIS ET CANADA

CUS

I motori da BN 56 a BN 200 sono disponibili in esecuzione NEMA Design C (per le caratteristiche elettriche), certificata in conformità alle norme CSA (Canadian Standard) C22.2 N° 100 e UL (Underwriters Laboratory) UL 1004 con targhetta riportante il marchio:

BN motor's sizes 56 through 200, are available in NEMA Design C configuration (concerning electrical characteristics), certified to CSA (Canadian Standard) C22.2 No. 100 and UL (Underwriters Laboratory) UL 1004. Through the option CUS the name plate is " cCSAus" marked:

Die Motoren BN 56...BN 200 sind in der Ausführung NEMA, Design C (aufgrund der elektrischen Eigenschaften), den Normen CSA (Canadian Standard) C22.2 Nr. 100 und UL (Underwriters Laboratory) UL 1004 gemäß zertifiziert und mit einem Typenschild mit:

Les moteurs BN 56...BN 200 sont disponibles en exécution NEMA Design C (pour les caractéristiques électriques), certifiée conforme aux normes CSA (Canadian Standard) C22.2 N° 100 et UL (Underwriters Laboratory) UL 1004 avec plaque signalétique indiquant la marque :

C US

(tensione ≤ 600V).

(voltage ≤ 600V)

Zeichen (Spannung ≤ 600V) versehen.

(tension ≤ 600V).

Le tensioni delle reti di distribuzione americane e le corrispondenti tensioni nominali da specificare per il motore sono indicate nella tabella seguente:

US power mains voltages and the corresponding rated voltages to be specified for the motor are indicated in the following table:

Die Spannungen der amerikanischen Verteilernetze und die entsprechenden Nennspannungen, die bei der Bestellung der Motore angegeben werden müssen, können der folgenden Tabelle entnommen werden:

Les tensions des réseaux de distribution américains ainsi que les tensions nominales à spécifier pour le moteur sont indiquées dans le tableau suivant :

(10)

Frequenza *Frequency* Frequenz *Fréquence*	Tensione di rete *Mains voltage* Netzspannung *Tension de réseau*	Tensione nominale motore *Motor rated voltage* Nennspannung des Motors *Tension nominale moteur*
60 Hz	208 V	**200 V**
	240 V	**230 V**
	480 V	**460 V**
	600 V	**575 V**

I motori con tensione nominale 230/460V 60Hz sono previsti di serie con collegamento YY/Y e morsettiera a 9 terminali.
Per i motori autofrenanti con freno in c.c. tipo BN_FD l'alimentazione del raddrizzatore è da morsettiera motore con tensione 230V a.c. monofase.
Per i motori autofrenanti **l'alimentazione del freno** è così predisposta:

Motors with rated voltage 230/460V 60Hz are supplied with YY/Y connection and 9-stud terminal box from standard.
For DC brake motors type BN_FD, the rectifier is connected to a single-phase 230 VAC supply voltage in the motor terminal box.
***Brake power supply** for brake motors is as follows:*

Die Motoren mit einer Nennspannung von 230/460V 60 Hz sind serienmäßig mit einer Verbindung YY/Y und einer 9-Pin-Klemmenleiste ausgestattet. Für Bremsmotoren mit Gleichstrombremse vom Typ BN_FD erfolgt die Versorgung des Gleichrichters über den Motorklemmenkasten mit einer Spannung von 230V (einphasiger Wechselstrom). Bei Bremsmotoren stellt sich die **Versorgung der Bremse** wie folgt dar:

*Les moteurs avec tension nominale 230/460V 60Hz sont prévus de série avec raccordement YY/Y et boîte à bornes à 9 bornes.Pour les moteurs frein avec frein en c.c. type BN_FD , l'alimentation du redresseur provient de la boîte à bornes moteur avec une tension 230V c.a. monophasée. Pour les moteurs frein **l'alimentation du frein** est la suivante :*

(11)

BN_FD		**BN_FA ; BN_BA**	Specificare: *Power supply:* Bitte angeben: *Spécifier* :
Da morsettiera motore *Connected to terminal box* Vom Motorklemmenkasten *Depuis boîte à bornes moteur* 1~ 230 V a.c.		Alimentazione separata *Separate power supply* *Fremdversorgung* *Alimentation séparée* 230 V Δ - 60 Hz	**230SA**
		Alimentazione separata *Separate power supply* Fremdversorgung *Alimentation séparée* 460 V Y - 60 Hz	**460SA**

M8 - ALIMENTAZIONE DA INVERTER

I motori elettrici della serie BN possono essere utilizzati con alimentazione da inverter PWM e tensione nominale all'ingresso del convertitore fino a 500 V.
Il sistema isolante adottato sui motori di serie prevede l'isolamento di fase con separatori, l'utilizzo di filo smaltato in grado 2 e resine d'impregnazione in classe H (limite di tenuta all'impulso di tensione 1600V picco-picco e fronte di salita t_s > 0.1 µs ai morsetti motore).
Le caratteristiche tipiche coppia/velocità in servizio S1 per motore con frequenza base f_b = 50 Hz sono riportate nella tabella seguente.
Per frequenze di funzionamento inferiori a circa 30 Hz, a causa della diminuzione della ventilazione, i motori standard autoventilati (IC 411) devono essere opportunamente declassati in coppia o, in alternativa, devono essere provvisti di ventilatore con alimentazione separata (vedi par. M12).
Per frequenze maggiori alla frequenza base, raggiunto il valore massimo di tensione di uscita dell'inverter, il motore lavora in un campo di funzionamento a potenza costante, con coppia all'albero che si riduce ca. con il rapporto (f/f_b).
Poiché la coppia massima del motore decresce ca. con $(f/f_b)^2$, il margine di sovraccarico ammesso dovrà essere progressivamente ridotto.

M8 - INVERTER CONTROL

The BN type electric motors are suitable for PWM inverter control with rated voltage at transformer input up to 500 V.
The insulating system adopted on standard motors uses phase insulation with separators, grade 2 enamelled wire and impregnation resins in class H (maximum voltage pulse 1600 V peak-to-peak and rise edge t_s > 0.1 µs at motor terminals).
Typical torque/speed characteristics for S1 duty for motors operating with basic frequency f_b= 50 Hz is are reported in the table below.
Operating at the frequencies below 30 Hz impair ventilation efficiency, standard motors with incorporated fan (IC 411) require either a corresponding torque reduction or, alternately, a fan with separate power supply. (See par M12)
For frequencies greater than basic frequency, once inverter maximum output voltage has been reached, the motor will be working in a steady power operation range, with shaft torque decreasing approximately with ratio (f/f_b).
As motor maximum torque decreases approximately with $(f/f_b)^2$, the permitted overload reserve will have to be reduced gradually.

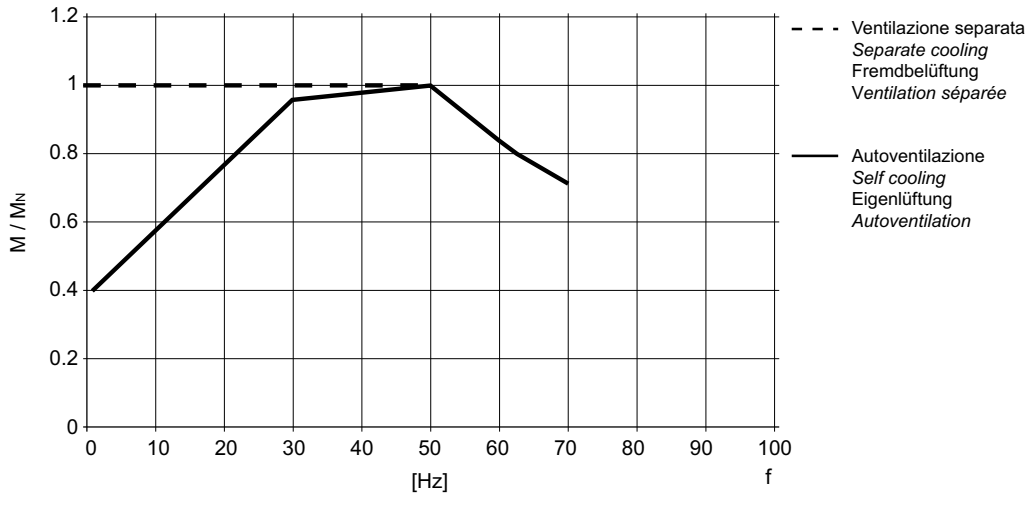
M8 - FREQUENZUMRICHTER-BETRIEB

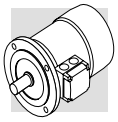
Die Elektromotoren der Serie BN können mit einem Frequenzumrichter und einer Nennspannung am Eingang des Umrichters bis zu 500 V versorgt werden.
Die Motoren haben eine Phasentrennung über Wicklungstrenner, Emaildraht der Klasse 2 mit Imprägnierharzen der Klasse H vor (Widerstandsgrenze gegen einen Spannungsimpuls von 1600 V und Anstiegsrampe t_s > 0.1 µs an den Motorklemmen).
Die typischen Merkmale Drehmoment/Drehzahl in der Betriebsart S1 für Motoren mit einer Eckfrequenz von f_b= 50 Hz werden in der nachstehenden Tabelle angegeben. Bei Frequenzen von unter 30 Hz liegenden Betriebsfrequenzen müssen die eigenbelüfteten Standardmotoren (IC 411) aufgrund ihrer geringeren Kühlwirkung in ihrem Drehmoment zurückgestuft oder, alternativ, mit einem Fremdlüfter ausgestattet werden (siehe Par. M12).
Wenn der Motor oberhalb der Eckfrequenz betrieben wird, arbeitet er im Feldschwächebereich. In diesem Bereich konstanter Leistung fällt das Drehmoment des Motors ungefähr um das Verhältnis (f/f_b) ab. Da die maximale Motordrehzahl sich mit ungefähr $(f/_{fb})^2$ verringert, muss die zulässige Belastungsgrenze in progressiv reduziert werden.

M8 - ALIMENTATION PAR VARIATEUR

Les moteurs électriques de la série BN peuvent être utilisés avec alimentation par variateur PWM, et tension nominale en entrée du convertisseur jusqu'à 500V. Le système isolant adopté sur les moteurs de série prévoit l'isolation de phase avec séparateurs, l'utilisation de fil émaillé niveau 2 et résines d'imprégnation de classe H (limite de maintien à l'impulsion de tension 1600V pic-pic et front de montée t_s > 0.1µs aux bornes moteur).
Les caractéristiques typiques couple/vitesse en service S1 pour moteur avec fréquence de base f_b = 50 Hz sont indiquées dans le tableau suivant. Pour des fréquences de fonctionnement inférieures à environ 30 Hz, à cause de la diminution de la ventilation, les moteurs standards autoventilés (IC411) doivent être opportunément déclassés au niveau du couple ou, en alternative, doivent être équipés de ventilateur avec alimentation séparée (voir paragraphe M12).
Pour des fréquences supérieures à la fréquence de base, une fois la valeur maximale de tension de sortie du variateur atteinte, le moteur fonctionne dans une plage de fonctionnement à puissance constante, avec un couple à l'arbre qui se réduit approximativement dans le rapport ($f/_{fb}$). Etant donné que le couple maximum du moteur diminue approximativement en relation avec $(f/_{fb})^2$, la marge de surcharge admise devra être progressivement réduite.

(12)





Per funzionamento oltre la frequenza nominale, la velocità limite meccanica dei motori è riportata nella tabella qui di seguito:

The following table reports the mechanical speed limit for motors operating above rated frequency:

Für Anwendungen, bei denen der Motor oberhalb der Eckfrequenz betrieben wird, finden sie die mechanische Drehzahlgrenzen in der folgenden Tabelle:

En cas de fonctionnement au-delà de la fréquence nominale, la vitesse limite mécanique des moteurs est indiquée dans le tableau suivant :

(13)

	n [min^{-1}]		
	2P	**4P**	**6P/8P**
BN 56...BN 100	5200	4000	3000
BN 112	5200	4000	3000
BN 132...BN 160MR	4500	4000	3000
BN 160M...BN 180M	4500	4000	3000
BN 180L...BN 200L	4500	3600	3000

A velocità superiori alla nominale i motori presentano maggiori vibrazioni meccaniche e rumorosità di ventilazione; è consigliabile, per queste applicazioni, un bilanciamento del rotore in grado R - opzione **RV** - ed eventualmente il ventilatore con alimentazione separata - opzioni **U1** o **U2**.
Sia il servoventilatore, sia il freno elettromagnetico, devono sempre essere alimentati direttamente dalla rete.

*Motors operating above rated speed show an increased tendency for mechanical vibration and fan noise. When this is the case, rotor balancing in grade R - option **RV** - and possibly a fan with separate power supply - options **U1** or **U2** - should be specified.*
Both servo-fan and electromagnetic brake require direct connection to mains power supply.

Bei Drehzahlen oberhalb der Nenndrehzahlen weisen die Motoren stärkere mechanische Schwingungen und Llüftungergeräusche auf: In diesen Fällen wird das Auswuchten des Rotors im Grad R – Option **RV** – und eventuell die Installation eines Fremdlüfters– Option **U1** oder **U2** - empfohlen. Sowohl der Fremdlüfter als auch die elektromagnetische Bremse müssen bei Frequenzumrichterbetrieb auf Grund der abfallenden Versorgungsspannung immer direkt über das Stromnetz versorgt werden.

*A des vitesses supérieures à la vitesse nominale, les moteurs présentent plus de vibrations mécaniques et de bruit de ventilation ; pour ces applications, il est conseillé d'effectuer un équilibrage du rotor en niveau R - option **RV** - et de monter éventuellement un ventilateur avec alimentation séparée – options **U1** ou **U2**.*
Le servoventilateur ainsi que le frein électromagnétique doivent toujours être alimentés directement par le réseau.

M9 - TIPO DI SERVIZIO

Se non indicato diversamente, la potenza dei motori riportata a catalogo si riferisce al servizio continuo S1.
Per i motori utilizzati in condizioni diverse da S1 sarà necessario identificare il tipo di servizio previsto con riferimento alle Norme CEI EN 60034-1.
In particolare per servizi S2 ed S3 è possibile ottenere una maggiorazione della potenza rispetto a quella prevista per il servizio continuo secondo quanto indicato nella tabella che segue, valida per i motori a singola polarità.
Per le maggiorazioni applicabili a motori a doppia polarità consultare preferibilmente il Servizio Tecnico Bonfiglioli.

M9 - TYPE OF DUTY

Unless otherwise specified, catalogue motor power refers to continuous duty S1.
Any operating conditions other than S1 duty must be identified in accordance with duty cycle definitions laid down in standards CEI EN 60034-1.
For duty cycles S2 and S3, the power increase co-efficient reported in the following table may be used. Please note that the table provided below applies to single-speed motors.
Please contact Bonfiglioli Engineering for the power increase coefficients applicable to switch-pole motors.

M9 - BETRIEBSARTEN

Sofern nicht anderweitig angegeben, beziehen sich die im Katalog angegebene Motorleistungen auf den Dauerbetrieb S1. Bei Motoren, die unter Bedingungen eingesetzt werden, die nicht mit S1 übereinstimmen, muss die entsprechende Betriebsart unter Bezugnahme auf die Normen CEI EN 60034-1 festgelegt werden. Insbesondere kann man, für die Betriebsarten S2 und S3, durch Anwendung der in der nachstehenden Tabelle angeführten Koeffizienten der für den Dauerbetrieb vorgesehenen Leistung gegenüber eine Leistungssteigerung erzielen. Diese Tabelle gilt für einpolige Motoren. Für die polumschaltbaren Motoren sollte man sich im Hinblick auf den Leistungssteigerung, mit unserem Technischen Kundendienst in Verbindung setzen.

M9 - TYPE DE SERVICE

Sauf indication contraire, la puissance des moteurs indiquée dans le catalogue se réfère au service continu type S1.
Pour les moteurs utilisés dans des conditions différentes de S1, il est nécessaire d'identifier le type de service en se référant aux Normes CEI EN 60034-1.
Plus particulièrement, pour les types de service S2 et S3 il est possible d'obtenir une majoration de la puissance par rapport à celle prévue pour le service continu, en appliquant les coefficients indiqués dans le tableau suivant, valable pour les moteurs à simple polarité. En ce qui concerne les majorations applicables aux moteurs à double polarité, il est préférable de contacter le Service Technique Bonfiglioli.

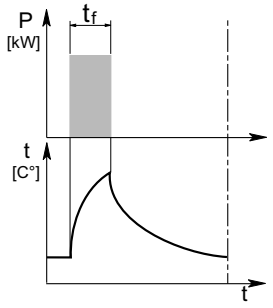
S2

Funzionamento a carico costante per un periodo di tempo limitato, inferiore a quello richiesto per raggiungere l'equilibrio termico, seguito da un periodo di riposo di durata sufficiente a ristabilire nel motore la temperatura ambiente.

Operation under steady loading for a limited period of time (less than the time taken to achieve thermal balance), followed by a period of time at rest long enough for engine to cool down to ambient temperature.

Betrieb mit konstanter Last für eine begrenzte Dauer, die unter der Zeit liegt, die für das Erreichen des thermischen Gleichgewichts erforderlich ist, gefolgt von einer Aussetzzeit mit einer Dauer, die für das erneute Erreichen der Umgebungstemperatur im Motor erforderlich ist.

Fonctionnement à charge constante pendant une période de temps limitée, inférieure à celle nécessaire pour atteindre l'équilibre thermique, suivie par une période de repos de durée suffisante pour rétablir la température ambiante dans le moteur.



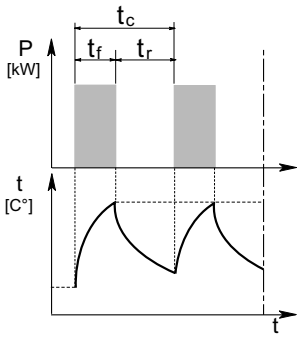
S3

Sequenza di cicli di funzionamento identici, ciascuno comprendente un periodo di funzionamento a carico costante ed un periodo di riposo.
In questo tipo di servizio la corrente d'avviamento non influenza la sovratemperatura in modo significativo.

A sequence of identical operation cycles, each including operation under steady loading followed by some time at rest. In this type of duty, starting current has no significant effect on overtemperature.

Betriebsweise mit identischen Betriebszyklen, von denen jeder Zyklus eine Betriebsdauer mit konstanter Last und eine Aussetzzeit einschliesst. Bei dieser Betriebsart beeinflußt der Anlaufstrom die Übertemperatur in keinerlei ausschlaggebender Weise.

Séquence de cycles de fonctionnement identiques, comprenant chacun une période de fonctionnement à charge constante et une période de repos. Dans ce type de service, le courant de démarrage n'influence pas l'excès de température de façon significative.



(14)

Tipo di Servizio *Type of duty* Betriebsart *Type de service*		Potenza ammissibile in p.u. della potenza in S1 *Permitted power in p.u. of S1 power* Zulässige Leistung in % der Leistung bei S1 *Puissance admissible en p.u. de la puissance en S1*

$$I = \frac{t_f}{t_f + t_r} 100$$

t_f = tempo di funzionamento sotto carico

t_r = tempo di riposo

La durata del ciclo dovrà essere ≤ 10 min. Per durate superiori interpellarci.

t_f = *work time under constant load*

t_r = *rest time*

Cycle duration must be up to 10 min. Please contact us when cycle duration exceeds this limit.

t_f = Betriebszeit mit konstanter Last

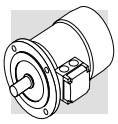
t_r = Aussetzzeit

Die Zyklusdauer muss ≤ 10 min. betragen. Falls der Zyklus länger sein sollte, setzen Sie sich bitte mit unserem Kundendienst in Verbindung.

t_f = *temps de fonctionnement à charge constante*

t_r = *temps de repos*

La durée du cycle devra être ≤ 10 min. Pour des durées supérieures, nous contacter.



M10 - MORSETTIERA MOTORE

La morsettiera principale è a 6 morsetti per collegamento con capicorda (esecuzione a 9 morsetti per tensioni americane "dual voltage" - vedi par. M7.1).
All'interno della scatola coprimorsetti è previsto il morsetto di terra per il collegamento del conduttore di protezione.
Le dimensioni dei terminali sono riportati nella tabella (15).
Per l'alimentazione del freno vedi par. M25 (freno FD), M26 + M27 (freno FA e BA).
Nei motori in forma costruttiva IM B3 la scatola coprimorsetti è posta in alto (posizione opposta ai piedi).
Eseguire i collegamenti elettrici secondo gli schemi riportati all'interno della scatola coprimorsettiera o nei manuali d'uso.

M10 - TERMINAL BOX

The main terminal box has 6 terminals for connection to lead-in wires (9-terminal version is supplied for "dual voltage" US voltage ratings - see M7.1)
The ground terminal for earth lead connection is housed in the terminal box.
Terminal sizes are listed in the table (15).
For brake power supply, please read par. M25 (brake FD), M26 + M27 (brake FA and BA).
In motor design IM B3, the terminal box is top mounted (side opposite to feet).
Please refer to the wiring diagrams reported inside the terminal box, or in the operating instructions, for correct wiring.

M10 - MOTORKLEMMENKASTEN

Der Klemmenkasten hat ein Klemmbrett mit 6 Klemmen für einen Anschluss über Kabelschuhe (für die amerikanischen Spannungswerte "dual voltage" sind 9 Klemmen vorgesehen – siehe M7.1. Im Inneren des Klemmenkastens ist ein Erdungsanschluß für den Anschluss des Schutzleiters vorgesehen. Die Abmessungen der Anschlüsse werden in der Tabelle (15) angegeben. Für Informationen über die Bremsversorgung verweisen wir an dieser Stelle auf den Par. M25 (Bremstyp FD), M26 + M27 (Bremstyp FA und BA). Bei Motoren in der Bauform IM B3 ist der Klemmenkasten oben angeordnet (den Füßen entgegengesetzt).
Die elektrischen Anschlüsse müssen entsprechend den Schaltplänen, die sich im Inneren des Klemmenkästen befinden oder in den Betriebsanleitungen zu finden sind, vorgenommen werden.

M10 - BORNIER MOTEUR

Le bornier principal est de type à 6 bornes pour raccordement avec cosses (exécution à 9 bornes pour les tensions américaines "dual voltage" – voir M7.1).
A l'intérieur du couvercle du bornier se trouve la borne de terre pour le raccordement du conducteur de protection.
Les dimensions des bornes sont indiquées dans le tableau (15). Pour l'alimentation du frein, voir par. M25 (frein FD), M26 + M27 (frein FA et BA).
Sur les moteurs de forme de construction IM B3 la boîte à bornes est située en haut (à l'opposé des pieds).
Effectuer les branchements électriques selon les schémas indiqués à l'intérieur du couvercle de la boîte à bornes ou dans les manuels d'instructions.

M10.1 - INGRESSO CAVI

Nell'esecuzione standard l'ingresso dei cavi di alimentazione è previsto per pressacavo metrici in accordo alla Norma CEI EN 50262. Dimensioni e disposizioni come indicato nelle tabelle che seguono.

M10.1 - CABLE GLAND HOLES

Standard cable gland holes accommodate metric-size cable glands in accordance with standard CEI EN 50262. Dimensions and locations are as shown in the following tables.

M10.1 - KABELDURCHFÜHRUNG

In der Standardversion ist die Ein- bzw. Durchführung der Kabel in Übereinstimmung mit der Norm CEI EN 50262 über metrische Kabelführungen vorgesehen. Maße und Anordnung werden in den folgenden Tabellen angegeben.

M10.1 - ENTREE CABLES

Dans l'exécution standard, l'entrée des câbles d'alimentation est prévue pour des serre-câbles métriques, en accord avec la Norme CEI EN 50262. Dimensions et dispositions comme indiqué dans les tab. suivantes.

M11 - FORME COSTRUTTIVE

I motori sono previsti nelle forme costruttive IM B3, IM B5, IM B14 e derivate in accordo alla Norma CEI EN 60034-7, come indicato nella tabella seguente.

M11 - DESIGN VERSIONS

Motors are available in the design versions IM B3, IM B5, IM B14 and derived versions in accordance with standard CEI EN 60034-7, as outlined in the table below.

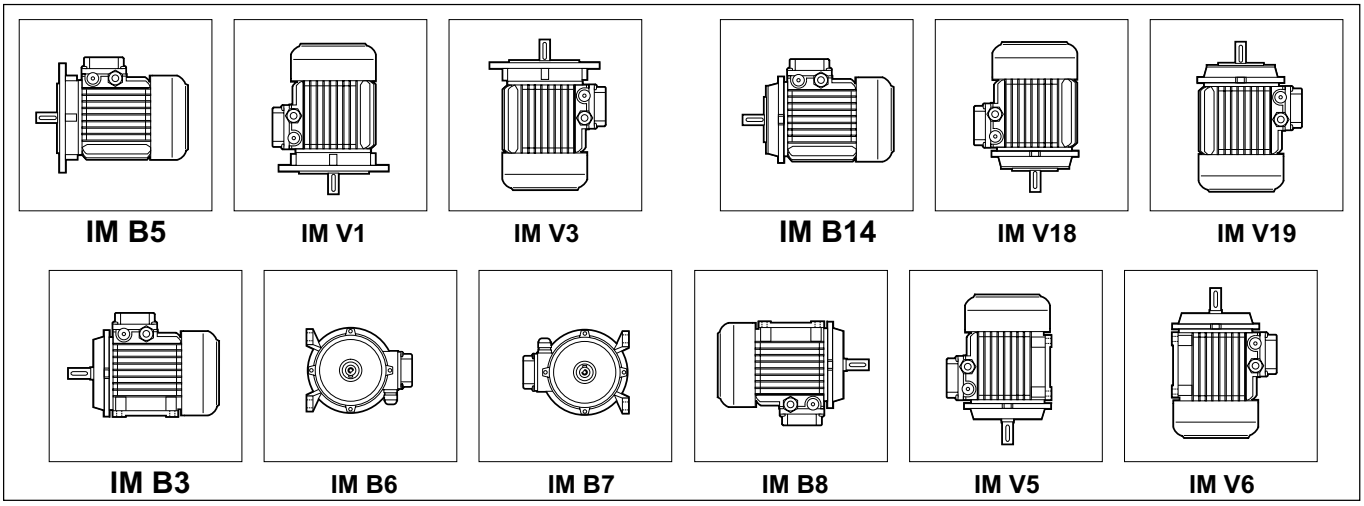
M11 - BAUFORMEN

Die Motoren sind in den Bauformen IM B3, IM B5, IM B14 und abgeleitete Versionen erhältlich und wurden in Übereinstimmung mit der Norm CEI EN 60034-7, entsprechend den Angaben in der nachstehenden Tabelle, realisiert.

M11 - FORMES DE CONSTRUCTION

Les moteurs sont disponibles dans les formes de construction IM B3, IM B5, IM B14 et dérivées, en accord avec la Norme CEI EN 60034-7, comme indiqué dans le tableau suivant.

(18)



I motori, targati esclusivamente nella forma costruttiva base, possono essere installati anche nelle forme costruttive derivate, come illustrato nella tabella seguente:

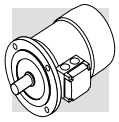
Motors in the derived design versions may also be installed as outlined in the table below. however, note that motor name plate will report the corresponding basic design version:

Die Motoren werden auf dem Typenschild in der Einbaulage B3 angegeben, sie können aber auch in den anderen, in der nachfolgenden Tabelle angegebenen Bauformen montiert werden:

Les moteurs, marqués exclusivement dans la forme de construction de base, peuvent aussi être installés dans les formes de construction dérivées, comme indiqué dans le tableau suivant :

(19)

Forma costruttiva base ***Basic design version*** **Gundbauform** ***Forme de construction de base***	**Forma costruttiva derivata / *Derived design version* Andere Einbaulagen / Forme de construction dérivée**				
IM B3	IM B6	IM B7	IM B8	IM V5	IM V6
IM B5	IM V1	IM V3			
IM B14	IM V18	IM V19			



Nelle installazioni con l'albero rivolto verso il basso è consigliabile specificare l'opzione **RC** - tettuccio parapioggia**,** vedi par. M23 in particolar modo nel caso di motore autofrenante.
I motori in forma flangiata possono essere forniti con dimensioni di accoppiamento ridotte, corrispondenti alle forme costruttive B5R o B14R, con dimensioni dettagliate nella tabella seguente:

*If motor is to be installed with the shaft pointing downwards, the rain canopy option **RC** – see par. M23 is recommended, especially where a brake motor is used.*
Flange output motors are also available with reduced coupling dimensions corresponding to design versions B5R or B14R. Dimensions are indicated in the table below:

Bei Anwendungen mit senkrecht unten zeigender Welle, wird empfohlen, den Motor mit der Option **RC** – Schutzdach, siehe M23 zu bestellen, insbesondere dann, wenn es sich um einen Bremsmotor handelt. Die Motoren mit Flansch können mit reduzierten Wellen- und Flanschmaßen geliefert werden, die den Bauformen B5R oder B14R entsprechen und folgende Maße aufweisen:

*En ce qui concerne les installations avec arbre dirigé vers le bas, il est conseillé de spécifier l'option **RC** – capot antipluie, voir par. M23 plus particulièrement en cas de moteur frein. Les moteurs avec bride peuvent être fournis avec des dimensions d'accouplement réduites, correspondant aux formes de construction B5R ou B14R, avec les dimensions détaillées dans le tableau suivant :*

(2)Bride avec orifices filetés

M12 - VENTILAZIONE

I motori sono raffreddati mediante ventilazione esterna (IC 411 secondo CEI EN 60034-6) e sono provvisti di ventola radiale in plastica, funzionante in entrambi i versi di rotazione.
L'installazione dovrà assicurare una distanza minima della calotta copriventola dalla parete più vicina, in modo da non creare impedimento alla circolazione dell'aria, oltre che permettere l'esecuzione della manutenzione ordinaria del motore e, se presente, del freno.
Su richiesta, a partire dalla grandezza BN 71, i motori possono essere forniti con ventilazione forzata ad alimentazione indipendente. Il raffreddamento è realizzato per mezzo di un ventilatore assiale con alimentazione indipendente, montato sulla calotta copriventola (metodo di raffreddamento IC 416).

M12 - VENTILATION

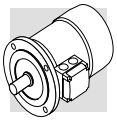
Motors are cooled by external ventilation systems (IC 411 in accordance with CEI EN 60034-6) and are equipped with a plastic radial fan running in both directions of rotation.
Installation must take into account a minimum distance of the fan cover from the nearest wall so as to ensure unobstructed air circulation. This also facilitates routine maintenance operations for motor and brake (if fitted).
At request, motor frame sizes BN 71 and larger may be equipped with forced ventilation with independent power supply. Motor is cooled by an axial ventilator mounted on the fan cover using an independent power supply (cooling method IC 416).

M12 - KÜHLUNG

Die Motoren werden mittels Eigenbelüftung gekühlt (IC 411 gemäß CEI EN 60034-6) und sind mit einem Radiallüfterrad aus Kunststoff ausgestattet, das in beide Richtungen drehen kann. Bei der Montage des Motors muss darauf geachtet werden, das zwischen Lüfterhaube und dem nächsten Bauteil eine Mindestabstand einzuhalten, damit die Luftzirkulation nicht beeinträchtigt werden kann. Dieser Abstand ist ebenso für die regelmäßige Instandhaltung des Motors und, falls vorhanden, der Bremse erforderlich. Ab der Baugröße BN 71 können die Motoren auf Anfrage mit einem unabhängig gespeisten Fremdlüfter geliefert werden. Die Kühlung erfolgt hier durch einen Axialventilator, der an Stelle der Standardlüfterhaube (Kühlmethode IC 416) montiert wird.

M12 - VENTILATION

Les moteurs sont refroidis par ventilation externe (IC 411 selon CEI EN 60034-6) et sont équipés de ventilateur radial en plastique fonctionnant dans les deux sens de rotation.
L'installation doit garantir une distance minimum du capot cache-ventilateur par rapport au mur le plus proche de façon à ne pas créer d'empêchement à la circulation de l'air ainsi que pour permettre les interventions d'entretien ordinaire du moteur et, si présent, du frein. Sur demande, à partir de la taille BN 71, les moteurs peuvent être fournis avec ventilation forcée à alimentation indépendante. Le refroidissement est réalisé au moyen d'un ventilateur axial avec alimentation indépendante monté sur le capot cache-ventilateur (méthode de refroidissement IC 416).



Questa esecuzione è utilizzata in caso di alimentazione del motore tramite inverter allo scopo di estendere il campo di funzionamento a coppia costante anche a bassa velocità, o quando per lo stesso sono richieste elevate frequenze di avviamento.
Da questa opzione sono esclusi i motori autofrenanti tipo BN_BA e motori con doppia sporgenza d'albero (opzione PS).

This design is adopted on inverter-controlled motors in order to extend torque-control operating range to include low speeds, or when the motor is to perform a large number of starts per hour.
This option is not compatible with brake motors type BN_BA and motors with double-extended shaft (option PS).

Diese Ausführung sollte eingestzt werden, falls der Motor über einen Frequenzumrichterbetrieben wird, so dass der Motor bei konstantem Drehmoment auch bei niedrige Drehzahlen oder bei hohen Anlauffrequenzen. eingesetzt werden kann.
Von dieser Option ausgeschlossen sind die Bremsmotoren BN_BA und Motoren mit zweitem Wellenende (Option PS).

Cette exécution est utilisée en cas d'alimentation du moteur par variateur dans le but d'étendre aussi la plage de fonctionnement à couple constant aux faibles vitesses ou lorsque des fréquences de démarrage élevées sont nécessaire à celui-ci.
Les moteurs frein type BN_BA et les moteurs avec arbre sortant des deux côtés (option PS) sont exclus de cette option.

Δ L_2 = variazione dimensionale rispetto alla lunghezza LB del motore autofrenante corrispondente.

Δ L_1 = *dimension variation compared to length LB of the corresponding standard motor.*

Δ L_2 = *dimension variation compared to length LB of the corresponding brake motor.*

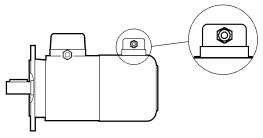
Δ L_1 = = Maßänderung gegenüber Maß LB des entsprechenden Standardmotors.

Δ L_2 = Maßänderung gegenüber Maß LB des entsprechenden Bremsmotors.

Δ L_1 = *variation de dimension par rapport à la cote LB du moteur standard correspondant.*

Δ L_2 = *variation de dimension par rapport à la cote LB du moteur frein correspondant.*

U1



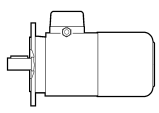
Terminali di alimentazione del ventilatore in scatola morsetti separata. Nei motori autofrenanti grandezza BN 71...BN 160MR, con variante **U1**, la leva di sblocco non è collocabile nella posizione AA (vedi par. M24.1).

Terminals of the independent fan motor are housed in a separate terminal box. The hand release cannot be located in the AA position for brake motors size BN71...BN160MR that feature the U1 type forced cooling, as described at section M24.1.

Versorgungsanschlüsse des Ventilators im Zusatzklemmenkasten. Bei den Bremsmotoren in der Baugröße BN 71...BN 160MR, mit Variante **U1** kann der Bremslüfthebel nicht in der Position AA (siehe Par. M24.1) angeordnet werden.

*Bornes d'alimentation du ventilateur dans une boîte à bornes séparée. Pour les moteurs frein taille BN 71...BN 160MR, avec variante **U1**, le levier de déblocage ne peut être installé en position AA (voir par. M24.1).*

U2



Terminali di alimentazione del ventilatore nella scatola morsettiera principale del motore.

L'opzione non è applicabile ai motori BN 160M...BN 200L.

Terminals of the fan motor are located in the main terminal box.

The U2 option does not apply to motors BN 160M…BN 200L.

Versorgungsanschlüsse des Ventilators im Hauptklemmenkasten des Motors.

Die Option kann nicht an den Motoren BN 160M…BN 200L geliefert werden.

Bornes d'alimentation du ventilateur dans la boîte à bornes principale du moteur.

L'option n'est pas applicable aux moteurs BN 160M…BN 200L.

M15 - GRADO DI PROTEZIONE | ***M15 - DEGREE OF PROTECTION*** | **M15 - SCHUTZART** | ***M15 - DEGRE DE PROTECTION***

IP...

Nella loro esecuzione standard (non autofrenante) i motori tipo BN sono caratterizzati dal grado di protezione IP55, a richiesta è disponibile la protezione aumentata IP56.
I motori autofrenanti tipo BN_FD e BN_FA sono protetti in grado IP54 e, opzionalmente, in IP55.
La tabella sottostante riassume la disponibilità dei vari gradi di protezione.
Indipendentemente dal grado di protezione specificato, per installazione all'aperto i motori devono essere protetti dall' irraggiamento diretto e, nel caso di installazione con l'albero rivolto verso il basso, è necessario specificare ulteriormente il tettuccio di protezione contro l'ingresso di acqua e di corpi solidi (opzione **RC**).

Standard BN motors (where standard means other than brake motors) are manufactured in protection class IP55. A higher protection class IP56 is available at request. Brake motors type BN_FD and BN_FA are in protection class IP54 or IP55 (at request).
Brake motors BN_BA are only available in protection class IP55. The following table provides an overview of available protection classes.
*Regardless of the protection class specified on order, motors to be installed outdoors require protection against direct sunlight and in addition – when they are to be installed with the shaft pointing downwards – a rain canopy to keep out water and solid bodies (option **RC**).*

In der Standardausführung (ohne Bremse) werden die Motoren vom Typ BN in Schutzart IP55 ausgeliefert. Auf Anfrage können sie mit einer auf IP56 erhöhten Schutzart geliefert werden. Die Bremsmotoren vom Typ BN_FD und BN_FA verfügen über die Schutzart IP54 und können Optional in IP55 geliefert werden. Die Bremsmotoren vom Typ BN_BA sind nur in der Schutzart IP55 lieferbar. In der nachstehenden Tabelle werden die jeweiligs zur Verfügung stehenden Schutzarten zusammengefasst. Unabhängig von der spezifischen Schutzart müssen die im Freien installierten Motoren vor direkten Strahlungen geschützt werden. Im Fall einer senkrechten Montage, in der die Welle nach unten gerichtet ist, sollte darüber hinaus das Schutzdach bestellt werden, das vor dem Eindringen von Wasser und festen Fremdkörpern schützt (Option **RC**).

*Dans l'exécution standard (non frein), les moteurs type BN sont caractérisés par le degré de protection IP55. Sur demande, la protection majorée IP56 est aussi disponible. Les moteurs frein type BN_FD et BN_FA sont protégés en degré IP54 et, en option, en IP55. Les moteurs frein type BN_BA sont disponibles uniquement avec degré de protection IP55. Le tableau ci-dessous résume la disponibilité des différents degrés de protection. Indépendamment du degré de protection spécifié, en cas d'installation en plein air, les moteurs doivent être protégés des rayons directs du soleil et, en cas d'installation avec arbre dirigé vers le bas, il est nécessaire de spécifier ultérieurement le capot de protection contre la pénétration de l'eau et des corps solides (option **RC**).*

M16 - CLASSE DI ISOLAMENTO ***M16 - INSULATION CLASS*** **M16 - ISOLATIONSKLASSE** ***M16 - CLASSES D'ISOLATION***

CLF

I motori di produzione Bonfiglioli impiegano, di serie, materiali isolanti (filo smaltato, isolanti, resine d'impregnazione) in classe **F**.

*Bonfiglioli motors use class **F** insulating materials (enamelled wire, insulators, impregnation resins) as compare to the standard motor.*

Die Motoren von Bonfiglioli sind serienmäßig mit Isolierstoffen (Emaildraht, Isolierstoffen, Imprägnierharzen) der Klasse **F** ausgestattet.

*De série, les moteurs fabriqués par Bonfiglioli utilisent des matériaux isolants (fil émaillé, isolants, résines d'imprégnation) en classe **F**.*

In genere, per i motori in esecuzione standard la sovratemperatura dell'avvolgimento statore è contenuta entro il limite di 80 K, corrispondente alla sovratemperatura di classe B.
L'accurata scelta dei componenti del sistema isolante consente l'impiego dei motori anche in climi tropicali ed in presenza di vibrazioni normali.

In standard motors, stator windings over temperature normally stays below the 80 K limit corresponding to class B over temperature.
A careful selection of insulating components makes the motors compatible with tropical climates and normal vibration.

Allgemein hält sich die Übertemperatur der Motoren in der Standardausführung innerhalb des Grenzwerts von 80 K, der einer Übertemperatur der Klasse B entspricht. Die sorgfältig Wahl der Komponenten des Isoliersystem gestatten den Einsatz dieser Motoren auch unter tropischen Klimabedingungen und bei Vorliegen normaler Schwingungen.

En général, pour les moteurs en exécution standard, l'échauffement de l'enroulement du stator se situe dans la limite de 80 K, correspondant à un échauffement de classe B.
Le choix soigné des composants du système d'isolation permet d'utiliser également les moteurs dans des climats tropicaux et en présence de vibrations normales.

Per applicazioni in presenza di sostanze chimiche aggressive o di elevata umidità, è consigliabile contattare il Servizio Tecnico Bonfiglioli per la selezione del prodotto più idoneo.

For applications involving the presence of aggressive chemicals or high humidity, contact Bonfiglioli Engineering for assistance with product selection.

Für den Einsatz in in der Nähe aggressiv wirkenden chemischen Substanzen oder bei hoher Luftfeuchtigkeit, wird empfohlen sich zur Wahl eines passendes Produktes mit unserem Technischen Kundendienst in Verbindung zu setzen.

Pour des applications en présence de substances chimiques agressives, ou d'humidité élevée, il est conseillé de contacter le Service Technique Bonfiglioli pour sélectionner le produit le plus adapté.

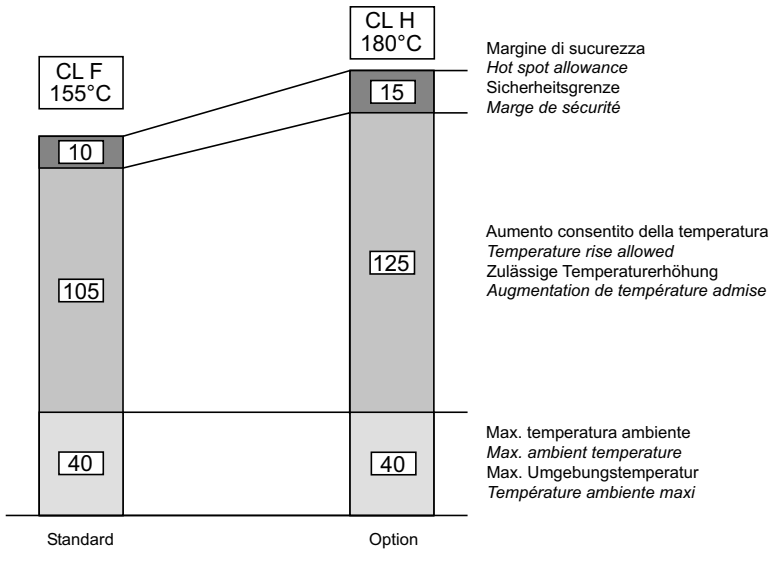
CLH

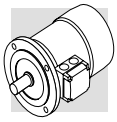
Su richiesta può venire specificata la classe di isolamento **H**.

*Motors manufactured in insulation class **H** are available at request.*

Auf Anfrage können sie auch in der Klasse **H** geliefert werden.

Sur demande, la classe d'isolation H peut être spécifiée.





M17- PROTEZIONI TERMICHE

Oltre alla protezione garantita dall'interruttore magnetotermico, i motori possono essere provvisti di sonde termiche incorporate per proteggere l'avvolgimento da eccessivo riscaldamento dovuto alla scarsa ventilazione o servizio intermittente. Una protezione aggiuntiva di questo tipo dovrebbe sempre essere specificata per i motori dotati di ventilazione separata. Le varianti a disposizione sono:

M17- THERMAL PROTECTIVE DEVICES

The standard thermal cut out fitted to motors may be supplemented by incorporating thermistors or thermostats to protect winding from overheating due to poor ventilation or intermittent duty.
Such additional protection is highly recommended for motors with separate ventilation. Available variants are as follows:

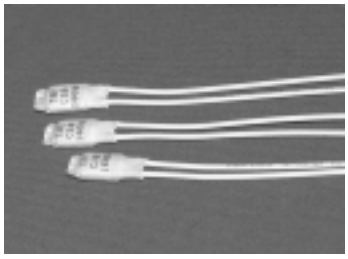
M17- THERMISCHE WICKLUNGSSCHUTZEINRICHTUNGEN

Abgesehen vom durch den Magnetwärmeschalter garantierten Schutz können die Motoren mit integrierten. Temperaturfühler ausgestattet werden, die die Wicklung vor Überhitzung aufgrund einer unzureichenden Lüftung oder eines Aussetzbetriebs sichern. Ein solcher zusätzlicher Schutz sollte bei Motoren mit Fremdlüftung immer verwendet werden. Die verfügbaren Optionen sind:

M17- PROTECTIONS THERMIQUES

Outre la protection garantie par le thermocontact moteur, les moteurs peuvent être équipés de sondes thermiques incorporées pour protéger le bobinage contre une surchauffe excessive due à une faible ventilation ou un service intermittent.
Ce type de protection supplémentaire devrait toujours être prévue pour les moteurs dotés de ventilation séparée. Les variantes à disposition sont les suivantes :

D3



n° 3 sonde bimetalliche negli avvolgimenti con temperatura 150 °C
3 Bi-metallic thermostats in the windings, 150 °C temperature
3 Bimetallfühler in den Wicklungen mit einer Ansprechtemperatur von 150 °C
n° 3 sondes bimétalliques dans les bobinages avec température de 150 °C

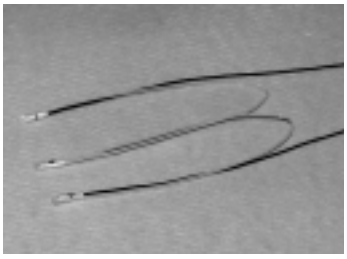
I protettori di questo tipo contengono all'interno di un involucro un disco bimetallico che, raggiunta la temperatura nominale di intervento, commuta i contatti dalla posizione di riposo.
Con la diminuzione della temperatura, il disco e i contatti riprendono automaticamente la posizione di riposo.
Normalmente si impiegano tre sonde bimetalliche in serie con contatti normalmente chiusi e terminali disponibili in una morsettiera ausiliaria.

Bimetallic thermostats consist of a bimetallic disc mounted inside a casing. Upon reaching the preset operating temperature, the disc operates the contacts causing them to disengage from the rest position.
As temperature decreases, disc and contacts return to the rest position.
Normally, three bimetallic thermostats connected in series with normally closed contacts and an auxiliary terminal board are used.

Diese Schutzeinrichtungen enthalten in einer Kaspel eine Bimetallscheibe, die bei Erreichen der Nennansprechtemperatur die Kontakte aus ihrer Ruhestellung heraus schaltet. Bei abnehmender Temperatur nehmen die Scheibe und die Kontakte automatisch wieder ihre Ruhestellung ein. Normalerweise werden diese drei Bimetallfühler bei normal geschlossenen Kontakten und auf einer Hilfsklemmenleiste verfügbaren Anschlüsse in Reihe geschaltet.

Les protecteurs de ce type contiennent, dans une enveloppe interne, un disque bimétallique qui, lorsque la température nominale d'intervention est atteinte, commute les contacts de la position de repos.
Avec la diminution de la température, le disque et les contacts reprennent automatiquement la position de repos.
Normalement, on utilise trois sondes bimétalliques en série avec contacts normalement fermés et extrémités disponibles dans une boîte à bornes auxiliaire.

E3



n° 3 termistori PTC negli avvolgimenti, con temperatura 150 °C
3 PTC thermistors in the windings, 150 °C temperature
3 PTC-Thermistoren in den Wicklungen mit einer Ansprechtemperatur 150 °C
3 thermistors PTC dans les bobinages, avec température de 150 °C

I termistori sono semiconduttori che presentano una rapida variazione di resistenza in prossimità della temperatura nominale d'intervento. In genere sono impiegati termistori a coefficiente di temperatura positivo, anche conosciuti con la sigla PTC.

Thermistors are semiconductors that exhibit a rapid resistance change when approaching a preset switch temperature. Normally, positive temperature coefficient (PTC) thermistors are used.

Bei diesen Thermistoren handelt es sich um Halbleiter, die eine schnelle Änderung des Widerstands kurz vor der Nennansprechtemperatur aufweisen. Im allgemeinen werden Thermistoren mit positivem Temperaturkoeffizienten verwendet, die auch unter der Bezeichnung PTC bekannt sind.

Les thermistors sont des semi-conducteurs qui présentent une variation rapide de résistance à proximité de la température nominale d'intervention. En général, on utilise des thermistors à coefficient de température positif, connus aussi sous le sigle PTC.

Questi sensori presentano il vantaggio di avere ingombri ridotti, un tempo di risposta molto contenuto e la totale assenza di usura. A differenza delle sonde termiche bimetalliche i termistori non possono comandare direttamente i relais e devono pertanto essere collegati ad una particolare apparecchiatura di sgancio.
I terminali di 3 PTC collegati in serie, sono disponibili in una morsettiera ausiliaria.

These sensors offer such advantages as a compact, space-efficient design, very low response time and totally wear-free operation.
Unlike bi-metallic thermostats, thermistors do not operate the relays directly and need to be connected to a special release device for this purpose.
The terminals for three PTC thermistors connected in series are available in an auxiliary terminal board.

Diese Sensoren haben den Vorteil kleiner Abmessungen, einer stark eingehaltenen Ansprechzeit und weisen keinerlei Verschleißerscheinungen auf.
Im Unterschied zu Bimetall-Temperaturfühlern können diese Thermistoren die Relais nicht direkt schalten und müssen daher an ein spezielles Auslösegerät angeschlossen werden.
Die Anschlüsse der 3 in Reihe geschalteten PTC-Thermistoren sind an einer Zusatzklemmleiste verfügbar.

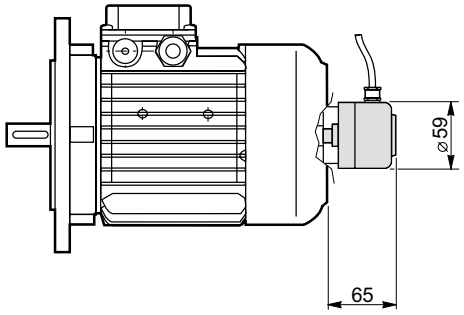
Ces capteurs présentent l'avantage d'être de dimensions réduites, leur temps de réponse est très limité et l'absence d'usure est totale.
A la différence des sondes thermiques bimétalliques, les thermistors ne peuvent pas commander directement les relais, par conséquent, ils doivent être branchés à un appareil de déclenchement particulier.
Les extrémités de 3 PTC reliés en série sont disponibles dans une boîte à bornes auxiliaire.

M18 - DISPOSITIVI DI RETROAZIONE

M18 - FEEDBACK UNITS

M18 - ENCODER / INKREMENTALGEBER

M18 - DISPOSITIFS DE RETROACTION



BN 71...BN 200

I motori possono essere dotati di tre diversi tipi di encoder, qui di seguito descritti.

Il montaggio dell'encoder esclude le esecuzioni con doppia estremità d'albero (PS) e tettuccio di protezione (RC, TC). Il dispositivo non è applicabile ai motori con freno tipo BA.

Motors may be combined with three different types of encoders to achieve feedback circuits.

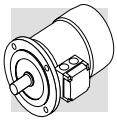
Configurations with double-extended shaft (PS) and rain canopy (RC, TC) are not compatible with encoder installation. Also not compatible are motors equipped with BA brakes.

Die Motoren mit drei unterschiedlichen Encodertypen ausgestattet werden.

Nachstehend finden Sie die entsprechenden Beschreibungen. Die Montage des Encoders schließt die Version mit zweitem Wellenende (PS) und Schutzdach (RC, TC) aus. Die Vorrichtung kann an Motoren mit Bremse vom Typ BA nicht angebaut werden.

Les moteurs peuvent être dotés de trois types de codeurs différents, décrits ci-après.

Le montage du codeur exclu les exécutions avec arbre à double extrémité (PS) et le capot de protection (RC, TC). Le dispositif n'est pas applicable aux moteurs avec frein type BA.



EN1

Encoder incrementale, V_{IN}= 5 V, uscita line-driver RS 422.

M19 - RISCALDATORI ANTICONDENSA

I motori funzionanti in ambienti molto umidi e/o in presenza di forti escursioni termiche, possono essere equipaggiati con una resistenza anticondensa.
L'alimentazione monofase è prevista da morsettiera ausiliaria posta nella scatola principale.

M19 - ANTI-CONDENSATION HEATERS

Where an application involves high humidity or extreme temperature fluctuation, motors may be equipped with an anti-condensate heater. A single-phase power supply is available in the auxiliary terminal board inside the main terminal box.

M19 - WICKLUNGSHEIZUNG

Die Motoren, die in besonders feuchten Umgebungen und/oder unter starken Temperaturschwankungen eingesetzt werden, können mit einem Heizelement als Kondenswasserschutz ausgestattet werden. Die einphasige Versorgung erfolgt über eine Zusatzklemmenleiste, die sich im Klemmenkasten befindet.

M19 - RECHAUFFEURS ANTICONDENSATION

Les moteurs fonctionnants dans des milieux très humides et/ou en présence de fortes plages thermiques peuvent être équipés d'une résistance anticondensation.
L'alimentation monophasée est prévue par l'intermédiaire d'une boîte à bornes auxiliaire située dans la boîte principale.

H1

	H1
	1~ 230V ± 10% **P [W]**

BN 90 … BN 160MR	25
BN 160M … BN 180M	50
BN 180L … BN 200L	65

Durante il funzionamento del motore la resistenza anticondensa non deve mai essere alimentata.

Always remove power supply to the anti-condensate heater before operating the motor.

Während des Motorbetriebs darf die Wicklungsheizung nie gespeist werden.

Durant le fonctionnement du moteur, la résistance anticondensation ne doit jamais être alimentée.

M20 - TROPICALIZZAZIONE

TP

Su richiesta, mediante la specifica dell'opzione **TP**, gli avvolgimenti del motore ottengono una protezione aggiuntiva che li rende idonei al funzionamento in condizioni di elevata temperatura e umidità.

M20 - TROPICALIZATION

*When option **TP** is specified, motor windings receive additional protection for operation in high humidity and temperature conditions.*

M20 - TROPENSCHUTZ

Wird die Option **TP** bestellt, wird die Motorwicklung mit einem zusätzlichen Schutz ausgestattet, der ihren Einsatz unter hohen Temperaturen und starker Feuchtigkeit ermöglicht.

M20 - TROPICALISATION

*Sur demande, en spécifiant l'option **TP**, les bobinages du moteur obtiennent une protection supplémentaire qui les rend apte au fonctionnement dans des conditions de température et d'humidité élevées.*

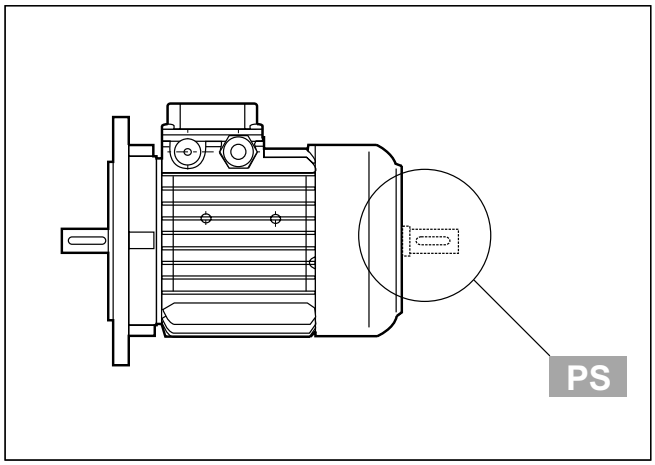
M21 - ESECUZIONI ALBERO

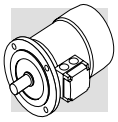
PS

M21 - ROTOR SHAFT CONFIGURATIONS

M21 - OPTIONEN DER ROTORWELLE

M21 - EXECUTIONS ARBRE ROTOR





Seconda estremità d'albero

L'opzione esclude le varianti RC, TC, U1, U2, EN1, EN2, EN3 – non applicabile ai motori con freno tipo BA.
Le dimensioni sono reperibili nelle tavole dimensionali dei motori.

Second shaft extension

This option is not compatible with variants RC, TC, U1, U2, EN1, EN2, EN3 – and is not feasible on motors equipped with BA brake.
For shaft dimensions please see motor dimensions tables.

Zweites Wellenende

Diese Option schließt die Optionen RC, TC, U1, U2, EN1, EN2, EN3 aus – sie kann nicht außerdem nicht an Motoren, die mit einer Bremse vom Typ BA ausgestattet sind, angebaut werden.
Die entsprechenden Maße können den Maßtabellen der Motoren entnommen werden.

Arbre à double extrémité

L'option exclut les variantes RC, TC, U1, U2, EN1, EN2, EN3 – non applicables aux moteurs avec frein type BA.
Les dimensions figurent sur les planches de dimensions des moteurs.

M22 - EQUILIBRATURA ROTORE

I motori sono equilibrati dinamicamente con mezza linguetta e rientrano nel grado di vibrazione **N**, secondo la Norma CEI EN 60034-14.

M22 - ROTOR BALANCING

*Motors are dynamically balanced with a half key and fall within vibration class **N** in accordance with standard CEI EN 60034-14.*

M22 - ROTORAUSWUCHTUNG

Die Motoren werden dynamisch durch das Einsetzen eines halben Federkeils ausgewuchtet und fallen der Norm CEI EN 60034-14 gemäß unter die Einstufung **N** des Schwingungsgrads.

M22 - *EQUILIBRAGE DU ROTOR*

*Les moteurs sont équilibrés du point de vue dynamique avec une demi-clavette et rentrent dans le degré de vibration **N**, selon la norme CEI EN 60034-14.*

RV

Per esigenze di particolare silenziosità è disponibile l'esecuzione opzionale **RV** che garantisce vibrazioni ridotte, secondo il grado **R**.
La tabella sottostante riporta i valori della velocità efficace di vibrazione per equilibratura normale (N) e in grado R.

*Where low noise is a priority requirement, the option **RV** ensures reduced vibration in accordance with vibration class **R**.*
The table below reports effective velocity of vibration for normal (N) and R grade balancing.

Sollte eine besondere Laufruhe gefordert werden, steht als Option **RV** eine Ausführung mit reduziertem Schwingverhalten nach Grad **R**, zur Verfügung.
Die folgende Tabelle gibt die Werte der effektive Schwingungen für das normale Auswuchten (N) und im Grad R an.

*En cas d'exigence particulière de faible niveau de bruit, l'exécution **RV** est disponible en option, elle garantit des vibrations réduites, de degré **R**.*
Le tableau ci-dessous indique les valeurs de la vitesse efficace de vibration pour un équilibrage normal (N) et en degré R.

(26)

Grado di vibrazione *Vibration class* Schwingungsklasse *Degrée de vibration*	Velocità di rotazione *Synchronous speed* Drehungsgeschwindikeit *Viitesse de rotation* n [min^{-1}]	Limiti della velocità di vibrazione *Limits of the vibration velocity* Grenzen der Schwingungsgeschwindikeit *Limites de la vitesse de vibration* (mm/s)	
		63 < H ≤ 132	**132 < H ≤ 200**
N	600 < n < 3600	1.8	2.8
R	600 < n < 1800	0.71	1.12
	1800 < n < 3600	1.12	1.8

I valori si riferiscono a misure con motore liberatamente sospeso e funzionamento a vuoto; tolleranza ±10%.

Values are obtained from measurements on freely suspended motor during no-load operation; tolerance ± 10%.

Diese Werte beziehen sich auf einem frei hängenden und sich im Leerbetrieb befindlichen Motor; Toleranz ± 10%.

Les valeurs se réfèrent à des mesures avec moteur librement suspendu et fonctionnement à vide, tolérance ± 10%.

M23 - PROTEZIONI MECCANICHE ESTERNE

M23 - EXTERNAL MECHANICAL PROTECTIONS

M23 - MECHANISCHE SCHUTZVORRICHTUNGEN

M23 - PROTECTIONS MECANIQUES EXTERIEURES

RC

Il dispositivo parapioggia, che è raccomandato quando il motore è montato verticalmente con l'albero verso il basso, serve a proteggere il motore stesso dall'ingresso di corpi solidi e dallo stillicidio. Le dimensioni aggiuntive sono indicate nella tabella (27).
Il tettuccio esclude le varianti PS, EN1, EN2, EN3 e non è applicabile ai motori con freno tipo BA.

The rain canopy protects the motor from dripping and avoids the ingress of solid matter. It is recommended when motor is installed in a vertical position with the shaft pointing downwards.
Relevant dimensions are indicated in the table (27).
The rain canopy is not compatible with variants PS, EN1, EN2, EN3 and will not fit motors equipped with a BA brake.

Ein Regenschutzdach, dessen Montage empfohlen wird, wenn der Motor senkrecht mit einer nach unten gerichteten Welle montiert wird. Es dient dem Schutz des Motors vor dem Eindringen von festen Fremdkörpern und Tropfwasser. Die Dimensionen werden in der Tabelle (27) angegeben. Das Schutzdach schließt die Möglichkeit der Optionen PS, EN1, EN2, EN3 aus und kann bei Bremsmotoren vom Typ BN_BA nicht montiert werden.

Le capot de protection antipluie est recommandé lorsque le moteur est monté verticalement avec l'arbre vers le bas, il sert à protéger le moteur contre l'introduction de corps solides et le suintement. Les dimensions à ajouter sont indiquées dans le tableau (27).
Le capot antipluie exclue les variantes PS, EN1, EN2, EN3 et n'est pas applicable aux moteurs avec frein type BA.

(27)

	AQ	**∆ V**	BN 63	118	24	
BN 71	134	27	
BN 80	134	25	
BN 90	168	30	
BN 100	168	28	
BN 112	211	32	
BN 132 ... BN 160MR	211	32	
BN 160M ... BN 180M	270	36	
BN 180L ... BN 200L	310	36	

TC

La variante del tettuccio tipo TC è da specificare quando il motore è installato in ambienti dell'industria tessile, dove sono presenti filamenti che potrebbero ostruire la griglia del copriventola, impedendo il regolare flusso dell'aria di raffreddamento.
L'opzione esclude le varianti EN1, EN2, EN3 e non è applicabile ai motori con freno tipo BA.

L'ingombro complessivo è lo stesso del tettuccio tipo RC.

Option TC is a rain canopy variant for textile industry environments, where lint may obstruct the fan grid and prevent a regular flow of cooling air.
This option is not compatible with variants EN1, EN2, EN3 and will not fit motors equipped with a BA brake.

Overall dimensions are the same as rain canopy type RC.

Bei dieser Option handelt es sich um ein Schutzdachs mit einem Textilnetz, dessen Einsatz empfohlen wird wenn der Motor in Bereichen der Textilindustrie installiert wird, in denen Stofffusseln das Lüfterradgitter verstopfen und so einen ausreichenden Kühlluftfluss verhindern könnten. Diese Option schließt die Möglichkeit der Optionen EN1, EN2, EN3 aus und kann bei Bremsemotoren vom Typ BN_BA nicht montiert werden.

Die Gesamtmaße entsprechen denen des Schutzdachs vom Typ RC.

La variante du capot type TC est à spécifier lorsque le moteur est installé dans des sites de l'industrie textile, où sont présents des filaments qui pourraient obstruer la grille du cache-ventilateur et empêcher le flux régulier de l'air de refroidissement. L'option exclue les variantes EN1, EN2, EN3 et n'est pas applicable aux moteurs avec frein type BA.

L'encombrement total est identique à celui du capot type RC.

M24 - MOTORI ASINCRONI AUTOFRENANTI

Funzionamento

L'esecuzione autofrenante prevede l'impiego di freni a pressione di molle alimentati in c.c. (tipo FD) o in c.a. (tipo FA, BA).
Tutti i freni funzionano secondo il principio di sicurezza, ossia intervengono in seguito alla pressione esercitata dalle molle, in mancanza di alimentazione.

M24 - ASYNCHRONOUS BRAKE MOTORS

Operation

Versions with incorporated brake use spring-applied DC (FD option) or AC (FA, BA options) brakes.
All brakes are designed to provide fail-safe operation, meaning that they are applied by spring-action in the event of power failure.

M24 - DREHSTROMBREMS-MOTOREN

Betriebsweise

Die selbstbremsende Ausführung der Motoren sieht den Einsatz von Federdruckbremsen vor, die mit Gleichstrom (Typ FD) oder mit Wechselstrom (Typ FA, BA) gespeist werden. Alle Bremsen arbeiten gemäß dem Sicherheitsprinzip, d.h. sie greifen, im Fall eines Stromausfalls in Folge eines auf die Feder ausgeübten Drucks ein.

M24 - MOTEURS FREIN ASYNCHRONES

Fonctionnement

L'exécution avec frein prévoit l'utilisation de freins à pression de ressorts alimentés en c.c. (type FD) ou en c.a. (type FA, BA). Tous les freins fonctionnent selon le principe de sécurité, c'est-à-dire qu'ils interviennent suite à la pression exercée par les ressorts, en cas de coupure d'alimentation.

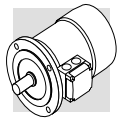
In mancanza di tensione, l'ancora mobile spinta dalle molle di pressione blocca il disco freno tra la superficie dell'ancora stessa e lo scudo motore impedendo la rotazione dell'albero. Quando la bobina viene eccitata, l'attrazione magnetica esercitata sull'ancora mobile vince la reazione elastica delle molle e libera il disco freno, e conseguentemente l'albero motore con esso solidale.

When voltage is interrupted, pressure springs push the armature plate against the brake disc. The disc becomes trapped between the armature plate and motor shield and stops the shaft from rotation. When the coil is energized, a magnetic field strong enough to overcome spring action attracts the armature plate, so that the brake disc – which is integral with the motor shaft – is released.

Wenn die Spannungsversorgung abfällt, sorgt der bewegliche, von den Druckfedern geschobene Anker für die Blockierung der Bremsscheibe zwischen der Ankerfläche und dem Motorschild und blockiert damit den Rotor Wird die Spule erregt, kommt es durch den magnetischen auf den beweglichen Anker wirkenden Anzug zur Überwindung der elastischen Federkraft und zum Lösen der Bremsscheibe, wodurch der rotor wieder freigegeben wird.

En cas de coupure de courant, l'armature mobile, poussée par les ressorts, bloque le disque de frein entre la surface de l'armature et le bouclier moteur en empêchant la rotation de l'arbre. Lorsque la bobine est excitée, l'attraction magnétique exercée sur l'armature mobile annule la réaction élastique des ressorts et libère le disque de frein, et par conséquent l'arbre moteur, qui est solidaire.



Caratteristiche generali:

- Coppie frenanti elevate (generalmente $M_b \cong 2\ M_n$) e regolabili
- Disco freno con anima in acciaio a doppia guarnizione d'attrito (materiale a bassa usura, senza amianto)
- Cava esagonale sull'albero motore, lato ventola (N.D.E.), per rotazione manuale (non prevista quando sono presenti le opzioni PS, RC, TC, U1, U2, EN1, EN2, EN3)
- Sblocco meccanico manuale (opzioni **R** e **RM** per BN_FD, BN_FA).
- Trattamento anticorrosivo di tutte la superfici del freno
- Isolamento in classe F

Most significant features:

- *High braking torques (normally $M_b \cong 2\ M_n$) braking torque adjustment*
- *Steel brake disc with double friction lining (low-wear, asbestos-free lining)*
- *Hexagonal seat on motor shaft fan end (N.D.E.) for manual rotation (not compatible with options PS, RC, TC, U1, U2, EN1, EN2, EN3)*
- *Manual release lever (options **R** and **RM** for BN_FD, BN_FA).*
- *Corrosion-proof treatment on all brake surfaces*
- *Insulation class F*

Allgemeine Eigenschaften:

- Hohe und regulierbare Bremsmomente (allgemein $M_b \cong 2\ M_n$).
- Bremsscheibe mit Stahlkern und doppeltem Bremsbelag (Material mit geringem Verschleiß, asbestfrei).
- Sechskant hinten an der Motorwelle, auf Lüfterradseite (N.D.E.), für eine manuelle Drehung des Rotors mit einem Inbusschlüssel. (nicht lieferbar, wenn die Optionen PS, RC, TC, U1, U2, EN1, EN2, EN3) bestellt wurden.
- Manuell zu betätigende, mechanische Bremslüftvorrichtung (Optionen **R** und **RM** für BN_FD, BN_FA).
- Korrionsschutzbehandlung an allen Flächen der Bremse.
- Isolierung in Klasse F.

Caractéristiques générales:

- *Couples de freinage élevés (généralement $M_b \cong 2\ M_n$) et réglables.*
- *Disque de frein avec structure en acier à double garniture de frottement (matière à faible usure, sans amiante).*
- *Empreinte hexagonale sur l'arbre moteur, côté ventilateur (N.D.E.), pour la rotation manuelle (non prévue en cas de présence des options PS, RC, TC, U1, U2, EN1, EN2, EN3).*
- *Déblocage mécanique manuel (options **R** et **RM** pour BN_FD, BN_FA).*
- *Traitement anticorrosion sur toute la surface du frein.*
- *Isolation en classe F.*

M24.1 - LEVA SBLOCCO FRENO

I freni a pressione di molle tipo **FD** e **FA** possono essere dotati opzionalmente di dispositivi per lo sblocco manuale del freno, normalmente utilizzati per condurre interventi di manutenzione sulle parti di macchina, o dell'impianto, comandate dal motore.

M24.1 - BRAKE RELEASE SYSTEMS

*Spring-applied brakes type **FD** and **FA** may be equipped with optional manual release devices. These are typically used for manually releasing the brake before servicing any machine or plant parts operated by the motor.*

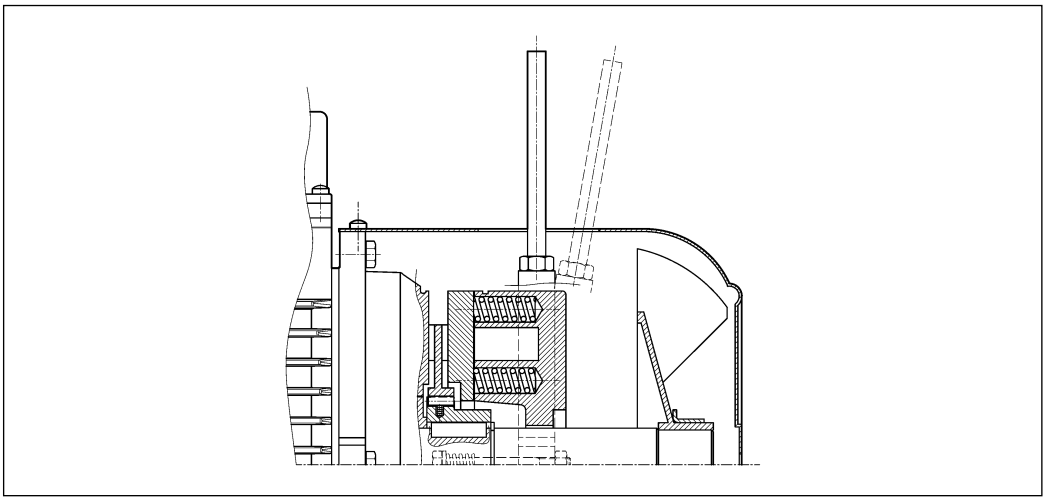
M24.1 - BREMSLÜFTHEBEL

Die Federdruckbremsen vom Typ **FD** und **FA** können Optional mit Bremslüfthebeln geliefert werden, die ein manuelles Lüften der Bremse ermöglichen. Diese Lüftungseinrichtungen können bei Instandhaltungsarbeiten an vom Motor betriebenen Maschinen- oder Anlagenteilen verwendet werden.

M24.1 - SYSTEMES DE DEBLOCAGE FREIN

*Les freins à pression de ressorts type **FD** et **FA** peuvent, en option, être dotés de dispositifs de déblocage manuel du frein, normalement utilisés pour effectuer des interventions d'entretien sur les composants de la machine, ou de l'installation commandée par le moteur.*

R



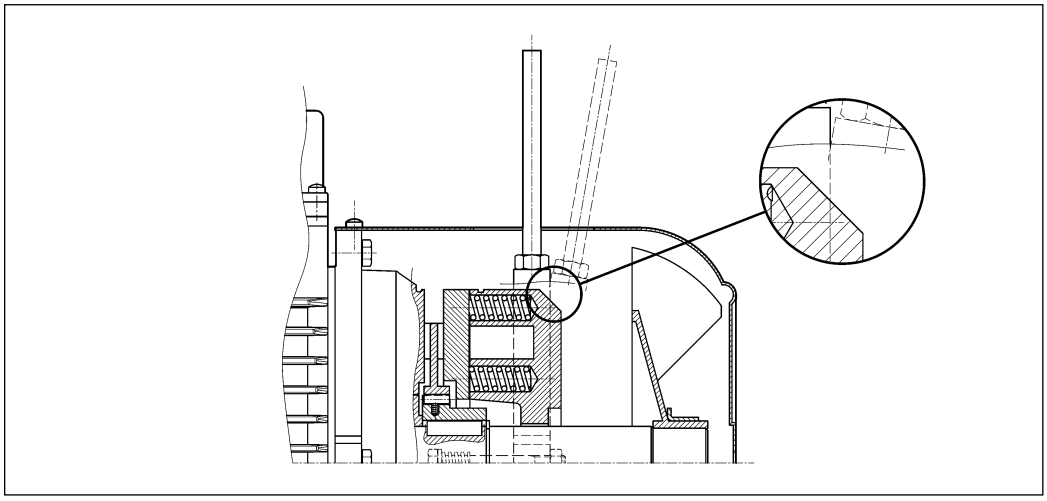
La leva di sblocco è dotata di ritorno automatico, tramite dispositivo a molla.

A return spring brings the release lever back in the original position.

Bremslüfthebel mit automatischer Rückstellung durch Federkraft.

Le levier de déblocage est doté de retour automatique, au moyen d'un dispositif à ressort.

RM



La leva di sblocco può essere temporaneamente bloccata in posizione di rilascio del freno, avvitando la stessa fino ad impegnarne l'estremità in un risalto del corpo del freno. La disponibilità dei sistemi di sblocco freno è diversa per i vari tipi di motore, ed è descritta dalla tabella seguente:

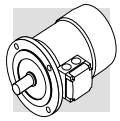
The release lever may be locked in the "release" position by tightening the lever until lever end becomes engaged with a brake housing projection. There are different brake release systems available for the various types of motors as indicated in the table below:

Der Bremslüfthebel kann zeitweise in der Bremslüftposition arretiert werden, indem man ihn so lange einschraubt, bis die Bremse arretiert ist. Für die unterschiedlichen Motortypen sind ebenso verschiedene Bremslüftsysteme verfügbar, die Sie der folgenden Tabelle entnehmen können:

Le levier de déblocage peut être temporairement bloqué en position de déblocage du frein en le vissant jusqu'à engager l'extrémité dans une saillie du corps du frein. La disponibilité des systèmes de déblocage du frein est différente en fonction des types de moteur et figure dans le tableau suivant :

(29)

	R	RM
BN_FD	63 ≤ H ≤ 200	63 ≤ H ≤ 160MR
BN_FA	63 ≤ H ≤ 132	⛔
BN_BA		di serie *std. supply* serienmäßig *de série*



Orientamento della leva di sblocco

Per entrambe le opzioni **R** e **RM**, la leva di sblocco del freno viene collocata, se non diversamente specificato, con orientamento di 90° in senso orario, rispetto alla posizione della morsettiera - riferimento [AB] nel disegno sottostante.
Orientamenti alternativi, tipo [**AA**], [**AC**] e [**AD**] possono essere richiesti citandone la relativa specifica:

Release lever orientation

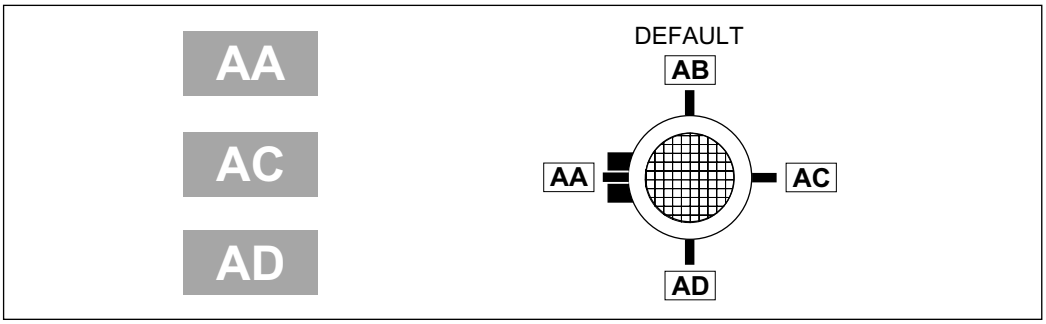
*Unless otherwise specified, the release lever is located 90° away from the terminal box – identified by letters [AB] in the diagram below – in a clockwise direction on both options **R** and **RM**.*
*Alternative lever positions [**AA**], [**AC**] and [**AD**] are also possible when the corresponding option is specified:*

Ausrichtung des Bremslüfthebels

Bei beiden Optionen, **R** und **RM**, wird der Bremslüfthebel, falls nicht anderweitig festgelegt, um 90° im Uhrzeigersinn zur Position des Klemmenkastens montiert (Position [AB] in der nachfolgenden Zeichnung).
Andere Positionen: **AA** (0° zum Klemmenkasten), **AC** (180° zum Klemmenkasten) oder **AD** (270° zum Klemmenkasten, im Uhrzeigersinn vom Lüfter aus gesehen) können unter Angabe der entsprechenden Spezifikation bestellt werden:

Orientation du levier de déblocage

*Pour les deux options **R** et **RM**, le levier de déblocage du frein est positionné, sauf spécification contraire, avec une orientation de 90° dans le sens des aiguilles d'une montre par rapport à la position de la boîte à bornes - référence [AB] sur le dessin ci-dessous.*
*Des orientations différentes, type [**AA**], [**AC**] et [**AD**] peuvent être demandées à condition de préciser la position correspondante :*



M24.2 - ALIMENTAZIONE SEPARATA DEL FRENO

M24.2 - SEPARATE BRAKE SUPPLY

M24.2 - BREMSE MIT SEPARATER SPANNUNGSVERSORGUNG

M24.2 - ALIMENTATION FREIN SEPAREE

...SA

La bobina del freno è alimentata da linea separata e indipendente dall'alimentazione del motore.
Il valore di tensione alla bobina deve essere specificato, es. 230SA.
L'opzione è applicabile ai motori con freno tipo FD, FA e BA.

The brake coil is directly fed through an independent line, separately from the motor.
In this case the rated voltage for the coil must be specified, e.g. 230SA.
The option is applicable to all motors with brake type FD, FA and BA.

Die Bremsspule wird, unabhaengig vom Motor, durch einen separaten Anschluss gespeist.
In diesem Fall muss Betriebsspannung fuer die spule spezifiziert werden, z.b. 230SA.
Die Option ist verfuegbar für alle Motoren mit Bremstyp FD, FA und BA.

La bobine du frein est alimentée par une ligne séparée et indépendante de l'alimentation du moteur.
La valeur de tension à la bobine doit être spécifiée, ex. 230SA.
L'option est applicable aux moteurs avec frein type FD, FA et BA.

...SD

La bobina del freno tipo FD è alimentata direttamente con corrente continua e l'alimentatore NON è fornito.
Il valore di tensione alla bobina deve essere specificato, es. 24SD.

The brake coil is directly fed with DC current and the rectifier is out of the scope for supply.
The rated voltage for the coil must be specified, e.g. 24SD.

Die Bremsspule wird direkt mit Gleichspannung gespeist. Der Gleichrichter ist nicht im Lieferimfang enthalten.
Die Betriebsspannung für die Spule muss spezifiziert werden, z.b. 24SD.

La bobine du frein type FD est alimentée directement avec courant continu et l'alimentateur n'est pas fourni.
La valeur de tension à la bobine doit être spécifiée, es. 24SD.

M24.3 - FREQUENZA MASSIMA D'AVVIAMENTO

Nelle tabelle dei dati tecnici, per ogni tipo di freno, è indicata la massima frequenza di inserzione a vuoto Z_0, con intermittenza I = 50%.
Questo valore definisce il nume-

M24.3 - MAXIMUM STARTS PER HOUR

For all types of Brakes the rating charts reports the maximum number of starts per hour under no-load conditions Z_o with cyclic duration factor I = 50 % .
This parameter gives the num-

M24.3 - MAX. SCHALTHÄUFIGKEIT

In den Tabellen, in denen die technischen Daten enthalten sind, wird für jeden Bremstyp die maximal Schalthäufigkeit im Leerbetrieb Z_o mit einer Einschaltdauer I = 50 % angege-

M24.3 - FREQUENCE MAXIMUM DE DEMARRAGE

Les tableaux des caractéristiques techniques indiquent, pour chaque type de frein, la fréquence maximum d'enclenchement à vide Z_o, avec intermittence I = 50 %. Cette valeur dé-

ro di avviamenti orari a vuoto che il motore può sopportare senza superare la temperatura ammessa dalla classe di isolamento F.
Nel caso pratico di motore accoppiato ad un carico esterno con potenza assorbita P_r, massa inerziale J_c e coppia resistente media durante l'avviamento M_L, il numero di avviamenti ammissibile si può calcolare con la seguente formula:

ber of starts per hour under no-load conditions a motor can withstand without exceeding the temperature limit permitted for insulation class F.
Assuming an application involving an overhung load applied to the motor with absorbed power P_r, inertial mass J_C and starting mean load torque M_L, the number of starts allowed is calculated by the following formula:

ben. Dieser Wert legt die Anzahl der Schaltungen im Leerbetrieb pro Stunde fest, denen der Motor standhalten kann, ohne dabei die von der Isolierstoffklasse F zulässige Temperatur zu überschreiten. Im praktischen Fall eines an eine externe Last gekoppelten Motors mit einer Leistungsaufnahme P_r, Trägheitsmasse J_C und einem durchschnittlichen Gegendrehmoment während des Anlaufs M_L, kann die Anzahl der zulässigen Schaltungen anhand der nachstehenden Formel berechnet werden:

finit le nombre de démarrages horaires à vide que le moteur peut supporter sans dépasser la température admise par la classe d'isolation F.
Dans le cas pratique d'un moteur accouplé à une charge extérieure avec puissance absorbée P_r, masse inertielle J_C et couple résistant moyen durant le démarrage M_L, il est possible de calculer le nombre de démarrages admissibles avec la formule suivante :

$$Z = \frac{Z_0 \; K_c \; K_d}{K_J}$$

dove:

$K_J = \frac{J_m + J_c}{J_m}$ = fattore di inerzia

$K_c = \frac{M_a - M_L}{M_a}$ = fattore di coppia

K_d fattore di carico vedi tabella:

where

$K_J = \frac{J_m + J_c}{J_m}$ = *inertia factor*

$K_c = \frac{M_a - M_L}{M_a}$ = *torque factor*

K_d = *load factor see table:*

wobei gilt:

$K_J = \frac{J_m + J_c}{J_m}$ = Trägheitsfaktor

$K_c = \frac{M_a - M_L}{M_a}$ = Drehmomentsfaktor

K_d = Lastfaktor siehe Tabelle:

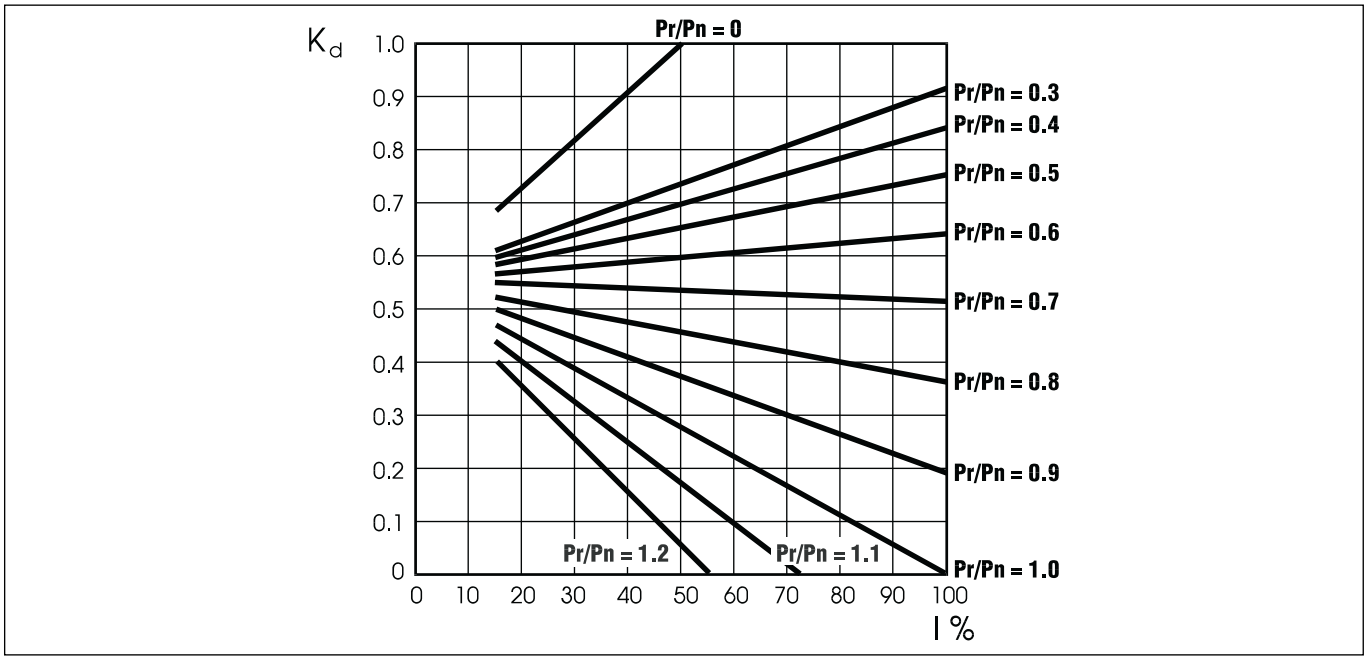
où

$K_J = \frac{J_m + J_c}{J_m}$ = *facteur d'inertie*

$K_c = \frac{M_a - M_L}{M_a}$ = *facteur de couple*

K_d = *facteur de charge voir tableau*

(30)



Con il numero di avviamenti così ottenuto si dovrà in seguito verificare che il massimo lavoro di frenatura sia compatibile con la capacità termica del freno W_{max}.

The resulting number of starts must be double-checked against maximum braking effort, which must be compatible with brake thermal capacity W_{max}.

Auf Grundlage der berechneten Anzahl der Schaltungen muss man prüfen, ob die maximale Bremsleistung mit der angegebenen thermischen Leistung der Bremse W_{max} übereinstimmt.

Avec le nombre de démarrages ainsi obtenu, il est ensuite nécessaire de vérifier que l'action maximum de freinage est compatible avec la capacité thermique du frein W_{max}.

M24.4 - AVVIAMENTO PROGRESSIVO

M24.4 - SOFT-START / STOP

M24.4 - SANFTANLAUF / STOP

M24.4 - DEMARRAGE/ARRET PROGRESSIF

F1

Per applicazioni che richiedono progressività nelle fasi di avvio e di arresto è disponibile un volano – opzione **F1** – la cui inerzia aggiuntiva assorbe energia cinetica durante l'avviamento e la restituisce in frenatura, rendendo i transitori più progressivi e graduali.
Il volano è disponibile per i motori autofrenanti del tipo BN_FD, con caratteristiche specifiche dettagliate nella tabella che segue:

*An optional flywheel – option **F1** – is available for applications requiring soft starting or stopping. The flywheel's added inertia uses up kinetic energy during starting and returns it back during braking, thus catering for more progressive and gradual shock loads.*
The optional flywheel is available for brake motors type BN_FD, with specific characteristics as detailed in the table below:

Für Anwendungen, bei denen einer sanfte Anlauf- und Stop erforderlich ist, steht als – Option **F1** – ein Schwungrad zur Verfügung, dessen zusätzliches Trägheitsmoment während der Anlaufphase kinetische Energie aufnimmt, die in der Abbremsphase wieder abgegeben wird. Dadurch erfolgen die Übergangsphasen progressiver und sanfter. Das Schwungrad ist für die Bremsmotoren vom Typ BN_FD in den nachstehend aufgeführten spezifischen Details verfügbar:

*Pour les applications nécessitant une progressivité au cours des phases de démarrage et d'arrêt, un volant – option **F1** – est disponible ; son inertie supplémentaire absorbe l'énergie cinétique durant le démarrage et la restitue au moment du freinage, rendant ainsi les phases transitoires plus progressives et graduelles: Le volant est disponible pour les moteurs frein du type BN_FD, ses caractéristiques spécifiques détaillées sont indiquées dans le tableau suivant :*

(31)

Volano per avviamento progressivo / *Flywheel for soft starting* / Schwungräder für Sanftanlauf *Volant pour demarrage/arret progressif*

Per le esigenze di particolari applicazioni, ad es. traslazioni, che richiedano regolazioni micrometriche della coppia frenante è disponibile una serie di motori autofrenanti, denominata BN_FM, dettagliata nel catalogo cod. 1134 R1, sviluppato per le motorizzazioni dei carriponte. Consultare per questo il Servizio Tecnico Bonfiglioli.

For special applications that require a fine adjustment of braking torque, as is the case with track drives, a specific brake motor type BN_FM is available. This type of product has been developed for bridge crane drives and is described in detail in catalogue no. 1134 R1. Please contact Bonfiglioli Engineering for more details.

Für besondere Anwendungen, z.B. Transfers, die fein abgestufte Einstellungen des Bremsmoments erfordern, ist eine Reihe an Bremsmotoren verfügbar (BN_FM) und die detailliert im Katalog Art.-Nr. 1134 R1 beschrieben werden. Dieser Katalog ist für die Antriebe von Laufkränen entwickelt wurde. Wenden Sie sich diesbezüglich bitte an unseren Technischen Kundendienst.

En cas d'exigences d'applications particulières, par ex. translations, qui nécessitent des réglages micrométriques du couple de freinage, une série de moteurs frein est disponible, dénommée BN_FM, détaillée dans le catalogue réf. 1134 R1, conçue pour les motorisations des ponts roulants. Dans ce cas, consulter le Service Bonfiglioli.

M24.5 - FILTRO CAPACITIVO

M24.5 - CAPACITIVE FILTER

M24.5 - KAPAZITIVER FILTER

M24.5 - FILTRE CAPACITIF

CF

Per i soli motori autofrenanti in corrente continua, tipo BN_FD, è disponibile in opzione il filtro capacitivo. Se corredati dell'opportuno filtro capacitivo a monte del raddrizzatore (opzione CF) i motori rientrano nelimiti di emissione previsti dalla Norma EN 50081-1 "Compatibilità elettromagnetica - Norma Generica sull'emissione – Parte 1: Ambienti residenziali, commerciali e dell'industria leggera".

An optional capacitive filter is available for DC brake motors type BN_FD only.
When the suitable capacitive filter is installed upstream of the rectifier (option CF), motors comply with the emission limits required by standard EN 50081-1 "Electromagnetic Compatibility – Generic Emission Standard – Part 1: Residential, commercial and light industrial environment".

Nur bei den Bremsmotoren mit Gleichstrombremse vom Typ BN_FD, ist die Option eines kapazitiven Filters vorgesehen. Wird dieser Filter vor dem Gleichrichter (Option CF) installiert, fallen die Motoren in die von der Norm EN 50081-1 "Elektromagnetische Kompatibilität – Allgemeine Norm zur Emission – Teil 1: Wohngebiete, Handels- und Leichtindustriezonen " vorgesehenen Emissionsgrenzen.

Un filtre capacitif en option est disponible uniquement pour les moteurs frein en courant continu type BN_FD. S'ils sont équipés du filtre capacitif approprié en amont du redresseur (option CF), les moteurs rentrent dans les limites d'émission prévues par la Norme EN 50081-1 "Compatibilité électromagnétique - Norme Générique sur l'émission – Partie 1: Milieux résidentiels, commerciaux et de l'industrie légère".

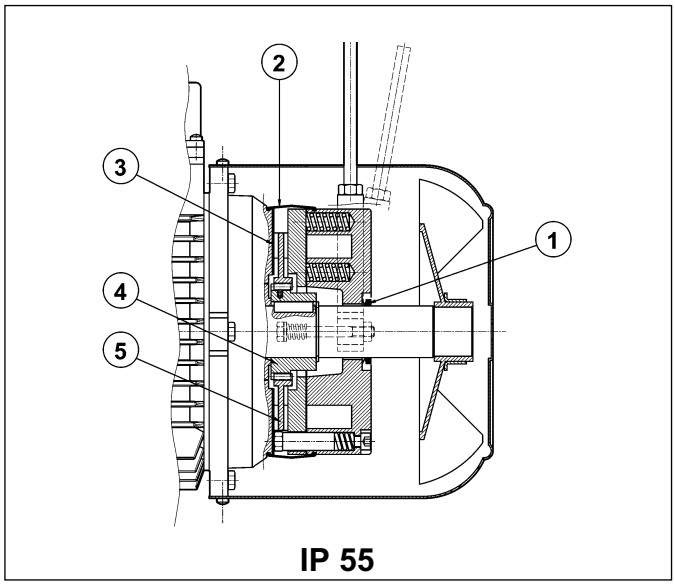
(33)



IP 55

Freno elettromagnetico con bobina toroidale in corrente continua fissato con viti allo scudo motore; le molle di precarico realizzano il posizionamento assiale del corpo magnete. Il disco freno è scorrevole sul mozzo trascinatore in acciaio calettato sull'albero e previsto di molla antivibrazione. I motori sono forniti con freno tarato in fabbrica al valore di coppia riportato nelle tabelle dati tecnici; la coppia frenante può essere regolata modificando il tipo e/o il numero delle molle. A richiesta, i motori possono essere previsti di leva per lo sblocco manuale con ritorno automatico (**R**) o con mantenimento della posizione di rilascio freno (**RM**); per la posizione angolare della leva di sblocco vedi descrizione della relativa variante alla pag. 32. Il freno FD garantisce elevate prestazioni dinamiche e bassa rumorosità; le caratteristiche d'intervento del freno in corrente continua possono essere ottimizzate in funzione dell'applicazione, utilizzando i vari tipi di alimentatore disponibili e/o realizzando l'opportuno cablaggio.

Direct current toroidal-coil electromagnetic brake bolted onto motor shield. Preloading springs provide axial positioning of magnet body.
Brake disc slides axially on steel hub shrunk onto motor shaft with anti-vibration spring.
Brake torque factory setting is indicated in the corresponding motor rating charts. Braking torque may be modified by changing the type and/or number of springs.
*At request, motors may be equipped with manual release lever with automatic return (**R**) or system for holding brake in the released position (**RM**).*
See variant at page 32 for available release lever locations.
FD brakes ensure excellent dynamic performance with low noise. DC brake operating characteristics may be optimized to meet application requirements by choosing from the various rectifier/power supply and wiring connection options available.

Elektromagnetische Bremse mit Ringwicklungsspule für Gleichstromspannung, die mittels Schrauben am hinteren Motorschild befestigt ist. Die Federn sorgen für die axiale Ausrichtung des Magnetkörpers. Die Bremsscheibe gleitet axial auf der Mitnehmernabe aus Stahl, die über eine Paßfeder mit der Motorwelle verbunden und mit einer Schwingungsdämpfung ausgestattet ist. Die Motoren werden vom Hersteller auf den in der Tabelle der technischen Daten angegebenen Bremsmoment eingestellt; das Bremsmoment kann durch das Ändern des Typs und/oder der Anzahl der Federn reguliert werden. Auf Anfrage können die Motoren mit einem Bremslüfthebel für die manuelle Lüftung der Bremse mit selbstständiger Rückstellung (**R**) ohne Arretierung oder mit arretierbarem Lüfterhebel (**RM**) geliefert werden. Die Fesstlegung der Position des Bremslüfthebel in Abhängigkeit von der Klemmkastenlage erfolgt durch die Option auf Seite 32.
Die Bremse vom Typ FD garantiert hohe dynamische Leistungen und niedrige Laufgeräusche. Die Ansprecheigenschaften der Bremse unter Gleichstrom können in Abhängigkeit zur jeweiligen Anwendung durch den Einsatz der verschiedenen verfügbaren Gleichrichter oder durch eine entsprechenden Anschluß der Bremse optimiert werden.

*Frein électromagnétique avec bobine toroïdale en courant continu, fixé avec des vis au bouclier moteur ; les ressorts de précharge réalisent le positionnement axial de la bobine. Le disque frein coulisse de façon axiale sur le moyeu d'entraînement en acier calé sur l'arbre et doté de ressort antivibration. Les moteurs sont fournis avec frein préréglé en usine à la valeur de couple indiquée dans les tableaux des caractéristiques techniques ; le couple de freinage peut être réglé en modifiant le type et/ou le nombre de ressorts. Sur demande, les moteurs peuvent être équipés de levier pour le déblocage manuel avec retour automatique (**R**) ou avec maintien de la position de déblocage frein (**RM**); pour la position angulaire du levier de déblocage, voir description de la variante correspondante à la page 32.*
Le frein FD garantit des performances dynamiques élevées et un faible niveau de bruit ; les caractéristiques d'intervention du frein en courant continu peuvent être optimisées en fonction de l'application en utilisant les différents types de dispositifs d'alimentation disponibles et/ou en réalisant un câblage approprié.

- Grado di protezione

L'esecuzione standard prevede il grado di protezione IP54.
In opzione il motore autofrenante tipo FD viene fornito con grado di protezione **IP 55**, prevedendo le seguenti varianti costruttive:

① anello V-ring posizionato sull'albero motore N.D.E.
② fascia di protezione in gomma
③ anello in acciaio inox interposto tra scudo motore e disco freno
④ mozzo trascinatore in acciaio inox
⑤ disco freno in acciaio inox

- Degree of protection

Standard protection is IP54.
*Brake motor FD is also available in protection **IP 55**, which mandates the following variants:*

① *V-ring at N.D.E. of motor shaft*
② *dust and water-proof rubber boot*
③ *stainless steel ring placed between motor shield and brake disc*
④ *stainless steel hub*
⑤ *stainless steel brake disc*

- Schutzart

Die Standardausführung ist Schutzart IP54 vor.
Optional kann der Bremsmotor vom Typ FD in der Schutzart **IP 55** geliefert werden, wobei sind folgende Komponenten eingesetzt werden:

① V-Ring an der Motorwelle N.D.E.
② Schutzring aus Gummi
③ Ring aus rostfreiem Stah zwischen Motorschild und Bremsscheibe
④ Mitnehmernabe aus rostfreiem Stahl
⑤ Bremsscheibe aus rostfreiem ahl

- Degré de protection

L'exécution standard prévoit le degré de protection IP54.
En option, le moteur frein type FD est fourni avec degré de protection IP 55, en prévoyant les variantes de construction suivantes :

① *bague V-ring positionnées sur l'arbre moteur N.D.E.*
② *bande de protection en caotchouc*
③ *bague en acier inox interposée entre le bouclier moteur et le disque de frein*
④ *moyeu d'entraînement en acier inox*
⑤ *disque frein en acier inox*

- Alimentazione freno FD

L'alimentazione della bobina freno in c.c. è prevista per mezzo di opportuno raddrizzatore montato all'interno della scatola coprimorsetti e già cablato alla bobina del freno.
Per motori a singola polarità è inoltre previsto di serie il collegamento del raddrizzatore alla morsettiera motore.
Indipendentemente dalla frequenza di rete, la tensione standard di alimentazione del raddrizzatore V_B ha il valore indicato nella tabella qui di seguito:

- FD brake power supply

A rectifier accommodated inside the terminal box feeds the DC brake coil. Wiring- connection across rectifier and brake coil is performed at the factory.
On all single-pole motors, rectifier is connected to the motor terminal board.
Rectifier standard power supply voltage V_B is as indicated in the following table, regardless of mains frequency:

- Spannungsversorgung der Bremse FD

Die Versorgung der Gleichstrombremsspule erfolgt über einen Gleichrichter im Klemmenkasten der bei Lieferung, wenn nicht anders bestellt, bereits mit der Bremsspule verkabelt ist.
Bei den einpoligen Motoren ist serienmäßig der Anschluss des Gleichrichters an die Motorsspannung vorgesehen. Unabhängig von der Netzfrequenz erfolgt die Versorgung des Gleichrichters V_B über die in der nachstehenden Tabelle angegebenen Standardspannung:

- Alimentation frein FD

L'alimentation de la bobine de frein en c.c. est prévue au moyen d'un redresseur approprié monté à l'intérieur de la boîte à bornes et déjà câblé à la bobine de frein.
De plus, pour les moteurs à simple polarité, le raccordement du redresseur au bornier moteur est prévu de série.
Indépendamment de la fréquence du réseau, la tension standard d'alimentation du redresseur V_B correspond à la valeur indiquée dans le tableau ci-dessous :

(34)

2, 4, 6 P				**1 speed**
	BN_FD V_{mot} ± 10% 3 ~	V_B ± 10% 1 ~	alimentazione freno da morsettiera *brake connected to terminal board power supply* Bremsversorgung über die Motorspannung *Alimentation frein depuis boîte à bornes*	alimentazione separata *separate power supply* Separate Versorgung *Alimentation séparée*
BN 63…BN 132	230/400 V – 50 Hz	230 V	standard	specificare **V_B SA** o **V_B SD** *specify **V_B SA** or **V_B SD*** **V_B SA** oder **V_B SD** angeben *spécifier **V_B SA** ou **V_B SD***

Per i motori a doppia polarità l'alimentazione standard del freno è da linea separata con tensione d'ingresso al raddrizzatore V_B come indicato in tabella:

Switch-pole motors feature a separate power supply line for the brake with rectifier input voltage V_B as indicated in the table:

Die polumschaltbaren Motoren müssen immer mit separater Bremsversorgungsspannung betrieben werden, deshalb erfolgt die Lieferung standardmäßig ohne Anschluß der Bremse an die Motorspannung, da diese mit einer am Eingang des Gleichrichters V_B anliegenden Spannung versorgt werden muß, entsprechend Werte in der nachstehenden Tabelle:

Pour les moteurs à double polarité, l'alimentation standard du frein dérive d'une ligne séparée avec tension d'entrée aredresseur V_B comme indiqué dans le tableau :

(35)

Il raddrizzatore è del tipo a diodi a semionda (Vc.c ≈ 0,45 x Vc.a.) ed è disponibile nelle versioni **NB**, **SB**, **NBR** e **SBR**, come dettagliato nella tabella seguente:

*The diode half-wave rectifier (VDC ≈ 0,45 x VAC) is available in versions **NB**, **SB**, **NBR** e **SBR**, as detailed in the table below:*

Bei dem Gleichrichter handelt es sich um einen Typ mit Halbwellendioden (Vc.c ≈ 0,45 Vc.a.). Er ist in den Versionen **NB**, **SB**, **NBR** und **SBR**, gemäß den Details in der nachstehenden Tabelle, verfügbar:

*Le redresseur est du type à diodes à demi-onde (Vc.c ≈ 0,45 x Vc.a.) et il est disponible dans les versions **NB**, **SB**, **NBR** et **SBR**, comme indiqué de façon détaillée dans le tableau suivant :*

(36)

	Freno *Brake* Bremse Ffrein	**Raddrizzatore** ***Rectifier*** **Gleichrichter** ***Redresseur***	
		standard	A richiesta At request Auf Anfrage *Sur demande*
BN 63	FD 02	**NB**	**SB, SBR, NBR**
BN 71	FD 03 FD 53		
BN 80	FD 04		
BN 90S	FD 14		
BN 90L	FD 05		
BN 100	FD 15		
BN 112	FD 06S	**SB**	**SBR**
BN 132 - 160MR	FD 56 FD 06 FD 07		
BN 160L - BN 180M	FD 08		
BN 180L - BN 200M	FD 09		

Il raddrizzatore **SB** a controllo elettronico dell'eccitazione, riduce i tempi di sblocco del freno sovreccitando l'elettromagnete nei primi istanti d'inserzione, per passare poi al normale funzionamento a semionda a distacco del freno avvenuto.

*Rectifier **SB** with electronic energizing control over-energizes the electromagnet upon power-up to cut brake release response time and then switches to normal half-wave operation once the brake has been released.*

Der Gleichrichter **SB** mit elektronischer Kontrolle der Erregung reduziert die Bremslösezeiten, indem er die Bremsspule in den ersten Momenten der Einschaltung übermäig erregt, um dann, nach erfolgter Bremslösung, in die normale Halbwellenfunktion umzuschalten.

*Le redresseur **SB** à contrôle électronique de l'excitation réduit les temps de déblocage du frein en surexcitant l'électro-aimant durant les premiers instants d'enclenchement pour passer ensuite au fonctionnement normal à demi-onde une fois le frein désactivé.*

L'impiego del raddrizzatore tipo **SB** è sempre da prevedere nei casi di:

- elevato numero di interventi orari
- tempi di sblocco freno ridotti
- elevate sollecitazioni termiche del freno.

Per applicazioni dove è richiesto un rapido rilascio del freno sono disponibili a richiesta i raddrizzatori **NBR** o **SBR**.
Questi raddrizzatori completano i tipi **NB** e **SB**, integrando nel circuito elettronico un interruttore statico che interviene diseccitando rapidamente il freno in caso di mancanza di tensione.
Questa soluzione consente di ridurre i tempi di rilascio del freno evitando ulteriori cablaggi e contatti esterni.
Per il migliore utilizzo dei raddrizzatori **NBR** e **SBR** è richiesta l'alimentazione separata del freno.
Tensioni disponibili: 230V ± 10%, 400V ± 10%, 50/60 Hz.

*Use of the **SB** rectifier is mandatory in the event of:*

- *high number of operations per hour*
- *reduced brake release response time*
- *brake is exposed to extreme thermal stress.*

*Rectifiers **NBR** or **SBR** are available for applications requiring quick brake release response.*
*These rectifiers complement the **NB** and **SB** types as their electronic circuit incorporates a static switch that de-energizes the brake quickly in the event voltage is missing.*
This arrangement ensures short brake release response time with no need for additional external wiring and contacts.
*Optimum performance of rectifiers **NBR** and **SBR** is achieved with separate brake power supply.*
Available voltages: 230V ± 10%, 400V ± 10%, 50/60 Hz.

Der Einsatz eines Gleichrichters vom Typ **SB** wird in folgenden Fällen empfohlen:

- hohe Anzahl von Schaltungen pro Stunde
- schnelle Bremsansprechzeiten
- starke thermische Beanspruchungen der Bremse.

Für die Anwendungen, bei denen eine schnelle Ansprechzeit der Bremse gefordert wird, können auf Anfrage die Gleichrichter **NBR** oder **SBR** geliefert werden. Diese Gleichrichter erweitern die Funktion der Typen **NB** und **SB**, indem in dem elektronischen Schaltkreis ein statischen Schalter integriert ist, durch dessen Auslösen die Bremse im Fall eines Spannungsausfalls schnell abgeregt wird. Diese Lösung ermöglicht eine Verringerung der Ansprechzeiten der Bremse, wodurch weitere Schaltungen und externe Sensoren vermieden werden können. Im Hinblick auf einen besseren Einsatz der Gleichrichter **NBR** und **SBR** ist bei der Bremse eine separate Versorgung erforderlich.
Verfügbare Spannungen: 230V ± 10%, 400V ± 10%, 50/60 Hz.

*L'utilisation du redresseur type **SB** doit toujours être prévue dans les cas suivants:*

- *nombre d'interventions horaires élevé*
- *temps de déblocage frein réduits*
- *sollicitations thermiques du frein élevées.*

*Pour les applications nécessitant un déblocage rapide du frein, sur demande les redresseurs **NBR** ou **SBR** sont disponibles.*
*Ces redresseurs complètent les types **NB** et **SB**, en intégrant dans le circuit électronique un interrupteur statique qui intervient en désexcitant rapidement le frein en cas de coupure de tension.*
Cette solution permet de réduire les temps de déblocage du frein en évitant d'autres câblages et contacts extérieurs.
*Pour une meilleure utilisation des redresseurs **NBR** et **SBR** l'alimentation séparée du frein est nécessaire.*
Tensions disponibles : 230V ± 10%, 400V ± 10%, 50/60 Hz.

- Dati tecnici freni FD

Nella tabella sottostante sono riportati i dati tecnici dei freni in c.c. tipo FD.

- FD brake technical specifications

The table below reports the technical specifications of DC brakes FD.

- Technische Daten - Bremstyp FD

In der nachstehenden Tabelle werden die technischen Daten der Gleichstrombremsen vom Typ FD angegeben.

- Caractéristiques techniques freins FD

Le tableau suivant indique les caractéristiques techniques des freins en c.c. type FD.

Legenda:

t_1 = tempo di rilascio del freno con alimentatore a semionda

t_{1s} = tempo di rilascio del freno con alimentatore con sovraeccitaz.

t_2 = ritardo di frenatura con interruzione lato c.a. e alimentazione separata

t_{2c} = ritardo di frenatura con interruzione lato c.a. e c.c. I valori di t_1, t_{1s}, t_2, t_{2c}, indicati nella tabella (37) sono riferiti al freno tarato alla coppia massima, traferro medio e tensione nominale.

W_{max} = energia max per frenata

W = energia di frenatura tra due regolazioni successive

P_b = potenza assorbita dal freno a 20°C

M_b = coppia frenante statica (± 15%)

c/h = avviamenti orari

Key:

t_1 = *brake release time with half-wave rectifier*

t_{1s} = *brake release time with over-energizing rectifier*

t_2 = *brake engagement time with AC line interruption and separate power supply*

t_{2c} = *brake engagement time with AC and DC line interruption – Values for t_1, t_{1s}, t_2, t_{2c} indicated in the tab. (37) are referred to brake set at maximum torque, medium air gap and rated voltage*

W_{max} = *max energy per brake operation*

W = *braking energy between two successive air gap adjustments*

P_b = brake power absorption at 20 °C

M_b = *static braking torque (± 15%)*

c/h = *starts per hour*

Legende:

t_1 = Ansprechzeit der Bremse mit Halbwellengleichrichter

t_{1s} = Ansprechzeit der Bremse mit elektronisch gesteuerten Erregungsgleichrichter

t_2 = Bremsverzögerung mit Unterbrechung auf Wechselstromseite und Fremdversorgung

t_{2c} = Bremsverzögerung mit Unterbrechung auf Wechselstrom- und Gleichstromseite – Die in der Tab. (37) angegebenen Werte t_1, t_{1s}, t_2, t_{2c}, beziehen sich auf eine auf das max. Bremsmoment geeichte Bremse, mit mittlerem Luftspalt und Nennspannung.

W_{max} = max. Energie pro Bremsung

W = Bremsenergie zwischen zwei Einstellungen des Luftspalts

P_b = bei 20° C von der Bremse aufgenommene Leistung (50 Hz)

M_b = statisches Bremsmoment (± 15%)

c/h = Schaltungen pro stunde

Légende:

t_1 = *temps de déblocage du frein avec dispositif d'alimentation à demi-onde*

t_{1s} = *temps de déblocage du frein avec dispositif d'alimentation à contrôle électronique de l'excitation*

t_2 = *retard de freinage avec interruption côté c.a. et alimentation séparée*

t_{2c} = *retard de freinage avec interruption côté c.c.Les valeurs de t_1, t_{1s}, t_2, t_{2c}, indiquées dans le tab. (37) se réfèrent au frein étalonné au couple maximal, entrefer moyen et tension nominale.*

W_{max} = *énergie max. par freinage*

W = *énergie de freinage entre deux réglages successifs de l'entrefer*

P_b = *puissance absorbée par le frein à 20 °C*

M_b = *couple de freinage statique (± 15%)*

c/h = *démarrages horaires*

- Collegamenti freno FD

I motori standard ad una velocità sono forniti con il collegamento del raddrizzatore alla morsettiera motore già realizzato in fabbrica.

Per motori a 2 velocità, e dove è richiesta l'alimentazione del freno separata, prevedere il collegamento al raddrizzatore in accordo alla tensione freno V_B indicata nella targhetta del motore.

Data la natura induttiva del carico, per il comando del freno e per l'interruzione lato corrente continua devono essere utilizzati contatti con categoria d'impiego AC-3 secondo IEC 60947-4-1.

- FD brake connections

On standard single-pole motors, the rectifier is connected to the motor terminal board at the factory.

For switch-pole motors and where a separate brake power supply is required, connection to rectifier must comply with brake voltage V_B stated in motor name plate.

Because the load is of the inductive type, brake control and DC line interruption must use contacts from the usage class AC-3 to IEC 60947-4-1.

- Anschlüsse - Bremstyp FD

Die einpoligen Motoren werden vom Werk ab mit an die Motorspannung angeschlossenem Gleichrichters geliefert. Für die polumschaltbaren Motoren, und Bremse mit separater Versorgung, wird in Übereinstimmung mit der auf dem Typenschild des Motors angegebenen Bremsspannung V_B der Anschluss an den Gleichrichter vorgesehen.

Da es sich bei der Bremsleistung um eine induktive Kraft handelt, müssen gemäß IEC 60947-4-1 für die Steuerung der Bremse und die Unterbrechung der Gleichstromseite Kontakte der Kategorie AC-3 verwendet werden.

- Raccordements frein FD

Les moteurs standard à une vitesse sont fournis avec le raccordement du redresseur au bornier moteur déjà réalisé en usine.

Pour les moteurs à 2 vitesses, et lorsqu'une alimentation séparée du frein est requise, prévoir le raccordement au redresseur conformément à la tension frein V_B indiquée sur la plaque signalétique du moteur.

Etant donné la nature inductive de la charge, pour la commande du frein et l'interruption côté courant continu, il est nécessaire d'utiliser des contacts avec catégorie d'utilisation AC-3 selon la norme IEC 60947-4-1.

Tabella (38) - Alimentazione freno dai morsetti motore ed interruzione lato a.c.
Tempo di arresto t_2 ritardato e funzione delle costanti di tempo del motore.
Da prevedere quando sono richiesti avviamenti/arresti progressivi.

Tabella (39) – Bobina freno con alimentazione separata ed interruzione lato c.a.
Tempo di arresto normale ed indipendente dal motore.

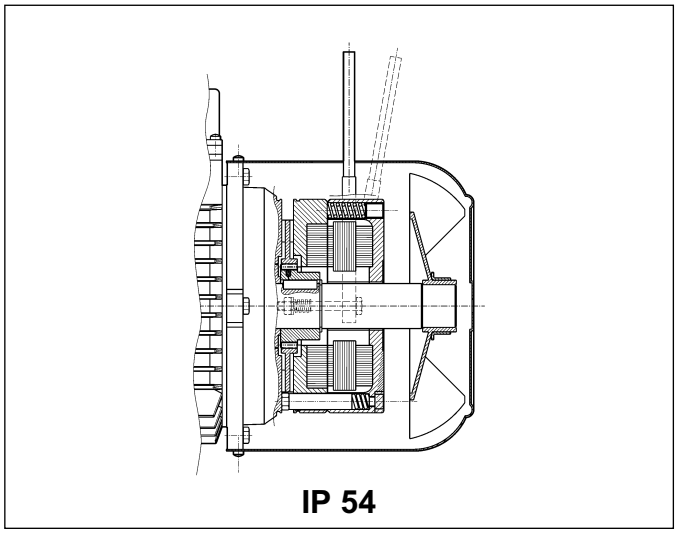
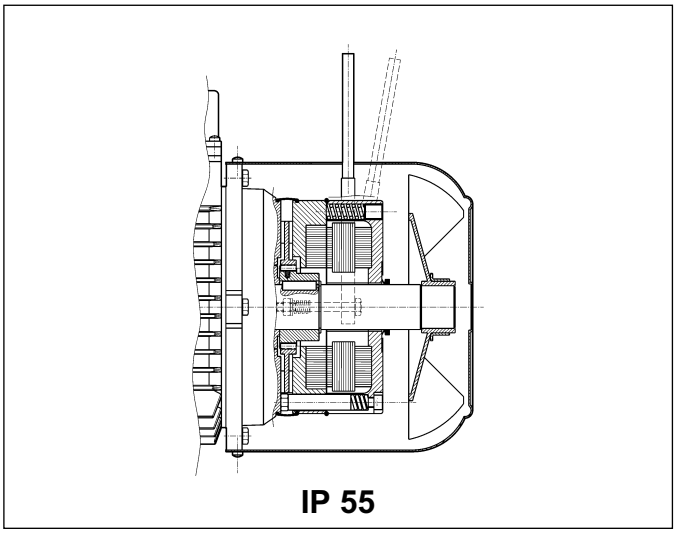
(42)



IP 54

(43)



IP 55

Freno elettromagnetico con alimentazione in **corrente alternata** trifase, fissato con viti allo scudo motore; le molle di precarico realizzano il posizionamento assiale del corpo magnete.
Il disco freno è scorrevole assialmente sul mozzo trascinatore in acciaio calettato sull'albero e previsto di molla antivibrazione.
La coppia frenante è preimpostata in fabbrica su valori che sono indicati nelle tabelle dati tecnici dei relativi motori.
L'azione del freno è inoltre modulabile, regolando con continuità la coppia frenante, tramite le viti che realizzano il precarico delle molle; il campo di regolazione della coppia è: 30% $M_{bMAX} < M_b < M_{bMAX}$ (M_{bMAX} è il momento frenante max riportato in tab. (46).
Il freno tipo FA presenta dinamiche molto elevate che lo rendono idoneo in applicazioni dove sono richieste frequenze di avviamento elevate con tempi d'intervento molto rapidi.
A richiesta, i motori possono essere previsti di leva per lo sblocco manuale con ritorno automatico (R). Per la specifica della posizione angolare della leva vedi relativa variante alla pag. 34.

*Electromagnetic brake operates from three-phase **alternated current** power supply and is bolted onto conveyor shield. Preloading springs provide axial positioning of magnet body.*
Steel brake disc slides axially on steel hub shrunk onto motor shaft with anti-vibration spring.
Brake torque factory setting is indicated in the corresponding motor rating charts.
Spring preloading screws provide stepless braking torque adjustment. Torque adjustment range is 30% $M_{bMAX} < Mb < M_{bMAX}$ (where M_{bMAX} is maximum braking torque as shown in tab. (46).
Thanks to their high dynamic characteristics, FA brakes are ideal for heavy-duty applications as well as applications requiring frequent stop/starts and very fast response time.
Motors may be equipped with manual release lever with automatic return (R) at request. See variants at page 34 for available lever locations.

Elektomagnetische Bremse mit **Drehstromversorgung**, die mittels Schrauben am hinteren Motorschild befestigt ist. Die Federn sorgen dabei für die axiale Ausrichtung des Magnetkörpers. Die Bremsscheibe (Stahl) gleitet axial auf dem sich auf dem Rotor befindlichen Mitnehmer, der über eine Paßfeder mit Motorwelle verbunden und mit einer Schwingungsdämpffeder ausgestattet ist. as Bremsmoment wird auf das entsprechende Motormoment eingestellt (siehe Tabelle der technischen Daten der entsprechenden Motoren). Das Bremsmoment ist stufenlos durch über die Schrauben die die Federvorspannung einstellbar. Der Einstellbereich beträgt 30% $Mb_{MAX} < Mb < Mb_{MAX}$ (Mb_{MAX} steht für den max. Bremsmoment, der in der Tab (46) angegeben wird). Die Bremse vom Typ FA zeichnet sich durch ihre hohen Dynamik aus, weshalb sie für Anwendungen geeignet sind, in denen hohe Schaltfrequenzen und schnelle Ansprechzeiten gefordert werden.
Auf Anfrage können die Motoren mit einem Lüfterhebel für die manuelle Lüftung der Bremse mit automatischer Rückstellung (R) geliefert werden. Die Angabe der Montageposition erfolgt über die Angabe der Option auf Seite 34.

*Frein électromagnétique avec alimentation en **courant alternatif** triphasé, fixé avec des vis au bouclier ; les ressorts de précharge réalisent le positionnement axial de la bobine.*
Le disque frein coulisse de façon axiale sur le moyeu d'entraînement en acier, calé sur l'arbre et doté de ressort antivibration.
Le couple de freinage est préréglé en usine aux valeurs qui sont indiquées dans les tableaux des caractéristiques techniques des moteurs correspondants. De plus, l'action du frein est modulable, en réglant le couple de freinage en continu au moyen des vis qui réalisent la précharge des ressorts ; la plage de réglage du couple est de 30% $M_{bMAX} < Mb < M_{bMAX}$ (M_{bMAX} est le couple de freinage maximum indiqué dans le tab. (46).
Le frein type FA présente des caractéristiques dynamiques très élevées, il est donc adapté pour des applications nécessitant des fréquences de démarrage élevées et des temps d'intervention très rapides.
Sur demande, les moteurs peuvent être prévus avec levier pour le déblocage manuel avec retour automatique (R). Pour la spécification de la position angulaire du levier, voir variante page 34.

- Grado di protezione

L'esecuzione standard prevede il grado di protezione IP54.

In opzione, il motore autofrenante BN_FA viene fornito con grado di protezione **IP 55** prevedendo le seguenti varianti costruttive:

- anello V-ring posizionato sull'albero motore N.D.E.
- fascia di protezione in gomma
- anello o-ring

- Degree of protection

Standard protection is IP54.

*Brake motor BN_FA is also available in protection **IP 55**, which mandates the following variants:*

- V-ring at N.D.E. of motor shaft

- rubber boot

- O-ring

- Schutzart

Die Standardausführung ist Schutzart IP54 vor.

Optional kann der Bremsmotor BN_FA auch in der Schutzart IP 55 geliefert werden, was durch die folgenden zusätzlichen Bauteile erreicht wird:

- V-Ring an der Motorwelle N.D.E.
- Schutzring aus Gummi
- O-Ring

- Degré de protection

L'exécution standard prévoit le degré de protection IP54.
*En option, le moteur frein BN_FA est fourni avec degré de protection **IP 55**, les variations de construction suivantes sont prévues :*

- bague V-ring positionné sur l'arbre moteur N.D.E.

- bande de protection en caoutchouc

- joint torique

- Alimentazione freno FA

Nei motori a singola polarità l'alimentazione della bobina freno è derivata direttamente dalla morsettiera motore e la tensione del freno quindi coincide con la tensione del motore. In questo caso la tensione del freno può essere omessa dalla designazione.

Per i motori a doppia polarità, e per i motori con alimentazione separata del freno, è presente una morsettiera ausiliaria con 6 terminali per il collegamento alla linea del freno. In entrambi i casi il valore di tensione del freno dovrà essere specificato in designazione.
Nella tabella seguente sono riportate le condizioni di alimentazione standard del freno in c.a. per i motori a singola e doppia polarità:

- FA brake power supply

In single-pole motors, power supply is brought to the brake coil direct from the motor terminal box. As a result, brake voltage and motor voltage are the same. In this case, brake voltage indication may be omitted in the designation.

Switch-pole motors and motors with separate brake power supply feature an auxiliary terminal board with 6 terminals for connection to brake line. In both cases, brake voltage indication in the designation is mandatory.

The following table reports standard AC brake power supply ratings for single- and switch-pole motors:

- Stromversorgung - Bremstyp FA

Bei den einpoligen Motoren wird die Versorgung der Bremsspule direkt vom Motorklemmenkasten abgenommen, das bedeutet, dass die Spannung der Bremse mit der Motorspannung übereinstimmt. In diesem Fall braucht die Bremsenspannung nicht extra angegeben werden.

Für die polumschaltbaren Motoren und für eine separate Bremsversorgung ist eine Hilfsklemmenleiste mit 6 Anschlüssen vorgesehen, die einen Anschluß der Bremse ermöglichen. In beiden Fällen muss die Bremspannung in der Bestellung angegeben werden.
In der nachstehenden Tabelle werden für die einpoligen und die polumschaltbaren Motoren die Standardspannungen der Wechselstrombremsen angegeben:

- Alimentation frein FA

Sur les moteurs à simple polarité, l'alimentation de la bobine frein dérive directement du bornier moteur, par conséquent, la tension du frein coïncide avec la tension du moteur. Dans ce cas, la tension du frein peut être omise de la désignation.

Pour les moteurs à double polarité et les moteurs avec alimentation séparée du frein, une boîte à bornes auxiliaire avec 6 bornes pour le raccordement à la ligne du frein, est présente. Dans les deux cas, la valeur de tension du frein doit être spécifiée dans la désignation.
Le tableau suivant indique les conditions d'alimentation standard du frein en c.a. pour les moteurs à simple et double polarité :

(44)

Motori a singola polarità ***Single-speed motors*** **Einpolige Motoren** ***Moteurs à simple polarité***	**BN 63 ... BN 132**	**BN 160 ... BN 180 M**
	230Δ / 400Y V ±10% – 50 Hz	400Δ / 690Y V ±10% – 50 Hz
	265Δ / 460Y V ±10% - 60 Hz	460Δ V – 60 Hz

(45)

Motori a doppia polarità (alimentazione da linea separata) ***Switch-speed motors*** *(separate power supply line*) **Polumschaltbare Motoren** (separate Versorgung) ***Moteurs à double polarité*** *(alimentation depuis ligne séparée)*	**BN 63 ... BN 132**
	230Δ / 400Y V ±10% – 50 Hz
	460Y V – 60 Hz

Su richiesta, sono disponibili tensioni speciali, nel campo 24…690 V, 50... 60 Hz.

Special voltages in the 24…690 V, 50... 60 Hz range are available at request.

Auf Anfrage können Sonderspannungen von 24…690 V, 50... 60 Hz geliefert werden.

Sur demande, des tensions spéciales sont disponibles dans la plage 24…690 V, 50... 60 Hz.

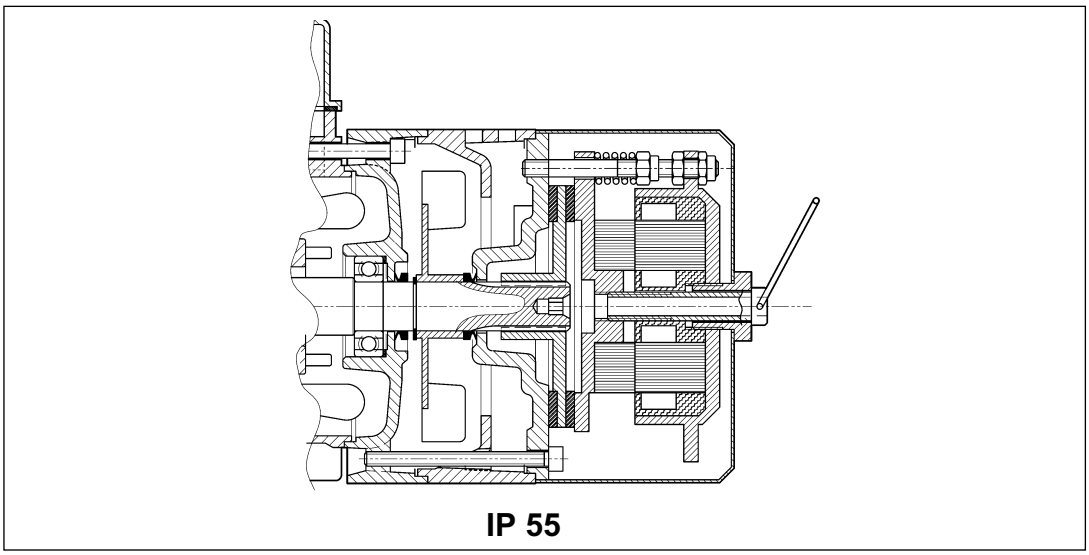
(49)



IP 55

Freno elettromagnetico con alimentazione in **corrente alternata** trifase, fissato con viti allo scudo convogliatore.
Disco freno in acciaio scorrevole assialmente sull'albero motore scanalato (mozzo trascinatore in acciaio calettato sull'albero per grandezza 132).
I motori sono forniti con freno tarato alla massima coppia. La coppia freno è regolabile con continuità agendo sulle viti di compressione delle molle; il campo di regolazione consentito è 30% $M_{bMAX} < M_b < M_{bMAX}$ (M_{bMAX} è il momento frenante max riportato in tab. (52).
Di serie i motori sono forniti completi di vite per lo sblocco manuale del freno, con mantenimento della posizione di rilascio per consentire la rotazione dell'albero motore.
La vite di sblocco deve essere smontata dopo l'utilizzo per assicurare il corretto funzionamento del freno ed evitare situazioni potenzialmente pericolose.
Il freno BA, oltre alle elevate caratteristiche dinamiche tipiche dei freni in corrente alternata, presenta una costruzione robusta con energia di frenatura aumentata che lo rendono particolarmente idoneo a servizi pesanti oltre che in applicazioni dove sono richieste frequenze di manovra elevate e tempi d'intervento molto rapidi.

*Electromagnetic brake operates from three-phase **alternated current** power supply and is bolted onto conveyor shield.*
Steel brake disc slides axially on splined motor shaft (steel drive hub is shrunk onto shaft on frame size 132).
Factory setting is maximum brake torque.
Step less braking torque adjustment by screws which compress the brake springs. Allowed adjustment range is 30% $M_{bMAX} < M_b < M_{bMAX}$ (M_{bMAX} is maximum braking torque as shown in tab. (52).
Motors are supplied complete with manual brake release screw as standard. Screw may be locked in the release position to allow for motor shaft rotation.
The brake release screw must be removed after use to ensure proper brake operation and avoid potentially dangerous conditions.
In addition to the high dynamic characteristics typical of AC brakes, a sturdy design and increased braking energy make the BA brake ideal for heavy-duty applications as well as applications requiring frequent stop/starts and very fast response time.

Elektomagnetische Bremse mit Drehstromversorgung, die mittels Schrauben am Motorschild des Motors befestigt ist. Die Bremsscheibe (Stahl) gleitet axial auf der Rotorwelle (bei Baugröße 132 über einem auf die Welle aufgezogenem Mitnehmer aus Stahl). Die Motoren werden mit einer auf das maximale Drehmoment des Motors eingestellten Bremse geliefert. Das Bremsdrehmoment ist durch Betätigen der Federdruckschrauben stufenlos regelbar. Der zulässige Einstellbereich beträgt 30% $M_{bMAX} < M_b < M_{bMAX}$ (M_{bMAX} steht für den max. Bremsmoment, das in der Tab. (52) angegeben wird.
Die Motoren werden serienmäßig mit einer Schraube zur manuelle Bremslüftung geliefert; die arretierbar ist, um ein Drehen der Motorwelle zu ermöglichen.
Diese Schraube muss im Betrieb des Motors wieder abmontiert werden, damit die korrekte Funktion der Bremse gesichert ist Die Bremse vom Typ BA zeichnet sich durch ihre dynamischen Eigenschaften und die robuste Bauweise aus, durch die sie eine erhöhte Bremsenergie abzugeben kann. Diese Bremstypen eignen sich besonders für einen Einsatz unter harten Bedingungen und überall dort, wo häufige Schaltfrequenzen und schnelle Ansprechzeiten gefordert werden.

*Frein électromagnétique avec alimentation en **courant alternatif** triphasé, fixé avec des vis au bouclier.*
Disque frein en acier coulissant de façon axiale sur l'arbre moteur rainuré (moyeu d'entraînement en acier calé sur l'arbre pour la taille 132).
Les moteurs sont fournis avec frein étalonné au couple maximal. Le couple de freinage est réglable en continu en intervenant sur les vis de compression des ressorts ; la plage de réglage autorisé est de 30% $M_{bMAX} < M_b < M_{bMAX}$ (M_{bMAX} étant le couple de freinage maximum indiqué dans le tab. (52).
De série, les moteurs sont fournis avec vis de déblocage manuel du frein, avec maintien de la position de relâchement afin de permettre la rotation de l'arbre moteur.
La vis de déblocage doit être démontée après utilisation afin de garantir le fonctionnement correct du frein et d'éviter les situations potentiellement dangereuses. Le frein BA, outre les caractéristiques dynamiques élevées typiques des freins en courant alternatif, est de fabrication robuste avec énergie de freinage majorée, ce qui le rend particulièrement adapté pour les services difficiles ainsi que pour les applications nécessitant des fréquences de manœuvre élevées et des temps d'intervention très rapides.

- Grado di protezione

È disponibile un'unica esecuzione, con grado di protezione IP55.

- Degree of protection

Only available with degree of protection IP55.

- Schutzart

Es ist eine nur die Ausführung in Schutzklasse IP55 verfügbar.

- Degré de protection

Il est disponible en une exécution unique, avec degré de protection IP55.

- Alimentazione freno BA

Nei motori a singola polarità l'alimentazione della bobina freno è derivata direttamente dalla morsettiera motore e la tensione del freno quindi coincide con la tensione del motore. In questo caso la tensione del freno può essere omessa dalla designazione.
Per i motori a doppia polarità, e per i motori con alimentazione separata del freno, è presente una morsettiera ausiliaria con 6 terminali per il collegamento alla linea del freno. In entrambi i casi il valore di tensione del freno dovrà essere specificato in designazione.
Nella tabella seguente sono riportate le condizioni di alimentazione standard del freno in c.a. per i motori a singola e doppia polarità:

- BA brake power supply

In single-pole motors, power supply is brought to the brake coil direct from the motor terminal box. As a result, brake voltage and motor voltage are the same. In this case, brake voltage indication may be omitted in the designation.
Switch-pole motors and motors with separate brake power supply feature an auxiliary terminal board with 6 terminals for connection to brake line. In both cases, brake voltage indication in the designation is mandatory.
The following table reports standard AC brake power supply ratings for single- and switch-pole motors:

- Stromversorgung - Bremstyp BA

Bei den einpoligen Motoren wird die Versorgung der Bremsspule direkt vom Motorklemmenkasten abgezweigt, das bedeutet also, dass die Spannung der Bremse mit der Motorspannung übereinstimmt. In diesem Fall braucht die Bremsenspannung nicht extra angegeben werden. Für polumschaltbaren Motoren und für eine separate Bremsversorgung ist eine Hilfsklemmenleiste mit 6 Anschlüssen vorgesehen, die einen Anschluss der Bremse ermöglichen. In beiden Fällen muss die Bremsspannung bei der Bestellung angegeben werden.
In der nachstehenden Tabelle werden für die einpoligen und die polumschaltbaren Motoren die Standardversorgung der Wechselstrombremsen angegeben.

- Alimentation frein BA

Sur les moteurs à simple polarité, l'alimentation de la bobine frein dérive directement du bornier moteur, par conséquent, la tension du frein coïncide avec la tension du moteur. Dans ce cas, la tension du frein peut être omise de la désignation.
Pour les moteurs à double polarité et les moteurs avec alimentation séparée du frein, un boîte à bornes auxiliaire avec 6 bornes pour le raccordement au réseau du frein, est présente. Dans les deux cas, la valeur de tension du frein doit être spécifiée dans la désignation.
Le tableau suivant indique les conditions d'alimentation standard du frein en c.a. pour les moteurs à simple et double polarité :

(50)

Motori a singola polarità ***Single-speed motors*** **Einpolige Motoren** ***Moteurs à simple polarité***	**BN 63 ... BN 132**
	230Δ / 400Y V ± 10% – 50 Hz
	265Δ / 460Y ± 10% - 60 Hz

(51)

Motori a doppia polarità (alimentazione da linea separata) ***Switch-pole motors*** *(separate power supply line*) **Polumschaltbare Motoren** (separate Versorgung) ***Moteurs à double polarité*** *(alimentation depuis ligne séparée)*	**BN 63 ... BN 132**
	230Δ / 400Y V ± 10% – 50 Hz
	460Y – 60 Hz

Se non diversamente specificato, l'alimentazione standard del freno è 230Δ /400Y V - 50 Hz.
Su richiesta, sono disponibili tensioni speciali, nel campo 24…690 V, 50... 60 Hz.

Unless otherwise specified, standard brake power supply is 230Δ /400Y V - 50 Hz.
Special voltages in the 24…690 V, 50... 60 Hz range are available at request.

Falls nicht anderweitig angegeben, beträgt die Standardversorgung der Bremse 230Δ /400Y V - 50 Hz.
Auf Anfrage können Sonderspannungen von 24…690 V, 50... 60 Hz geliefert werden.

Sauf spécification contraire, l'alimentation standard du frein est 230Δ /400Y V - 50 Hz.
Sur demande, des tensions spéciales sont disponibles dans la plage 24…690 V, 50... 60 Hz.

N.B.:

1) Queste dimensioni sono riferite alla seconda estremità d'albero.
2) Per freno FD07 quota R=226

L'esagono ES non è presente con l'opzione PS

NOTE:

1) These values refer to the rear shaft end.
2) For FD07 brake value R=226

ES hexagon is not supplied with PS option

HINWEIS:

1) Diese Maße betreffen das zweite Wellenende
2) Für Bremse FD07, Maß R=226

Der Sechskant ES ist bei der Option PS nicht vorhanden.

REMARQUE :

1) Ces dimensions se réfèrent à la deuxième extrémité de l'arbre
2) Pour frein FD07 valeur R=226

L'hexagone ES n'est pas disponible avec l'option PS

N.B.:

1) Queste dimensioni sono riferite alla seconda estremità d'albero.
2) Per freno FD07 quota R=226

Per la versione BN..FA le dimensioni della scatola morsettiera AD, AF, LL, V sono uguali al tipo BN..FD.

L'esagono ES non è presente con l'opzione PS.

NOTE:

1) These values refer to the rear shaft end.
2) For FD07 brake value R=226

For motors type BN..FA, the terminal box sizes AD, AF, LL, V are the same as for BN..FD.

ES hexagon is not supplied with PS option.

HINWEIS:

1) Diese Maße betreffen das zweite Wellenende
2) Für Bremse FD07, Maß R=226

Bei der Motor typ BN..FA sind die Maße des Klemmenkastens AD, AF, LL, V denen der Version BN..FD gleich.

Der Sechskant ES ist bei der Option PS nicht vorhanden.

REMARQUE :

1) Ces dimensions se réfèrent à la deuxième extrémité de l'arbre
2) Pour frein FD07 valeur R=226

Pour moteurs type BN..FA les dimensions de la boîte à bornes AD, AF, LL, V sont les mêmes de BN..FD.

L'hexagone ES n'est pas disponible avec l'option PS.

Revisioni
Le edizioni dei cataloghi che subiscono revisioni, riportano al centro in basso delle pagine che hanno subito delle modifiche, il relativo ultimo indice di revisione. L'elenco delle pagine interessate alle relative revisioni è a pag.40.
L'indice di revisione del catalogo è riportato nella IVa di copertina in basso al centro.

Revisions
For catalogue editions that include revised material, the latest relevant revision index is shown at bottom centre of the modified pages. The list of pages with revisions is shown on page 40. The index of catalogue revisions appears at bottom centre of back cover page.

Änderungen
Der Änderungstatus ist auf jedem Blatt unten, in der Mitte enthalten. Auf Seite 40 ist eine Übersicht der berichtigten Seiten enthalten. Die Änderung des Katalogs ist auf der letztch. Seite des Einbands unten in der Mitte sichtlich.

Révisions
Les éditions des catalogues qui subissent des révisions présentent au centre, du bas des pages ayant subi des modifications, le dernier indice de révision. La liste des pages concernées par les révisions se trouve page 40. L'indice de révision du catalogue se trouve à la IVème page de couverture en bas au centre.

Il Gruppo Bonfiglioli, sensibile ai problemi dell'ambiente e all'ecologia, ha realizzato le pagine di questo catalogo in carta raciclata.

Bonfiglioli Group, in its commitment to environment to environmental preservation, have printed these pages on recycled paper.

Die Gruppe Bonfiglioli denkt umweltbewußt: Vorliegender Katalog ist auf Altpapier gedruckt.

Le Groupe Bonfiglioli, sensible aux problèmes de préservation de l'environnement, a imprimé ce catalogue sur du papier recyclé.

1 - CONDIZIONI DI FORNITURA

I riduttori vengono forniti come segue:

a) già predisposti per essere installati nella posizione di montaggio come definito in fase di ordine;

b) **senza olio lubrificante ed internamente protetti con un film d'olio usato per il collaudo finale (tipo SHELL ENSIS OIL N);**

c) verniciati con vernice di fondo antiossidante all'acqua di colore grigio (tipo Idrayon Primer-Ral 7042/C441).
Le superfici di accoppiamento non sono verniciate.
La verniciatura finale è a cura del cliente;

d) collaudati secondo specifiche interne;

e) appositamente imballati;

f) provvisti di dadi e bulloni per montaggio motori elettrici versione IEC;

g) già provvisti di lubrificante per quelli a lubrificazione permanente.

1 - SUPPLY CONDITIONS

Gearboxes are supplied as follows:

a) ready for installation in the mounting position specified on order;

*b) **dry; inner parts are protected by a film of the oil used for final testing (type SHELL ENSIS OIL N);***

c) painted with antioxidant water primer in the colour grey (type Idrayon Primer-Ral 7042/C441).
Mating surfaces are not painted.
Final coat is to be applied by the Customer;

d) tested to in-house specifications;

e) suitably packed;

f) complete with mounting nuts and bolts for IEC electric motors;

g) life-lubed gearboxes are factory filled with oil.

1 - LIEFERBEDINGUNGEN

Die Getriebe werden folgendermaßen geliefert:

a) bereits für die Installation in der Einbaulage gemäß Auftrag bereit;

b) **ohne Schmieröl und innen mit einem Öl, das für die Endabnahmeprüfung verwendet wurde, überzogen (Typ SHELL ENSIS OIL N);**

c) mit einer grauen, vor Oxydation durch Wasser schützenden Grundlackierung überzogen (Typ Idrayon Primer Ral 7042/C441).
Die Verbindungsflächen sind nicht lackiert.
Die Endlackierung geht zu Lasten des Kunden;

d) gemäß werksinterner Spezifikationen geprüft;

e) in angemessener Weise verpackt;

f) mit Muttern und Schrauben für die Montage an Elektromotoren der Version IEC;

g) die mit Dauerschmierung, bereits mit Schmiermittel ausgestattet.

1 - CONDITIONS DE LIVRAISON

Les réducteurs sont livrés comme suit:

a) déjà adaptés pour l'installation dans la position d'assemblage définie en cours de commande;

*b) **sans huile lubrifiante et protégés à l'intérieur avec un film d'huile utilisée lors de l'essai final (type SHELL ENSIS OIL N);***

c) peints avec une couche de fond de protection antioxydant à l'eau, de coloris gris (type idrayon Primer-Ral 7042/C441).
Les surfaces d'accouplement ne sont pas peintes.
La peinture de finition doit être réalisée par le client;

d) essayés d'après les spécifications internes;

e) dûment emballés;

f) pourvus d'écrous et de boulons pour l'assemblage aux moteurs électriques, version CEI;

g) déjà pourvus de lubrifiant pour ceux à lubrification permanente.

TRASPORTO

Durante il trasporto è norma trattare i riduttori come merce delicata per evitare danni.
Durante i trasporti interni dei riduttori sballati, evitare che questi prendano urti per non danneggiare parti esterne delicate.

SHIPMENT

Always handle gearboxes as fragile goods during shipment.
When moving unpacked gearboxes inside your factory, ensure that they are not subjected to impacts which could damage delicate external components and surfaces.

TRANSPORT

Während dem Transport empfiehlt es sich, die Getriebe mit Sorgfalt und Vorsicht zu behandeln, um Schäden zu vermeiden.
Beim werksinternen Transport der schon ausgepackten Getriebe sollte vermieden werden, dass diese Schläge oder Stösse erleiden, welche empfindliche äussere Teile beschädigen könnten.

TRANSPORT

Durant le transport, il est nécessaire de traiter les réducteurs comme des produits délicats, afin d'éviter tout dommage.
Durant les transports internes des réducteurs déballés, éviter que ces derniers ne subissent des chocs pour ne pas endommager les parties externes sensibles.

STOCCAGGIO

Il corretto stoccaggio dei prodotti ricevuti richiede l'esecuzione delle seguenti attività:

a) Escludere aree all'aperto, zone esposte alle intemperie o con eccessiva umidità;

b) Interporre sempre tra il pavimento ed i prodotti, pianali lignei o di altra natura, atti ad impedire il diretto contatto col suolo;

c) Per periodi di stoccaggio superiori ai 60 giorni, le superfici interessate agli accoppiamenti quali flange, alberi e giunti, devono essere protette con idoneo prodotto antiossidante (SHELL ENSIS FLUID SDC od equivalente);

d) Per periodi di stoccaggio previsti superiori ai 6 mesi, i prodotti devono essere oggetto delle seguenti attività:

d1) Ricoprire le parti lavorate esterne e quelle di accoppiamento con grasso atto ad evitare ossidazioni;

d2) Posizionare i riduttori con il tappo di sfiato nella posizione più alta e riempirli di olio ad eccezione di quelli con lubrificazione permanente .
I riduttori, prima del loro utilizzo, dovranno essere riempiti con la corretta quantità e tipo di lubrificante previsto (vedi pag.35-36)

STORAGE

Observe the following instructions to ensure correct storage of delivered products:

a) Do not store outdoors, in areas exposed to weather or with excessive humidity;

b) Always place boards in wood or other material between floor and products, to avoid direct contact with the floor;

c) For storage periods of over 60 days, all machined surfaces such as flanges, shafts and couplings must be protected with a suitable antioxidation product (SHELL ENSIS FLUID SDC or equivalent product);

d) The following measures must be taken in respect of products for which the expected storage period exceeds 6 months:

d1) Cover outer machined parts and mating parts with grease to avoid oxidation;

d2) Position the gearboxes with the breather plug up and fill them with oil (this does not apply to life-lubed gearboxes).
Before use, the gearboxes should be filled with the proper amount of lubricant of the recommended type (page 35-36).

LAGERUNG

Die korrekte Lagerung der Antriebe erfordert folgende Vorkehrungen:

a) Die Produkte nicht im Freien lagern und nicht in Räumen, die der Witterung ausgesetzt sind, oder eine hohe Feuchtigkeit aufweisen;

b) Die Produkte nie direkt auf dem Boden, sondern auf Unterlagen aus Holz oder einem anderen Material lagern;

c) Bei Lagerzeiten von mehr als 60 Tagen die Oberflächen für die Verbindung, wie Flansche, Wellen oder Kupplungen mit einem geeigneten Oxidationsschutzmittel behandeln (SHELL ENSIS FLUID SDC oder ein äquivalentes Mittel);

d) Bei Lagerzeiten von mehr als 6 Monaten müssen folgende Vorkehrungen getroffen werden:

d1) Die bearbeiteten Außenteile und die Passflächen mit Oxydationschutzfett abdecken;

d2) Die Getriebe mit der Entlüftungsschraube in der obersten Position ausgerichtet aufstellen und, die mit Dauerschmierung ausgestatteten Getriebe ausgenommen, mit Öl füllen.
Die Getriebe müssen vor ihrem Einsatz mit der richtigen Menge des vorgesehenen Schmiermittels aufgefüllt werden (Seite 35-36).

STOCKAGE

Un stockage correct des produits reçus nécessite de respecter les règles suivantes:

a) Exclure les zones à ciel ouvert, les zones exposées aux intempéries ou avec humidité excessive;

b) Interposer dans tous les cas entre le plancher et les produits des planches de bois ou des supports d'autre nature empêchant le contact direct avec le sol;

c) Pour les périodes de stockage supérieures à 60 jours, les surfaces concernées par les liaisons telles que les brides, les arbres et les accouplements doivent être protégées avec un produit antioxydant spécial (SHELL ENSIS FLUID SDC ou équivalent);

d) Pour les périodes de stockage prévues supérieures à 6 mois, les produits doivent être objet des contrôles suivants:

d1) Recouvrir les parties extérieures usinées et les éléments d'accouplement avec de la graisse contre l'oxydation;

d2) Positionner les réducteurs avec le bouchon reniflard le plus haut possible et les remplir d'huile, à l'exception de ceux à lubrification permanente.
Avant utilisation, les réducteurs doivent être remplis de la quantité et du type de lubrifiant préconisés (page 35-36).

2 - NORME PER L'INSTALLAZIONE

Prima dell'installazione del riduttore controllare che questo sia nella esecuzione prevista per la posizione di montaggio.

2 - INSTALLATION

Check that the gearbox is the right model and type before starting installation.

2 - INSTALLATION

Vor Installation des Getriebes kontrollieren, daß die gelierferte Ausführung für die gewünschte Einbaulage vorgesehen ist.

2 - INSTRUCTIONS D'INSTALLATION

Avant installation du réducteur s'assurer que celui-ci soit prédisposé pour sa position de montage.

ESECUZIONE CON FLANGIA

Ricavare, sulla macchina o impianto su cui vengono installati, le controflange di accoppiamento.
Queste dovranno avere la superficie di accoppiamento con la flangia del riduttore piana e lavorata di macchina utensile. Collegare l'albero d'uscita all'organo da comandare secondo le indicazioni dei disegni seguenti (FIG. 8) e (FIG.9).
Per i centraggi attenersi a quanto segue:

GRANDEZZE FINO AL 307:
esecuzione con albero maschio: vedi disegno (FIG.10).

FLANGE MOUNTING

Prepare the counter-flanges on the machine or plant to which the gearbox is to be applied. The mating surfaces used for gearbox mounting must be perfectly flat and machine finished.
Refer to drawings (FIG.8) and (FIG.9) to match the output shaft to the device to be operated.
Refer to the drawings below to ensure correct centering of the gearboxes:

SIZES UP TO 307:
Refer to drawing (FIG.10) for solid shaft coupling.

AUSFÜHRUNG MIT FLANSCH

Die entsprechenden Gegenflansche an der Maschine oder Anlage, an der das Getriebe eingebaut werden soll, vorbereiten.
Die Kontaktflächen mit dem Getriebeflansch müssen perfekt eben und mit Werkzeugmaschinen bearbeitet sein.
Die Abtriebswelle, den auf den nachstehenden Zeichnung (Abb.8) und (Abb.9) gegebenen Angaben gemäß, an das zu steuernde Organ schließen.
Für die genaue Zentrierung

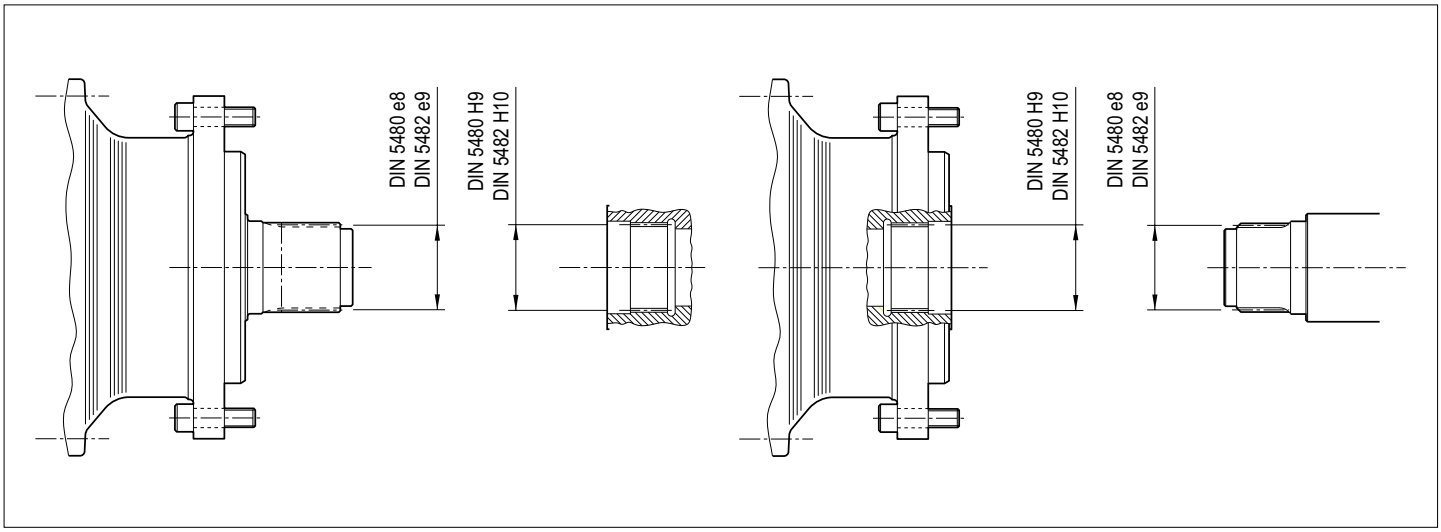
GRÖSSEN BIS 307:
Version mit Innenwelle: siehe Zeichnung (Abb.10)

EXECUTION AVEC BRIDE

Repérer les contre-brides de couplage sur la machine ou l'installation existante.
Celles-ci devront avoir une surface de couplage avec la bride du réducteur plane et usinée.
Relier l'arbre de sortie à l'organe qui doit être commandé suivant les indications sur les plans (Figure 8) et (Figure 9).
Pour les centrages, respecter les indications suivantes:

GRANDEURS JUSQU'À 307:
execution avec arbre male: se référer au plan (Figure 10)

(FIG.8)



(FIG.9)

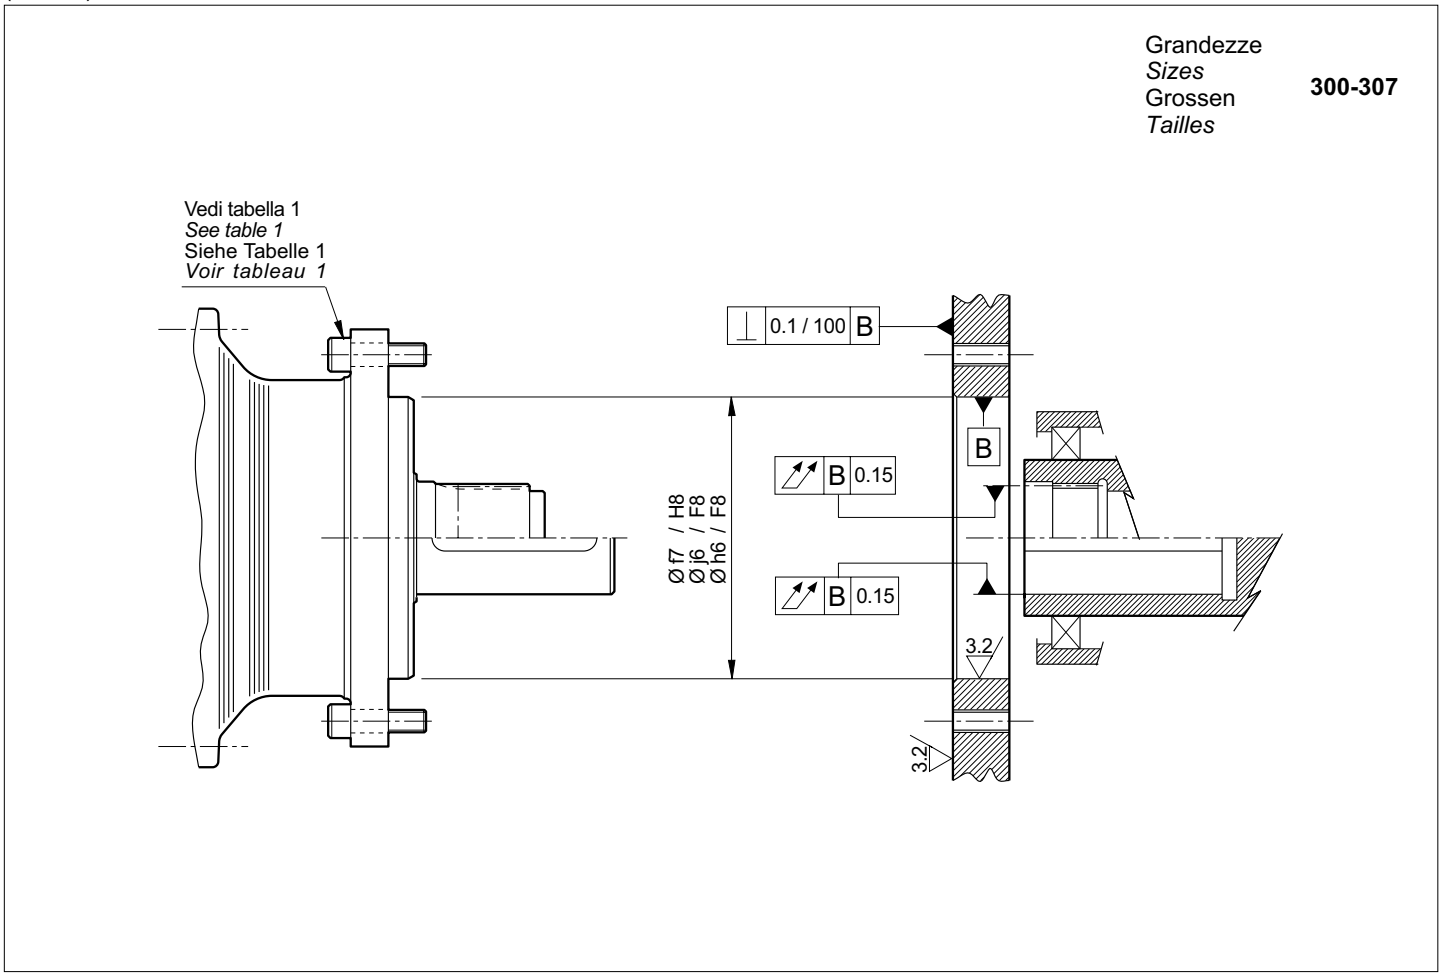
Ø d r6	Ø D E7	Ø d r6	Ø D H7

(FIG.10)



GRANDEZZE DAL 309 IN POI CON USCITA ALBERO MASCHIO

Questi riduttori sono provvisti di due diametri di centraggio.
Per le flange di accoppiamento è sufficiente un solo centraggio quando sull'albero in uscita non vi sono carichi radiali o comunque questi sono inferiori al 60% dei carichi ammessi.
Per carichi superiori prevedere la flangia di accoppiamento con tutti e due i diametri di centraggio.
Nel caso in cui il riduttore debba trasmettere coppie elevate con urti ed inversioni del senso di rotazione occorre eseguire sulla controflangia fori per le spine.
Al momento della installazione fare avanzare nella controflangia le spine già montate sul riduttore di una misura pari al loro diametro.
Vedi disegno (FIG.11).

SIZES FROM 309 UPWARDS, WITH MALE OUTPUT SHAFT

These gearboxes have two alignment rings of different diameter. If the output shaft is not subject to radial load, or if radial load is below 60% maximum allowable, only one alignment ring needs to be fitted to the counter-flange. For higher loads, the counter-flange must hold both rings firmly. If the gearbox has to transmit high torque or is subjected to loads with impact or direction changes, dowel holes must also be drilled in the counter-flange.
The dowels provided on the gearbox flanges should enter the holes in the counter-flanges by a length equivalent to their diameter.
See drawing (FIG.11).

GRÖSSEN VON 309 AUFWÄRTS MIT EINFÜHRWELLE

Diese Getriebe sind mit zwei Zentrierdurchmessern ausgestattet. Für die Verbindungsflanschs genügt eine einzige Zentrierung, wenn an der Abtriebswelle keine Radialbelastungen vorliegen oder wenn sie weniger als 60% der zulässigen Belastungen betragen.
Für höhere Belastungen den Verbindungsflansch mit beiden Zentrierdurchmessern vorbereiten.
Falls das Getriebe hohe Drehmomente übertragen muss, mit Schlägen und Umkehrungen der Drehrichtung, sollten auf dem Gegenflansch Bohrungen für Stift angebracht werden. Bei der Installation die am Getriebe schon angebrachten Stift um ein Mass in den Gegenflansch einführen, das ihrem Durchmesser entspricht.
Siehe Zeichnung (Abb.11).

TAILLES 309 ET AU-DELA, AVEC ARBRE DE SORTIE MÂLE

Ces réducteurs sont prévus avec deux diamètres de centrage. Pour les brides da fixation, un seul centrage est suffisant, quand l'arbre de sortie n'est soumis à aucune charge radiale, ou lorsque celle-ci est inférieure à 60% de la valeur des charges maximum admissibles.
Pour des chaerges supérieures, il est nécessaire de prévoir la bride de fixation avec les deux diametrès de centrage. Lorsque le réducteur est soumis à des couples élevés avec chocs, et inversions du sens de rotation, il est nécessaire d'effectuer, sur la bride de fixation, des trous pour recevoir des goupilles.
Au moment de l'installation, faire avancer, dans la bride recevant le réducteur, les goupilles dèjà montées, d'une longueur équivalente à leur diamètre.
Voir plan (Figure 11).

ESECUZIONE CON ALBERO FEMMINA SCANALATO

Assicurare l'allineamento fra riduttore e albero condotto e che quest'ultimo non subisca flessioni durante l'esercizio. Vedi disegno (FIG.12).

SPLINED FEMALE SHAFT MOUNTING

Make sure that the gearbox is perfectly aligned with the driven shaft, and also check that the driven shaft is not subject to flexure during rotation.
See drawing (FIG.12).

AUSFÜHRUNG MIT NUTAUFNAHMEWELLLE

Die Flucht zwischen Getriebe und Abtriebswelle herstellen und sicherstellen, dass letztere während dem Betrieb keinen Biegungen ausgesetzt ist. Siehe Zeichnung (Abb.12).

EXECUTION AVEC ARBRE FEMELLE CANNELÉ

S'assurer de l'alignement entre le réducteur et l'arbre entraîné, et vérifier que ce dernier ne subisse aucune flexion durant le fonctionnement.
Voir plan (Figure 12).

Classe/*Class*/Klasse/*Classe*		8.8	8.8	8.8	8.8	8.8	8.8	8.8	8.8
Coppia di serraggio/*Tightening torque* Anzugsmoment/*Couple de serrage*	Nm	200	200	200	400	400	1400	1400	1400

Per coppie massime trasmesse maggiori o uguali al 70% della coppia con M_{2max} indicata e con frequenti inversioni del moto, utilizzare viti in classe minima di resistenza 10.9.

With transmitted output torque greater than or equal to 70% of the indicated M_{2max} torque, and with frequent movement reversals, use screws with minimum resistance 10.9.

Für zu übertragene Maximaldrehmomente, die höher als 70% des angegebenen Werts M_{2max} oder diesem Prozentsatz gleich kommen und im Fall von häufigen Schaltungen sind Schrauben aus der Klasse der min. Widerstandsgrads 10.9 zu verwenden.

Puor des couples maximaux transmis plus importants ou équivalents à 70% du couple M_{2max} indiqué, et en cas d'inversions fréquentes du mouvement, utiliser des vis dans une classe minimale de résistance 10.9.

ESECUZIONE CON PIEDI DI SUPPORTO

Il fissaggio di questi riduttori deve avvenire su una base sufficientemente rigida, lavorata di macchina utensile con un errore massimo di planarità non superiore a 0,2 mm/100mm.
Vedi disegno (FIG.13).

FOOT MOUNTING

Make sure that the mounting base is sufficiently rigid. Bases must be machined to a maximum flatness tolerance of 0.2mm/100mm.
See drawing (FIG.13).

AUSFÜHRUNG MIT STANDFÜSSEN

Diese Getriebe sollten auf einer ausreichend starren und mit Werkzeugmaschinen bearbeiteten Grundlage befestigt werden, wobei der maximal zulässige Ebenheitsfehler nicht grösser als 0,2 mm/100 mm sein darf.
Siehe Zeichnung (Abb.13).

EXECUTION AVEC CARTER A PATTES

La fixation de ces réducteurs doit s'effectuer sur un châssis suffisamment rigide, usiné sur machine-outil avec une erreur maximum de planéité ne dépassant pas 0,2 mm/100 mm.
Voir plan (Figure 13).

VERSIONE PENDOLARE

Fissare il braccio di reazione con viti classe minima di resistenza 8,8 serrate ad una coppia corrispondente al 70% del loro carico di snervamento.
Pulire e sgrassare le superfici degli alberi di accoppiamento sia interna del riduttore che quella esterna dell'albero da accoppiare.
Montare il giunto sull'albero del riduttore dopo aver leggermente lubrificato la sua superficie esterna. Serrare leggermente un primo gruppo di 3 viti, posizionate secondo i vertici di un triangolo equilatero (esempio: le viti pos. 1-5-9 del disegno FIG.15). Accoppiare il riduttore sull'albero da azionare.
Serrare le viti gradualmente (secondo lo schema del triangolo equilatero) procedendo in senso circolare, effettuando più passaggi affinchè tutte le viti siano serrate alla coppia specificata in tabella 2, a seconda del tipo di giunto/riduttore.
Vedi disegno (FIG.14)

N.B. : non serrare in sequenza viti diametralmente opposte.

SHAFT MOUNTING DESIGN

Secure the torque arm with fixing bolts rated at least class 8.8, torqued to 70% of their yield stress.
Clean and degrease the mating surfaces of the gear unit output bore and the driven machine pivot.
Fit the coupling onto the gear unit hollow shaft after having lubricated the shaft external surface.
Lightly tighten the first 3 screws that are placed following the vertexes of an equilateral triangle (for instance: screw pos. 1-5-9 on drawing FIG.15). Match the gearbox to the shaft to be activated.

Follow the equilateral triangle scheme and keep tightening the screws in a circular sequence until you reach the torque specified in table 2 - according to the type of joint-gearbox. See drawing (FIG.14)

NOTE: do not follow a sequence when tightening opposite screws.

AUFSTECKMONTAGE

Die Achsstrebe mit Spannschrauben mit Mindestfestigkeitsklasse 8,8 und mit einem Anzugsmoment von 70% ihrer Biegegrenze befestigen.
Die Oberflächen der Kupplungswellen im und außerhalb des Getriebes reinigen und entfetten.
Die Kupplung an der Getriebewelle nach einer leichten Schmierung ihrer externen Oberfläche anbauen.Eine erste Gruppe aus 3 Schrauben anziehen, diese den Spitzen eines Dreiecks mit gleichlangen Seiten entsprechend anordnen (Beispiel: die Schrauben Pos. 1-5-9 der Zeichnung Abb.15). Das Getriebe auf die anzutreibende Welle passen.
Die Schrauben graduell und in mehreren Gängen anziehen, bis alle auf den Anzugsmoment, der in der Tabelle 2 angegeben wird und der sich dem Typ von Kupplung/Getriebe entsprechend ändert, festgestellt sind. Siehe Zeichnung (Abb.14).

HINWEIS: Diametral gegenüberliegende Schrauben nicht befestigen.

VERSION MONTAGE FLOTTANT

Fixer le bras de réaction avec des vis de résistance classe minimum 8,8 vissées à un couple de serrage correspondant à 70% de leur charge d'élasticité.
Nettoyer et dégraisser les surfages des arbres d'accouplement, aussi bien celles intèrieures du réducteur que cells extérieures de l'arbre à accoupler.
Monter le joint sur l'arbre du réducteur après en avoir légèrement lubrifié la surface extérieure.
Serrer légèrement un premier groupe de 3 vis positionnées selon les sommets d'un triangle équilatéral (exemple : les vis pos. 1-5-9 du plan Figure 15). Accoupler le réducteur à l'arbre qui doit être actionné.
Serrer les vis en phases successives (selon le schéma du triangle équilatéral) suivant un ordre circulaire et continuer le serrage jusqu'à atteindre le couple spécifié dans le tableau 2, selon le type de joint/réducteur. Se référer au plan (Figure 14).

Remarque: ne pas serrer en séquence des vis diamétralement opposées.

3 - COLLEGAMENTI

- Fissare gli organi di collegamento in entrata ed uscita al riduttore o motoriduttore evitando di battere con martello o equivalenti. Utilizzare per l'inserimento degli organi le viti di servizio e i fori filettati presenti negli alberi. Prima di montare gli organi di collegamento avere cura di pulire gli alberi eliminando grassi o protettivi eventualmente presenti.

3 - CONNECTIONS

- *Secure the connection parts to gearbox or gearmotor input and output. Do not tap them with hammers or similar tools. To insert these parts, use the service screws and threaded holes provided on the shafts. Be sure to clean off any grease or protectants from the shafts before fitting any connection parts.*

3 - ANSCHLÜSSE

- Die Anschlußteile im An-und Abtrieb des Getriebes oder des Getriebemotors befestigen, dabei ist ein Einklopfen dieser unter Anwendung eines Hammers oder anderer gleicharti- ger Instrumente zu vermeiden. Zum Einführen der Teile die Serviceschrauben und die Gewindebohrungen der Wellen verwenden. Vor der Montage der Verbindungsteile, die Wellen sorgfältig von Fett oder eventuell vorhandenen Schutzmitteln reinigen.

3 - RACCORDEMENTS

- *Fixer les éléments de raccordement en entrée et en sortie du réducteur ou du motoréducteur en évitant de frapper avec un marteau ou autre. Pour l'introduction des organes, utiliser les vis appropriées et les orifices filetés présents sur les arbres. Avant de monter les éléments de raccordement, nettoyer les arbres en éliminant les graisses ou produits de protection éventuellement présents.*

- Versi di rotazione.
  Al momento del collegamento verificare con l'aiuto delle seguenti illustrazioni il verso di rotazione degli alberi a seconda di ciò che si ha in ingresso.

- *Direction of rotation*
  When couplings the output shaft, refer to the following diagrams to ensure that the direction of rotation is correct for the input.

- Drehrichtung
  Beim Anschluss mit Hilfe der nachfolgenden Darstellungen die korrekte Drehrichtung je nach Drehrichtung am Antrieb prüfen.

- *Sens de rotation.*
  Lors de la liaisons'assurer à l'aide des illustrations des arbres en fonction de ce dont on dispose en entrée.

NOTA:

Non usare martelli od altri organi meccanici per forzare l'inserimento di giunti, flange od altro.

NOTE:

Never use hammers or other mechanical means to force disks, flanges, etc. into place.

ANMERKUNG:

Keine Hämmer oder sonstige mechanischen Organe benutzen, um das Einsetzen bzw. die Verbindung von Kupplungen, Flanschen oder sonstigem zu erzwingen.

NOTA:

Ne pas utiliser de marteau ou d'autres organes mécaniques pour permettre l'introduction d'accouplements, de brides, ou autres.

Pulire gli alberi dai protettivi prima di accoppiare l'organo da collegare. Spalmare un velo di grasso per favorire il montaggio.

Clean all protective coatings off shafts before coupling units together. Apply a thin smear of grease to facilitate assembly.

Die Wellen von den Schutzmitteln reinigen, bevor die Verbindungen hergestellt werden. Eine dünne Schicht Fett auftragen, um die Montage zu vereinfachen.

Nettoyer les arbres des vernis de protection, avant de monter l'organe à accoupler. Enduire les pièces d'un voile de graisse pour favoriser le montage.

COLLEGAMENTI IN ENTRATA

Collegamento al motore elettrico

Pulire zone di centraggio ed il giunto di collegamento albero motore; applicare sul giunto un velo di grasso per facilitare il montaggio, inserire il motore e serrare le viti di assemblaggio con la flangia motore.
Usare sempre viti con classe di resistenza minima 8,8.

INPUT COUPLINGS

Connection to electric motor

Clean the mating surfaces and the motor shaft coupling. Smear the coupling with a thin coating of grease to facilitate assembly. Fit the motor and tighten the securing bolts to the motor flange. Always use bolts of minimum resistance class 8.8.

ANSCHLÜSSE AM EINGANG

Anschluss an den Elektromotor

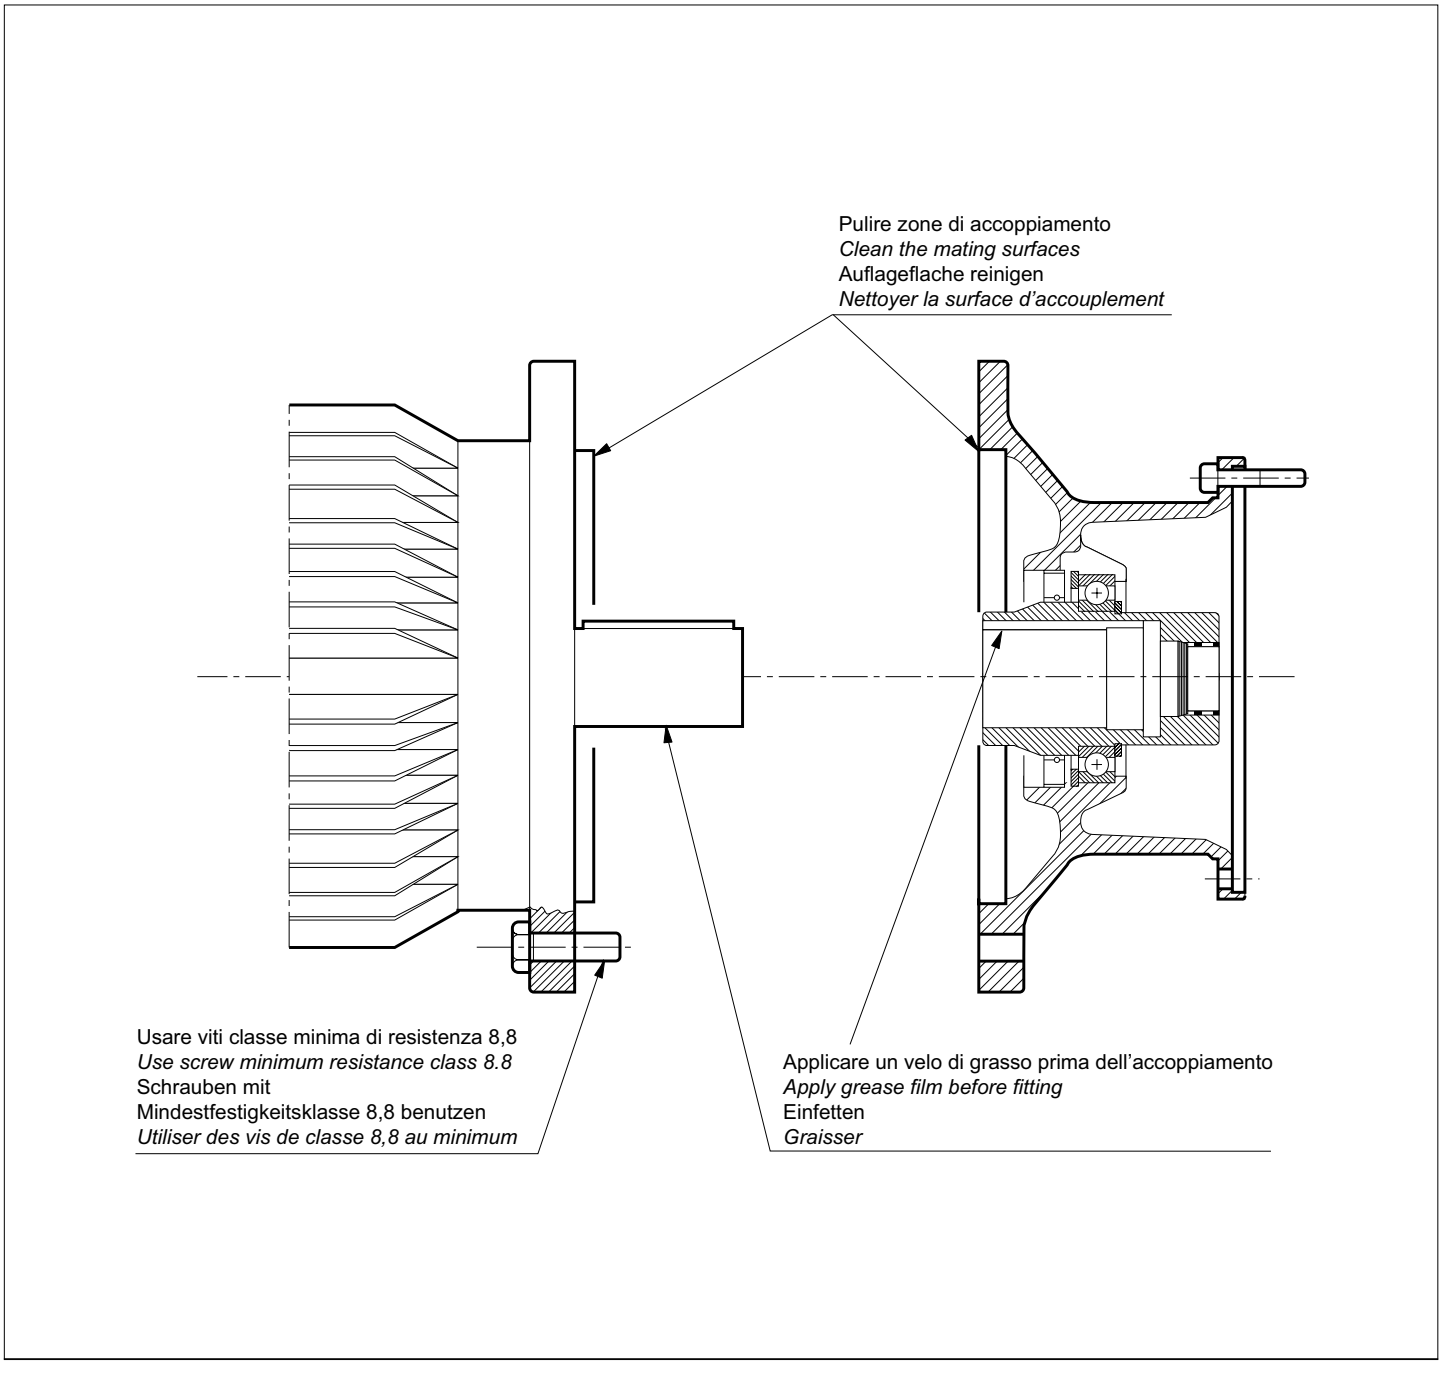
Die Bereiche für die Zentrierung und die Verbindungskupplung der Motorwelle reinigen. Auf der Kupplung eine dünne Schicht Fett auftragen, um die Montage zu vereinfachen. Den Motor einsetzen und die Schrauben zur Verbindung mit dem Motorflansch anziehen.
Stets Schrauben mit Mindest-Festigkeitsklasse 8,8 benutzen.

LIAISON EN ENTREE

Liaison au moteur électrique

Nettoyer les zones de centrage, et l'accouplement de liaison à l'arbre moteur.
Appliquer, sur le manchon d'accouplement, un voile de graisse pour faciliter le montage, insérer le moteur et serrer les vis de fixation avec la bride moteur.
Utiliser toujours des vis de classe 8,8 au minimum.

(FIG.17)



COLLEGAMENTI IN ENTRATA

INPUT COUPLINGS

ANSCHLÜSSE AM EINGANG

LIAISON EN ENTREE

Collegamento al motore elettrico

In caso di motori di elevata potenza usare motori in esecuzione B3-B5 opportunamente sopportati.

Connection to electric motor

With high power motors always use suitably supported B3-B5 mountings.

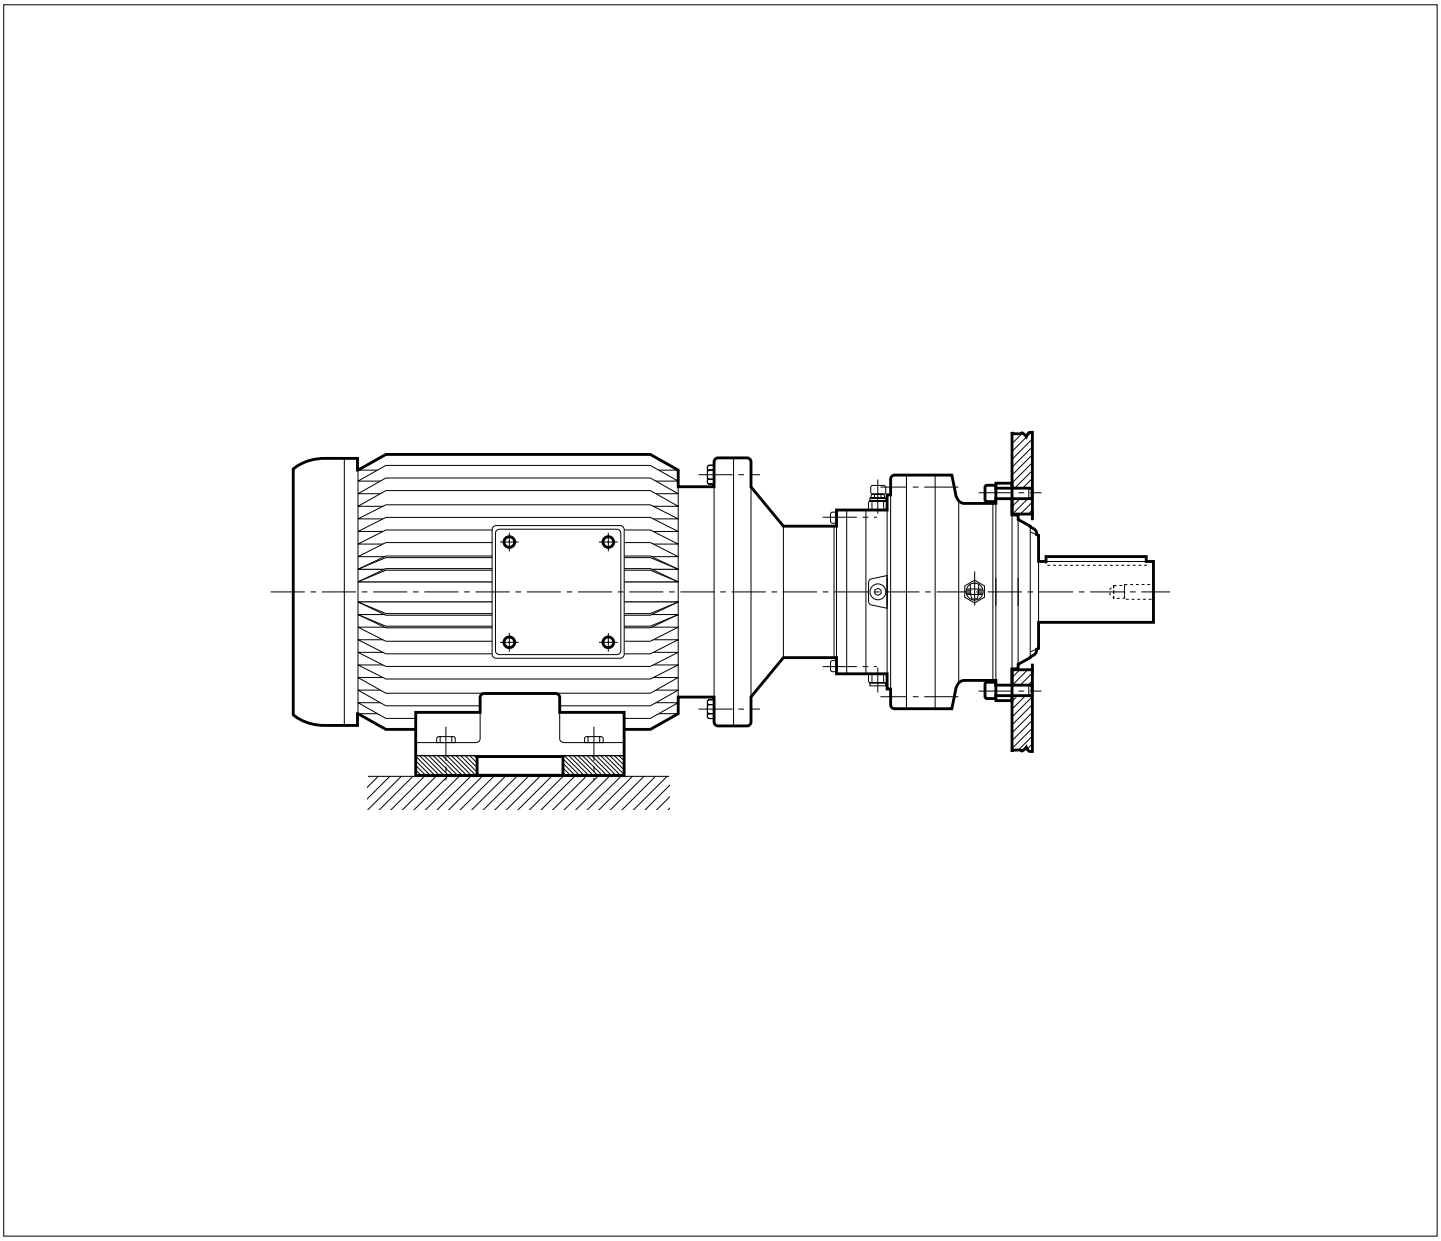
Anschluss an den Elektromotor

Bei Motoren mit hoher Leistung sind Motoren in Ausführung B3-B5 anzuwenden, die gut gelagert sind.

Liaison au moteur électrique

En cas d'utilisation de moteurs de puissance élevée, prévoir ces derniers en exécution B3-B5 supportés en conséquence.

(FIG.18)



Nota: i motori devono essere sempre perfettamente allineati sia in caso di accoppiamento tra albero motore e albero in ingresso tramite giunto sia soprattutto in caso di accoppiamento diretto.
Una posizione errata può causare danni ai cuscinetti, sia del motore che della predisposizione motore.

Note: *Ensure that the motors are perfectly aligned. This is important wehen joints are used between the motor shaft and the input shaft, and even more so in cases of direct coupling.*
Incorrect alignment can cause damage to both motor and input side bearings.

Anmerkung: die Motoren müssen stets gut gefluchtet sein, sowohl bei Verbindung von Motorwelle und Getriebe-Antriebswelle als auch insbesondere bei direkter Verbindung.
Eine falsche Position kann zu Schäden an den Lagern des Motors als auch der Motorvorbereitung führen.

Remarque: *Les moteurs doivent toujours être parfaitement alignés en cas de couplage entre arbre moteur et arbre d'entrée par l'intermédiaire d'un accouplement surtout en cas de couplage direct.*
Une position erronée peut endommager les roulements du moteur ou de la prédisposition moteur.

COLLEGAMENTO ALL'ALBERO VELOCE

Pulire prima di accoppiare gli organi.
In caso di montaggio pulegge per trasmissioni a cinghia, gli alberi devono essere paralleli e le pulegge devono essere allineate.
Non tendere la cinghia più del necessario in quanto una eccessiva tensione può causare danni ai cuscinetti.

HIGH SPEED SHAFT COUPLINGS

Clean all units prior to assembly.
When fitting belt driven pulleys, make sure that the shafts are perfectly parallel and that the pulleys themselves are aligned with each other.
Avoid over tensioning the belts since excess tension can cause bearing failure.

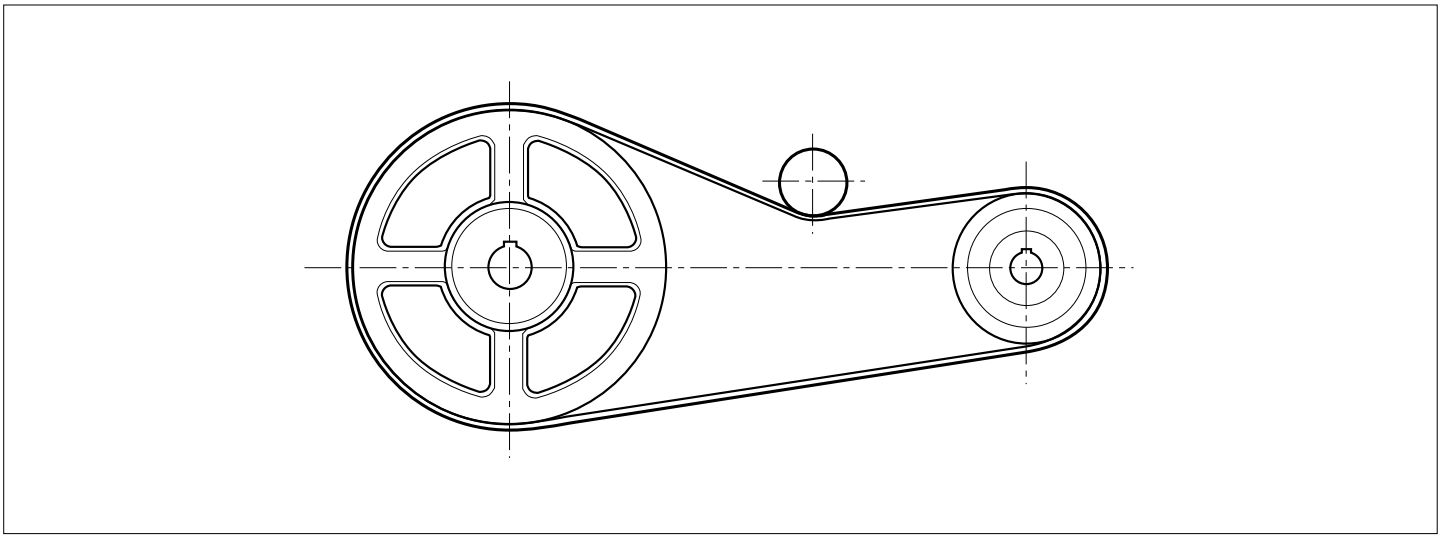
VERBINDUNG AN DIE ANTRIEBSWELLE

Die Organe vor Anschluß reinigen.
Bei Montage von Riemenscheiben müssen die Wellen parallel stehen und die Riemenscheiben gut gefluchtet sein.
Den Riemen nicht übermässing spannen, da ein zu hohe Spannung zu Schäden an den Lagern führen kann.

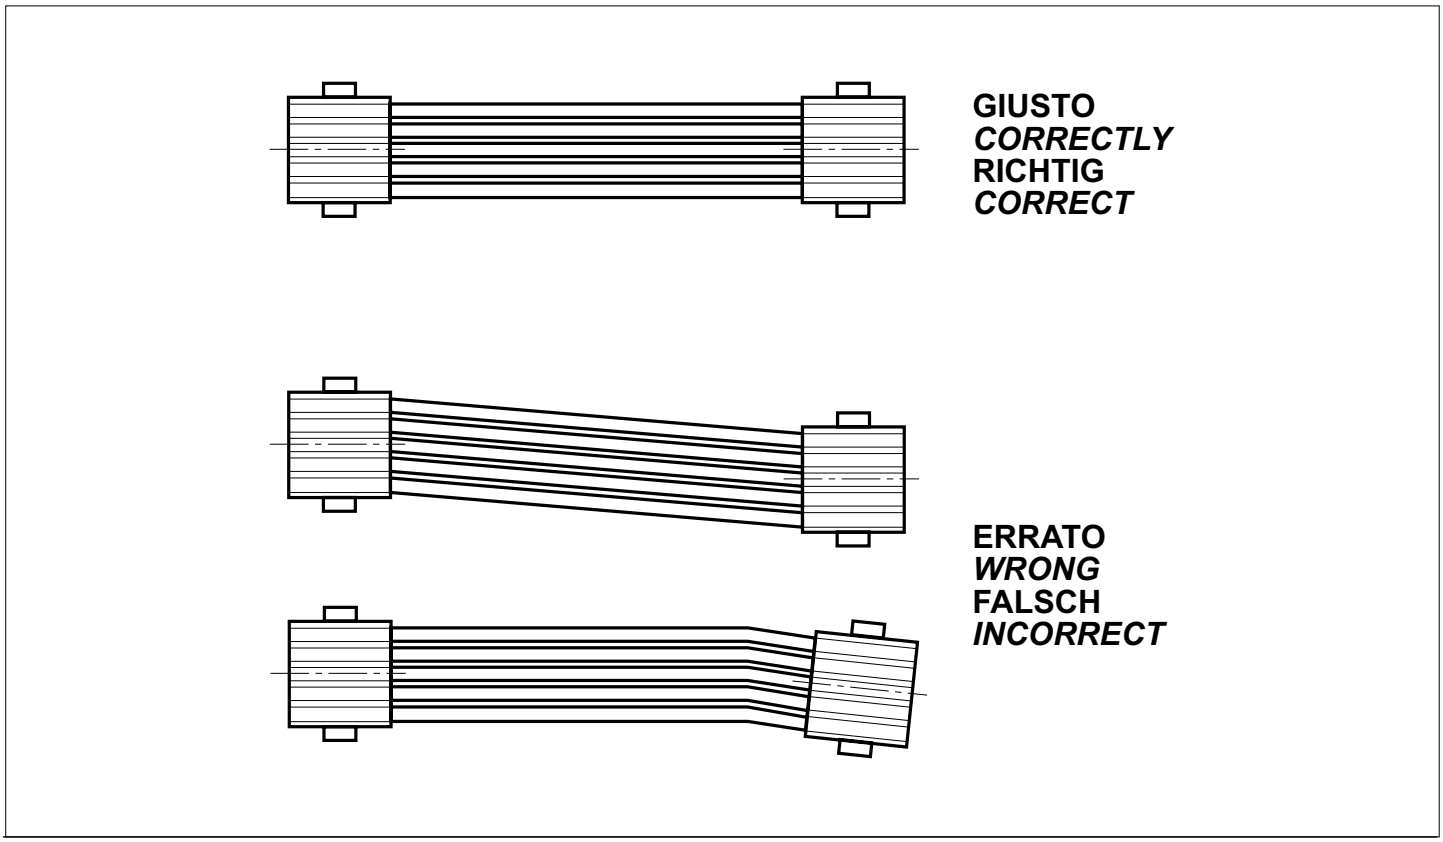
LIAISON A L'ARBRE RAPIDE

Procéder au nettoyage, avant d'accoupler les organes.
En cas de montage de poulies de transmission à courroie, les arbres doivent être parallèles et les poulies alignées.
Ne pas tendre la courroie plus que nécessaire car une tension excessive peut entraîner des dommages aux roulements.

(FIG.19)



(FIG.20)



COLLEGAMENTO AL MOTORE IDRAULICO

Togliere il cappellotto di protezione.
Le predisposizioni per motori idraulici sono di due tipi:

a) Versione con O-ring di tenuta olio fra flangia motore e riduttore (FIG. 21).

b) Versione con anello di tenuta già montato sul giunto di collegamento (FIG.22).

Nel caso a) montare l'O-ring che assicura la tenuta fra riduttore e motore avendo cura di mantenerlo nella propria sede e di non rovinarlo.

HYDRAULIC MOTOR COUPLINGS

Remove the protective cap.
Two types of hydraulic motor couplings are possible:

a) With O ring seal between motor flange and gearbox. (FIG.21)

b) With seal incorporated in motor joint. (FIG 22)

With type a) connections, fit the O ring seal between the gearbox and motor making sure that it fits snugly in its seat and is not damaged.

ANSCHLUß AN HYDRAULIKMOTOR

Die Schutzkappe entfernen.
Es bestehen zwei Arten Vorbereitung für den Anschluß von Hydraulikmotoren:

a) Ausführung mit O-Dichtring für Öl zwschen Motorflansch und Getriebe. (Abb. 21)

b) Ausführung mit schon montiertem Dichtring an der Verbindungskupplung. (Abb. 22)

Im Fall a) den O-Ring montieren, der für die Abdichtung zwischen Getriebe und Motor sorgt, hierbei darauf achten, dass er gut in seinen Sitz eingesetzt und nicht beschädigt wird.

LIAISON AU MOTEUR HYDRAULIQUE

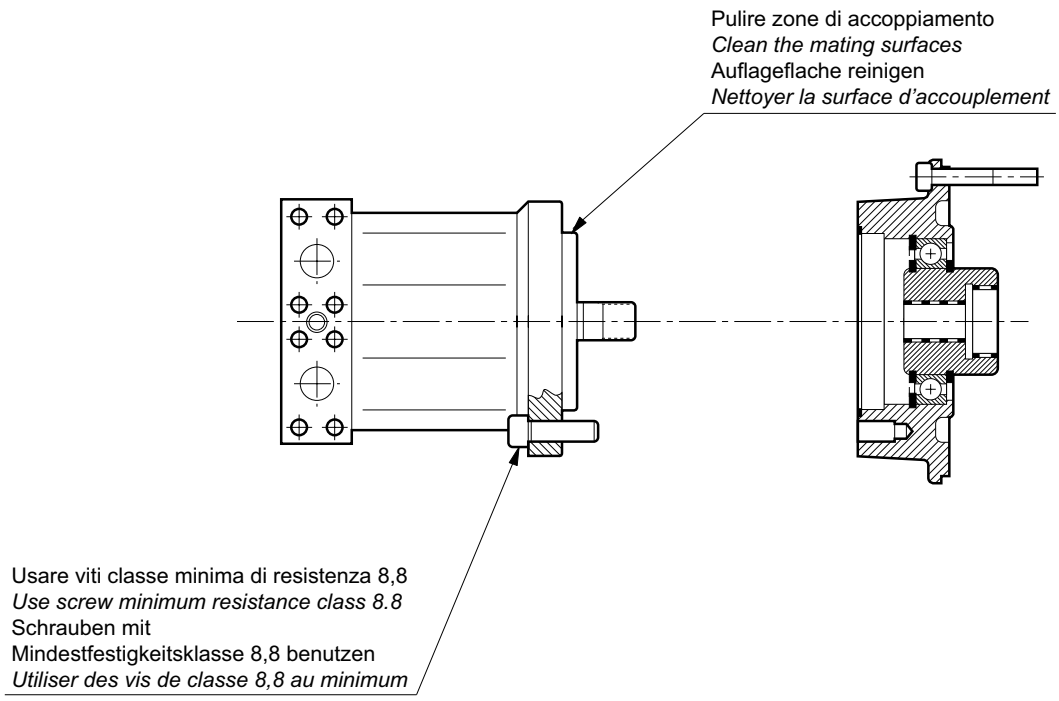
Enlever le capuchon de protection.
Les prédispositions pour moteurs hydrauliques sont de deux types:

a) Version avec joint d'étanchéïté O-ring entre bride moteur et réducteur. (Figure21)

b) Version avec bague d'étanchéïté déjà montée sur le manchon de liaison. (Figure 22)

Dans le cas a) monter le joint O-ring qui assure l'étanchéïté entre réducteur et moteur en prenant soin de le maintenir dans son logement et de ne pas le blesser.

(FIG.21)



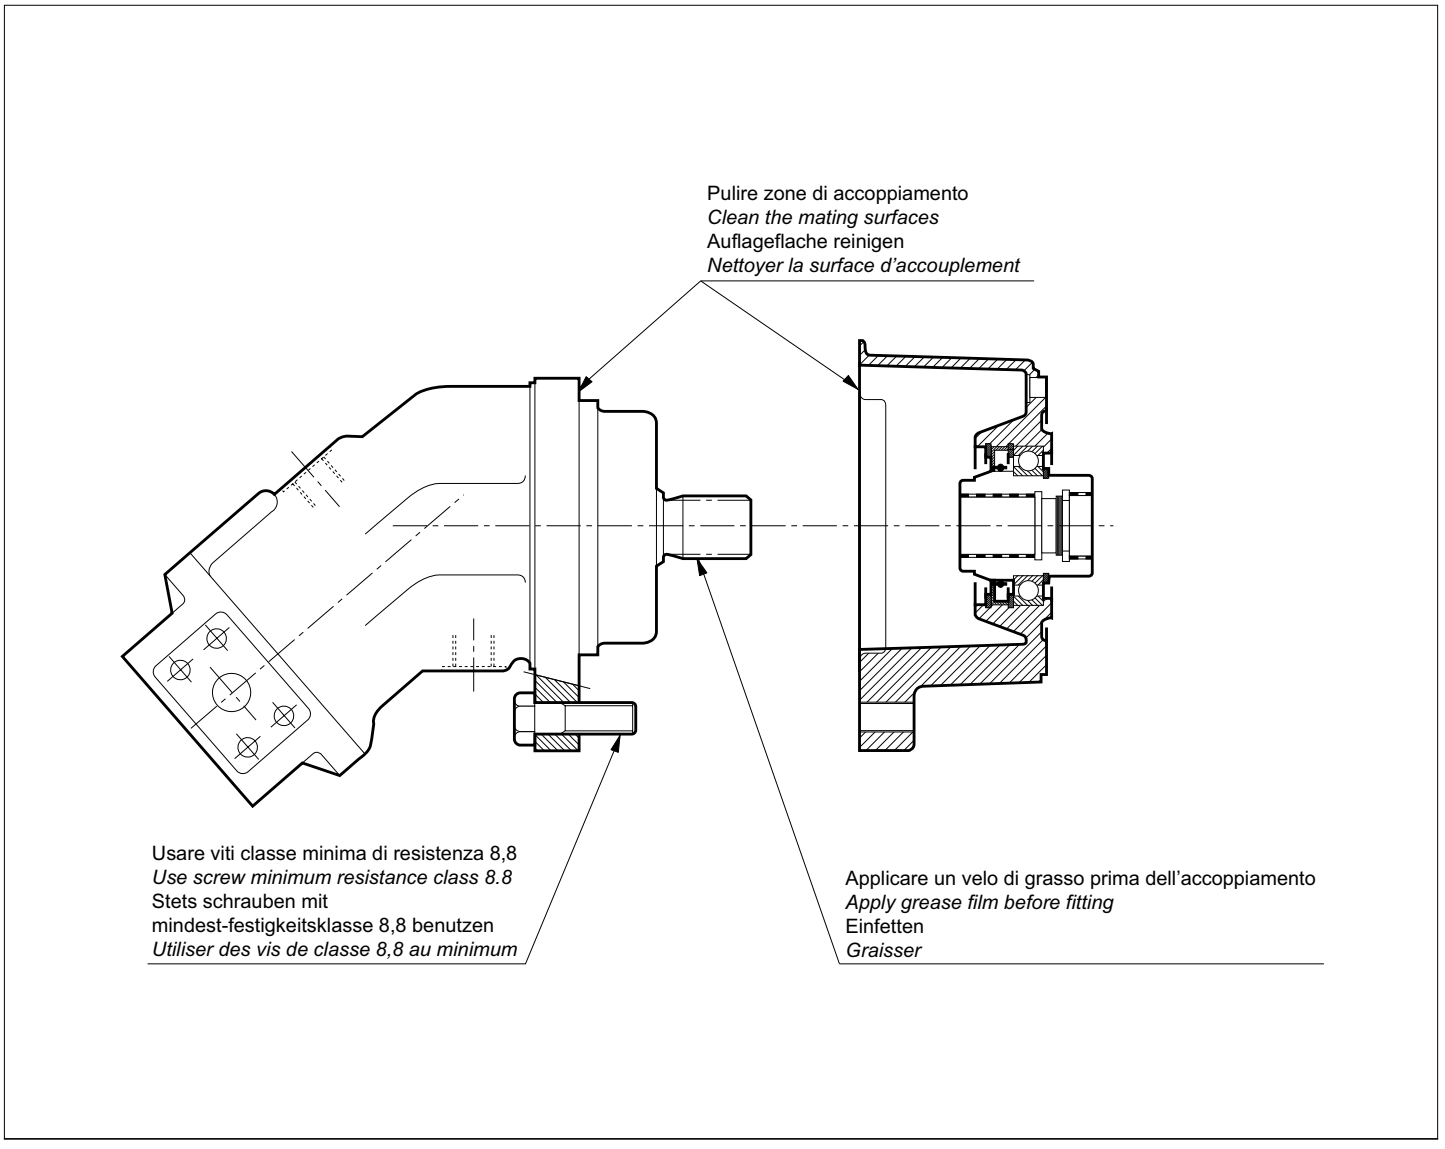
Nel caso b) non occorre far nulla per assicurare la tenuta dell'olio in quanto questa è già effettuata sul giunto motore, applicare solo un velo di grasso sull'albero motore.
In ambedue i casi pulire le zone di centraggio ed il giunto dove va inserito il motore, inserire il motore e serrare le viti di assemblaggio con la flangia.
Usare sempre viti con classe di resistenza minima 8,8.

With type b) connections, no specific action is required to ensure oil-tight operation since the seal is incorporated in the motor casing.
Apply a thin smear of grease to the motor shaft to facilitate assembly.
For both types of coupling, clean all mating surfaces couplings first. Fit the motor and tighten the flange securing bolts.
Always use bolts of minimum resistance class 8.8.

Im Fall b) ist es nicht notwendig, die gute Abdichtung sicherzustellen, da dies schon von der Motorkupplung gewährleistet wird. Man sollte jedoch etwas Fett auf die Motorwelle streichen. In beiden Fällen die Zentrierbereiche und Kupplung zum Anschluss des Motors gut reinigen.
Den Motor einsetzen, die Schrauben zur Befestigung mit dem Flansch anziehen.
Stets Schrauben mit Mindest-Festigkeitsklasse 8,8 benutzen.

Dans le cas b) il n'y a rien à faire pour assurer l'étanchéïté dans la mesure où celle-ci est déjà effectuée sur le manchon de liaison au moteur.
Appliquer seulement un voile de graisse sur l'arbre moteur.
Dans les deux cas nettoyer les zones de centrage et le manchon qui reçoit le moteur, monter le moteur et serrer les vis de liaison avec la bride.
Toujours utiliser des vis de classe minimum 8,8.

(FIG.22)



COLLEGAMENTO AL FRENO

Per riduttori predisposti per motori idraulici e completi di freno, collegarsi all'atto della installazione con un apposito tubo del circuito idraulico al foro di comando previsto sul corpo freno.

BRAKE COUPLINGS

With gearboxes designed for coupling to a hydraulic motor and pre-fitted with a hydraulic brake, simply connect the hydraulic circuit to the delivery hole on the brake body when assembling the units.

ANSCHLUß AN DIE BREMSE

Für Getriebe, die zur Montage mit Hydraulikmotoren vorbereitet und komplett mit Bremse ausgestattet sind, ist bei Installation mit einem eigens vorgesehenen Schlauch des Hydrauliksystems die Verbindung mit der Bohrung auf dem Bremskörper herzustellen.

CONNEXION DU FREIN

Pour les réducteurs prédisposés pour moteurs hydrauliques et équipés de frein, relier au moment de l'installation le raccord approprié du circuit hydraulique au trou de commande prévu sur le carter du frein.

Avviamento

Pressione minima tale da garantire apertura freno (vedi tabella) inferiore 320 bar.

Start-up

Regulate to the minimum pressure which will release the brake (see table).
This must be below 320 bar.

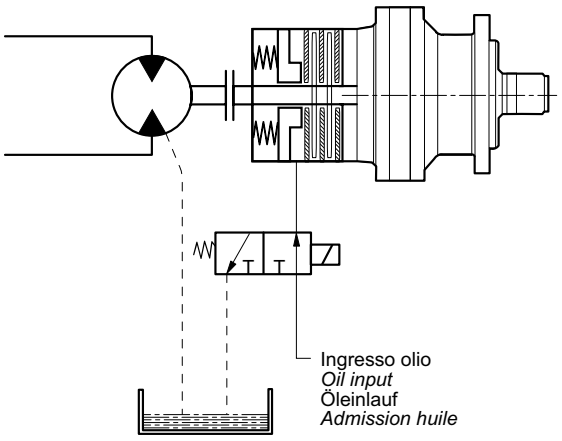
Start

Der Mindestdruck muß so sein, daß die Öffnung der Bremse gewährleistet wird (siehe Tabelle).
Unter 320 bar.

Démarrage

Pression minimum pour permettre l'ouverture du frein (voir tableau).
Inférieure à 320 bars.

(FIG.23)



DATI TECNICI — *TECHNICAL DATA* — TECHNISCHE DATEN — *DONNEES TECHNIQUES*

Freno tipo - *Brake type* / **BremseTyp - *Frein type***		**4...**							**5...**					**6...**

Peso *Weight* Gewicht *Poids*	Kg	10							18					35					

NOTA: La coppia statica Ms è la max che può esercitare il freno. – In condizioni dinamiche la coppia frenante è inferiore. – I valori effettivi di Ms possono variare da –5% a +15% rispetto a quelli indicati in tabella.

NOTE: The values for Ms given above are valid when circuit pressure is 0. If ther is any back-pressure in the circuit, contact our technical assistance depatment. Allow for a varation of –5% to +10% in above values. Braking torque is reduced in dynamic operating condition.

ANMERKUNG: Der statische Bremsmoment Ms ist der max. Wert, den die Bremse ausüben kann.-In dynamischem Zustand ist der Bremsmoment geringer.- Die effektiven Werte von Ms können von -5% bis +15% von den in der Tabelle angegebenen abweichen.

REMARQUE: le couple statique Ms est le cuople max. que le frein peut exercer. En conditions dynamiques le couple de freinage est inférieur.
Les valeurs effectives de Ms peuvent varier de -5% à +15% par rapport aux valeurs indiquées sur le tableau.

INSTALLAZIONE MOTORIDUTTORE

Nei casi in cui venga fornito il gruppo motoriduttore completo, per l'installazione di sua macchina attenersi alle indicazioni fornite precedentemente.
Per i collegamenti idraulici od elettrici si forniscono a titolo di esempio due tipologie di schemi ai quali ci si può attenere in via generica in quanto ogni impianto ha le sue esigenze che devono essere valutate di volta in volta dal costruttore.

INSTALLATION OF GEARMOTORS

If a complete gearmotor is supplied, follow the instructions given above for installation to any machine or plant.
Two sample diagrams are provided for generic hydraulic and electrical connections. Each individual installation will, of course, have its own specific requirements which must be catered for.

INSTALLATION GETRIEBE-MOTOR

Sollte die komplette Gruppe Getriebemotor gelierfet werden, dann sind zur Installation an der Maschine die vorher gemachten Angaben zu befolgen.
Für die hydraulischen oder elektrischen Anschlüsse werdwn als Beispiele zwei Schemen angeführt, an die man sich in grossen Zügen halten kann. Jede Anlage bringt jedoch spezifische Anforderungen mit sich, die von Fall zu Fall vom Hersteller bewertet werden müssen.

INSTALLATION MOTOREDUCTEUR

Dans de nombreux cas TRASMITAL fournit le groupe motoréducteur complet.
Pour son installation il convient dans tous les cas de respecter les indications susmentionnées. Pour les branchements hydrauliques ou électriques il est fourni à titre d'exemple deux types de schémas auxquels on peut se référer d'une façon générale, car chaque installation a ses exigences qui doivent être évaluées à chaque fois par le constructeur.

INSTALLAZIONE MOTORIDUTTORE

Con motore elettrico.

Vedere schemi qui di seguito.

INSTALLATION OF GEARMOTORS

With electric motors.

See generic diagrams to follow.

INSTALLATION GETRIEBEMOTOR

Mit Elektromotor.

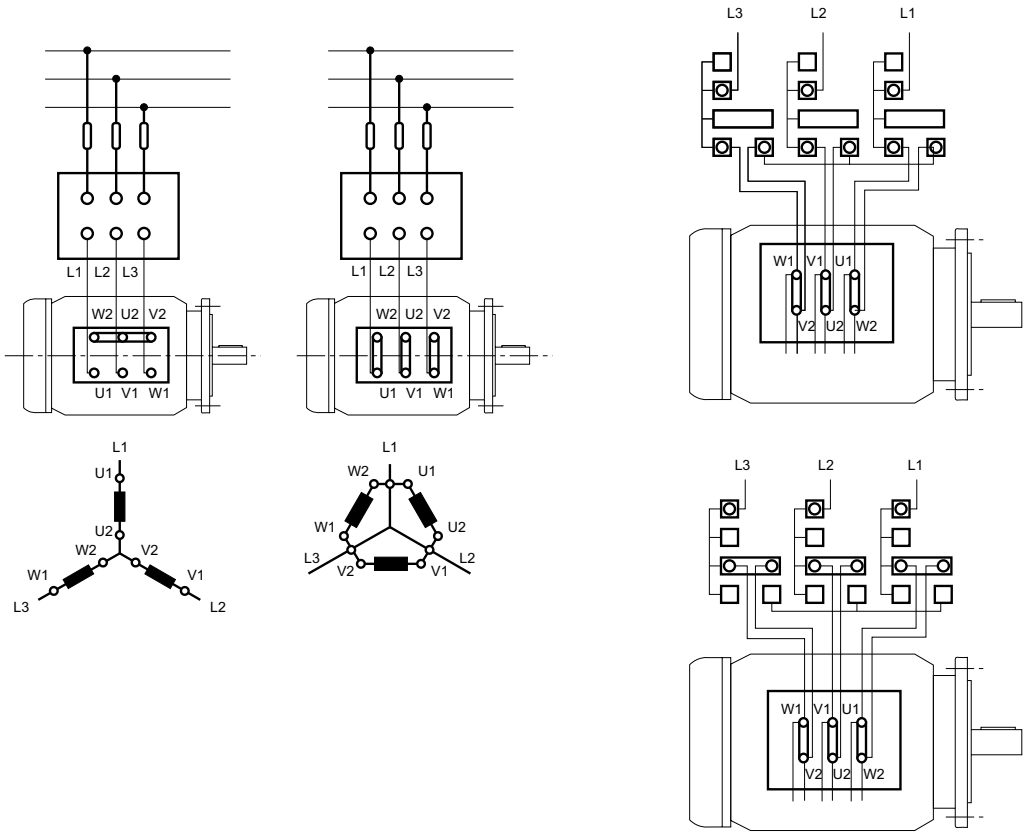
Siehe folgendes Diagramm.

INSTALLATION MOTOREDUCTEUR

Avec moteur électrique.

Voir schémas suivants.

(FIG.24)



INSTALLAZIONE MOTORIDUTTORE

- Con motore idraulico TRASMITAL MG.

In aggiunta alle norme relative alla installazione del riduttore, è raccomandato seguire le seguenti norme per l' installazione del motore idraulico.

INSTALLATION OF GEARMOTORS

- With hydraulic motor TRASMITAL MG.

Further to standards on gearbox installation, comply with the following hydraulic motor installation instructions:

INSTALLATION GETRIEBE-MOTOR

- Mit Hydraulikmotor TRASMITAL MG

Zusätzlich zu den Normen für die Vorgangsweise bei der Installation des jeweiligen Getriebes, wird empfohlen, die auch folgenden Anweisungen für die Installation des Hydraulikmotors zu befolgen.

INSTALLATION MOTOREDUCTEUR

- Avec moteur hydraulique TRASMITAL MG

En plus des règles concernant l'installation du réducteur, on préconise de suivre les instructions ci-dessous pour l'installation du moteur hydraulique.

a) Collegamento al circuito idraulico

I motori possono essere collegati sia a circuiti del tipo chiuso che aperto.
Nel caso di circuito aperto la elettrovalvola o distributore di comando può essere sia di tipo a centro chiuso che aperto.
Occorre che nel ramo del circuito corrispondente alla mandata del motore idraulico sia sempre montata una valvola di massima pressione tarata ad un valore non superiore al valore p_{int} ammesso sul motore idraulico. Vedi schemi idraulici (FIG.25).

a) Connection to the hydraulic circuit

Motors can be connected either to closed or open circuits.
In case of an open circuit, solenoid valve or control distributor can be of the closed or open center type.
The hydraulic motor delivery side should always have a max. pressure valve set to a value not exceeding the p_{int} value allowed for the hydraulic motor. See hydraulic diagrams (FIG.25).

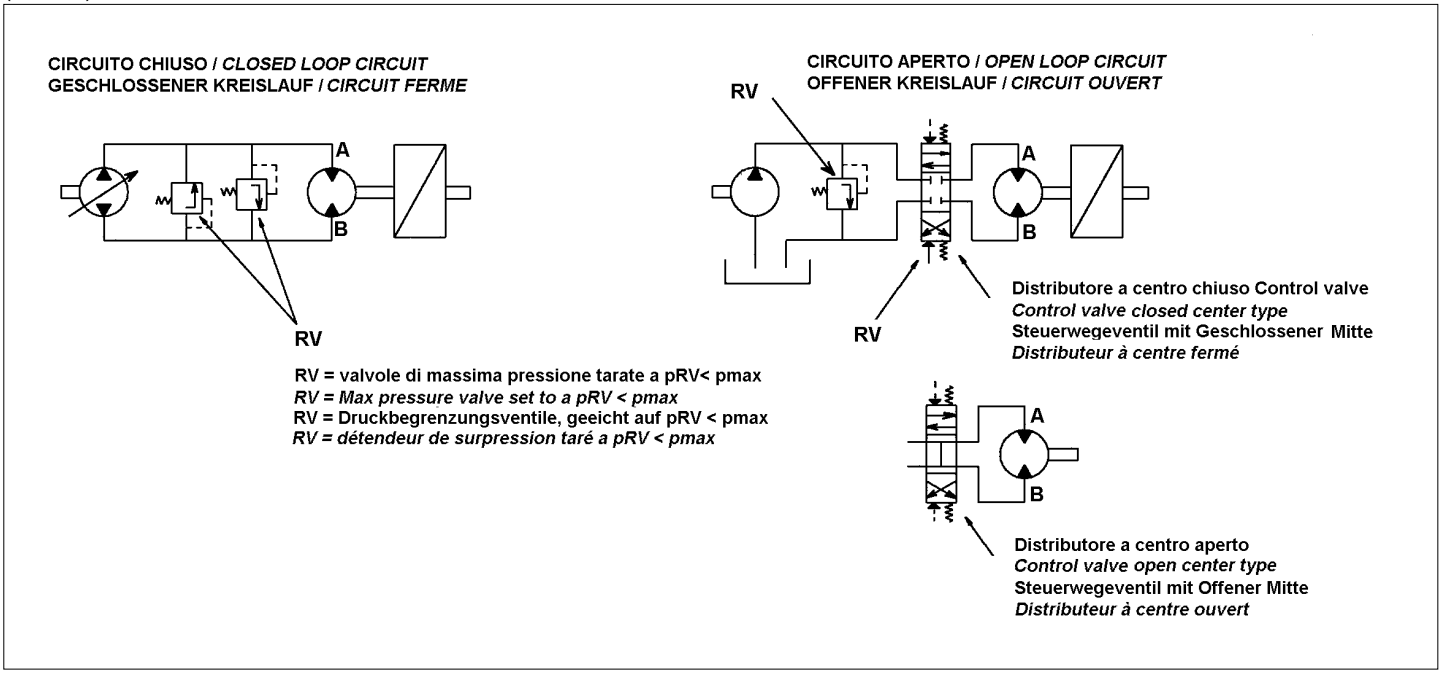
a) Anschluß an den hydraulischen Kreislauf

Die Motoren können, sowohl an geschlossene, als auch an offene Kreisläufe verwendet werden.
Handelt es sich um einen offenen Kreislauf kann das Elektroventil oder das Steuerwegeventil, sowohl vom Typ mit geschlossener Mitte, als auch mit offener Mitte sein.
Es ist erforderlich, daß am Zweig des Kreislaufs, gegenüber der Druckleitung des Hydraulikmotors immer ein Druckbegrenzungsventil montiert ist, welches auf einen Wert geeicht ist, der den am Hydraulikmotor zulässigen Wert von p_{int} nicht überschreitet. Siehe Hydraulikpläne (Abb.25).

a) Raccordement au circuit hydraulique

Les moteurs peuvent être raccordés à des circuits de type fermé aussi bien qu'ouvert.
En cas de circuit ouvert, l'électrovanne, ou distributeur de commande, peut être de type tant à centre fermé qu'ouvert.
Il y a lieu que la portion de circuit, correspondant à l'alimentation du moteur hydraulique, soit toujours équipée d'un détendeur de surpression taré à une valeur pas supérieure à p_{int} maximale admise sur le moteur hydraulique. Voir schémas hydrauliques (Figure25).

(FIG.25)



Nel caso in cui questo non sia possibile in quanto il circuito deve comandare altri azionamenti a pressione più' elevata e/o nel caso cui si abbia un distributore a centro chiuso ed il motore aziona organi ad

If not possible, because the circuits control other devices needing a higher pressure and/or a closed center control valve is fitted and the motor controls parts with a high moment of inertia, max. pressure

Ist dies nicht möglich, weil der Kreislauf noch andere, unter höheren Druck stehende Antriebe steuern muß und/oder in dem Fall, daß kein Wegeventil mit geschlossener Mitte zur Verfügung steht und der

Si cela n'est pas possible, du fait que le circuit doit commander d'autres entraînements, ayant une pression plus élevée, et/ou qu'il y a un distributeur à centre fermé et le moteur actionne des orga-

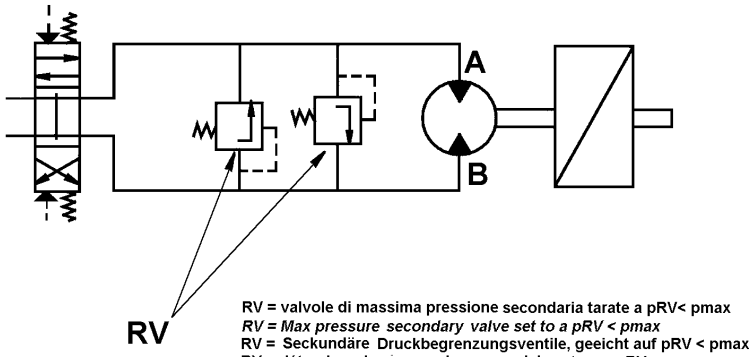
elevato momento d'inerzia occorre montare valvole di massima pressione secondarie il più' vicino possibile al motore. Vedi schema (FIG.26).

secondary valves should be as close as possible to the motor.
See diagram (FIG.26).

Motor Organe mit einem erhöhten Trägheitsmoment antreibt, muß man so nahe wie möglich am Motor sekundäre Druckbegrenzungsventile montieren. Siehe Schema (Abb.26).

nes, ayant un moment d'inertie élevé, il faut monter des détendeurs de surpression secondaires, le plus près du moteur.
Voir schéma (Figure 26).

(FIG.26)



b) Collegamento foro di drenaggio T

In esecuzione standard i motori vengono forniti senza foro di drenaggio. In questo caso il motore è provvisto di drenaggio interno. Questo soddisfa la maggioranza delle applicazioni dove il funzionamento è intermittente e la pressione media di comando è inferiore al 50% della pressione sopportabile dal motore.
Quando il funzionamento è in continuo o intermittente con una percentuale di funzionamento maggiore del 50% e la pressione media di comando è superiore al 50% della pressione, occorre richiedere il motore in esecuzione con drenaggio esterno e collegare il foro di drenaggio T al serbatoio.

b) Connection of drain hole T

Standard motors are supplied with no drain hole. In this case, the motor has an internal drain system.
This meets most application requirements with intermittent duty and average control pressure under 50% of the max. pressure bearable by the motor.
In continuous or intermittent duty with operation percentage over 50% and average control pressure over 50% of the max. pressure, motor should be ordered in the external drain version and the drain hole T should be connected to the tank.

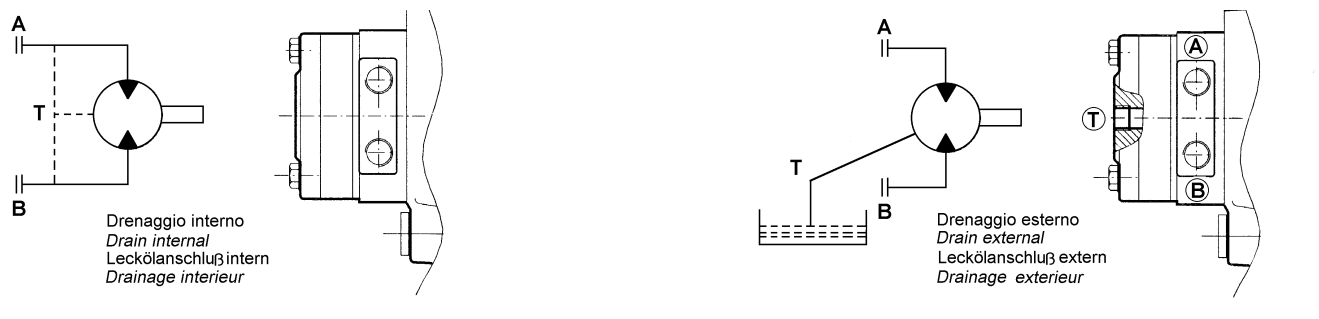
b) Anschlüsse an der Drainagebohrung T

In der Standardausführung werden die Motoren ohne Drainagebohrung geliefert. Diese Lösung reicht bei den meisten Applikationsfällen, bei denen ein Schaltbetrieb verwendet wird und der mittlere Steuerdruck unter den 50% des max. vom Motor tragbaren Drucks liegt, aus.
Handelt es sich um einen Dauer- oder einen Schaltbetrieb mit einem Betriebsprozentsatz über 50% und der mittlere Steuerdruck liegt über 50% des Drucks, muß man eine Motorausführung mit einer Außendrainage anfordern und die Drainagebohrung T dann mit dem Tank verbinden.

b) Raccordement orifige de purge T

L'exécution standard des moteurs ne prévoit pas d'orifice de purge.
Dans ce cas le moteur est dépourvu de purge intérieure.
Cela satisfait à la plupart des applications où le fonctionnement est intermittent et la pression moyenne de commande est inférieure à 50% de la pression maximale admise pour le moteur .
Si le fonctionnement est continu ou intermittent, avec un pourcentage de fonctionnement supérieur à 50% et la pression moyenne de commande est supérieure à 50% de la pression, il faut commander le moteur dans la variante avec purge extérieure et raccorder l'orifice de purge T au réservoir.

(FIG.27)



c) Comando freno

Nel caso in cui il motoriduttore sia dotato di freno, il motore può essere in due esecuzioni: B02P oppure P01S.
Nella esecuzione B02P, il comando del freno è interno, diretto dal motore.
Nella esecuzione P01S, occorre un ramo ausiliario per il comando del freno.
Vedere lo schema seguente (FIG.28).

c) Brake control

For gearmotors equipped with brakes, there are two motor versions available, i.e. the B02P or P01S executions.
In the B02P version, the motor has an in-built, direct brake control system.
In the P01S version, an auxiliary branching is required to control the brake.
See the following diagram (FIG.28).

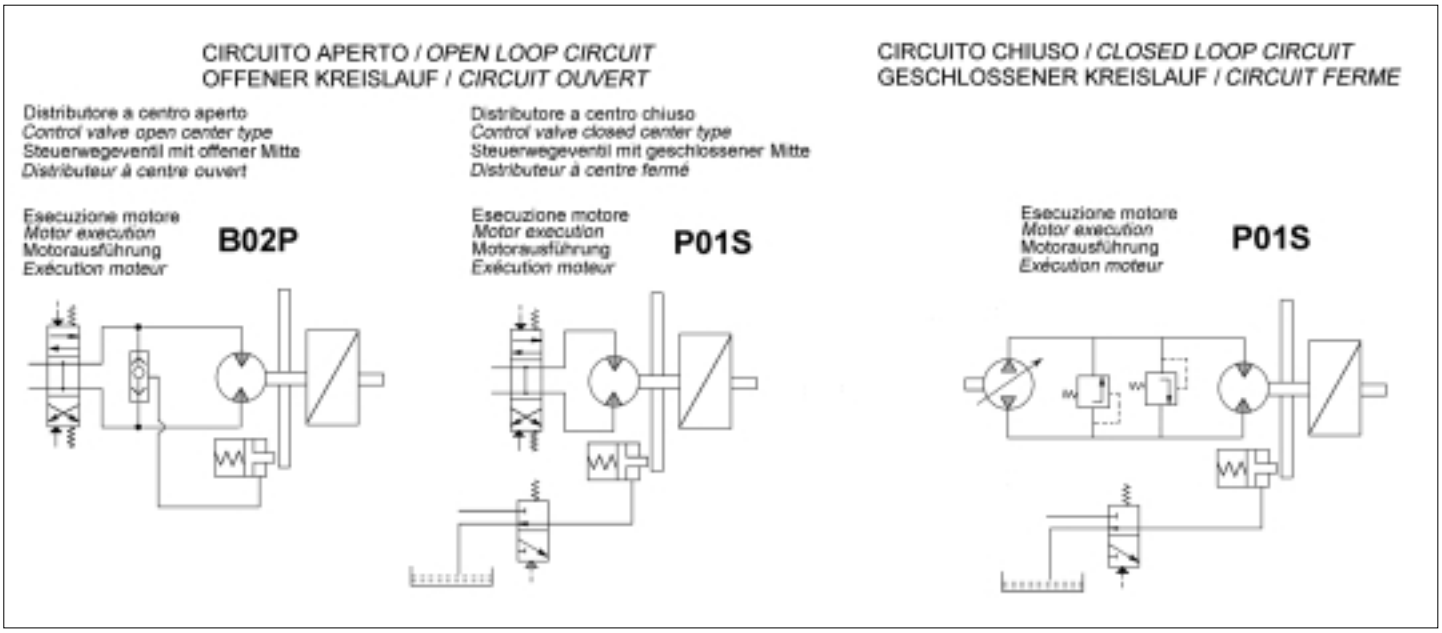
c) Bremssteuerung

Ist der Getriebemotor mit einer Bremse ausgestattet, können zwei Motorausführungen verwendet werden: B02P oder P01S.
Bei der Ausführung B02P liegt die Bremssteuerung im Inneren und wird vom Motor gesteuert. Bei der Ausführung P01S ist für die Bremssteuerung eine Hilfsüberzweigung erforderlich.
Siehe dazu folgendes Schema (Abb.28).

c) Commande frein

Au cas où le motoréducteur serait équipé de frein, le moteur pourra avoir deux exécutions: B02P ou P01S.
Dans l'exécution B02P, la commande du frein est à l'intérieur, derrière le moteur.
Dans l'exécution P01S, il faut disposer d'une branche auxiliaire pour la commande du frein. Voir schéma suivant (Figure 28).

(FIG.28)



d) Tipo olio idraulico

E' raccomandato l'uso di olio idraulico minerale con viscosità ISO VG 46 (46 Cst a t = 40°C).
E' raccomandabile che la temperatura dell'olio sia compresa fra +30 °C e + 70 °C.

d) Hydraulic oil

Use hydraulic mineral oil with viscosity ISO VG 46 (46 Cst at t = 40°C).
It is recommended the oil temperature should be between +30°C and +70°C.

d) Hydrauliköltyp

Es wird der Einsatz von Mineralhydrauliköl mit einem Viskositätsgrad ISO VG 46 (46 Cst bei t = 40°C) empfohlen.
Die Öltemperatur sollte zwischen +30°C und +70°C liegen.

d) Type d'huile hydraulique

On préconise d'utiliser de l'huile hydraulique minérale avec viscosité ISO VG 46 (46 Cst à t = 40°C).
On préconise que le domaine de température de l'huile soit compris entre +30 °C et + 70 °C.

e) Filtraggio

Per assicurare un funzionamento affidabile del motore ed una sua durata è estremamente importante che il circuito idraulico sia dotato di filtro con capacità filtrante tale da assicurare un grado di pulizia dell'olio secondo grado:

e) Oil filtering

For reliable motor operation and long life, it is important that the hydraulic circuit has a filter for a proper oil filtering according to the following degree:

e) Filtrierung

Um einen zuverlässigen Betrieb des Motors und eine lange Lebensdauer zu gewährleisten, ist es besonders wichtig, daß der hydraulische Kreislauf mit einem Filter ausgestattet ist, der eine Filtrierleistung bieten, die einen Ölreinigungsgrad gemäß folgender Angaben sichert Grad:

e) Filtrage

Pour assurer un fonctionnement fiable du moteur, ainsi que sa longévité, il est extrêmement important que le circuit hydraulique soit équipé de filtre, ayant une capacité de filtration en mesure d'assurer un niveau de propreté de l'huile conforme aux degres suivants:

grado 9 NAS 1638	*degree 9 NAS 1638*	Grad 9 NAS 1638	*degré 9 NAS 1638*
grado 6 SAE	*degree 6 SAE*	Grad 6 SAE	*degré 6 SAE*
grado 18/15 SO DIS 4406	*degree 18/15 SO DIS 4406*	Grad 18/15 SO DIS 4406	*degré 18/15 SO DIS 4406*

- Con motore idraulico

Con motore idraulico tutti i motori devono essere riempiti col fluido idraulico prima della messa in esercizio e durante il montaggio nell'impianto.
Posizionare il foro di drenaggio nella posizione più alta per fare il riempimento.
Fare attenzione a che le tubazioni siano dislocate in modo da evitare che il corpo del motore si svuoti per non avere inclusioni di aria che potrebbero causare difficoltà di aspirazione nelle pompe.

- With hydraulic motors

All hydraulic motors must be filled with hydraulic fluid prior to installation and start-up.
Turn the drain hole upwards to fill the motor.
Make sure that the hydraulic hoses are arranged so that they do not drain the motor, and so that air pockets do not form, causing pump suction malfunctions during operation.

- Mit Hydraulikmotor

Mit Hydraulikmotor müssen alle Motoren vor Inbetriebnahme bei Montage der Anlage mit Hydrauliköl gefüllt werden.
Die Ablassbohrung in de höchste Stellung bringen, um zu füllen.
Darauf achten, daß die Leitungen so angeordnet sind, dass eine Entleerung des Motorgehäuses vermieden wird, um Luftblasen zu vermeiden, die zu Schwierigkeiten beim Ansaugen der Pumpen führen könnten.

- Avec moteur hydraulique

Tous les moteurs doivent être remplis avec du fluide hydraulique avant la mise en fonction et pendant le montage dans l'installation.
Positionner le trou de drainage dans la position la plus haute pour effecteur le remplissage.
Faire attention que les tubes soient déconnectés de façon à éviter que le corps moteur se vide pour ne pas avoir d'introduction d'air qui pourrai causer des difficultés d'aspiration dans les pompes.

4 - LUBRIFICAZIONE (prima della messa in funzione)

La lubrificazione è normale in bagno d'olio. A seconda dell'applicazione se in impianto fisso o su macchina mobile attenersi alle seguenti tabelle:

1) Macchine mobili: oli a norme SAE 80 W/90 con caratteristiche API GL5.

2) Impianti industriali: oli a norme ISO VG 150 con caratteristiche E.P.

Nella tabella seguente sono riportati le marche più diffuse di lubrificanti con i tipi di oli consigliati per applicazioni normali.

4 - LUBRICATION (prior to start-up)

Standard lubrication is oilbath. Respect the specifications given below for fixed and mobile machines:

1) Mobile machinery: SAE 80W/90 olis with API GL5 properties

2) Industrial machinery: ISO VG 150 oils with E.P. properties

The following table lists the most common brands of lubricant and the types recommended for normal applications.

4 - SCHMIERUNG (Von Inbetriebnahme)

Die Schmierung erfolgt normal im Ölbad.
Je nach Einsatz, d.h. Festanlage oder bewegliche Maschine, sollte man sich an folgende Tabellen halten:

1) Bewegliche Maschinen: Öl gem. Norm SAE 80 W/90 mit Eigenschaften API GL5

2) Industrieanlagen: Öl gem. Norm ISO VG 150 mit Eigenschaften E.P.

In der nachfolgenden Tabelle sind die üblichsten Schmiermittelmarken aufgeführt, mit Angabe der empfohlenen Ölsorten für normalen Einsatz.

4 - LUBRIFICATION (avant la mise en route)

La lubrification normale s'effectue en bain d'huile.
Selon l'application, installation fixe ou équipement mobile, se reporter aux tableaux suivants:

1) Machines mobiles: Huiles aux normes SAE VG 150 avec caractéristiques API GL5.

2) Installations industrielles: Huiles aux normes ISO VG 150 avec caractéristiques E.P.

Sur le tableau suivant on a reporté les marques les plus répandues de lubrifiants avec les types d'huile conseillés pour des applications normales.

LUBRIFICAZIONE FRENI

I freni idraulici a dischi multipli hanno lubrificazione unica con il riduttore.

BRAKES LUBRICATION

The hydraulically operated multidisc brakes are lubricated by the same oil as the gearbox.

BREMSE SCHMIERUNG

Die hydraulischen Lamellenbremsen werden über die Schmierung des Untersetzungsgetriebes geschmiert.

FREINS LUBRIFICATION

Les freins hydrauliques à disques multiples sont lubrifié avec la même huile que les réducteurs.

Per applicazioni particolari come temperature particolarmente elevate, requisiti di non infiammabilità dell'olio, ecc. interpellare l'Ufficio tecnico TRASMITAL.

For particular applications like: high temperature running conditions, noninflammable oil, etc. contact Trasmital Technical Departements.

Für speziellle Einsatzbedingungen, wie sehr hohe Temperaturen, Notwendigkeit der Verwendung von nicht entflammbarem Öl, usw. setzen Sie sich bitte mit dem technischen Büro von Trasmital in Verbindung.

Dans le cas d'applications particulières avec des températures élevées...où la non inflammabilité de l'huile est requise,...etc., contacter le service technique TRASMITAL.

La temperatura massima dell'olio in esercizio continuo non deve comunque superare gli 85°C.

Maximum operating oil temperature must never exceed 85° C.

Die maximale Öltemperatur darf im Dauerbetrieb 85°C nicht überschreiten.

La température maximum de l'huile en fonctionnement continu ne doit de toute façon pas dépasser 85°C.

RIEMPIMENTO

I riduttori vengono forniti senza olio lubrificante.

Tutti i riduttori sono provvisti dei tappi di carico, livello, sfiato e scarico olio.
Per effettuare il riempimento olio occorre avere il riduttore nella esatta posizione di funzionamento, svitare il tappo di carico olio e riempire fino al livello la cui posizione dipende dal tipo di montaggio: orizzontale o verticale.
Per lo scarico svitare il tappo di scarico magnetico e lasciare defluire l'olio.
Per agevolare l'operazione sarebbe meglio che l'olio fosse ancora caldo e che si sia smontato anche un tappo posizionato in alto nel riduttore per avere una circolazione di aria.

NOTA: per i riduttori con freno, la lubrificazione del freno è comune a quella del riduttore.

FILLING

Gearboxes are supplied without oil.

All gearboxes are equipped with filler, lever, breather, and drain plugs. To fill the gearbox secure it in its exact working position, unscrew the oil filler plug, and add oil until it is visible in the level window. The position of the window will obviously depend on whether the unit is mounted horizontally or vertically.
To drain, remove the magnetic drain plug and drain off oil. If possible, drain while the oil is hot and remove the filler plug from the top of the gearbox to give optimum oil flow.

Note: In gearboxes with brakes, brake lubrication is provided by the gearbox lubricant.

EINFÜLLEN

Die Getriebe werden ohne Schmieröl ausgeliefert.

Alle Getriebe sind mit Füllstopfen, Füllstandanzeige, Entlüftung und Ölablass ausgestattet.
Zum Einfüllen des Öls muss sich das Getriebe in der genauen Betriebsposition befinden, dann den Nachfüllstopfen lösen und bis zum korrekten Füllstand auffüllen, der von der Einbaulage abhängt: senkrecht oder waagerecht. Zum Ablassen des Öl den magnetischen Ablassstopfen entfernen und das Öl abfliessen lassen.
Dieser Vorgang ist einfacher, wenn das Öl noch warm ist und bei abgeschraubtem Nachfüllstopfen, damit die Luft besser nachfliesst.

Anmerkung: Für Getriebe mit Bremse, entspricht die Schmierung der Bremse auf jeden Fall der Getriebeschmierung.

REMPLISSAGE

Les réducteurs sont livrés sans huile de lubrification.

Tous les réducteurs sont équipés de bouchons de remplissage, niveau, reniflard et vidange d'huile.
Pour effectuer le remplissage d'huile il faut présenter le réducteur dans la position exacte de fonctionnement, dévisser le bouchon de remplissage d'huile et remplir jusqu'au niveau dépendant du type de montage: horizontal ou vertical.
Pour la vidange dévisser le bouchon magnétique de vidange et laisser couler l'huile.
Pour faciliter l'opération il est préférable que l'huile soit encore chaude et qu'un autre bouchon positionné en hauteur soit ôté pour permettre une circulation d'air.

NOTA: Pour les réducteurs équipés de frein, la lubrification de ce dernier est commune avec celle du réducteur.

Stadio epicicloidale / *planetary stage* / Planetenstufe / *étage épicycloidal*

Stadio di riduzione ad assi ortogonali / *Helical bevel reduction module* / Kegelradübersetzungsstufe / *étage de réduction à axes orthogonaux*

Lubrificazione permanente — *Life lubricated* — Dauerschmierung — *Lubrification permanente*

NOTA: nei riduttori e motoriduttori combinati la lubrificazione degli stadi epicicloidali è separata da quella dei riduttori a vite senza fine (3/VF) o ortogonali (3/A).

NOTE: Combined gearboxes and gearmotors feature separate lubrication for planetary stages and for worm gearboxes (3/VF) or helical bevel units (3/A).

MERKE: Bei den kombinierten Getrieben oder Getriebemotoren ist die Schmierung der Planetenstufen von denen der Schneckengetriebe (3/VF) oder Kegelradgetriebe (3/A) getrennt.

REMARQUE: Sur les réducteurs et motoréducteurs combinés, la lubrificationdes étages épicycloïdaux est séparée de celle des réducteurs à vis sans fin (3/VF) ou orthogonaux (3/A).

5 - MESSA IN FUNZIONE

Prima di avviare il riduttore controllare:

- Esatto posizionamento tappi olio.
- Tappo sfiato che non sia ostruito da sporcizia o vernice. La sua chiusura provoca sovrapressione all'interno del riduttore con conseguente espulsione degli anelli di tenuta.
- Avviare il riduttore possibilmente senza carico e quando è possibile a bassa velocità.
- Verificare che il funzionamento sia regolare ed in assenza di eccessiva rumorosità.

Dopo le prime ore di esercizio verificare:

- Temperatura sulla carcassa, questa non deve superare nel punto più caldo i 70-75°C.
- Esatto serraggio viti.

5 - START-UP

Before starting the gearbox, check the exact position of the oil plug and check that the breather is not blocked by dirt or paint.

If the breather is blocked, pressure can build up inside the gearbox and blow out the seal rings.

If possible, start up the gearbox without load and at low speed.

Check that the gearbox runs smoothly and does not generate excessive noise;

After the first few hours operation, check the temperature of the gearbox casing.

At its hottest point it should not exceed 70°-75°C.

Also check that all bolts are tight.

5 - INBETRIEBNAHME

Von Inbetriebnahme des Getriebes folgendes kontrollieren:

- Korrekte Position des Ölstopfens.
- Entlüftungsstopfen darf nicht von Schmutz oder Lack verstopft sein.Ist er geschlossen, dann führt dies zu Überdruck im Getriebe und die Dichtringe lösen sich.
- Das Getriebe möglichstohne Last und, falls möglich, mitgeringer Geschwindigkeitanfahren.
- Kontrollieren, ob der Betrieb gleichmässig und ohne Störgeräusche erfolgt.

Nach den ersten Betriebsstunden:

- Temperatur am Gehäuseprüfen: sie darf an der heissesten Stelle 70-75°C nicht überschreiten.
- Prüfen ob alle Schrauben gut angezogen sind.

5 - MISE EN ROUTE

Avant la mise en route, vérifier:

- *La position exacte des bouchons.*
- *Que le bouchon reniflard ne soit pas obstrué par des impurités ou de la peinture. Son obstruction provoque une surpression à l'intérieur du réducteur avec pour conséquence l'extrusion des bagues d'étanchéïté.*
- *Procéder au démarrage du réducteur si possible à vide et éventuellement à basse vitesse.*
- *Vérifier que le fonctionnement est normal et sans-bruit excessif.*

Après les premières heures de fonctionnement, vérifier:

- *La température sur le carter - celle-ci ne doit pas dépasser au point le plus chaud 70-75°C.*
- *Le bon serrage des vis.*

6 - MANUTENZIONE

In condizioni di normale esercizio il riduttore non necessita di manutenzione.
Sono solo da effettuare le normali verifiche di livello e cambio olio come segue:

Cambio olio

Effettuare il primo cambio olio circa dopo 100÷150 ore di lavoro.
Successivamente effettuare il cambio ogni 2000÷3000 ore a seconda degli impieghi o almeno una volta all'anno.
È buona norma comunque controllare il livello una volta al mese per funzionamento intermittente, più frequentemente per funzionamento in continuo e aggiungere olio se necessario.

Nota: è sempre opportuno procedere al cambio degli anelli di tenuta, quando:

- l'anello di tenuta viene smontato;
- quando si fa una revisione del riduttore;
- riposizionare l'anello di tenuta in modo che il labbro di tenuta del nuovo anello non lavori sulla stessa pista di scorrimento dell'anello precedente.

Nota: se il riduttore dovesse rimanere fermo per lunghi periodi si consiglia di riempirlo completamente di olio che sarà riportato al giusto livello quando questo verrà rimesso in esercizio.

6 - MAINTENANCE

Gearboxes are virtually maintenance free under normal operating conditions. The only periodic operations required are checks on oil level and oil changes as follows:

Oil Changes

Change the oil first after 100-150 hours operation.
Subsequently, change the oil only every 2000-3000 hours operation depending on application. Alternatively change oil once a year.
Check the oil level in the gearbox every month and top up as necessary.

***Note:** We recommend that you also change the oil seals on the following occasions:*

- *whenever the seal rings are removed;*
- *whenever the gearbox is serviced/reconditioned;*
- *at least once a year with electric motor drives.*

When fitting new seals, avoid locating the lip of the new seal in exactly the same place as that of the old seal.

***Note:** Fill a gearbox completely with oil before any long idle period. Drain to the normal level prior to re-starting operation.*

6 - WARTUNG

Unter normalen Betriebsbedingungen berdaf das Getriebe keiner Wartung. Nur der Ölstand sollte regelmässig geprüft und das Öl muss gewechselt werden:

Ölwechsel

Den ersten Ölwechsel nach ca. 100-150 Betriebsstunden vornehmen, dann alle 2000 bis 300 Betriebsstunden je nach Einsatz, oder mindestens einmal im Jahr. Es empfiehlt sich, die Ölstand einmal im Monat zu kontrollieren und, falls nötig, nachfüllen.

Anmerkung: Es ist stets empfehlenswert, die Dichtringe auszutauschen, wenn:

- der Dichtring ausgebaut wird
- wenn das Getriebe überholt wird
- bei Antrieb mit Elektromotor mindestens einmal jährlich.

Den Dichtring so einsetzen, daß die Dichtlippe des neuen Rings nicht an der gleichen Stelle ansetzt, wie jene des alten Rings.

Anmerkung: Sollte das Getriebe über längere Zeiträume stehen, dann wird empfohlen, es vollständing mit Öl zu füllen und den korrekten Füllstand erst bei erneuter Inbetriebnahme wiederherzustellen.

6 - ENTRETIEN

Dans les conditions normales d'utilisation le réducteur ne nécessite pas d'entretien. Seul sont à effectuer les contrôles habituels de niveau et la vidange de l'huile comme suit:

Vidange d'huile

Effectuer la première vidange après 100/150 heurs de travail environ.
Puis successivement toutes les 2000-3000 heurs selon le type d'utilisation ou au minimum une fois l'an.
Il est toutefois conseillé de contrôler le niveau une fois par mois et faire l'appoint d'huile si nécessaire.

***Remarque:** Il est toujours opportun de procéder au changement des joints d'étanchéité, lorsque:*

- *Le joint a été démonté.*
- *On procède à une révision du réducteur.*

Replacer le nouveau joint de façon que les bords ne travaillent pas sur la même piste de glissement que le joint précédent.

***Remarque:** Si par nécessité le reducteur devait rester arrêté pour de longues périodes, il est conseillé de remplir complètement d'huile.*
La mise à niveau sera effectuée lors de la remise en route du réducteur.

PRECARICO E MOMENTO DI SERRAGGIO PER VITI CON FILETTATURA ISO A PASSO GROSSO

Il precarico è stato calcolato pari al 70% del carico di snervamento minimo. Il momento torcente è stato calcolato impiegando la formula (39) del manuale Junker & Blume, ed attribuendo al coefficiente di attrito µges il valore medio ges 0,14.

PRELOADING AND TIGHTENING TORQUE FOR ISO STD. PITCH SCREWS

Preloading has been calculated at 70% of the vizls point. Formula (39) of the Junker and Blume's handbook has been used to calculate the torque, and a mean value of µges 0,14 has been given to friction coefficent µges.

BEANSPRUCHBARKEIT UND ANZUGSMOMENT DER SCHRAUBEN MIT HOHER GEWINDESTEIGUNG GEM.ISO

Die Beanspruchbarkeitswerte betragen 70% der min. Bruchbelastung. Das Anzugsmoment wurde gem Formel 39 des Junker und Blume Manuels errechnet unter Berücksichtigung eines Reribungskoeffizienten von µ ges.-0,14 (Mittelwert).

PRÉCHARGE ET COUPLE DE SERRAGE POUR VIS À FILETAGE ISO PAS GROS.

La précharge a été calculée à 70% de la charge minimum de rupture. Le moment de torsion a été calculé par la formule (39) du manuel Junker et Blume, en attribuant au coefficient de frottement µ ges la valeur moyenne 0,14.

ISTRUZIONI DI SICUREZZA

Le seguenti istruzioni di sicurezza fanno riferimento in via principale all'utilizzo di motoriduttori. Tenere in considerazione le istruzioni di sicurezza supplementari riportate nelle singole sezioni di questo manuale istruzioni. I conduttori di tensione e gli organi in movimento di macchine elettriche possono provocare gravi lesioni o la morte. L'installazione, il collegamento e la messa in funzione, unitamente agli interventi di manutenzione e riparazione, devono essere effettuati esclusivamente da personale specializzato tenendo in considerazione quanto di seguito riportato:

- le presenti istruzioni
- i segnali di avvertimento e le etichette istruzioni sull'unità motore / riduttore
- tutte le documentazioni di progettazione, le istruzioni di messa in funzione e gli schemi tecnici
- le regolamentazioni e i requisiti specifici del sistema
- le normative nazionali/regionali vigenti (normative di sicurezza/antinfortunistiche)

Uso previsto

Questi motori elettrici sono destinati all'uso in sistemi industriali. Essi sono conformi alle normative e alle regolamentazioni vigenti e rispettano le disposizioni della Direttiva Bassa Tensione 73/23/CEE. I dati tecnici, come pure le condizioni ammesse sul luogo, sono indicati sulla targhetta identificativa della macchina e nel presente manuale istruzioni. Le informazioni ivi riportate devono essere rispettate!

SAFETY INSTRUCTIONS

The following safety instructions relate primarly to the use of geared motors. Please consider the additional safety instructions in the individual sections of these operating instructions. Voltage conductors and movable parts of electrical machines can cause serious or fatal injury. Installation, connection, commissioning as well as maintenance and repair work may only be carried out by qualified specialists, taking into account:

- *these instructions*
- *the warning and instructions labels on the motor / gear unit*
- *all other project planning documentation, commissioning instructions and schematic diagrams*
- *the system specific regulations and requirements*
- *the current national / regional regulations (safety / accident prevention regulations)*

Intended use

These electrical motors are intended for industrial systems. They conform to the valid standards and regulations and meet the requirements of the Low Voltage Directive 73/23/EEC. Technical data as well as permitted conditions on site can be found on the nameplate and in these operating instructions. These details must be observed!

SICHERHEITSANWEISUNGEN

Die nachstehenden Sicherheitsanweisungen beziehen sich hauptsächlich auf den Einsatz der Getriebemotoren. Dabei sind jedoch auch die zusätzlichen, in den einzelnen Abschnitten dieses Anleitungshandbuchs enthaltenen Sicherheitsanweisungen zu berücksichtigen. Die Spannungsleiter und die sich in Bewegung befindlichen Organe an elektrischen Maschinen können schwere Verletzungen verursachen oder gar tödliche Gefahren in sich bergen. Die Installation, der Anschluss und die Inbetriebsetzung, ebenso wie die Instandhaltungs- und Reparatureingriffe, dürfen ausschließlich nur von Fachpersonal durchgeführt werden, dass folgendes berücksichtigen muss:

- die vorliegenden Anleitungen
- die Warnhinweise und die Angaben auf den an der Einheit Motor / Getriebe angebrachten Anweisungsetiketten
- alle Projektdokumente, die Anleitungen für die Inbetriebsetzung und die technischen Pläne
- die spezifischen Regeln und Anforderungen des Systems
- die sich in Kraft befindlichen nationalen/regionalen Richtlinien (Sicherheits-/Unfallschutznormen)

Vorgesehener Einsatz

Diese Elektromotoren sind für den Einsatz an industriellen Systemen bestimmt. Sie entsprechen den gültigen Richtlinien und Regelungen und der Niederspannungsrichtlinie EWG/73/23. Die technischen Daten, ebenso wie die zulässigen Bedingungen vor Ort, werden auf den Typenschild der Maschine und in der vorliegenden Anleitung angegeben. Die hier enthaltenen Informationen müssen eingehalten werden!

INSTRUCTION DE SÉCURITÉ

Les instructions de sécurité suivantes se réfèrent principalement à l'utilisation des motoréducteurs.

Considérer les instructions de sécurité supplémentaires indiquées dans les chapitres de ce manuel d'instructions. Les conducteurs de tension et les organes en mouvement des machines électriques peuvent provoquer de graves lésions, voire même être mortels. L'installation, le branchement et la mise en service, ainsi que les interventions d'entretien et de réparation, doivent être effectués exclusivement par du personnel qualifié, dans le respect des indications suivantes:

- *les présentes instructions*
- *les signaux d'avertissement et les autocollants d'instructions présents sur l'unité moteur/réducteur*
- *tous les documents de conception, les instructions de mise en service et les schémas techniques*
- *les réglementations et les conditions requises spécifiques du système*
- *les normes nationales/régionales en vigueur (normes de sécurité/de prévention des accidents)*

Utilisation prévue

Ces moteurs électriques sont destinés à être utilisés dans des systèmes industriels. Ils sont conformes aux normes et réglementations en vigueur et respectent les dispositions de la Directive Basse Tension 73/23/CEE. Les caractéristiques techniques ainsi que les conditions admises sur le site sont indiquées sur la plaquette signalétique de la machine et dans ce manuel d'instructions. Il est indispensable de respecter les informations qui y sont indiquées !

1.0 IDENTIFICAZIONE

Tutti i riduttori, motoriduttori e motori sono muniti di una targhetta dalla quale potranno essere rilevati i dati necessari alla loro identificazione.
Nella tabella sono indicate le tre tipologie di targhe di identificazione utilizzate per le varie configurazioni.

1.0 IDENTIFICATION

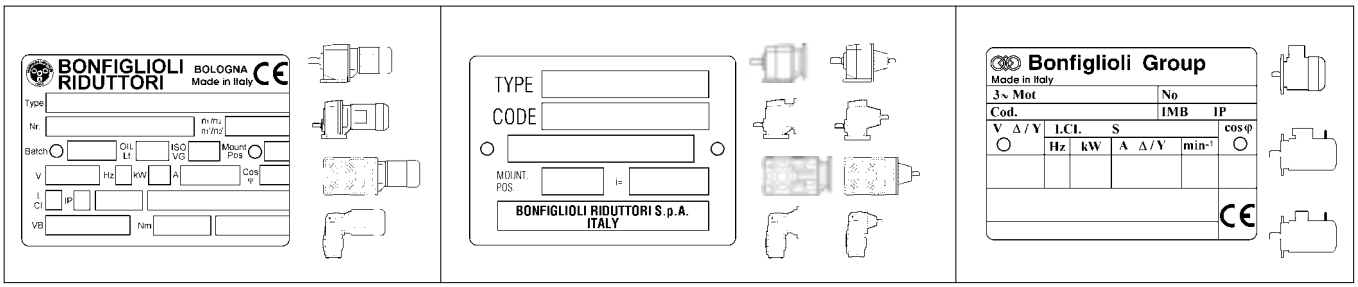
All gearboxes, gearmotors, and motors carry a nameplate with data to be used for their identification.
Table shows the three types of name plates used for the various configurations.

1.0 IDENTIFIKATION

Alle Getriebe, Getriebemotoren und Motoren sind mit einem Namensschild ausgerüstet, auf dem die technischen Daten, die für ihre Identifikation ausschlaggebend sind, abgelesen werden können. In der Tabelle sind die drei Schildertypen aufgeführt, die zur Identifikation der verschiedenen Konfigurationen dienen.

1.0 IDENTIFICATION

Tous les réducteurs, motoréducteurs et moteurs sont munis d'une plaque sur laquelle figurent les données nécessaires à leur identification.
Dans le tableau sont indiqués les trois types de plaques signalétiques utilisées pour les différentes configurations.



2.0 RICHIESTA RICAMBI

La tabella indica i dati che è indispensabile fornire in fase di richiesta ricambi per poter effettuare una corretta identificazione del prodotto e di conseguenza una sollecita risposta alla richiesta stessa.
In funzione delle particolari tecniche di montaggio dei componenti utilizzate dalla BONFIGLIOLI RI- DUTTORI atte a ottimizzare le prestazioni dei riduttori e motoriduttori si consiglia, dove previsto, l'acquis- to dei kit di montaggio.

2.0 SPARE PARTS ORDER

Table indicates the data that must be supplied when placing a spare part order so that the product may be correctly identified and the order processed promptly.
Due to the assembly techniques for components used by BONFIGLIO- LI RIDUTTORI to optimise the performance of gearboxes and gearmotors, we recommend the purchase (where applicable) of the mounting kits.

2.0 BESTELLUNG VON ERSATZTEILEN

In der Tabelle sind die Daten aufgelistet, die bei der Bestellung von Ersatzteilen unbedingt angegeben werden müssen, damit die Teile richtig identifiziert werden und die Bestellung schneller folgen kann.
Wegen der speziellen Montagetechniken der Komponenten, die bei BONFIGLIOLI RIDUTTORI angewendet werden und die zu einer Verbesserung der Leistungen der Getriebe und Getriebemotoren führen, empfehlen wir, wenn möglich die Ausrüstungselemente zu kaufen.

2.0 DEMANDE DE PIECES DETACHEES

Le tableau indique les données qu'il est indispensable de fournir pour toute commande de pièces détachées, ceci pour permettre l'identification correcte du produit et, par conséquent, une livraison dans les meilleurs délais. Du fait des techniques particulières de montage des composants utilisées par BONFIGLIOLI RIDUTTORI à même d'optimiser les performances de réducteurs et motoréducteurs, nous vous conseillons dans la mesure du possible l'achat des kits.

3.0 LAYOUT GENERALE

La tabella sottostante illustra lo schema generale di collegamento dei vari moduli con l'indicazione dei paragrafi in cui sono riportate le sezioni e le liste dei componenti.

3.0 GENERAL LAYOUT

Table below shows the general layout for the various modules and indicates the paragraphs in which the cross-sectional drawings and parts lists are given.

3.0 ALLGEMEINES LAYOUT

Die Tabelle zeigt das Gesamtschema zum Zusammenbau der verschiedenen Baueinheiten und verweist auf die Abschnitte, in denen die einzelnen Untergruppen und Komponentenlisten aufgeführt sind.

3.0 SCHEMA D'IMPLANTATION

Le tableau présente le schéma général d'accouplement des différents modules, avec l'indication des paragraphes où sont fournies les sections et les nomenclatures des composants.

8.0 MODULO ADDIZIONALE

Il modulo addizionale viene interposto fra il modulo uscita del riduttore (C, A, F) e uno dei moduli entrata (paragrafo 9.0).

8.0 ADDITIONAL GEAR MODULE

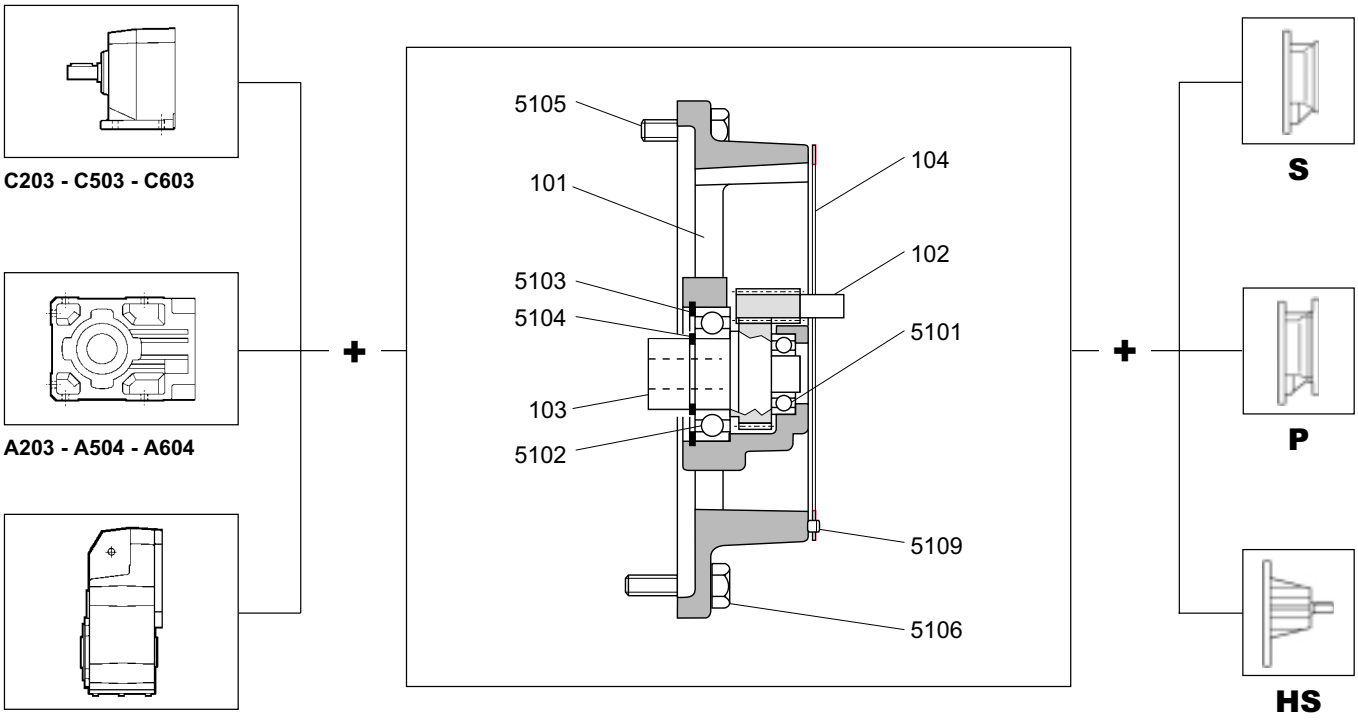
The additional module is assembled between the output module of the gearbox (C, A, F) and one of the input modules (section 9.0).

8.0 ZUSÄTZLICHE BAUEINHEIT

Die zusätzliche Baueinheit mit wird zwischen die Ausgangseinheit des Getriebes (C, A, F) und eine der Baueinheiten mit (siehe Abschnitt 9.0) eingefügt.

8.0 MODULE ADDITIONNEL

Le module additionnel est interposé entre le module de sortie du réducteur (C, A, F) et un des modules d'entrée (paragraphe 9.0).



Quando le entrate S,P,HS devono essere fissate alle casse o ai moduli addizionali, le viti di fissaggio, nel caso in cui si trovino in corrispondenza di fori passanti devono avere il trattamento "DRILOC" sul filetto. Se non è possibile reperirle, è indispensabile effettuare un'efficace sigillatura applicando un adeguato prodotto (Loctite 574) sul filetto all'atto del montaggio.

S (integr. motor), P (IEC motor interface), or HS (free shaft) input kits are to be fitted onto the main gear housings or to the additional gear module. Should fasteners engage into through holes, the threads of the forner must be "DRILOC" treated for sealing purposes. If such screws are not available locally, we recommend to apply Loctite 574, or an equivalent product, on the threads before connecting the parts.

Sollten die Antriebe S,P,HS an den Gehäusen oder den zusätzlichen Einheiten befestigt werden, muß auf die Gewinde der Schrauben 5002, 5027, und 5047, falls sie in den durchgehenden Bohrungen angeordnet sein sollten, "DRILOC" aufgetragen werden. Sollte dieses Mittel nicht erhältlich sein, muß bei der Montage durch das Auftragen eines geeigneiten Produkts (Loctite 574) auf das Gewinde, eine haltbare Sicherung gewährleistet werden.

Lorsque les entrée S,P,HS doivent être fixées aux carters ou aux modules additionnels, les vis de fixation, lorsq'elles se trouvent en face des orifices passants, doivent être traitées avec "DRILOC" au niveau du filetage. Si ce produit nìest pas disponible, au moment du montage, il est indispensable d'effectuer un scellement efficace en appliquant un produit spécifique (Loctite 574) sur le filetage.

	5051	Anello O-ring	*O-ring seal*	O-Ring	*Bague O-ring*

Quando le entrate S,P,HS devono essere fissate alle casse o ai moduli addizionali, le viti di fissaggio, nel caso in cui si trovino in corrispondenza di fori passanti devono avere il trattamento "DRILOC" sul filetto. Se non è possibile reperirle, è indispensabile effettuare un'efficace sigillatura applicando un adeguato prodotto (Loctite 574) sul filetto all'atto del montaggio.

S (integr. motor), P (IEC motor interface), or HS (free shaft) input kits are to be fitted onto the main gear housings or to the additional gear module. Should fasteners engage into through holes, the threads of the forner must be "DRILOC" treated for sealing purposes. If such screws are not available locally, we recommend to apply Loctite 574, or an equivalent product, on the threads before connecting the parts.

Sollten die Antriebe S,P,HS an den Gehäusen oder den zusätzlichen Einheiten befestigt werden, muß auf die Gewinde der Schrauben 5002, 5027, und 5047, falls sie in den durchgehenden Bohrungen angeordnet sein sollten, "DRILOC" aufgetragen werden. Sollte dieses Mittel nicht erhältlich sein, muß bei der Montage durch das Auftragen eines geeigneiten Produkts (Loctite 574) auf das Gewinde, eine haltbare Sicherung gewährleistet werden.

Lorsque les entrée S,P,HS doivent être fixées aux carters ou aux modules additionnels, les vis de fixation, lorsq'elles se trouvent en face des orifices passants, doivent être traitées avec "DRILOC" au niveau du filetage. Si ce produit niest pas disponible, au moment du montage, il est indispensable d'effectuer un scellement efficace en appliquant un produit spécifique (Loctite 574) sur le filetage.

11.0 LUBRIFICAZIONE

Un sistema misto bagno d'olio-sbattimento garantisce di regola la lubrificazione dei riduttori.
Per alcune posizioni di montaggio, generalmente caratterizzate da uno dei due assi verticali, opportune precauzioni vengono adottate al fine di garantire una adeguata lubrificazione anche agli organi più sfavoriti.

In alcune grandezze di riduttore il particolare lubrificante adottato, cosìddetto "long life" non richiede alcuna sostituzione per tutto l'arco di vita del riduttore stesso il quale pertanto viene fornito privo dei tappi di carico, scarico e livello.
Il primo riempimento viene effettuato da tutti gli stabilimenti Bonfiglioli esclusivamente con lubrificanti sintetici di marca **SHELL**.

Funzionamenti a temperature ambiente ta comprese fra -15 °C e +50°C sono in questo caso ammessi. Per temperature inferiori a -15 °C consigliamo di contattare il ns. Servizio Tecnico.

Riduttori delle taglie superiori sono invece forniti "a secco" e sarà pertanto cura dell'utilizzatore riempirli di lubrificante prima della messa in opera.A questo scopo tali riduttori sono provvisti di tappi di carico, scarico e livello disposti in funzione della posizione di moantaggio specificata in fase di ordinativo (illustrata nella specifica sezione di catalogo).

A garanzia di un funzionamento ottimale Bonfiglioli consiglia di eseguire il primo ed i successivi riempimenti ricorrendo sempre alle elevate prestazioni dei lubrificanti **SHELL**.

Confezioni da 4 l di Shell Tivela Oil SC 320 sono disponibili e possono essere ordinate presso la rete di vendita Bonfiglioli.

11.0 LUBRICATION

Lubrication of gear units is usually provided through a combination of oil bath and oil-splash patterns.
For some mounting positions, typically those featuring a vertical shaft, provisions are made to guarantee lubrication of even the least favourably located drive components.

Smallest gear units are filled in at the factory with a "long life" poliglycol-based lubricant, virtually maintenance-free and thus not requiring oil changes all throughout the operating life of the gearbox. In such a case gear units do not feature oil fill, level and drain plugs.
*Original filling is provided by all Bonfiglioli assembly facilities exclusively with synthetic-base **SHELL** oil.*

Under these conditions operation at ambient temperatures in the range of -15 °C to +50 °C is allowed. Should the unit operate at temperatures well below -15 °C please contact Bonfiglioli's Technical Service for specific directions.

Larger size units are instead supplied dry and it will be the customer care to fill them with lubricant prior to putting them into operation. Consequently such units feature oil plugs properly located according to the particular mounting position specified at the ordering stage (coding shown in the specific catalogue section).

*For a long lasting and trouble-free operation Bonfiglioli recommends that the first fill as well as following replacements are only made using **SHELL** lubricants.*

4 l cans of Shell Tivela Oil SC 320 are available and can be sourced through Bonfiglioli Riduttori's sales network.

11.0 SCHMIERUNG

Normalerweise sorgt ein kombiniertes System aus Ölbad-Ölumlauf für die Gewährleistung der Schmierung der Getriebe.
In einigen Montagepositionen, die im Allgemeinen von einer der beiden senkrechten Achsen gegeben wird, werden, um auch an den ungünstig liegenden Organen eine geeignete Schmierung zu gewährleisten entsprechende Vorsichtsmaßnahmen getroffen.

Bei einigen Getriebegrößen muß das verwendete Schmiermittel, das sogenannte "Long-Life"-Schmiermittel, während der gesamten Lebensdauer des Getriebes nicht mehr gewechselt werden. Aus diesem Grund werden sie auch ohne jeglichen Einfüll- sowie Ablaßverschluß und ohne Pegelanzeige geliefert. Die Füllung erfolgt direkt in den Bonfiglioli-Werken, dabei werden ausschließlich nur synthetische Schmiermittel der Marke **SHELL** verwendet.

In diesem Fall ist der Getriebeeinsatz unter Umgebungstemperaturen zwischen –15°C und +50°C zulässig. Bei Temperaturen unter –15°C empfehlen wir, sich mit unserem Technischen Kundendienst abzustimmen.

Die größeren Getriebe werden "trocken" geliefert, d.h. der Anwender muß vor der Inbetriebnahme das entsprechende Schmiermittel zugeben. Zu diesem Zweck sind diese Getriebe mit Einfüll- sowie Ablaßschrauben und mit einer Pegelanzeige ausgestattet, die der, bei der Auftragsgebung angegebenen Montageposition (im entsprechenden Abschnitt des Katalogs angegeben) entsprechend angeordnet sind.

Um den optimalen Betrieb gewährleisten zu können, empfiehlt die Bonfiglioli sowohl die Erstbefüllung als auch die nachfolgenden Füllungen mit den stark belastungsfähigen Schmiermitteln der **SHELL** vorzunehmen.

Die 4-Liter-Behälter des "Shell Tivela Oil SC 320" können bei den Verkaufsstellen der Bonfiglioli angefordert werden.

11.0 LUBRIFICATION

Normalement, un système mixte bain d'huile-barbotage garantit la lubrification des réducteurs.
Pour certaines positions de montage, généralement caractérisées par un des deux axes verticaux, des précautions opportunes sont adoptées afin de garantir une lubrification adéquate, même des organes les plus mal placés.

Sur certaines tailles de réducteur, le lubrifiant particulier adopté, de type " ong life", ne nécessite aucun remplacement au cours de la durée de vie du réducteur, par conséquent, ce dernier est fourni sans bouchon de remplissage, de vidange et de niveau.
*Le premier remplissage est effectué par tous les établissements Bonfiglioli, exclusivement avec des lubrifiants synthétiques de marque **SHELL**.*

Dans ce cas, des fonctionnements à des températures ambiantes comprises entre –15°C et + 50°C sont admis. En cas de températures inférieures à –15°C, il est conseillé de contacter notre service technique.

Au contraire, les réducteurs de tailles supérieures sont fournis " à sec", par conséquent, l'utilisateur doit se charger de les remplir avec du lubrifiant avant leur mise en service.
Dans ce but, ces réducteurs sont équipés de bouchon de remplissage, de vidange et de contrôle du niveau situés en fonction de la position de montage spécifiée au moment de la commande (voir chapitre spécifique dans le catalogue).

*Afin de garantir un fonctionnement optimal, nous vous conseillons d'effectuer le premier remplissage, ainsi que les suivants, en utilisant toujours des lubrifiants **SHELL**, dont les performances sont élevées.*

Des bidons de 4 l de Shell Tivela Oil SC 320 sont disponibles et peuvent être commandés dans les points du réseau de vente Bonfiglioli.

Lubrificante di fornitura originale Bonfiglioli Riduttori / *Original Bonfiglioli's supply* Schmiermittel der Orginalfüllung – Bonfiglioli Riduttori / *Lubrifiants de fourniture originale Bonfiglioli Riduttori*	
Riduttori ad ingranaggi elicoidali / *Helical and bevel helical gear unit* Stirnradgetriebe und Kegelradgetriebe / *Réducteurs à engrenages hélicoïdaux*	**SHELL Tivela Oil SC 320**

Qualora il lubrificante sintetico, preferibile per le superiori prestazioni, non sia disponibile localmente è consentito, **solo per i riduttori ad ingranaggi elicoidali e non per i riduttori a vite senza fine**, l'uso di lubrificante a base minerale. In questo caso suggeriamo l'uso di **SHELL Omala 220**.

*Should the synthetic lubricant option, preferred performancewise, not be available locally it is allowed, **for helical and bevel helical units only, NOT for worm units**, the use of a mineral-base oil. In this case **SHELL Omala 220** must be considered as the preferred option.*

Sollte das bei höheren Leistungsausbringungen empfohlene synthetische Schmiermittel vor Ort nicht verfügbar sein, kann, **nur für die Stirnradgetriebe, Kegelradgetriebe und auf keinen Fall für die Schneckengetriebe**, auch ein Schmiermittel auf Mineralbasis verwendet werden. In diesem Fall empfehlen wir den Einsatz von **SHELL Omala 220**.

*Si le lubrifiant synthétique, préférable pour ses performances supérieures, n'est pas disponible sur place, il est possible **uniquement en ce que concerne les réducteurs à engrenages hélicoïdaux et non les réducteurs à vis sans fin**, d'utiliser un lubrifiant à base minérale. Dans ce cas, nous conseillons d'utiliser **SHELL Omala 220**.*

Bonfiglioli infine raccomanda che, qualora il lubrificante venga scelto al di fuori del tipo SHELL consigliato, questo sia di composizione equivalente in merito alla natura sintetica e alla viscosità, inoltre sia dotato degli opportuni additivi con funzione antischiuma.

Bonfiglioli finally recommends that should the oil type be selected outside the recommended SHELL range the same is at least of equivalent composition as to the synthetic base and viscosity index besides including the appropriate anti-foam additives.

Die Bonfiglioli weist letztendlich darauf hin, daß falls man ein von den empfohlenen SHELL-Typen abweichendes Schmiermittel wählen sollte, daß dieses in bezug auf seine synthetische Herkunft und Viskosität gleichwertig zusammengesetzt und darüber hinaus über geeignete Schaumschutzstoffe verfügen sollte.

Enfin, en cas de choix autre que le type SHELL conseillé, nous vous recommandons de choisir un lubrifiant équivalent, tant du point de vue de la nature synthétique que de la viscosité, de plus, sa composition doit comprendre des additifs anti-mousse appropriés.

11.1 LUBRIFICAZIONE RIDUTTORI SERIE C

11.1 LUBRICATION OF HELICAL UNITS, C SERIES

11.1 SERIE C GETRIEBES SCHMIERUNG

11.1 LUBRIFICATION REDUCTEURS SERIE C

I riduttori dal tipo C102 al tipo C403 compreso, sono forniti con lubrificazione permanente ad olio sintetico e non necessitano di alcuna manutenzione.
Gli altri tipi sono predisposti per la lubrificazione ad olio e pertanto dotati dei tappi di carico, livello e scarico olio (tabelle S71 e S72); sarà cura dell'utente immettere il lubrificante avvalendosi delle quantità (litri) indicate in tabella (S70).
Evidenziamo però che tali quantità sono indicative, pertanto l'esatto livello dovrà essere valutato osservandolo dall'apposita spia (con il riduttore già installato nella corretta posizione di montaggio).

Gearboxes from C102 to C403 are life lubricated with synthetic oil and do not require any maintenance.
The remaining types are designed for oil lubrication and therefore have oil filling, level and drain plugs (tables S71 and S72);
users should fill the units with oil, consulting table (S70), with the correct quantity (litres).
However, it must be underlined that these quantities are only guidelines, therefore users should check the correct level through the oil level plug (when the gearbox is installed in its correct mounting position).

Die Getriebe von Typ C102 bis Typ C403 werden mit Dauerschmierung mit Syntheseöl geliefert und sind wartungsfrei.
Die anderen sind für die Ölschmierung vorgerüstet und verfügen daher über einen Einfüllverschluß, Ölstands-und Öl-ablaßschrauben (Tabelle S71 und S72). Das Öl muß vom Kunden in der in Tabelle (S70) angegebenen Menge (Liter) eingefüllt werden. Wir weisen jedoch darauf hin, daß es sich bei diesen Angaben nur um Richtwerte handelt und daher der tatsächlich Ölbedarf durch das Schauglas geprüft werden muß (das Getriebe muß sich hierzu schon in seiner endgültigen Einbaulage befinden).

Les réducteurs du type C102 au type C403 compris sont fournis avec lubrification permanente à l' huile synthétique et n'ont besoin d'aucun entretien.
Les autres types sont prédisposés pour la lubrification à l'huile et par conséquent dotés de bouchons de remplissage, niveau et vidange d'huile (tableau S71 et S72); l'utilisateur devra introduire le lubrifiant en se conformant aux quantités (litres) indiqués sur le tableau (S70).
Ces quantités sont toutefois indicatives et le niveau exact devra être contrôlé par le voyant spécial (avec le réducteur déjà installé dans la position correcte de montage).

Lubrificazione permanente

* = La quantità è indicativa. Controllare il riempimento attraverso il relativo vetro spia.

° = Il riempiemento parziale o totale deve essere effettuato dal foro presente sulla flangia P

Life lubricated

* = *Quantity is indicative. Check filling through the sight glass.*

° = *The oil must be fitted through the hole located on the motor flange.*

Dauerschmierung

* = Bei der angegebenen Menge handelt es sich um einen Anhaltswert. Den Füsstand über das entsprechendeKontrollglaskontrollieren.

° = Ein teilweise oder vollkommene Füllung muss über die Bohrung am Flaschn erfolgen.

Lubrification permanente

* = *In allen anderen Fällen, den Verschluss geschlossen lassen.*

° = *Le remplissage partiel ou total doit s'effectuer au moyen de l'orifice positionné sur la bride.*

Posizione dei tappi di carico, scarico e livello olio

Positions of oil filling, level and drain plugs.

Anordnung des Einfüllv, Ölstands- und Ölablaßschrauben.

Position des bouchons de remplissage, niveau et vidange d'huile.

(S71)

• Numero di riferimento delle posizioni dei tappi di carico, scarico e livello olio come da tabella (S71).

• Reference number for positions of oil filling, level and drain plugs as shown in table (S71).

• Bezugsnummer der Positionen des Einfüll Ölstands-und Ölablaßschrauben (Siehe TabelleS71).

• Numéro de référence des positions des bouchons de remplissage, vidange et niveau d'huile comme d'après tableau (S71).

Posizioni dimontaggio e orientamento morsettiera

Per i riduttori C50 - C100, dalle posizioni standard B3 e B5 è possibile ottenere le altre (B6,B7,B8,V5 e V1) disponendo i tappi come indicato nelle tabelle (S72a) e (S72b) provvedendo ad immettere la corretta quantità di lubrificante riportata in tabella (S70b) relativa alla nuova posizione scelta.

Mounting position and terminal box angular position

The B6, B7, B8, V5 and V1 mounting positions of gear units C50 through C100 can be obtained from the original B3 and B5 arrangemets by re-locating the oil plugs, as indicated in tables (S72a) and (S72b) and adjusting the relevant oil quantity, as per table (S70b).

Einbaulagen und lage des klemmenkastens

Von den Standardpositionen B3 und B5 gelangt man zu den anderen Positionen (B6, B7, B8, V5 und V1), indem man die Verschlußschrauben wie in den Tabellen, (S72a) und (S72b) angegeben anordnet.

Positions de montage et orientation boite a borne

A partir des positions standard B3 et B5, il est possible d'obtenir les autres (B6, B7, B8, V5 et V1) en disposant les bouchons comme indiqué sur les tableaux (S72a) et (S72b).

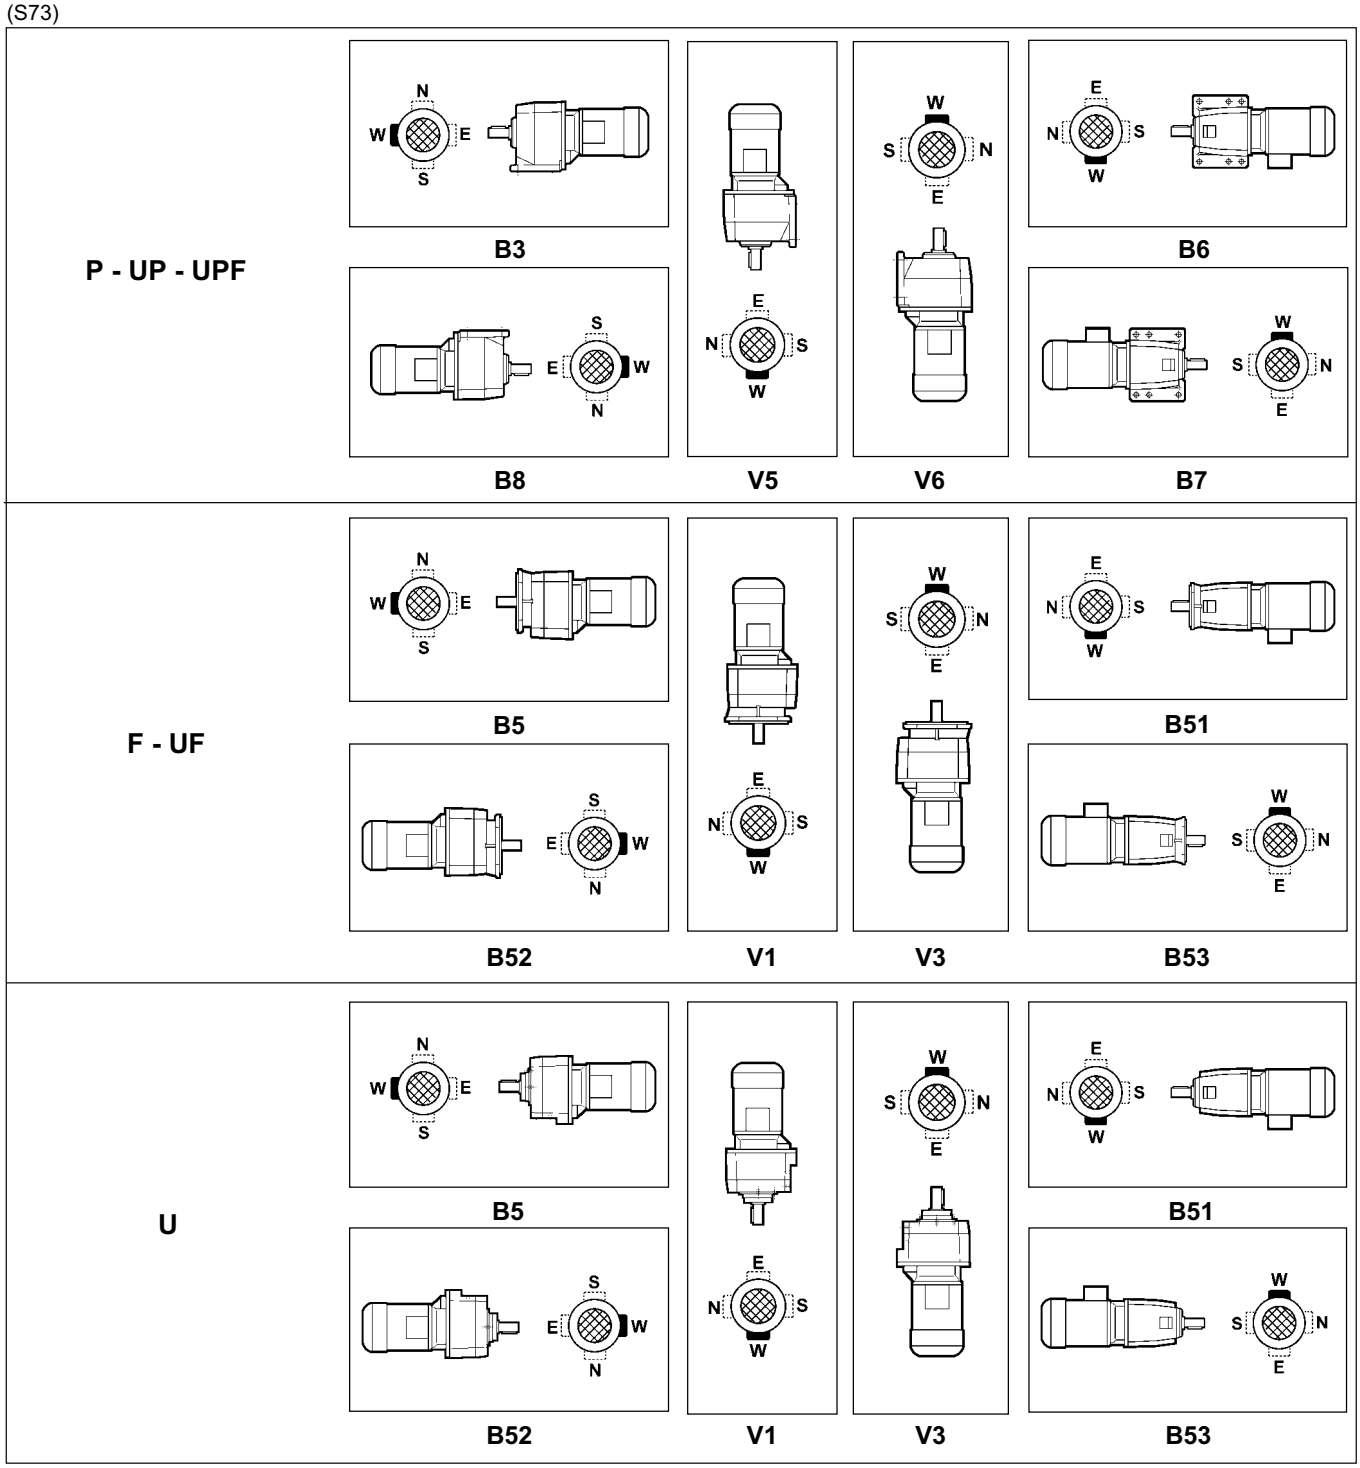
Fanno eccezione a questa regola le posizioni V3 e V6 (per i riduttori suddetti) le quali dovranno obbligatoriamente essere richieste nella corretta configurazione alla BONFIGLIOLI RIDUTTORI in quanto è indispensabile schermare alcune parti interne.
Gli orientamenti delle morsettiere dei motori sono identificati osservando il motore dal lato ventola; l'orientamento standard è evidenziato in nero **(W)** come indicato nella tabella (S73).

Positions V3 and V6 (for sizes C50 - C100) are an exception to this rule. These must be ordered to BONFIGLIOLI RIDUTTORI in their correct configuration as some internal parts require separate lubrication activities.
Orientation of motor terminal boxes can be determined by observing the motor from the fan side; standard orientation is highlighted in black ***(W)*** *as in table (S73).*

Von dieser Regel aus-genommen sind die Anordnungen V3 und V6 (für die Typen C50 - C100), die obligatorisch mit der gewünschten Konfiguration bei BONFIGLIOLI RIDUTTORI bestellt werden müssen, da einige innere Bauteile zusätzlich abgeschirmt werden müssen.
Die Angaben zur Lage des Klemmenkastens beziehen sich auf das von der Lüfterseite her betrachtete Getriebe. Die Standardorientierung ist schwarz hervorgehoben **(W)**, wie in Abbildung (S73) angegeben.

Les positions V3 et V6 (pour les types C50- C100) ne suivent pas cette règle. Elles devront obligatoirement être demandées dans la configuration correcte à BONFIGLIOLI RIDUTTORI étant donné qu'il est indispensable de proteger certaines parties intérieures.
Les orientations des boîtes à bornes des moteurs sont définies en regardant le moteur du côté ventilateur. L'orientation standard est indiquée en noir ***(W)*** *comme d'après le tableau (S73).*

(S73)



11.2 LUBRIFICAZIONE RIDUTTORI SERIE S

I riduttori dal tipo S101 al tipo S401 compreso, sono forniti con lubrificazione permanente ad olio sintetico e non necessitano di sostituzioni periodiche del lubrificante.
Il tipo S501 è predisposto per la lubrificazione ad olio e pertanto dotato dei tappi di carico, livello e scarico olio (tabelle S74 e S75); sarà cura dell'utente immettere il lubrificante avvalendosi delle quantità (litri) indicate in tabella (S76).
Evidenziamo però che tali quantità sono indicative, pertanto l'esatto livello dovrà essere valutato osservandolo dall'apposita spia (con il riduttore già installato nella corretta posizione di montaggio).

11.2 LUBRICATION OF SINGLE REDUCTION UNITS, S SERIES

Gearboxes from S101 to S401 are life lubricated with synthetic oil and do not require any periodical oil changes.
The remaining type S501 is designed for oil lubrication and therefore has filling, level and drain plugs (tables S74 and S75); users should fill the units with oil, consulting table (S76), with the correct quantity (litres).
However, it must be underlined that these quantities are only guidelines, therefore users should check the correct level through the oil level plug (when the gearbox is installed in its correct mounting position).

11.2 SERIE S GETRIEBES SCHMIERUNG

Die Getriebe von Typ S101 bis Typ S401 werden mit Dauerschmierung mit Syntheseöl geliefert und sind wartungsfrei.
Die anderen sind für die Ölschmierung vorgerüstet und verfügen daher über einen Einfüllverschluß, Ölstands-und Ölablaßschrauben (Tabelle S74 und S75). Das Öl muß vom Kunden in der in Tabelle (S76) angegebenen Menge (Liter) eingefüllt werden.
Wir weisen jedoch darauf hin, daß es sich bei diesen Angaben nur um Richtwerte handelt und daher der tatsächlich Ölbedarf durch das Schauglas geprüft werden muß (das Getriebe muß sich hierzu schon in seiner endgültigen Einbaulage befinden).

11.2 LUBRIFICATION REDUCTEURS SERIE S

Les réducteurs du type S101 au type S401 compris sont fournis avec lubrification permanente à l' huile synthétique et n'ont besoin d'aucun entretien.
Le type S501 est prédisposé pour la lubrification à l'huile et par conséquent doté de bouchons de remplissage, niveau et vidange d'huile (tableau S74 et S75); l'utilisateur devra introduire le lubrifiant en se conformant aux quantités (litres) indiqués sur le tableau (S76).
Ces quantités sont toutefois indicatives et le niveau exact devra être contrôlé par le voyant spécial (avec le réducteur déjà installé dans la position correcte de montage).

Dimensioni e collocazione dei tappi di carico, scarico e livello olio.

Dimensions and location of oil filling, level and drain plugs.

Abmessungen und Anordnung des Einfüll, Ölstands-und Ölablaßschrauben.

Dimensions et emplacement des bouchons de remplissage, de vidange et niveau d'huile.

Lubrificazione permanente

* = La quantità è indicativa. Controllare il riempimento attraverso il relativo vetro spia.

° = Il riempiemento parziale o totale deve essere effettuato dal foro presente sulla flangia P

Life lubricated

* = *Quantity is indicative. Check filling through the sight glass.*

° = *Fill the gear unit through the hole located on the motor flange.*

Dauerschmierung

* = Bei der angegebenen Menge handelt es sich um einen Anhaltswert. Den Füsstand über das entsprechende Kontrollglas kontrollieren.

° = Ein teilweise oder vollkommene Füllung muss über die Bohrung am Flaschn erfolgen.

Lubrification permanente

* = *La quantité est citée seulement à titre indicatif. Contrôler le remplissage par le hublot de visite correspondant.*

° = *Le remplissage partiel ou total doit s'effectuer au moyen de l'orifice positionné sur la bride.*

Posizioni di montaggio e orientamento morsettiera

Per il riduttore S501 dalle posizioni standard B3 e B5 è possibile ottenere le altre (B6,B7,B8,V5 e V1) disponendo i tappi come indicato nelle tabelle (S74) e (S75) e provvedendo all'aggiunta di un quantitativo di olio tale da rispettare le indicazioni della tabella (S76) per la nuova posizione di montaggio.

Fanno eccezione a questa regola le posizioni V3 e V6 (per il tipo S501) le quali dovranno obbligatoriamente essere richieste nella corretta configurazione a BONFIGLIOLI RIDUTTORI in quanto è indispensabile schermare alcune parti interne.

Mounting position and terminal box position

The B6, B7, B8, V5 and V1 mounting positions of model S501 can be obtained from the base mounting positions B3 and B5, by re-locating the oil plugs, as indicated in the table (S74) and (S75). Oil quantity must be adjusted as per table (S76).

Mounting positions V3 and V6 instead must be specified at the time of ordering, as specific arrangemets are made at the factory.

Einbaulagen und lage des klemmenkastens

Von den Standardpositionen B3 und B5 (S501) gelangt man zu den anderen Positionen (B6, B7, B8, V5 und V1), indem man die Verschlußschrauben wie in den Tabellen (S74) und (S75) angegeben anordnet.

Von dieser Regel aus-genommen sind die Anordnungen V3 und V6 (für die Type S501), die obligatorisch mit der gewünschten Konfiguration bei BONFIGLIOLI RIDUTTORI bestellt werden müssen, da einige innere Bauteile zusätzlich abgeschirmt werden müssen.

Positions de montage et orientation boite a borne

Pour le réducteurs S501à partir des positions standard B3 et B5, il est possible d'obtenir les autres (B6, B7, B8, V5 et V1) en disposant les bouchons comme indiqué sur les tableaux (S74) et (S75).

Les positions V3 et V6 (pour les type S501) ne suivent pas cette règle. Elles devront obligatoirement être demandées dans la configuration correcte à BONFIGLIOLI RIDUTTORI étant donné qu'il est indispensable de proteger certaines parties intérieures.

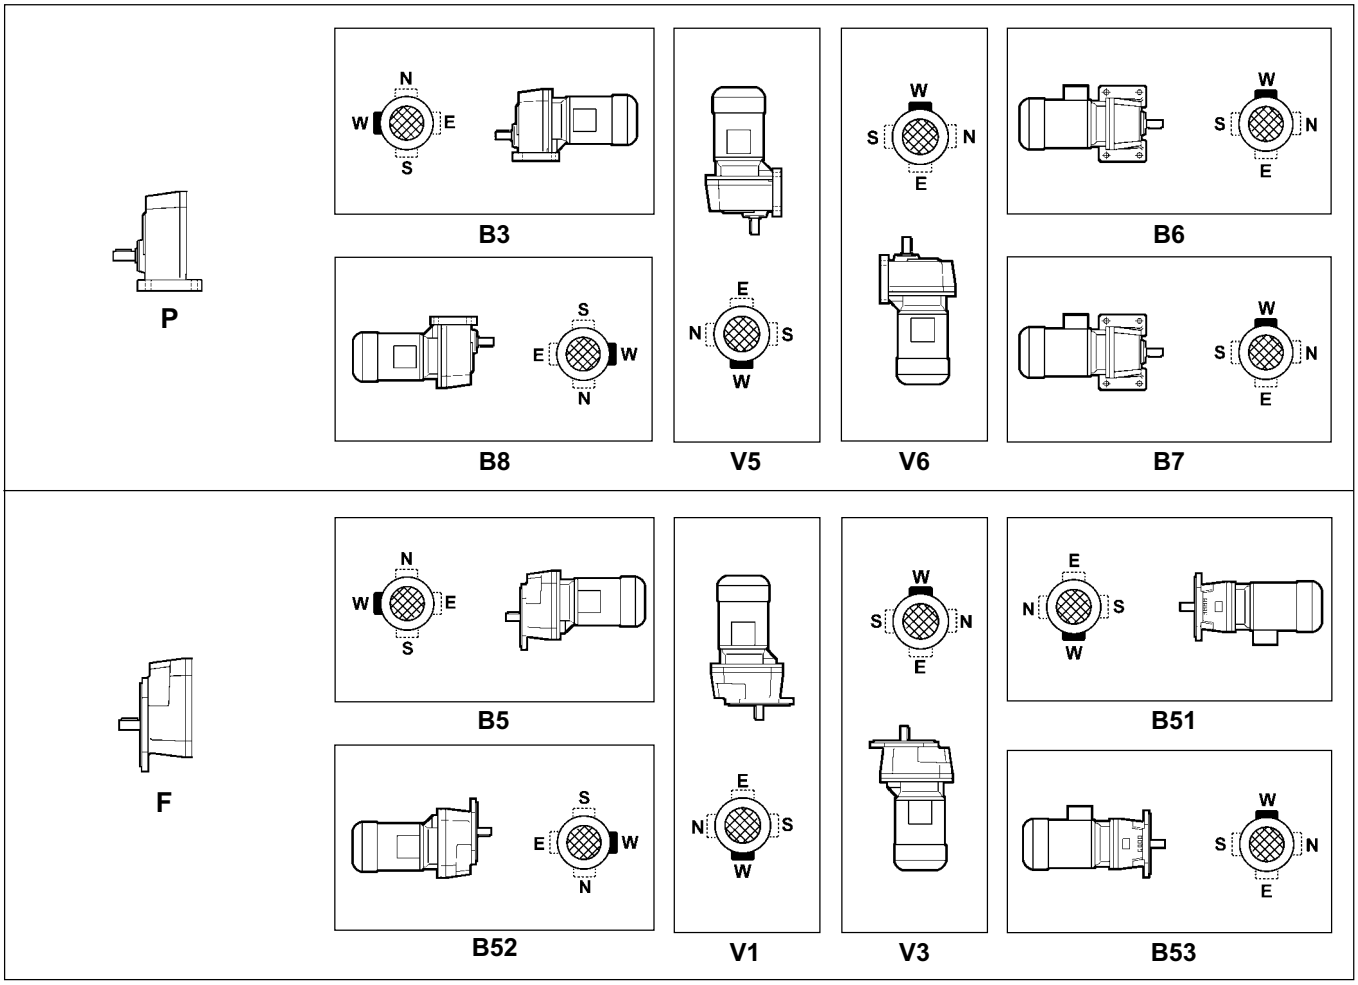
Gli orientamenti delle morsettiere dei motori sono identificati osservando il motore dal lato ventola; l'orientamento standard è evidenziato in nero **(W)** come indicato nella tabella (S77).

*Orientation of motor terminal boxes can be ascertained by observing the motor from the fan side; standard orientation is highlighted in black **(W)** in table (S77).*

Die Angaben zur Lage des Klemmenkastens beziehen sich auf das von der Lüfterseite her betrachtete Getriebe. Die Standardorientierung ist schwarz hervorgehoben **(W)**, wie in Abbildung (S77) angegeben.

*Les orientations des boîtes à bornes des moteurs sont définies en regardant le moteur du côté ventilateur. L'orientation standard est indiquée en noir **(W)** comme d'après le tableau (S77).*

(S77)



11.3 LUBRIFICAZIONE RIDUTTORI SERIE A

I riduttori dal tipo A102 al tipo A303 compreso, sono forniti con lubrificazione permanente ad olio sintetico e non necessitano di alcuna manutenzione.
Gli altri tipi sono predisposti per la lubrificazione ad olio e pertanto dotati dei tappi di carico, livello e scarico olio (tabelle S78 e S79); sarà cura dell'utente immettere il lubrificante avvalendosi delle quantità (litri) indicate in tabella (S80).
Evidenziamo però che tali quantità sono indicative, pertanto l'esatto livello dovrà essere valutato osservandolo dall'apposita spia (con il riduttore già installato nella corretta posizione di montaggio).

11.3 LUBRICATION OF BEVEL HELICAL UNITS, A SERIES

Gearboxes from A102 to A303 are life lubricated with synthetic oil and do not require periodical oil change.
The remaining types are designed for oil lubrication and therefore have oil filling, level and drain plugs (tables S78 and S79); users should fill the units with oil, consulting table (S80), with the correct quantity (litres).
However, it must be underlined that these quantities are only indicative, therefore users should check the correct level through the oil level plug (when the gearbox is installed in the actual mounting position).

11.3 SERIE A GETRIEBES SCHMIERUNG

Die Getriebe von Typ A102 bis Typ A303 werden mit Dauerschmierung mit Syntheseöl geliefert und sind wartungsfrei.
Die anderen sind für die Ölschmierung vorgerüstet und verfügen daher über einen Einfüllverschluß, Ölstands-und Öl-ablaß- schrauben (Tabelle S78 und S79). Das Öl muß vom Kunden in der in Tabelle (S80) angegebenen Menge (Liter) eingefüllt werden. Wir weisen jedoch darauf hin, daß es sich bei diesen Angaben nur um Richtwerte handelt und daher der tatsächlich Ölbedarf durch das Schauglas geprüft werden muß (das Getriebe muß sich hierzu schon in seiner endgültigen Einbaulage befinden).

11.3 LUBRIFICATION REDUCTEURS SERIE A

Les réducteurs du type A102 au type A303 compris sont fournis avec lubrification permanente à l'huile synthétique et n'ont besoin d'aucun entretien.
Les autres types sont prédisposés pour la lubrification à l'huile et par conséquent dotés de bouchons de remplissage, niveau et vidange d'huile (tableau S78 et S79); l'utilisateur devra introduire le lubrifiant en se conformant aux quantités (litres) indiqués sur le tableau (S80).
Ces quantités sont toutefois indicatives et le niveau exact devra être contrôlé par le voyant spécial (avec le réducteur déjà installé dans la position correcte de montage).

Dimensioni e collocazione dei tappi di carico, scarico e livello olio.

Dimensions and location of oil filling, level and drain plugs.

Abmessungen und Anordnung des Einfüll, Ölstands-und Ölablaßschrauben.

Dimensions et emplacement des bouchons de remplissage, de vidange et niveau d'huile.

Lubrificazione permanente.
* = La quantità è indicativa. Controllare il riempimento attraverso il relativo vetro spia.
° = Il riempiemento parziale o totale deve essere effettuato dal foro presente sulla flangia P.

Life lubricated.
* = *Quantity is indicative. Check filling through the sight glass.*
° = *Fill the gear unit through the hole located on the motor flange.*

Dauerschmierung.
* = Bei der angegebenen Menge handelt es sich um einen Anhaltswert. Den Füsstand über das entsprechende Kontrollglas kontrollieren.
° = Ein teilweise oder vollkommene Füllung muss über die Bohrung am Flaschn erfolgen.

Lubrification permanente.
* = *La quantité est citée seulement à titre indicatif. Contrôler le remplissage par le hublot de visite correspondant.*
° = *Le remplissage partiel ou total doit s'effectuer au moyen de l'orifice positionné sur la bride.*

Posizioni di montaggio e orientamento morsettiera

Gli orientamenti delle morsettiere dei motori sono identificati osservando il motore dal lato ventola; l'orientamento standard è evidenziato in nero **(W)** come indicato nella tabella (S81).

Mounting position and terminal box orientation

*Orientation of motor terminal boxes can be ascertained by observing the motor from the fan side; standard orientation is shown in black **(W)** as in table (S81).*

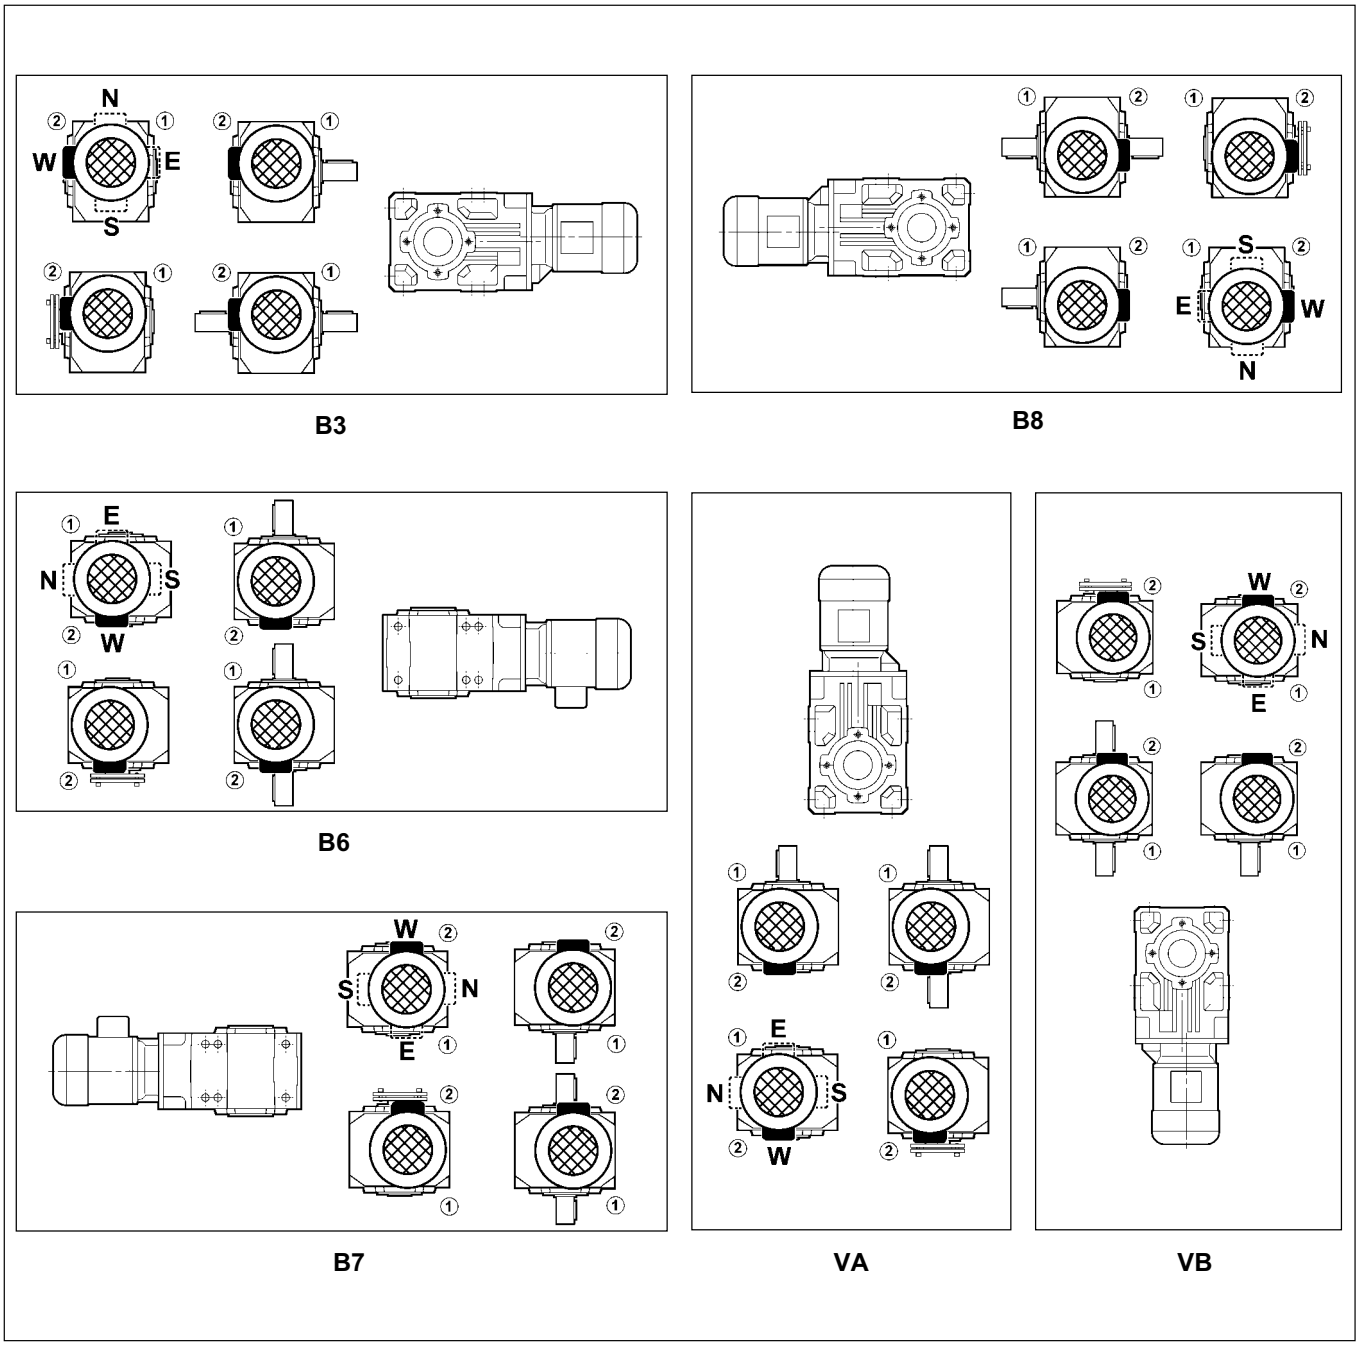
Einbaulagen und lage des klemmenkastens

Die Angaben zur Lage des Klemmenkastens beziehen sich auf das von der Lüfterseite her betrachtete Getriebe. Die Standardorientierung ist schwarz hervorgehoben **(W)**, wie in Abbildung (S81) angegeben.

Positions de montage et orientation boite a borne

*Les orientations des boîtes à bornes des moteurs sont définies en regardant le moteur du côté ventilateur. L'orientation standard est indiquée en noir **(W)** comme d'après le tableau (S81).*

(S81)



① ② Posizione flangia / *Flange position* / Flanschlage / *Position bride*

11.4 LUBRIFICAZIONE RIDUTTORI SERIE F

I riduttori dal tipo F102 al tipo F304 compreso, sono forniti con lubrificazione permanente ad olio sintetico e non necessitano di alcuna manutenzione.
Gli altri tipi sono predisposti per la lubrificazione ad olio e pertanto dotati dei tappi di carico, livello e scarico olio (tabelle S82 e S83); sarà cura dell'utente immettere il lubrificante avvalendosi delle quantità (litri) indicate in tabella (S84).
Evidenziamo però che tali quantità sono indicative, pertanto l'esatto livello dovrà essere valutato osservandolo dall'apposita spia (con il riduttore già installato nella corretta posizione di montaggio).

11.4 LUBRICATION OF SHAFT MOUNTED UNITS, F SERIES

Gearboxes from F102 to F304 are life lubricated with synthetic oil and do not require any periodical oil change.
The remaining types are designed for oil lubrication and therefore have oil filling, level and drain plugs (tables S82 and S83); users should fill the units with oil, consulting table (S84), with the correct quantity (litres).
However, it must be underlined that these quantities are only indicative, therefore users should check the correct level through the oil level plug (when the gearbox is installed in its actual mounting position).

11.4 SERIE F GETRIEBES SCHMIERUNG

Die Getriebe von Typ F102 bis Typ F304 werden mit Dauerschmierung mit Syntheseöl geliefert und sind wartungsfrei.
Die anderen sind für die Ölschmierung vorgerüstet und verfügen daher über einen Einfüllverschluß, Ölstands-und Öl-ablaß- schrauben (Tabelle S82 und S83). Das Öl muß vom Kunden in der in Tabelle (S84) angegebenen Menge (Liter) eingefüllt werden. Wir weisen jedoch darauf hin, daß es sich bei diesen Angaben nur um Richtwerte handelt und daher der tatsächlich Ölbedarf durch das Schauglas geprüft werden muß (das Getriebe muß sich hierzu schon in seiner endgültigen Einbaulage befinden).

11.4 LUBRIFICATION REDUCTEURS SERIE F

Les réducteurs du type F102 au type F304 compris sont fournis avec lubrification permanente à l'huile synthétique et n'ont besoin d'aucun entretien.
Les autres types sont prédisposés pour la lubrification à l'huile et par conséquent dotés de bouchons de remplissage, niveau et vidange d'huile (tableau S82 et S83); l'utilisateur devra introduire le lubrifiant en se conformant aux quantités (litres) indiqués sur le tableau (S84).
Ces quantités sont toutefois indicatives et le niveau exact devra être contrôlé par le voyant spécial (avec le réducteur déjà installé dans la position correcte de montage).

Dimensioni e collocazione dei tappi di carico, scarico e livello olio.

Dimensions and location of oil filling, level and drain plugs.

Abmessungen und Anordnung des Einfüll, Ölstands-und Öl-ablaßschrauben.

Dimensions et emplacement des bouchons de remplissage, de vidange et niveau d'huile.

12.0 INFORMAZIONI GENERALI RIDUTTORI

Avvertenze per l'operatore.
Per effettuare una corretta installazione e per prevenire eventuali situazioni di pericolo, è necessario acquisire la conoscenza delle modalità di utilizzo riportate nel presente manuale prima dell'installazione e della messa in moto.
Il presente manuale potrà essere aggiornato con l'integrazione di altri prodotti e di eventuali ulteriori indicazioni. Le pagine che subiranno delle variazioni rispetto all'edizione precedente verranno segnalate con gli appositi indici di modifica (R).

Riduttori di velocità
Si intende per riduttore solo la parte meccanica composta da una cassa e dagli ingranaggi di qualsiasi tipo in essa contenuti. Il sistema indicato non presenta pericoli fino a che ad esso non sarà applicata una motorizzazione; in tal caso dovranno essere previste protezioni sulle parti rotanti accessibili.
Per quanto concerne i motori e la parte elettrica relativa, si rimanda al paragrafo (13.0) motori elettrici.

12.0 GENERAL INFORMATION ON GEARBOXES

Operator warnings.
For correct installation and prevention of hazardous conditions, it is necessary to know the methods of operation described in this manual before installation and start-up.
This manual may be updated with the addition of other products and possible additional instructions.
Revised pages will be marked in the index of revisions (R).

Gearboxes
The gearbox is understood to mean only the mechanical part composed of a box containing any type of gears. This system presents no hazard until a drive is attached to it, and in this case guards must be provided for accessible moving parts.
With regard to motors and the relative electrical part, see section (13.0) Electric motors.

12.0 ALLGEMEINE INFORMATIONEN ÜBER DIE GETRIEBE

Warnung an den Betriebsmann.
Im Hinblick auf eine einwandfreie Installation und auf die Vermeidung von gefährlichen Situationen muß man dieses Handbuch aufmerksam lesen und so die notwendigen Kenntnisse erwerben, bevor mit der Installation und Inbetriebnahme begonnen wird.
Dieses Handbuch könnte in Zukunft durch Hinzufügen weiterer Produkte und eventueller weiterer Anweisungen erweitert werden.
Die abgeänderten Seiten werden dann mit einem speziellen Zeichen versehen (R).

Getriebe
Unter einem Getriebe verstehen wir nur den mechanischen Teil, der aus einem Gehäuse und Zahnrädern irgendwelcher Art besteht. Das gezeigte System birgt keine Gefahren, bevor es motorisiert wird, danach müssen vom Kunden auf den zuganglichen Teilen, die sich bewegen, Schutzvorrichtungen gemäß den Sicherheitsgesetzen angebracht werden. Bezüglich Motoren und der entsprechenden Elektrik siehe Abschnitt 13.0, elektrische Motoren.

12.0 INFORMATIONS GENERALES SUR LES REDUCTEURS

Instructions pour l'opérateur.
Pour effectuer une installation correcte et pour éviter tout danger, il est nécessaire d'acquérir la connaissance des modalités d'utilisation exposées dans le présent manuel avant l'installation et la mise en service.
Le présent manuel pourra être mis à jour par l'adjonction d'autres produits et d'indications supplémentaires.
Les pages qui seront l'objet de variations par rapport à l'édition précédente seront signalées par l'indice de modification (R).

Réducteurs de vitesse
Par réducteur de vitesse, il faut entendre uniquement la pièce mécanique composée d'une caisse et des engrenages qu'elle contient. Le système indiqué ne présente pas de dangers tant qu'on ne lui applique pas de motorisation. Dans ce cas, le client devra prévoir des protections sur les parties en mouvement accessibles, selon les normes de sécurité en vigueur dans son Pays.
En ce qui concerne les moteurs et la partie électrique correspondante, on se rapportera au paragraphe (13.0) Moteurs électriques.

Condizioni di fornitura

I riduttori vengono forniti da BONFIGLIOLI RIDUTTORI S.p.A. previo superamento delle attività di controllo previste nella documentazione applicabile del proprio sistema di qualità UNI EN ISO 9001, collaudati e già predisposti per essere installati nella posizione di montaggio come definito in fase di ordine del cliente e confermato dalla BONFIGLIOLI RIDUTTORI S.p.A.
Il ricevente avrà cura che i prodotti siano soggetti a trasporto e movimentazione utilizzando mezzi e attenzioni tali da assicurare il mantenimento dello stato delle condizioni fornite dalla BONFIGLIOLI RIDUTTORI S.p.A. all'atto della consegna.
Per quanto riguarda le caratteristiche di progetto si dovrà fare riferimento al catalogo o alla descrizione contenuta nell' ordine del cliente e confermato dalla BONFIGLIOLI RIDUTTORI S.p.A.

Conditions of supply

Gearboxes are supplied by BONFIGLIOLI RIDUTTORI S.p.A. after they have passed the controls provided in the applicable documentation for the Company's quality control system UNI EN ISO 9001, inspected and prepared for installation in the mounting position that was specified in the customer's order and confirmed by BONFIGLIOLI RIDUTTORI S.p.A.
The customer must transport and handle the products by appropriate means and with suitable care in order to keep them in the state in which they are supplied by BONFIGLIOLI RIDUTTORI S.p.A. at the time of delivery.
With respect to unit specifications, refer to the catalogue or to the description in the customer's order as confirmed by BONFIGLIOLI RIDUTTORI S.p.A.

Lieferbedingungen

BONFIGLIOLI RIDUTTORI S.p.A. liefert die Getriebe nach erfolgter Prüfung - gemäß den Unterlagen, die diese Kontrollen für ihr Qualitätssystem UNI EN ISO 9001 vorschreiben. Die Getriebe sind bereits kontrolliert und zur Installation in der Enbaulage bereit, die der Kunde bei Erteilung des Auftrags bestimmt und die BONFIGLIOLI RIDUTTORI S.p.A. danach bestätigt hatte.
Der Empfänger muß bedenken, daß die Produkte transportiert werden sollen und muß deshalb geeignete Transportmittel wählen sowie Vorsichtsmaßnahmen treffen, damit diese bei ihm so ankommen, wie sie BONFIGLIOLI RIDUTTORI S.p.A ausgeliefert hat.
Bezüglich der Projekteigenschaften muß man den Katalog und die Beschreibungen beachten, die im Auftrag des Kunden enthalten sind und die BONFIGLIOLI RIDUTTORI S.p.A. bestätigt hatte.

Conditions de fourniture

Les réducteurs sont fournis par BONFIGLIOLI RIDUTTORI S.p.A. à l'issue des contrôles de la documentation prévus par son système de la qualité UNI EN ISO 9001, testés et déjà prêts pour l'installation dans la position de montage définie dans la commande du client confirmée par BONFIGLIOLI RIDUTTORI S.p.A.
Le client veillera à ce que le transport et la manutention des produits se fassent de façon à assurer le maintien des conditions fournies par BONFIGLIOLI RIDUTTORI S.p.A. au moment de la livraison.
En ce qui concerne les caractéristiques de projet, on se rapportera au catalogue ou à la description figurant dans la commande du client confirmée par BONFIGLIOLI RIDUTTORI S.p.A.

Ricevimento, trasporto e movimentazione.

Al ricevimento del riduttore controllare che non abbia subito danni durante il trasporto ed eventualmente segnalarli allo spedizioniere. Controllare inoltre che le caratteristiche riportate in targa corrispondano a quanto richiesto in ordine e confermato da BONFIGLIOLI RIDUTTORI S.p.A.
I riduttori vengono consegnati imballati in contenitori di cartone.
In alcuni casi, gli imballi di maggiori dimensioni sono riempiti con dei materiali atti a compensare gli spazi vuoti rispettando la stabilità e le dimensioni dei riduttori.
Tutti gli elementi di imballaggio dovranno essere raccolti e smaltiti o riciclati secondo le norme vigenti nel proprio Paese.
Gli imballi contenenti più riduttori sono normalmente applicati a bancali in legno per facilitarne la movimentazione tramite carrelli elevatori o transpallets.
I riduttori possono essere movimentati individualmente sollevandoli con fasce o cinghie (se il peso lo richiede) applicate agli alberi entrata e uscita.
I riduttori di potenza medio alta sono provvisti di un golfare di sollevamento.

Gli alberi dei riduttori sono muniti di protezioni di sicurezza in plastica. Queste protezioni dovranno essere rimosse prima dell'installazione seguendo le norme di sicurezza e prevenzione in vigore nel paese del destinatario.
Successivamente, queste protezioni dovranno essere recuperate ed eliminate secondo le norme in vigore nel proprio paese.

Receipt, transport, and handling

Upon receipt of the gearbox, check that it was not damaged during transport; if damage is noted, inform the carrier immediately. In addition, check that the characteristics stated on the plate conform to those ordered and confirmed by BONFIGLIOLI RIDUTTORI S.p.A.
The gearboxes are delivered packed in cardboard cartons.
In some cases, larger cartons may be filled with polyurethane foam.
All packing parts must be collected and disposed of or recycled according to current regulations in the customer's country.
Cartons containing more than one gearbox are usually attached to wooden boards to facilitate handling by forklifts or transpallets.
Gearboxes may be handled individually by lifting them with belts or chains (if required due to weight) attached to input and output shafts.
Medium-high power gearboxes are equipped with an eyebolt for lifting.

Gear shafts are provided with plastic guards, which must be removed before installation, collected, and disposed of according to safety regulations in customer's country.

Warenempfang, Transport, Auf- und Abladung

Bei Eintreffen des Getriebes kontrolliere man, ob es beim Transport eventuell beschädigt worden ist. Ist dies der Fall, muß die Speditionsfirma sofort benachrichtigt werden. Zudem muß kontrolliert werden, ob die Eigenschaften, die auf dem Schild angegeben sind, denjenigen entsprechen, die im Auftrag verlangt und von BONFIGLIOLI RIDUTTORI S.p.A bestätigt wurden.
Die Getriebe werden in Kartonbehälter oder anders wie im Vertrag vorgesehen verpackt ausgeliefert.
In einigen Fällen werden größere Verpackungen mit geeigneten Materialen zur Kompensation der leeren Räumen unter Einhaltung der Stabilität und Erhaltung des Inhalts aufgefüllt.
Alle Verpackungselemente müssen nach den im betreffenden Land gültigen Vorschriften entsorgt oder recycelt werden.
Verpackungen, die mehrere Getriebe enthalten, werden normalerweise auf Holzverschlägen fixiert, dies vereinfacht ihren Transport auf Hubkarren oder Handgabelhubwagen.
Die Getriebe können individuell umplaziert werden, indem man sie, falls dies wegen ihres Gewichts notwendig ist, mit Riemen oder Bändern, die an die Eingangs - und Ausgangswellen befestigt sind, anhebt.
Getriebe mit mittel - höherer Leistung weisen eine Ösenschraube auf.

Die Wellen der Getriebe weisen einen Plastikschutz auf. Dieser Schutz muß vor der Installation entfernt und entsorgt werden, unter Einhaltung der Sicherheits und Verhütungsrechtinien gemäß des Gesetres.
Die Sammlung und Entsorgung der Schutzvorrichtungen muß vom Kunde erfolgen, der gemäß den gültigem Gesetzem in seinem Land wirken wird.

Réception, transport et manutention

A la réception du réducteur, contrôler qu'il n'a pas été abîmé pendant le transport. Le cas échéant, signaler les détériorations au transporteur. Contrôler également que les caractéristiques figurant sur la plaque signalétique correspondent bien à ce qui a été demandé dans la commande et confirmé par BONFIGLIOLI RIDUTTORI S.p.A.
Les réducteurs sont livrés emballés dans des emballages en carton ou autre prévu dans le contrat .
Dans certains cas, les emballages de dimensions plus grandes sont remplis avec des matériels aptes à compenser les espaces vides en respectant la stabilité et la dimension des réducteurs.
Tous les éléments d'emballage devront être récupérés et éliminés ou recyclés suivant les normes en vigueur dans le pays du destinataire.
Les emballages contenant plusieurs réducteurs sont normalement appliqués sur des palettes en bois pour faciliter la manutention au moyen de chariots élévateurs ou de transpalettes.
Les réducteurs peuvent être déplacés individuellement en les soulevant avec des bandes ou des courroies (si le poids le nécessite) appliquées aux arbres d'entrée et de sortie.
Les réducteurs de puissance moyenne ou haute sont dotés d'une cheville à oeillet.

Les arbres des réducteurs sont dotés de protections de securité en plastique. Ces protections devront être enlevées avant l'installation suivant les normes de securité et prévention en vigueur dans le pays du destinataire.
Ensuite, ces protections seront récuperées et éliminées du destinataire suivant les normes en vigueur dans son pays.

12.1 STOCCAGGIO

Il corretto stoccaggio dei prodotti ricevuti richiede l'esecuzione delle seguenti attività:

a) Escludere aree all'aperto, zone esposte alle intemperie o con eccessiva umidità.

b) Interporre sempre tra il pavimento ed i prodotti, pianali lignei o di altra natura, atti ad impedire il diretto contatto col suolo.

c) Per periodi di stoccaggio superiori ai 60 giorni, le superfici interessate agli accoppiamenti quali flange, alberi e giunti, devono essere protette con idoneo prodotto antiossidante (Mobilarma 248 od equivalente).

d) Per periodi di stoccaggio previsti superiori ai 6 mesi, i prodotti devono essere oggetto delle seguenti attività:
d1)
I prodotti forniti con lubrificazione permanente dovranno avere le parti lavorate esterne e quelle di accoppiamento ricoperte di grasso atto ad evitare ossidazioni.
d2)
I prodotti forniti privi di lubrificante, oltre alle attività descritte al punto d1), dovranno essere posizionati con il tappo di sfiato nella posizione più alta e riempiti di olio.
I riduttori, prima del loro utilizzo, dovranno essere riempiti con la corretta quantità e tipo di lubrificante previsto.

12.1 STORAGE

Observe the following instructions to ensure correct storage of delivered products:

a) Do not store outdoors, in areas exposed to weather or with excessive humidity.

b) Always place boards in wood or other material between floor and products, to avoid direct contact with the floor.

c) For storage periods of over 60 days, all machined surfaces such as flanges, shafts and couplings must be protected with a suitable anti-oxidation product (Mobilarma 248 or equivalent product).

d) The following measures must be taken in respect of products for which the expected storage period exceeds 6 months:
d1)
For life lubricated products, the external machined and coupled parts must be greased to prevent oxidation.
d2)
In addition to the measures at point d1), products supplied without oil must be positioned with the breather plug high up, and be filled with oil.
Before using the gearboxes, restore the correct quantity of recommended oil.

12.1 LAGERUNG

Die korrekte Lagerung der Antriebe erfordert folgende Vorkehrungen:

a) Die Produkte nicht im Freien lagern und nicht in Räumen, die der Witterung ausgesetzt sind, oder eine hohe Feuchtigkeit aufweisen.

b) Die Produkte nie direkt auf dem Boden, sondern auf Unterlagen aus Holz oder einem anderen Material lagern.

c) Bei Lagerzeiten von mehr als 60 Tagen die Oberflächen für die Verbindung, wie Flansche, Wellen oder Kupplungen mit einem geeigneten Oxidations-schutzmittel behandeln (Mobilarma 248 oder ein äquivalentes Mittel).

d) Bei Lagerzeiten von mehr als 6 Monaten müssen folgende Vorkehrungen getroffen werden:
d1)
Bei den Produkten mit Dauerschmierung müssen die maschinell bearbeiteten Außenseiten und die Verbindungsflächen mit Fett vor Oxidation geschützt werden.
d2)
Die Produkte ohne Schmiermittel müssen wie unter Punkt d1) behandelt werden und außerdem mit nach oben gerichteter Entlüftungsschraube gelagert und mit Öl gefüllt werden.
Die Getriebe müssen vor ihrer Verwendung mit der angegebenen Menge des vorgesehenen Schmiermittels gefüllt werden.

12.1 STOCKAGE

Un correct stockage des produits reçus nécessite de respecter les règles suivantes:

a) Exclure les zones à ciel ouvert, les zones exposées aux intempéries ou avec humidité excessive.

b) Interposer dans tous les cas entre le plancher et les produits des planches de bois ou des supports d'autre nature empêchant le contact direct avec le sol.

c) Pour les périodes de stockage supérieures à 60 jours, les surfaces concernées par les liaisons telles que les brides, les arbres et les accouplements doivent être protégées avec un produit antioxydant spécial (Mobilarma 248 ou équivalent).

d) Pour les périodes de stockage prévues supérieures à 6 mois, les produits doivent être objet des contrôles suivants:
d1)
les produits fournis avec lubrification permanente devront avoir les parties externes usinées ainsi que celles de liaison recouvertes de graisse pour éviter les oxydations. d2)
les produits fournis sans lubrifiant, outre les opérations décrites au point d1), devront être positionnés avec le bouchon reniflard dans la position la plus haute et remplis d'huile.
Les réducteurs, avant d'être utilisés, devront être remplis avec la juste quantité et type de lubrifiant prévu.

12.2 INSTALLAZIONE E MESSA IN SERVIZIO

E' molto importante, per l'installazione del riduttore, attenersi alle seguenti norme:

Rimuovere le eventuali protezioni in plastica presenti sugli alberi secondo le indicazioni riportate nel paragrafo.

Nei riduttori C602 e C603 rimuovere il golfare di sollevamento sostituendolo con il tappo allegato.

Rimuovere eventuali protettivi con solventi seguendo le norme in vigore nel paese del destinatario.

Evitare che il solvente venga a contatto con il labbro degli anelli di tenuta.

Assicurarsi che il fissaggio del riduttore sia stabile onde evitare qualsiasi vibrazione e sia effettuato su piani lavorati.

Installare (se si prevedono urti, sovraccarichi prolungati o possibili bloccaggi) giunti idraulici, frizioni, limitatori di coppia, ecc.

12.2 INSTALLATION AND COMMISSIONING

The following installation instructions for gearboxes must be observed:

Remove any plastic guards from the shafts according to paragraph.

On gearboxes C602 and C603, remove the eyebolt supplied for lifting and replace it with the plug provided.

Remove any protective coatings with solvents according to customer's country rules.

Do not let the solvent be in touch with oilseal lips.

Make sure that the gearbox is correctly secured and is fitted onto a machined surface to avoid vibrations.

(If shocks, overloading, or the possibility of locking are expected), install hydraulic couplings, clutches, torque limiters, etc.

12.2 INSTALLATION

Für die Installation des Getriebes ist es äußerst wichtig, daß folgende Normen beachtet werden:

Eventuell vorhandenen Plastikschutz von den Wellen entfernen, gemaß Abschnitt.

Bei den Getrieben C602 und C603 die Ösenschraube entfernen und durch den mitgelieferten Stöpsel ersetzen.

Eventuell vorhandene rastbeseitigenden Schutzschichten mit einem zulässigen Lösemittel gemäß Landgesetzen entfernen.

Es muß unbedingt vermieden werden, daß Lösemittel mit den Lippen der Dichtungsringe in Kontakt kommt.

Sicherstellen, daß die Befestigung des Getriebes stabil ist, damit keine Schwingungen entstehen und daß es auf einer bearbeiteten Fläche ohne Positioniertreiben zu liegen kommt.

(Wenn es voraussichtlich zu Stößen, längerdauernden Überlasten oder zu Blockierungen kommen kann) sind entsprechende Schutzelemente wie hydraulische Kupplungen, Rutschkupplungen usw. zu installieren.

12.2 INSTALLATION

Il est très important, pour l'installation du réducteur, de se conformer aux règles suivantes:

Enlever les éventuelles protections en plastique présentes sur les arbres selon les indications au point.

Sur les réducteurs C602 et C603, enlever la cheville à oeillet de levage en la remplaçant par le bouchon joint.

Enlever les éventuelles produits de protection antioxydants au moyen de solvants suivant les normes en vigueur dans le pays du destinataire.

Le solvant ne doit pas entrer en contact avec la lèvre des bagues d'étanchéité.

S'assurer que la fixation du réducteur soit stable afin d'éviter toute vibration et soit sur des surfaces ousinées sans aucun forcement de positionnement.

Installer (en cas de chocs, de surcharges prolongées ou de blocages) des accouplements hydrauliques, des embrayages, des limiteurs de couple, etc.

Nei riduttori ad assi ortogonali serie A è opportuno valutare attentamente il tipo di fissaggio desiderato per effettuare una installazione corretta.

Negli schemi indicati in tabella (S86) vengono riportati i 3 casi possibili per l'installazione dei riduttori serie A alla struttura della macchina da operare.
Per ognuno di questi casi riportiamo nella tabella (S87) le dimensioni delle viti a testa esagonale da utilizzare.
Inoltre, per una facile installazione, suggeriamo di utilizzare il tipo di chiave mostrato in tabella (S86).

With bevel helical units, A series, make sure that the type of fastening to be used will provide correct installation.

Schemes in table (S86) show the 3 possible installation cases for A gear units to the machine frame.
For each of these circumstances , table (S87) indicates exagonal head screw sizes to be used.
Besides, in order to operate an easy installation , we suggest to use a wrench of the type shown in table (S86).

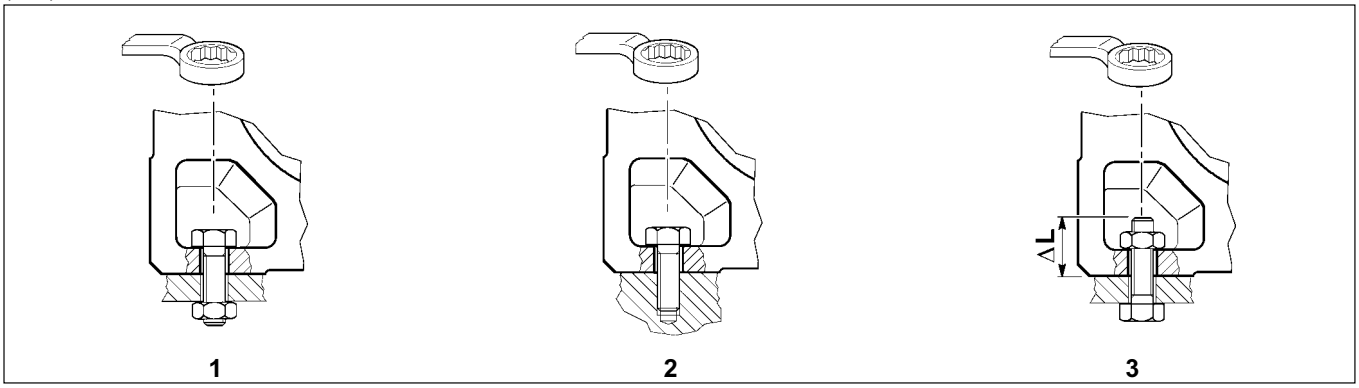
Vor allem bei den Parallelwellengetrieben der Serie A muß aufmerksam geprüft werden, welche Fixierungsart für eine fachmännische Installation wünschenswert ist.

In Tabelle (S86) sind die 3 Anbaumöglichteiten des Getriebes Typ A an die zu betreibende Maschine dargestellt.
Für jeden dieser Fällen sind in der Tabelle (S87) die Abmessungen der zu verwendenden Sechskantschrauben angegeben. Im übrigen schlagen wir zwechs einfachen Anbaus vor, den Schlüsseltyp wie in Tabelle (S86) zu verwenden.

Sur les réducteurs à arbres orthogonaux série A, il convient d'évaluer attentivement le type de fixation souhaité pour effectuer une installation correcte.

Dans les schèmas indiqués dans le tableau (S86) l'on a indiqué 3 cas possibles pour le montage des réducteurs type A à la structure de la machine.
Pour tous ces cas l'on doit se référer pour les dimensions des vis à tête hexagonales à employer, au tableau (S87).
Pour un montage plus soigneux nous conseillons l'emploi du type de clé indiquée au tableau (S86).

(S86)



(S87)

	Tipo vite / *Screw type* / Schraubentyp / *Type de vis*					Tipo vite / *Screw type* / Schraubentyp / *Type de vis*			
	1	2	3	ΔL (mm)		1	2	3	ΔL (mm)
A10	M8 x 25	M8 x 20	M8 x...	20	**A60**	M16 x 50	M16 x 45	M16 x...	40
A20	M8 x 25	M8 x 20	M8 x...	20	**A70**	M20 x 60	M20 x 55	M20 x...	45
A30	M10 x 30	M10 x 25	M10 x...	25	**A80**	M24 x 70	M24 x 65	M24 x...	55
A41	M12 x 35	M12 x 30	M12 x...	30	**A90**	M24 x 90	M24 x 80	M24 x...	65
A50	M14 x 45	M14 x 40	M14 x...	35					

Se i riduttori verranno riverniciati, si dovranno proteggere i piani lavorati e il bordo esterno degli anelli di tenuta per evitare che la vernice ne essichi la gomma, pregiudicando la tenuta del paraolio stesso. Si consiglia inoltre di proteggere il foro dell'eventuale tappo di sfiato per evitarne l'occlusione, la targa di identificazione e il tappo di livello olio (dove previsto).
Le superfici di contatto dovranno essere pulite e trattate con adeguati protettivi prima del montaggio, onde evitare l'ossidazione e il conseguente bloccaggio delle parti.
Gli organi che vanno calettati sugli alberi di uscita del riduttore devono essere lavorati con tolleranza ISO H7 per evitare accoppiamenti troppo bloccati che, in fase di montaggio potrebbero danneggiare irreparabilmente il riduttore stesso. Inoltre, per il montaggio e lo smontaggio di tali organi si consiglia l'uso di adeguati tiranti ed estrattori utilizzando il foro filettato posto in testa alle estremità degli alberi.

If the gearboxes are to be paint coated, protect the machined surfaces and the outside face of the oilseals to prevent paint from drying out the rubber and jeopardising the functioning of the seal.
In addition, protect the hole of the breather plug (if present) to prevent clogging, as well as the identification plate and the oil level plug (if present).
Contact surfaces must be cleaned and treated with suitable protective products before mounting to avoid oxidation and, as a result, seizure of parts.
Parts assembled on the gearbox output shafts must be machined to ISO H7 tolerance to prevent interference fits that could damage the gearbox itself during the mounting. Further, to mount or remove such parts, employ suitable pullers or extraction devices using the tapped hole located at the top of the shaft extensions.

Beim Lackieren die bearbeiten Flächen und die Dichtringe schützen, damit der Anstrichstoff nicht den Kunststoff angreift und somit die Dichtigkeit der Ölabdichtungen in Frage gestellt wird.
Es wird zudem empfohlen, die Öffnung der eventuell vorhandenen Entluftungsschraube, sowie das Typenschild und (wenn vorhanden) die Ölstandsschraube zu schutzen, damit es nicht zu Verstopfungen kommt.
Die Berührungsflächen müssen sauber sein und vor der Montage mit einem geeigneten Schutzmittel behandelt werden, um Oxidierung und die daraus folgende Blockierung der Teile zu verhindern.
Die Organe, die mit einer Keilverbindung auf der Abtriebswelle des Getriebes befestigt werden, müssen mit einer Toleranz ISO H7 gearbeitet sein, um allzu fest blockierte Verbindungen zu vermeiden, die eventuell zu einer irreparablen Beschädigung des Getriebes während des Einbaus führen könnten. Außerdem sind beim Ein- und Ausbau dieser Organe geeignete Zugstangen und Abzieher zu verwenden, wobei die Gewindebohrung an den Stirnseiten der Wellen zu verwenden sind.

En phase de peinture, il faudra protéger le plans usinés et le bord extérieur des bagues d'étanchéité pour éviter que la peinture ne dessèche le caoutchouc, ce qui risque de nuire à l'efficacité du joint.
Nous vous conseillons par ailleurs de protéger le trou du bouchon reniflard s'il y en a un, pour éviter qu'il ne se bouche, la plaque signalétique et le bouchon de niveau d'huile (s'il est prévu).
Les surfaces d'accouplement devront être propres et traitées avec des produits de protections appropriés avant le montage afin d'éviter l'oxydation et par suite le blocage des pièces.
Les organes qui sont calés sur les arbres de sortie du réducteur doivent être réalisés avec une tolérance ISO H7 pour éviter les accouplements trop serrés qui, en phase de montage, pourraient endommager irrémédia- blement le réducteur. En outre, pour le montage et le démontage de ces organes, nous conseillons d'utiliser un outillage et des extracteurs appropriés en utilisant le trou taraudé situé en extremité d' arbre.

Non sottoporre gli alberi ad urti che possano danneggiare i cuscinetti interni.

L'accoppiamento all'albero di uscita cavo del riduttore (tolleranza G7) viene normalmente eseguito con perni lavorati con tolleranza h6. Dove il tipo di applicazione lo richieda, si può prevedere un accoppiamento con una leggera interferenza (G7 - j6).

Avoid shocks on the shafts: this may damage internal bearings.

Coupling to the gearbox output hollow shaft (G7 tolerance) is usually effected with shafts machined to h6 tolerance. If the type of application requires it, coupling with a slight interference (G7 - j6) is possible.

Die Wellen dürfen nie Stößen ausgesetzt werden, denn diese können die inneren Lager beschädigen.

Die Verbindung mit der Abtriebshohlwelle des Getriebes (Toleranz G7) wird normalerweise mit Zapfen mit Toleranz h6 hergestellt. Wo die Anwendungsart dies verlangt, kann man die Verbindung mit einem leichten Übermaß ausführen (G7 - j6).

Ne pas soumettre les arbres à des chocs pouvant endommager les roulements internes.

L' accouplement à l'arbre de sortie creux du réducteur (tolérance G7) est habituellement réalisé avec des arbres exécutés à la tolérance h6. Lorsque le type d'application le demande, on peut prévoir un accouplement avec une légère interférence (G7 - j6).

ISTRUZIONI PER IL CORRETTO SERRAGGIO DEL CALETTATORE

I riduttori serie A ed F sono disponibili a richiesta con albero lento cavo munito di calettatore (forma costruttiva _S).
E' necessario eseguire le seguenti operazioni per effettuare il montaggio del riduttore sull'albero della macchina da azionare.

1) Svitare le viti di bloccaggio gradualmente e in successione rimuovendo il calettatore
2) Pulire e sgrassare accuratamente le zone di accoppiamento fra albero lento riduttore e albero della macchina da azionare
3) Accoppiare albero condotto e riduttore
4) Montare il calettatore sull'albero del riduttore
5) Avvitare a fondo tutte le viti del calettatore gradualmente e in successione, facendo uso di una chiave dinamometrica. **E' necessario ripetere la sequenza alcune volte al fine di raggiungere la coppia di serraggio Mt indicata in tabella (S87a).**

INSTRUCTIONS FOR FITTING OF SHRINK DISC

Gearboxes of the A and F series are available upon request with hollow output shaft complete with shrink disc (_S version).
To fit the gearbox onto the customer shaft the procedure described here below must be followed.

1) Unscrew the locking bolts progressively and remove the shrink disc
2) Carefully clean and degrease mating surfaces of the hollow shaft and customer shaft
3) Fit the gearbox onto the driven shaft
4) Fit the shrink disc onto the gearbox shaft
5) Tighten all locking bolts of the shrink disc gradually and progressively in circular sequence, using a torque wrench. ***Several sequences are necessary until the specified tightening torque Mt is reached. See tab. (87a) for reference.***

ANLEITUNGEN FÜR DEN KORREKTEN ANZUG DER SCHRUMPFSCHEIBE

Die Getriebe der Serie A und F sind auf Anfrage mit einer Abtriebswelle verfügbar, die mit einer Schrumpfscheibe versehen ist (Version _S). Um ein solches Getriebe auf die Welle der zu betreibenden Maschine montieren zu können, muß man folgendermaßen vorgehen:

1) Die Befestigungsschrauben schrittweise und in entsprechender Reihenfolge lockern und so die Schrumpfscheibe entfernen
2) Die Passbereiche zwischen Abtriebswelle des Getriebes und der Welle der anzutreibenden Maschine säubern und entfetten
3) Die geführte Welle und das Getriebe aneinander passen
4) Die Schrumpfscheibe auf die Getriebewelle montieren
5) Alle Schrauben der Schrumpfscheibe schrittweise und in entsprechender Reihenfolge anziehen. **Diese Sequenz ist mehrmals zu wiederholen, d.h. solange bis der in der Tabelle (87a) angegebene Anzugsmoment Mt erreicht wurde.**

INSTRUCTIONS POUR LE BLOCAGE CORRECT DE LA FRETTE DE SERRAGE

Les réducteurs série A et F sont disponibles sur demande avec un arbre de sortie creux équipé de frette de serrage (version S_).
Il est nécessaire d'exécuter les opérations suivantes pour effectuer le montage du réducteur sur l'arbre de la machine à actionner:

1) Dévisser graduellement et l'une après l'autre les vis de blocage et enlever la frette de serrage
2) Nettoyer et dégraisser soigneusement les zones d'accouplement entre arbre de sortie réducteur et arbre de la machine à actionner
3) Accoupler l'arbre mené et le réducteur
4) Monter la frette de serrage sur l'arbre réducteur
5) Visser à fond graduellement et l'une après l'autre toutes les vis de la frette de serrage. ***Il est nécessaire de répéter la séquence plusieurs fois afin d'atteindre le couple de serrage Mt indiqué dans le Tableau (87a).***

Attenzione! Non usare bisolfuro di molibdeno o altri grassi, causa di notevoli riduzioni del coefficiente d'attrito.

Warning! Do not use molibdenum disolphide or any grease whatsoever because of consequent reduction in the friction coefficient.

Achtung! Niemals Molybdändisulfid oder andere Fettarten verwenden, da sie zu erheblichen Reduzierungen des Reibkoeffizienten führen würden.

Attention! Ne pas utiliser de bisulfure de molybdène ou autres graisses, susceptibles de provoquer d'importantes réductions du coefficient de frottement.

(S87)

	A10	**A20**	**A30**	**A41**	**A50**	**A60**	**A70**	**A80**	**A90**
Mt [Nm]	14.5	14.5	14.5	14.5	35	35	35	69	69
	F10	**F20**	**F30**	**F40**	**F50**	**F60**	**F70**	**F80**	**F90**
Mt [Nm]	8.5	14.5	14.5	14.5	14.5	35	35	69	69

Prima della messa in funzione della macchina, accertarsi che la posizione del livello del lubrificante sia conforme alla posizione di montaggio del riduttore e che la viscosità sia adeguata al tipo del carico come indicato in tabella (S69).

Nei motoriduttori controllare che fra la calotta posteriore del motore ed eventuali carterature delle macchina vi sia lo spazio sufficiente per garantire il regolare afflusso dell'aria per il raffreddamento.

Before starting up the machine, make sure that oil level conforms to the reduction unit mounting position, and that viscosity is suitable for the load involved as indicated in the table (S69).

In gearmotors, check that there is sufficient space to guarantee a regular flow of cooling air between the rear motor cover and any machine frame.

Vor Inbetriebnahme der Maschine sicherstellen, daß die Anordn- ung der Füllstandschraube der Einbaulage entspricht und die Viskosität des Schmiermittels der Belastungsart entspricht, wie dies in Tabelle (S69) angegeben wird.

Bei den Getriebemotoren muß kontrolliert werden, ob zwischen der hinteren Lüfterraddeckel und eventuell vorhandenen Rahmen der Maschine genügend Platz ist, damit die Kühlungsluft gut hineinströmen kann.

Avant la mise en marche de la machine, s'assurer que la position du niveau du lubrifiant soit conforme à la position de montage du réducteur et que la viscosité soit appropriée au type de charge, voir tableau (S69).

Sur les motoréducteurs, contrôler qu'entre la calotte arrière du moteur et les éventuels carters de la machine il y ait assez d'espace pour garantir l'arrivée régulière de l'air pour le refroidissement.

Nelle installazioni all'aperto o in ambienti umidi o corrosivi, si consiglia di adottare tutte le precauzioni necessarie a preservare la funzionalità della macchina nel tempo.

For outdoor installations or in damp or corrosive conditions, use all of the precautions needed to maintain machine operation over an extended period of time.

Bei Installationen im Freien oder in feuchten oder korrosionsfördernden Räumen empfehlen wir, alle notwendigen Vorkehrungen zu treffen, damit der Maschine eine lange Lebensdauer garantiert werden kann.

Dans les installations en extérieur ou dans des milieux humides ou corrosifs, nous vous conseillons d'adopter toutes les précautions nécessaires pour préserver le bon fonctionnement de la machine dans le temps.

Tutte le operazioni descritte dovranno essere eseguite da personale qualificato.

All of the operations described above must be performed by qualified personnel only.

Alle Eingriffe müssen von geschultem Personal vorgenommen werden.

Toutes les opérations décrites devront être effectuées par du personnel qualifié.

12.3 USO E MANUTENZIONE

12.3 USE AND MAINTENANCE

12.3 VERWENDUNG UND INSTADHALTUNG

12.3 UTILISATION ET ENTRETIEN

Nei riduttori previsti con lubrificazione permanente non è necessario ripristinare il livello del lubrificante.
Il o i tappi presenti su questi riduttori dovranno essere del tipo chiuso.

Negli altri riduttori, provvisti dei tappi di carico, livello e scarico si dovrà effettuare un controllo periodico del livello del lubrificante e se necessario ripristinarlo aggiungendo la quantità necessaria.

It is not necessary to top up the oil in gearboxes with permanent lubrication.
The plug seals on these gearboxes must be closed type.

On other gearboxes with filler, level, and drain plugs, check oil level periodically and top up if necessary.

Bei den Getrieben mit einer Dauerschmierung muß kein Schmiermittel nachgefüllt werden.
Der oder die Stöpsel auf diesen Getrieben müssen so gestaltet sein, daß keine Öffnung vorgesehen ist.

Bei den anderen Getrieben, die Einfüll- Ölstand- und Ölablaß- schrauben aufweisen, muß eine periodische Kontrolle des Ölstands durchgeführt werden. Wenn nötig nachfüllen.

Sur les réducteurs à lubrification permanente, il n'est pas nécessaire de remettre à niveau le lubrifiant.
Le ou les bouchon(s) présents sur ces réducteurs devront être du type fermé.

Sur les autres réducteurs, dotés de bouchons de remplissage, niveau et vidange il faudra effectuer un contrôle périodique du niveau de lubrifiant et, si besoin est, le remettre à niveau.

Si raccomanda di non miscelare oli a base minerale con oli sintetici e viceversa.

Never mix mineral oils with synthetic oils and vice versa.

Es wird empfohlen, nie Mineralöle mit synthetischen Ölen (oder umgekehrt!) zu vermischen.

Ne pas mélanger des huiles à base minérale avec des huiles synthétiques et inversement.

La sostituzione del lubrificante potrà essere effettuata indicativamente agli intervalli (h) indicati nella tabella (S88).

Oil change may be performed in the approximate hourly intervals (h) shown in table (S88) below.

Das Schmiermittel wird ungefähr in den in Tabelle (S88) angegebenen Zeitabständen aus gewechselt.

Le renouvellement du lubrifiant devra être effectué indicativement aux échéances (en h) indiquées dans le tableau (S88).

(S88)

Temperatura olio / *Oil temperature* Öltemperatur / *Température huile* [°C]	Intervallo di lubrificazione / *Lubrication interval* Schmierfrist / *Intervalle de lubrification* [h]	
	olio minerale / *mineral oil* Mineralöl / *huile minérale*	olio sintetico / *synthetic oil* Syntheseöl / *huile synthétique*
< 65	8000	25000
65 - 80	4000	15000
80 - 95	2000	12500

Si consiglia di effettuare, sistematicamente, una accurata pulizia esterna del riduttore per rimuovere eventuali sedimenti che limiterebbero la capacità di dissipazione termica.

Nei motoriduttori verificare che la griglia posteriore del motore non sia ostruita da corpi estranei o da polvere.

We advise you to carefully clean the exterior of the gearbox on a regular basis to remove any sediments that might limit heat dissipation.

In gearmotors, check that the grid of the fan cowl is not blocked by foreign bodies or dirt.

Es wird empfohlen, das Getriebe systematisch und sorgfältig außen zu reinigen, damit eventuelle Ablagerungen entfernt werden, die die Wärmeabstrahlung einschränken könnten.

Bei den Getriebemotoren muß kontrolliert werden, ob das hintere Motorengitter nicht durch Fremdkörper oder Staub verstopft ist.

Nous vous conseillons d'effectuer systématiquement un nettoyage externe soigneux du réducteur, pour enlever d'éventuels sédiments, qui limiteraient la capacité de dissipation thermique.

Sur les motoréducteurs, s'assurer que la grille arrière du moteur n'est pas obstruée par des corps étrangers ou de la poussière.

Attenzione!!
Alcuni riduttori, in particolari condizioni ambientali e applicative possono raggiungere temperature di funzionamento superiori a 50 °C sulle parti esterne. Il contatto con tali parti senza l'ausilio di adeguate protezioni può provocare ustioni.
Il controllo del livello del lubrificante e l'eventuale rabbocco devono essere effettuati a macchina ferma e al ripristino delle condizioni della temperatura ambiente.

Warning!!
Under certain ambient and operating conditions, the external parts of certain gearmotors may reach temperatures exceeding 50 °C. Touching such parts without adequate protection may cause injury.
Checking of oil level and any topping up must be performed with the machine stopped and at ambient temperature.

Achtung!!
Einige Getriebe können unter speziellen Umwelt oder Einsatzbedingungen auf den äußeren Teilen Betriebstemperaturen von über 50 °C erreichen. Berührt man diese Teile ohne Körperschutz, kann dies zu Verbrennungen führen.
Die Kontrolle des Ölstandes und das eventuelle Nachfüllen müssen bei stillstehender Maschine erfolgen, nachdem die Getriebetemperatur auf Umgebungstemperatur gefallen ist.

Attention!!
Certains réducteurs, dans des conditions extérieures et d'application particulières, peuvent atteindre des températures de fonctionnement supérieures à 50 °C sur les parties externes. Le contact avec ces parties sans protections appropriées peut provoquer des brûlures.
Le contrôle du niveau de lubrifiant et l'éventuelle mise à niveau doivent être effectués quand la machine est à l'arrêt, une fois rétablies les conditions de température ambiante.

In caso di attività di manutenzione del riduttore, accertarsi che:

– non ci siano nelle vicinanze organi in movimento
– non ci siano carichi sospesi o instabili nelle vicinanze; in caso affermativo provvedere al loro bloccaggio,
– non ci siano sorgenti di calore elevate o fiamme libere nelle vicinanze se si usano solventi per la pulizia esterna,
– l'alimentazione del motore sia staccata.

When performing maintenance on the gearbox, make sure that:

– *there are no moving elements in the nearby*
– *there are no suspended or unstable loads in the vicinity; if there are, secure them*
– *there are no sources of intense heat or open flame in the vicinity if solvents are to be used for external cleaning*
– *power has been disconnected to the motor.*

Bei Wartungsarbeiten am Getriebe kontrolliere man:

– daß keine sich bewegenden Maschinenkomponenten in der Nähe sind,
– daß keine aufgehängten oder unstabilen Lasten in der Nähe sind; falls dies trotzdem der Fall ist, müssen diese blockiert werden,
– daß keine starken Wärmequellen oder freie Flammen in der Nähe sind, falls Lösemittel für die Reinigung der Außenteile verwendet worden ist,
– daß die Stromzufuhr des Motors unterbrochen ist.

Pour l'entretien du réducteur, s'assurer que :

– *il n'y a pas à proximité d'organes en mouvement;*
– *il n'y a pas de charges suspendues ou instables à proximité; si c'est le cas, les bloquer;*
– *il n'y a pas de sources de chaleur élevées ou de flammes libres à proximité si l'on utilise des solvant pour le nettoyage externe;*
– *l'alimentation du moteur est coupée.*

13.0 INFORMAZIONI GENERALI MOTORI ELETTRICI

Campo di applicazione

Le seguenti istruzioni si applicano ai motori elettrici asincroni trifasi prodotti dalla BONFIGLIOLI RIDUTTORI S.p.A. della serie:

- BN
- M
nella versione base.

Esecuzioni costruttive speciali come descritto nei cataloghi e/o nelle relative offerte, applicazioni particolari (p.e. alimentazione da inverter) necessitano di informazioni aggiuntive.
Per i tipi autofrenanti si applicano le istruzioni supplementari riportate nella specifica documentazione.

Informazioni generali sulla sicurezza

I motori elettrici descritti nelle seguenti istruzioni sono previsti per impiego in installazioni industriali e destinate ad essere utilizzate da personale qualificato.

Durante il funzionamento questi motori presentano parti sotto tensione o in movimento e pertanto la rimozione delle necessarie protezioni elettriche e meccaniche, l'uso improprio o la non adeguata manutenzione possono causare gravi danni a persone o cose.

Deve essere assicurato che ogni operazione sui motori venga eseguita da personale qualificato che abbia conoscenza delle istruzioni e dati tecnici relativi al prodotto e sia stato autorizzato dal responsabile della sicurezza all'intervento.

13.0 GENERAL INFORMATION ELECTRIC MOTORS

Field of application

The following instructions apply to the three-phase asynchronous electric motors manufactured by BONFIGLIOLI RIDUTTORI S.p.A., series:

- BN
- M
basic version.

Special versions as described in the catalogues and/or in offers, or special applications (for example, power supply from inverter) will require additional information.
For brake motors, refer to the supplementary instructions, given in the specific documentation.

General safety information

The electric motors described in the following instructions are designed to be used in industrial installations and must be operated by qualified personnel only.

When in operation, motors have live or moving parts. Therefore, removal of necessary electrical or mechanical guards, improper use, or inadequate maintenance may cause serious damage to persons or property.

All interventions on the motors must be performed only by qualified personnel who have thorough knowledge of the instructions and technical data for the product and who have been authorised to perform such intervention by the safety supervisor.

13.0 ALLGEMEINE INFORMATIONEN ÜBER DIE ELEKTROMOTOREN

Verwendungsbereich

Die folgenden Anweisungen betreffen die asynchronen, dreiphasigen Elektromotoren, die von BONFIGLIOLI RIDUTTORI S.p.A. hergestellt wurden und zu folgenden Serien gehören:

- BN
- M
in der Grundausführung.

Für Elektromotoren mit Sonderbauform, wie sie in den Katalogen und/oder Angeboten beschrieben werden, sowie für spezielle Anwendungen (wie z.B. Stromzufuhr aus einem Inverter) sind zusätzliche Informationen notwendig. Für die Bremsmotore müssen die zusätzlichen Anweisungen bezogen werden.

Allgemeine Sicherheitsinformationen

Die in den folgenden Anweisungen beschriebenen Elektromotoren sind für eine Verwendung durch geschultes Personal in Industriebetrieben vorgesehen.

Während ihres Betriebs stehen Teile dieser Motoren unter Spannung oder bewegen sich. Deshalb kann die Entfernung der notwendigen elektrischen oder mechanischen Schutzvorrichtungen, eine nicht sachgerechte Verwendung oder eine falsche Wartung schwere Schäden an Personen und Objekten verursachen.

Es muß unbedingt sichergestellt werden, daß alle Operationen an den Motoren von qualifiziertem Personal vorgenommen werden, das die Anweisungen und technischen Daten des Produktes zur Kenntnis genommen hat und vom Verantwortlichen für Sicherheitsfragen die entsprechende Erlaubnis erhalten hat.

13.0 INFORMATIONS GENERALES MOTEURS ELECTRIQUES

Domaine d'application

Les instructions suivantes s'appliquent aux moteurs électriques asynchrones triphasés produits de BONFIGLIOLI RIDUTTORI S.p.A. de la série :

- BN
- M
dans la version de base.

Les exécutions spéciales décrites dans les catalogues et/ou dans les offres correspondantes ainsi que les applications particulières (alimentation par convertisseur par exemple), requièrent des informations supplémentaires.
Pour les types freins, on se rapportera aux instructions supplémentaires figurant à la documentation relative.

Informations générales concernant la sécurité

Les moteurs électriques décrits dans les instructions suivantes sont prévus pour être employés sur des installations industrielles et doivent être utilisés par du personnel qualifié.

Pendant le fonctionnement, ces moteurs présentent des parties sous tension ou en mouvement. Par conséquent, l'enlèvement des protections électriques et mécaniques, l'utilisation non appropriée ou un mauvais entretien peuvent entraîner de graves dommages corporels ou matériels.

Veiller à ce que chaque opération sur les moteurs soit effectuée par du personnel qualifié connaissant le mode d'emploi et les caractéristiques techniques du produit et ayant reçu l'autorisation du responsable de la sécurité pour l'intervention.

Le presenti istruzioni devono essere integrate con quanto previsto dalle disposizioni legislative vigenti nel luogo di installazione nonchè da quanto prescritto dalle Norme tecniche, specifiche di impianto ed altre regolamentazioni ai fini della sicurezza.

These instructions must be integrated with current legislation in the country of installation, as well as with technical norms and specifications regarding layout and with safety norms.

Diese Anweisungen müssen im Hinblick auf die Sicherheit durch die gesetzlichen Vorschriften, die im betreffenden Land gelten, ergänzt werden, sowie durch die technischen Vorschriften, die Spezifikationen der Anlagen und andere Regelungen.

Ces instructions doivent être complétées par les obligations prévues par les dispositions législatives en vigueur dans l'endroit d'installation, ainsi que par les prescriptions des normes techniques, spécifications d'installation et autres réglementations de sécurité.

Altre informazioni e chiarimenti possono essere richiesti agli uffici commerciali BONFIGLIOLI RIDUTTORI S.p.A.

For additional information and explanations, contact the sales office of BONFIGLIOLI RIDUTTORI S.p.A.

Weitere Informationen und Erklärungen erhalten Sie bei den Handelsvertretungen von BONFIGLIOLI RIDUTTORI S.P.A.

Pour tout autre renseignement, veuillez vous adresser aux services commerciaux de BONFIGLIOLI RIDUTTORI S.p.A.

Condizioni dl fornitura

I motori vengono forniti dalla BONFIGLIOLI RIDUTTORI S.p.A. previo superamento delle attività di controllo previste nella documentazione applicabile nel proprio sistema qualità, collaudati e già predisposti per essere installati.
Il ricevente avrà cura che i prodotti siano soggetti a trasporto e movimentazione utilizzando mezzi e attenzioni tali da assicurare il mantenimento dello stato delle condizioni fornite dalla BONFIGLIOLI RIDUTTORI S.p.A. all'atto della consegna.
Per quanto riguarda le caratteristiche di progetto si dovrà fare riferimento al catalogo o alla descrizione contenuta in ordine del cliente e confermato dalla BONFIGLIOLI RIDUTTORI S.p.A.

Supply conditions

Motors are supplied by BONFIGLIOLI RIDUTTORI S.p.A. after they have passed the controls provided in the applicable documentation for the Company's quality control system, inspected and prepared for installation.
The customer must transport and handle the products by appropriate means and with suitable care in order to keep them in the state in which they are supplied by BONFIGLIOLI RIDUTTORI S.p.A. at the time of delivery.
With respect to product specifications, refer to the catalogue or to the description in the customer's order as confirmed by BONFIGLIOLI RIDUTTORI S.p.A.

Lieferbedingungen

BONFIGLIOLI RIDUTTORI S.p.A. liefert ihre Motoren nach erfolgter Prüfung - gemäß den Unterlagen, die diese Kontrollen für ihr Qualitätssystem vorschreiben. Sie sind bereits kontrolliert und zur Installation bereit.
Der Empfänger muß bedenken, daß die Produkte transportiert werden sollen und muß deshalb geeignete Transportmittel wählen sowie Vorsichtsmaßnahmen treffen, damit diese bei ihm so ankommen, wie sie BONFIGLIOLI RIDUTTORI S.p.A ausgeliefert hat.
Bei den Produkteigenschaften muß man den Katalog und die Beschreibungen beachten, die im Auftrag des Kunden enthalten sind und die BONFIGLIOLI RIDUTTORI S.p.A. bestätigt hatte.

Conditions de fourniture

Les moteurs sont fournis par BONFIGLIOLI RIDUTTORI S.p.A. à l'issue des contrôles de la documentation prévue par son système de la qualité, testés et déjà prêts pour l'installation.
Le client veillera à ce que le transport et la manutention des produits se fassent de façon à assurer le maintien des conditions fournies par BONFIGLIOLI RIDUTTORI S.p.A. au moment de la livraison.
En ce qui concerne les caractéristiques de projet, on se rapportera au catalogue ou à la description figurant dans la commande du client confirmée par BONFIGLIOLI RIDUTTORI S.p.A.

Dato che il motore elettrico non ha una funzione intrinseca per l'utilizzatore finale e viene meccanicamente accoppiato ad altra macchina, sarà responsabilità di chi esegue l'installazione e assemblaggio garantire che vengano presi tutti i provvedimenti necessari alla sicurezza durante il funzionamento.

Since the electric motor does not have an intrinsic function for the final user and is mechanically coupled to another machine, it is the responsibility of the installer and assembler to guarantee that all provisions for safe operation have been taken.

Da der Elektromotor keine eigenleitende Funktion für den Endbenützer hat und mechanisch an eine andere Maschine angeschlossen wird, ist derjenige, der Installation und Zusammenbau vornimmt dafür verantwortlich, daß alle zur Betriebssicherheit notwendigen Maßnahmen getroffen werden.

Etant donné que le moteur électrique n'a pas une fonction intrinsèque pour l'utilisateur final et est accouplé mécaniquement à une autre machine, il appartiendra au responsable de l'installation et de l'assemblage d'adopter toutes les mesures de sécurité nécessaires pendant le fonctionnement.

Ricevimento, trasporto e movimentazione

Al ricevimento del motore controllare che non abbia subito danni durante il trasporto ed eventualmente segnalarli allo spedizioniere. Controllare inoltre che le caratteristiche riportate in targa corrispondano a quanto richiesto in ordine e confermato da BONFIGLIOLI RIDUTTORI S.p.A.
I motori elettrici vengono consegnati imballati in contenitori di cartone.
Tutti gli elementi di imballaggio dovranno essere raccolti e smaltiti o riciclati secondo le norme vigenti nel proprio Paese.
Gli imballi contenenti più motori sono normalmente applicati a bancali in legno per facilitarne la movimentazione tramite carrelli elevatori o transpallets.

Receipt, transport, and handling

Upon receipt of the motor, check that it was not damaged during transport; if damage is noted, inform the carrier immediately. In addition, check that the characteristics stated on the plate conform to those ordered and confirmed by BONFIGLIOLI RIDUTTORI S.p.A.
The motors are delivered packed in cardboard cartons.
All packing parts must be collected and disposed of or recycled according to current regulations in the customer's country.
Cartons containing more than one motor are usually attached to wooden boards to facilitate handling by forklifts or transpallets.

Warenempfang, Transport, Auf - und Abladung

Beim Eintreffen des Motors kontrolliere man, ob er beim Transport eventuell beschädigt worden ist. Ist dies der Fall, muß die Speditionsfirma sofort benachrichtigt werden. Zudem muß kontrolliert werden, ob die Eigenschaften, die auf dem Schild angegeben sind, denjenigen entsprechen, die im Auftrag verlangt und von BONFIGLIOLI RIDUTTORI S.p.A bestätigt wurden. Alle Verpackungselemente müssen eingesammelt und nach den im betreffenden Land gültigen Vorschriften entsorgt oder recyceit werden.
Verpackungen, die mehrere Motoren enthalten, werden normalerweise auf Holzverschlägen fixiert, dies vereinfacht ihren Transport auf Hubkarren oder Handgabelhubwagen.

Réception, transport et manutention

A la réception du moteur, contrôler qu'il n'a pas été abîmé pendant le transport. Le cas échéant, signaler les détériorations au transporteur.
Contrôler également que les caractéristiques figurant sur la plaque signalétique correspondent bien à ce qui a été demandé dans la commande et confirmé par BONFIGLIOLI RIDUTTORI S.p.A.
Les moteurs électriques sont livrés emballés dans des emballages en carton.
Tous les éléments d'emballage devront être récupérés et éliminés ou recyclés suivant les normes en vigueur dans le pays du destinataire.
Les emballages contenant plusieurs moteurs sont normalement appliqués sur des palettes en bois pour faciliter la manutention au moyen de chariots élévateurs ou de transpalettes.

I motori possono essere movimentati individualmente sollevandoli con fasce o cinghie (se il peso lo richiede).
I motori ≥ 100, ≥ M3 sono provvisti di un golfare di sollevamento.
Gli alberi dei motori sono muniti di protezioni di sicurezza in plastica.
Esse dovranno essere rimosse prima dell'installazione seguendo le norme di sicurezza e prevenzione in vigore nel paese del destinatario.
Successivamente, queste protezioni dovranno essere recuperate ed eliminate secondo le norme in vigore nel proprio paese.

Motors may be handled individually by lifting them with belts or chains (if required due to weight) attached to input and output shafts.
Motors ≥ 100, ≥ M3 are fitted with a hoisting eye bolt.
Motor shafts feature plastic safety protections.
They shall be removed before assembly according to the safety standards in force in the country of destination.
These protections shall then be disposed of according to the standards in force in the country considered.

Die Motoren können individuell umpaziert werden, indem man sie, falls dies wegen ihres Gewichts notwendig ist, mit Riemen oder Bändern anhebt.
Die Motoren ≥ 100, ≥ M3, sind mit einer Transportöse ausgestattet.
Die Motorwellen sind mit einem Sicherheitsschutz auf Kunststoff versehen.
Letztere müssen vor der Installation unter Berücksichtigung der im jeweiligen Anwenderland gültigen Sicherheits- und Unfallvorsorgenormen abgenommen werden.
Diese Schutzabdeckungen müssen aufbewahrt und den im jeweiligen Land geltenden Normen gemäß entsorgt werden.

Les moteurs peuvent être déplacés individuellement en les soulevant avec des bandes ou des courroies (si le poids le nécessite).
Les moteurs ≥ 100, ≥ M3 possèdent un piton de levage.
Les arbres des moteurs sont munis de protections de sécurité en plastique.
Avant l'installation il est nécessaire de les démonter selon les normes de sécurité et prévention en vigueur dans le pays du destinataire.
Par la suite, il faut récupérer ces protection et les éliminer de la façon indiquée par les lois en vigueur dans le pays considéré.

I golfari sono adatti per il sollevamento del solo motore.

The eyebolts are suitable for lifting the motor only.

Die Ösenschrauben sind nur für die Anhebung des Motors vorgesehen.

Les chevilles à oeillet sont adaptés uniquement pour le levage du moteur.

Assicurarsi che il motore venga appoggiato in modo stabile e sia impedito il rotolamento nel caso di motori con flangia.

Make sure that the motor rests in a stable manner and will not roll (in the case of motors with flange).

Man kontrolliere, ob der Motor stabil aufgesetzt wird und - im Fall von Motoren mit Flansch - nicht wegrollen kann.

S'assurer que le moteur soit posé de façon stable et qu'ils ne puissent pas rouler en cas de moteurs à bride.

13.1 STOCCAGGIO

Il corretto stoccaggio dei prodotti ricevuti richiede l'esecuzione delle seguenti attività:

a) Escludere aree all'aperto, zone esposte alle intemperie o con eccessiva umidità.

b) Interporre sempre tra il pavimento ed i prodotti, pianali lignei o di altra natura, atti ad impedire il diretto contatto col suolo.

c) Per periodi di stoccaggio superiori ai 60 giorni, le superfici interessate agli accoppiamenti quali flange e alberi, devono essere protette con idoneo prodotto antiossidante (Mobilarma 248 od equivalente).

d) Per periodi di stoccaggio previsti superiori ai 6 mesi, sarà buona norma ruotare periodicamente, ogni 1-2 mesi, il rotore e prevedere misure adeguate di protezione contro la corrosione e l'umidità.

13.1 STORAGE

Observe the following instructions to ensure correct storage of delivered products:

a) Do not store outdoors, in areas exposed to weather or with excessive humidity.

b) Always place boards in wood or other material between floor and products, to avoid direct contact with the floor.

c) For storage periods exceeding 60 days, all coupling surfaces such as flanges and shafts must be protected with a suitable anti-oxidation product (Mobilarma 248 or equivalent).

d) For storage periods exceeding 6 months, it is a good rule to turn the rotor every 1-2 months and to take adequate measures against corrosion and humidity.

13.1 LAGERUNG

Die korrekte Lagerung der Antriebe erfordert folgende Vorkehrungen:

a) Die Produkte nicht im Freien lagern und nicht in Räumen, die der Witterung ausgesetzt sind, oder eine hohe Feuchtigkeit aufweisen.

b) Die Produkte nie direkt auf dem Boden, sondern auf Unterlagen aus Holz oder einem anderen Material lagern.

c) Bei Lagerungen, die länger als 2 Monate dauern, müssen die Oberflächen wie Flansche und Wellen, die an andere Geräte angeschlossen werden, mit einem geeigneten Antioxydierungsmittel (Mobilarma 248 oder ein gleichwertiges Produkt) geschützt werden.

d) Ist eine Lagerung von mehr als 6 Monaten vorgesehen, muß von Zeit zu Zeit, alle 1 - 2 Monate der Läufer gedreht werden, zudem müssen vorbeugende Schutzmaßnahmen gegen Rost und Feuchtigkeit getroffen werden.

13.1 STOCKAGE

Un correct stockage des produits reçus nécessite de respecter les règles suivantes:

a) Exclure les zones à ciel ouvert, les zones exposées aux intempéries ou avec humidité excessive.

b) Interposer dans tous les cas entre le plancher et les produits des planches de bois ou des supports d'autre nature empêchant le contact direct avec le sol.

c) Pour des périodes de stockage supérieures à 60 jours, les surfaces d'accouplement (brides et arbres) doivent être protégées au moyen d'un produit antirouille approprié (Mobilarma 248 ou équivalent).

d) Pour des périodes de stockage supérieures à 6 mois, il convient de tourner le rotor périodiquement, tous les mois ou les deux mois, et de prévoir des mesures appropriées de protection contre la rouille et l'humidité.

13.2 INSTALLAZIONE E MESSA IN SERVIZIO

Controllare che le condizioni di alimentazione, montaggio e servizio corrispondano a quanto indicato in targa e descritto nella documentazione tecnica.

È molto importante, per l'installazione del motore, attenersi alle seguenti norme:

13.2 INSTALLATION AND START-UP

Check that power supply, assembly and service conditions comply with the information on the plate and described in the technical documentation.

The following instructions must be observed when installing the motor:

13.2 INSTALLATION UND IBETRIEBSETZUNG

Man kontrolliere, ob die Stromversorgungs-, Montage- und Betriebsbedingungen denjenigen entsprechen, die auf dem Typenschild angegeben sind und den technischen Unterlagen entsprechen.

Bei der Installation des Motors müssen unbedingt folgende Regeln beachtet werden:

13.2 INSTALLATION ET MISE EN SERVICE

S'assurer que les conditions d'alimentation, de montage et de service correspondent bien aux indications figurant sur la plaque signalétique et dans la documentation technique.

Il est important, pour l'installation du moteur, de se conformer aux règles suivantes:

Rimuovere le eventuali protezioni in plastica presenti sugli alberi seguendo le norme di sicurezza e prevenzione in vigore nel paese del destinatario.

Rimuovere eventuali protettivi di protezione antiossidanti per mezzo di solventi seguendo le norme in vigore nel paese del destinatario.

Evitare che il solvente venga a contatto con il labbro degli anelli di tenuta.

Remove any plastic guards from the shafts according to safety regulations in customer's country.

Remove any protective coatings with solvents according to safety regulations in customer's country.

Do not let the solvent be in touch with oilseal lips.

Eventuell vorhandenen Plastikschutz von den Wellen entfernen, unter Einhaltung der Sicherheits und Varhütungsrichtlinien gemaß des Gesetzes.

Anhaftende Schutzschichten mit einem Lösemittel entfernen.

Es muß unbedingt vermieden werden, daß das Lösemittel mit den Lippen der Dichtungsringe in Kontakt kommt.

Enlever les éventuelles protections en plastique présentes sur les arbres suivant les normes de securité et prévention en vigueur dans le pays du destinataire.

Enlever les éventuelles produits de protection antioxidants au moyen de solvants suivant les normes en vigueur dans le pays du destinataire

Le solvant ne doit pas entrer en contact avec la lèvre des bagues d'étanchéité.

Assicurarsi che il motore sia ben ventilato, non vi siano impedimenti alla libera circolazione dell'aria e in generale, che non insorgano situazioni che compromettano il regolare smaltimento del calore.

L'installazione dovrà inoltre consentire l'esecuzione della manutenzione ordinaria del motore e, se previsto, del freno.

Make sure that the motor is well-ventilated, that there is nothing to block the free circulation of air, and that no situation will arise that could block the regular dissipation of heating.

The installation must also allow the ordinary maintenance on the motor and, if provided, of the brake.

Sicherstellen, daß die Lüftung des Motors gut funktioniert und daß die Luft frei strömen kann. Ganz allgemein darf es nicht zu Situationen kommen, die die normale Abkühlung verhindern.

Die Installation muß zudem so erfolgen, daß die normalen Wartungsarbeiten des Motors und, wenn vorgesehen, der Bremse ohne Behinderung vorgenommen werden können.

S'assurer que le moteur est bien aéré, qu'il n'y a pas d'empêchements à la libre circulation de l'air et, en général, qu'il ne se produit pas de situations compromettant la dissipation régulière de la chaleur.

L'installation devra en outre permettre l'entretien ordinaire du moteur et, s'il est prévu, du frein.

Non sottoporre l'albero motore ad urti che possano danneggiare i cuscinetti.

Avoid shocks on the motor shafts: this may damage the bearings.

Die Motorenwelle darf keine Stöße bekommen, denn diese könnten die Lager beschädigen.

Ne pas soumettre l'arbre à des chocs pouvant endommager les roulements.

Nel caso di motori con montaggio verticale ed albero in basso, l'ingresso aria dovrà essere protetto da un tettuccio.

Nelle installazioni all'aperto, proteggere il motore dall'irraggiamento diretto e, se possibile, dalle intemperie.

Accoppiando motori elettrici con flangia IEC B5 o B14 ai riduttori, e prima di introdurre l'albero del motore nell'albero cavo del riduttore stesso, assicurarsi che la linguetta del motore sia perfettamente stabile.
Spalmare su tutta la lunghezza dell'albero del motore appositi componenti (es. Loctite Antiseize 767) per prevenire fenomeni di usura superficiali, meglio conosciuti come “fretting corrosion” o “ polveri rosse”.
Ogni 6 - 12 mesi è opportuno scollegare il motore dal riduttore, pulire la zona di accoppiamento albero/foro e ripristinare la protezione antiusura sopra descritta.

Assicurarsi che il fissaggio del motore sulla flangia del riduttore avvenga in modo stabile per non dare luogo a vibrazioni.

Nel caso che i motori debbano essere verniciati è opportuno proteggere la targa di identificazione.

Nei motori flangiati il centraggio è previsto con tolleranza j6 ≤ 132, h6 ≥160.

In case of motors with vertical assembly and shaft below, fan cover must be protected by a canopy.

In outdoor installations, protect the motor from direct sunlight and, if possible, from inclement weather.

When coupling electric motors with flange IEC B5 or B14 to gearboxes, and before inserting the motor shaft in the hollow shaft of the gearbox, make sure that the motor key is perfectly stable.
Spread a suitable substance (such as Loctite Antiseize 767) over the entire length of the shaft to prevent surface wear, better known as fretting corrosion or red dust.
It is a good rule to disconnect the motor from the gearbox every 6-12 months, clean the shaft/hole coupling zone, and restore the above-described anti-wear conditions.

Make sure that the motor is secured to the gearbox flange in a stable manner and does not cause vibrations.

If the motors must be painted, it is advisable to protect the name plate.

Pilot diameter on flanged motors have a j6 ≤ 132, h6 ≥160 tolerance.

Falls die Motoren vertikal montiert werden und die Welle sich unten befindet, muß der Eingang durch ein Schutzdach geschützt werden.

Bei Installationen im Freien muß der Motor vor direkten Sonnenstrahlen und, wenn möglich, vor Witterungseinflüssen geschützt werden.

Werden Elektromotoren mit IEC B5- oder B14-Flanschen an die Getriebe angeschlossen, ist vor dem Einführen der Motorwelle in die Hohlwelle des Getriebes zu kontrollieren, ob die Feder des Motors völlig stabil ist. Auf die ganze Motorwellenlänge spezielle Produkte streichen (z.B. Loctite Antiseize 767), um eine Oberflächenabnützung zu verhindern - dieses Problem ist vielleicht besser bekannt unter dem Namen “fretting corrosion” oder “roter Staub”.
EAin- bis zweimal pro Jahr muß der Motor vom Getriebe entfernt und die Zone, wo sich Welle und Öffnung berühren, gereinigt werden, dann die eben beschriebene Oberflächenbehandlung wiederholen.

Man kontrolliere, ob der Motor gut am Getriebeflansch fixiert ist, sodaß er nicht vibriert.

Falls die Motoren lackiert werden sollen, empfehlen wir, das Typenschild zu schützen.

Bei Flanschmotoren beträgt die vorgesehene Zentrierungstoleranz j6 ≤ 132, h6 ≥ 160.

Sur les moteurs à montage vertical et avec arbre en bas, l'entrée de l'air doit être protégée par un capot de protection parapluie.

Sur les installations en extérieur, protéger le moteur du rayonnement direct et, si possible, des intempéries.

Pour l'accouplement de moteurs électriques aux réducteurs au moyen d'une bride IEC B5 ou B14, avant d'introduire l'arbre du moteur dans l'arbre creux du réducteur, s'assurer que la clavette du moteur soit parfaitement stable.
Appliquer sur toute la longueur de l'arbre du moteur un produit prévu à cet effet (par exemple, Loctite Antiseize 767), pour empêcher les phénomènes d'usure superficielle, mieux connus sous le nom de “fretting corrosion” ou “poudres rouges”.
Tous les 6-12 mois, il convient de déconnecter le moteur du réducteur, de nettoyer la zone d'accouplement arbre/trou, et d'appliquer de nouveau la protection anti-usure décrite ci- dessus.

S'assurer que la fixation du moteur sur la bride du réducteur se fasse de façon stable, sans possibilité de vibrations.

Si les moteurs doivent être peints, nous vous conseillons de protéger la plaque signalétique.

Sur les moteurs bridés, le centrage est prévu avec une tolérance j6 ≤ 132, h6 ≥160.

Bilanciamento

Il rotore è bilanciato dinamicamente con mezza linguetta.
Il montaggio dell'eventuale organo di trasmissione dovrà avvenire con l'utilizzo di strumenti adeguati e dopo opportuna equilibratura evitando colpi che danneggerebbero i cuscinetti.
Particolare attenzione dovrà essere posta per evitare l'avviamento del motore senza avere fissato opportunamente la linguetta non utilizzata (motori con due estremità d'albero).

Balancing

The rotor is dynamically balanced with full key.
The assembly of an external transmission must be performed with adeaquate instruments after suitable balancing, avoiding knocks which could damage the bearings.
Be especially careful not to rotate the motor without having properly secured the key not being used (motors with two shaft ends).

Auswuchtung

Der Läufer wird dynamisch mit der Feder ausgewuchtet.
Die Montage der eventuell notwendigen Antriebskomponente muß unter Verwendung geeigneter Instrumente und erst nach der Auswuchtung erfolgen, dabei darf es nicht zu Stößen kommen, die die Lager beschädigen könnten.
Man muß speziell aufpassen, daß der Motor sich nicht dreht, ohne daß die nicht benützte Feder richtig fixiert worden ist (Motoren mit Doppelwellenenden).

Equilibrage

Le rotor est équilibré dynamiquement avec une clavette entière.
Le montage de l'éventuel organe de transmission devra se faire au moyen d'instruments appropriés et après équilibrage, en évitant les coups qui pourraient abîmer les roulements.
Veiller en particulier à éviter la rotation du moteur sans avoir fixé la clavette non utilisée (moteurs avec deux extrémités d'arbre).

Adottare le misure adeguate per prevenire il contatto accidentale con parti nude in tensione o in movimento.

Adopt adequate measures to avoid accidental contact with exposed live or moving parts.

Es müssen entsprechenden Maßnahmen getroffen werden, um zufälligen Kontakt spannungstragender oder rotierender Teile mit Personen zu verhinden.

Adopter les mesures appropriées pour empêcher le contact accidentel avec des parties vives sous tension ou en mouvement.

Dovrebbe inoltre essere evitato il contatto con la cassa motore dato che nel normale funzionamento la temperatura può raggiungere valori superiori a 50 °C.

Avoid contact with the motor case, since the temperature under normal operating conditions may exceed 50 °C.

Zudem sollte der Kontakt mit dem Motorengehäuse vermieden werden, da bei normalem Betrieb die Temperatur auf über 50° C steigen kann.

Eviter également le contact avec la carcasse du moteurs : en fonctionnement normal, la température peut atteindre des valeurs supérieures à 50 °C.

Prova dI isolamento

Prima della messa in servizio o dopo lunghi periodi di giacenza a magazzino (o fermata), controllare la resistenza di isolamento verso massa con Megger da 500V in c.c. Il valore misurato a temperatura di +25 °C per avvolgimenti nuovi ed in buone condizioni deve essere superiore a 10 MΩ. Nel caso in cui questo valore non sia raggiunto è necessario l'essiccamento in forno per eliminare l'umidità presente.

Insulation test

Before start-up, or after long storage (or idle) periods, check insulation resistance to mass with Megger at 500V DC.
The level measured at 25 °C for new windings in good condition should exceed 10 MΩ.
If this level is not reached, oven drying will be required to eliminate humidity.

Isolationstest

Vor der Inbetriebsetzung oder nach langen Ruhepausen kontrolliere man mit einem 500 V-Megger mit Gleichstrom den Isolationswiderstand gegenüber der Erdung. Der Wert, der bei einer Temperatur von + 25 °C (für neue Wicklungen) und unter guten Bedingungen gemessen wird, muß mehr als 10 MΩ betragen. Wird dieser Wert nicht erreicht, muß die Feuchtigkeit durch Trocknen im Ofen eliminiert werden.

Test d'isolation

Avant la mise en service ou après de longues périodes de stockage (ou d'arrêt), contrôler la résistance d'isolation vers la masse au moyen d'un Megger 500 Vcc.
La valeur mesurée à une température de +25 °C pour des enroulements neufs et en bon état doit être supérieure à 10 MΩ.
Si ce n'est pas le cas, sécher au four pour éliminer l'humidité.

Collegamento elettrico

Utilizzare cavi di alimentazione di sezione adeguata alla corrente assorbita ed idonei alle condizioni di installazione previste evitando eccessivi riscaldamenti e/o cadute di tensione. Il collegamento in morsettiera deve essere eseguito secondo gli schemi riportati nella tabella (S89) o come indicato nelle istruzioni all'interno della scatola coprimorsetti utilizzando le apposite piastrine, dadi e rondelle. Eseguire la messa a terra secondo le disposizioni vigenti prima di procedere alla connessione alla rete.
Oltre ai morsetti principali, la scatola coprimorsettiera può contenere le connessioni per le protezioni termiche, dei riscaldatori anticondensa o del freno.
Eseguire le connessioni secondo gli schemi contenuti all'interno della scatola morsetti verificando il tipo di sonda installato (termistore o bimetallo).

Per le connessioni al freno vedi istruzioni supplementari.

Electrical connection

Use power cables with suitable section for absorbed current and for installation conditions, avoiding excessive heating and/or voltage drops. Connection at the terminal board must be performed according to the diagrams shown in table (S89) or according to the instructions contained in the terminal box, using the appropriate plates, nuts, and washers. Earth according to current norms before connecting to the mains.
In addition to the main terminals, the terminal box may contain thermal protection, anti-condensation heaters, and brake connections.
Make the connections according to the diagrams contained in the terminal box. Check the type of thermal protection installed (thermistor or bimetallic).

See the supplemental instructions for connections to the brake.

Elektrischer Anschluß

Der Querschnitt der Stromkabel muß der aufgenommenen Strommenge entsprechen und sich für die vorgesehenen Installationsbedingungen eignen. Allzu hohe Erwärmungen und/oder Spannungs- abfälle müssen verhindert werden. Der Anschluß an das Klemmenbrett erfolgt unter Beachtung der Tabelle (S89) oder der Anweisungen, die im Deckel des Klemmenbrettgehäuses angegeben werden. Dabei werden die dazu vorgesehenen Plättchen, Muttern und Rondellen verwendet. Die Erdung erfolgt entsprechend den im betreffenden Land geltenden Vorschriften, und erst danach wird der Netzanschluß vorgenommen. Außer den Hauptklemmen kann das Klemmenbrettdeckgehäuse Anschlüsse für den Wärmeschutz, die Heizgeräte zur Verhütung von Kondenswasser oder die Bremse enthalten.
Die Anschlüsse müssen nach den Zeichnungen, die sich im Innern des Klemmenbrettgehäuses befinden, vorgenommen werden, wobei man kontrollieren muß, welcher Schutzschalte installiert worden ist (Thermistor oder Bimetall).

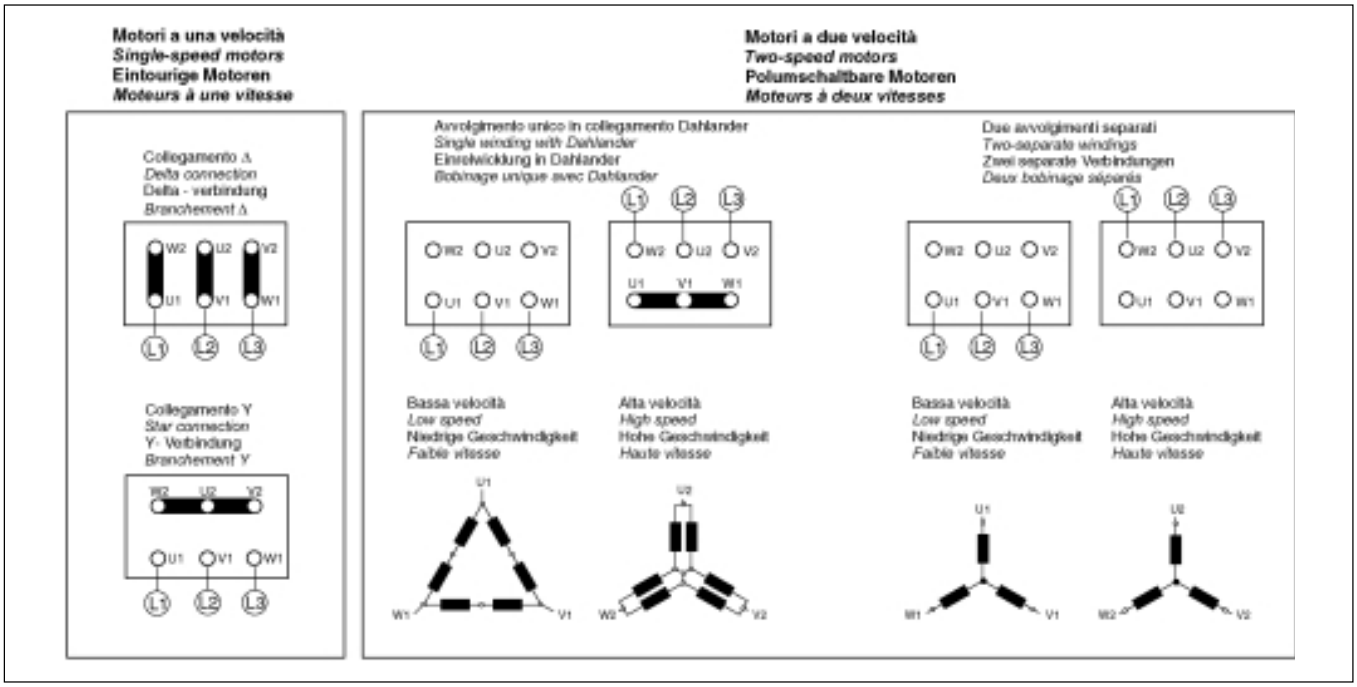
Für die Anschlüsse an die Bremse beachte man die zusätzlichen Anweisungen.

Branchement électrique

Utiliser des câbles d'alimentation d'une section appropriée au courant absorbé et adaptés aux conditions d'installation prévues, en évitant les surchauffages excessives ou les chutes de tension. Le branchement au bornier doit être effectué selon les schémas figurant au tableau (S89) ou de la façon indiquée dans les instructions fournies à l'intérieur de la boîte à bornes, en utilisant les platines, les écrous et le rondelles appropriés.
Effectuer la mise à la terre selon les dispositions en vigueur avant de procéder à la connexion au réseau.
En plus des bornes principales, la boîte à bornes peut contenir les connexions pour les protections thermiques, des réchauffeurs anticondensation ou du frein.
Effectuer les connexions selon les schémas figurant à l'intérieur de la boîte à bornes, en vérifiant le type de sonde installée (thermistor ou bimétal).

Pour les connexions au frein, voir instructions supplémentaires.

(S89)



L'alimentazione delle scaldiglie deve essere separata e deve sempre essere esclusa durante il funzionamento del motore.

Power for the heaters must be separate and must always be disconnected when the motor is running.

Die Stromzufuhr der Heizvorrichtungen muß getrennt erfolgen und bei funktionierendem Motor immer ausgeschaltet sein.

L'alimentation des réchauffeurs doit être séparée et doit toujours être désactivée pendant le fonctionnement du moteur.

Chiudere il coperchio interponendo la guarnizione, avvitare correttamente il bocchettone e la sua vite premicavo e chiudere le aperture d'ingresso non utilizzate.
Nel caso di motori con ventilazione assistita, l'avviamento del motore dovrà avvenire solo con ventilatore in funzione. Per questa applicazione prevedere sempre protezioni

Insert the gasket and close the cover. Carefully tighten the cable entrye and cable gland and close the openings not used.
In the case of motors with servo ventilation, the motor must be started only with the fan running. Always provide incorporated thermal protections for this application. The motors must be equipped with

Deckel schließen, indem man eine Dichtung dazwischenlegt.
Den Stutzen und seine Kabelhalteschraube richtig anschrauben, dann die nicht verwendeten Eingänge schließen. Bei Motoren, die eine Fremdbelüftung aufweisen, darf der Motor nur angelassen werden, wenn die Ventilation in Betrieb ist.

Fermer le couvercle en interposant le joint, visser correctement le bouchon et sa vis presse-étoupe et fermer les ouvertures d'entrée non utilisées.
Pour les moteurs à ventilation assistée, le démarrage du moteur ne doit se faire que lorsque le ventilateur est en fonction. Pour cette application, prévoir toujours des

termiche incorporate. I motori devono essere previsti di adeguate protezioni contro i cortocircuiti, sovraccarichi e sovratensioni di manovra.

adequate protections against short circuits, overloads, and overvoltages.

Für diese Verwendung muß immer ein Wärmeschutz eingebaut sein. Die Motoren müssen angemessene Schutzvorrichtungen gegen Kurz-schluß, Überlastung und übermäßige Spannung beim Manövrieren aufweisen

protections thermiques incorporées. Les moteurs doivent être dotés de protections appropriées contre les courts-circuits, les surcharges ou les surtensions de manoeuvre.

Durante le fermate può essere presente tensione per l'alimentazione delle scaldiglie o del freno. Accertarsi che manchi ogni connessione alla rete.
Si deve inoltre evitare che possano verificarsi riavviamenti automatici tali da creare situazioni pericolose e/o danneggiamenti.

During stops, there may be voltage to feed the heaters or the brake. Make sure that all connections to the mains have been cut.
In addition, be sure to prevent any automatic restarts that could create hazardous and/or destructive situations.

Wenn der Motor nicht in Betrieb ist, kann Spannung für die Wärmer oder für die Bremse vorhanden sein. Man kontrolliere, ob kein Anschluß ans Stromnetz vorhanden ist.
Zudem muß vermieden werden, daß es erneut zu automatischem Motorstart kommt, diese Situation könnte gefährlich sein und/oder Beschädigungen verursachen.

Pendant les arrêts, de la tension peut être présente pour l'alimentation des réchauffeurs ou du frein. S'assurer qu'il n'y a pas de connexion au reseau.
Eviter que ne se produisent des redémarrages automatiques, qui peuvent créer des situations de danger et/ou des dommages.

Senso dl rotazione

Se la rete di alimentazione con sequenza di fase L1, L2, L3 viene collegata ai morsetti U, V, W come indicato nella tabella (S89), il senso di rotazione del motore risulta orario visto dal lato comando. Se vengono scambiati tra loro due terminali qualsiasi, il senso di rotazione risulta antiorario.

Per i motori unidirezionali, sarà prevista una targhetta con indicato il senso di rotazione e la sequenza di fase da applicare (p.e. U, V, W).
Questa indicazione è presente soltanto quando il motore in funzione delle proprie caratteristiche di progetto prevede un unico senso di rotazione (p.e. dispositivo antiritorno installato).
Particolare attenzione dovrà porsi nei casi in cui l'unidirezionalità sia imposta dalle specifiche di macchina o impianto.

Direction of rotation

If the mains with phase sequence L1, L2, L3 is connected to terminals U, V, W as shown at table (S89), the direction of rotation of the motor will be clockwise as seen from the drive end. If any two terminals are switched, the direction of rotation will be counter- clockwise.

For single direction motors, a plate will be provided to indicate the direction of rotation and the phase sequence to be applied (for example, U, V, W).
This indication is present only when the motor, as a function of project characteristics, requires only one direction of rotation (for example, anti run-back device installed).
Pay special attention when single direction status is imposed by machine or plant specifications.

Drehrichtung

Wenn das Stromnetz mit Phasenfolge L1, L2, L3 wie in der Tabelle (S86) gezeigt an die Klemmen U, V, W angeschlossen wird, erfolgt die Drehrichtung des Motors - von der Antriebswellenseite her gesehen - im Uhrzeigersinn. Werden zwei beliebige Kabelenden untereinander vertauscht, ist die Drehrichtung im Gegenuhrzeigersinn.

Für Motoren, die nur eine Drehrichtung haben ist ein Typen- schild vorgesehen, auf dem die richtige Drehrichtung und die Phasenfolge (z.B.: U, V, W) angegeben sind.
Diese Angaben stehen nur auf Motoren, die aufgrund ihrer Bauweise eine einzige Drehrichtung haben (z.B. installierte Rücklaufsperre).
In den Fällen, wo die einzige Drehrichtung durch Eigenheiten der Maschine oder der Anlage bedingt ist, muß speziell vorsichtig vorgegangen werden.

Sens de rotation

Si le réseau d'alimentation avec séquence de phase L1, L2, L3 est relié aux bornes U, V, W de la façon indiquée au tableau (S89), la rotation du moteur se fait dans le sens horaire vu du côté arbre d'entrée. Si l'on intervertit deux bornes quelconques, la rotation se fait dans le sens anti-horaire.

Pour les moteurs unidirectionnels, on prévoira une plaque indiquant le sens de rotation et la séquence de phase à appliquer (par exemple, U, V, W).
Cette indication est présente uniquement quand le moteur, en fonction de ses caractéristiques, prévoit un sens de rotation unique (par exemple, dispositif anti-retour installé).
Faire particulièrement attention si la direction unique est imposée par les spécifications de la machine ou de l'installation.

Avviamento

Prima della messa in servizio si consiglia di eseguire le seguenti operazioni e controlli:

1) verificare che tutte le misure di sicurezza siano applicate;
2) alimentare il motore a vuoto alla tensione nominale;
3) controllare che l'eventuale servoventilatore sia inserito;
4) controllare che il funzionamento sia regolare e senza vibrazioni;
5) in caso di funzionamento soddisfacente applicare il carico controllando i relativi valori di tensione e corrente.

Per i motori autofrenanti vedi istruzioni supplementari.

Commissioning

Perform the following operations and checks before start-up:

1) check that all safety measures have been applied;
2) power up the motor unloaded at rated voltage;
3) check if the servoventilator (if any) is on;
4) check that operation is normal and vibration-free;
5) if operation is satisfactory, apply the load and check voltage, current, and power.

See the supplemental instructions for brake motors.

Anlassen

Bevor der Motor in Betrieb genommen wird, führe man folgende Kontrollen durch:

1) sicherstellen, daß alle Sicherheitsmaßnahmen getroffen worden sind;
2) den Motor bei Leerlauf und Nennspannung laufen lassen,
3) kontrollieren, ob der eventuell vorhandene Servoventilator eingeschaltet ist;
4) kontrollieren, ob der Motor gleichmäßig läuft und nicht vibriert;
5) falls man mit dem Betrieb des Motors zufrieden ist, kann er belastet werden, wobei die Spannungs-, Strom- und Leistungswerte kontrolliert werden müssen.

Für Bremsmotoren beachte man die zusätzlichen Anweisungen.

Démarrage

Avant la mise en service, nous vous conseillons d'effectuer les opérations et les contrôles suivants:

1) vérifier que toutes les mesures de sécurité sont appliquées;
2) alimenter le moteur à vide à la tension nominale;
3) contrôler que l'éventuel servo-ventilateur est bien installé;
4) contrôler que le fonctionnement est régulier et sans vibrations;
5) en cas de fonctionnement satisfaisant, appliquer la charge en contrôlant les valeurs correspondantes de tension, de courant et de puissance.

Pour les moteurs freins, voir informations supplémentaires.

Un funzionamento anomalo quale assorbimento oltre I limiti di targa, riscaldamento eccessivo, rumore, vibrazioni possono causare seri danneggiamenti o condizioni di pericolo. In questi casi interrompere l'alimentazione ed avvertire Il personale preposto alla manutenzione.

Malfunctions such as over current, overheating, noise, or vibrations, may cause serious damage or dangerous conditions. In these cases, cut power and notify maintenance personnel immediately.

Funktioniert der Motor nicht normal, d.h. nimmt er mehr Strom auf, als auf dem Schild angegeben ist, erhitzt er sich übermäßig, macht er zu viel Geräusch oder vibriert er, kann dies zu schweren Beschädigungen oder gefährlichen Situationen führen. In diesen Fällen muß man die Stromzufuhr unterbrechen und das Wartungspersonal benachrichtigen.

Un fonctionnement anormal (absorption au-delà des limites indiquées sur la plaque, réchauffement excessif, bruit, vibrations) peut entraîner des dommages et des dangers. Dans ce cas, couper l'alimentation et avertir le personnel chargé de l' entretien.

13.3 **MANUTENZIONE**

Prima di eseguire qualsiasi intervento il motore, i circuiti ausiliari e/o accessori devono venire correttamente scollegati dalla rete di alimentazione. In particolare:

controllare l'isolamento dalla rete elettrica

prevedere le opportune protezioni da eventuali parti nude in tensione

accertarsi che non si verifichino riavviamenti accidentali.

Si raccomanda di osservare frequentemente il funzionamento del motore e prevedere periodiche ispezioni.
Osservare inoltre quanto previsto nelle istruzioni aggiuntive per i motori con freno.
In generale si consiglia di operare come segue:

1) controllare che il funzionamento sia regolare e gli assorbimenti entro i valori riportati in targa;
2) mantenere il motore pulito e verificare che non vi siano ostruzioni alla ventilazione;
3) controllare le condizioni degli anelli di tenuta sull'albero;
4) controllare che le connessioni elettriche e le viti di fissaggio siano strette;
5) i cuscinetti utilizzati nell'esecuzione standard sono del tipo prelubrificati e non necessitano di manutenzione; è comunque buona norma sostituirli dopo circa 3 anni.

Per le normali ispezioni non è necessario smontare il motore se non per la sostituzione dei cuscinetti. In questo caso le operazioni dovrebbero essere eseguite dal personale specializzato e con strumenti idonei.

13.3 MAINTENANCE

Before any intervention, the motor, auxiliary circuits and/or accessories must be disconnected from the mains. In particular:

check insulation from the electrical mains

provide suitable protections from exposed live parts

make sure to prevent accidental restarts.

Be sure to frequently observe the operation of the motor. Inspect periodically.
In addition, follow the additional instructions for motors with brake.
In general, we advise you to do as follows:

1) check that operation is normal and that absorbed current is within rated limits;
2) keep the motor clean and check that ventilation is not obstructed;
3) check the condition of the seals on the shaft;
4) check that all electrical connections and fastening screws are tight;
5) the bearings used in the standard version are pre-lubricated e seded and do not require maintenance. Nevertheless, it is a good rule to replace them after approximately 3 years.

The motor does not have to be removed for normal inspections unless the bearings need to be replaced. In this case, the operations should be performed by specialised personnel and with appropriate tools.

13.3 **WARTUNG**

Bevor irgendwelche Wartungsarbeiten vorgenommen werden, muß beim Motor, sowie auf den Hilfs- und Nebenkreisen die Stromversorgung fachmännisch unterbrochen werden. Vor allem muß man:

die Isolation des Stromnetzes geeignete Schutzvorrichtungen kontrollieren,

gegegen unbeabrichtigten Kontakt mit spannungstragenden Teilen tragen,

sicherstellen, daß es nicht zu unvorhergesehenen Motorstarts kommt.

Es wird empfohlen, häufig den Betrieb des Motors zu beobachten und von Zeit zu Zeit eine Inspektion durchzuführen.
Bei Motoren mit Bremse beachte man zudem die zusätzlichen Anweisungen.
Im Allgemeinen empfehlen wir, wie folgt vorzugehen:

1) kontrollieren, ob der Motor richtig funktioniert und die Stromaufnahme den Angaben auf dem Typenschild entspricht
2) den Motor sauber halten und regelmäßig nachsehen, ob die Belüftung nicht verstopft ist;
3) die Dichtungsringe auf der Welle regelmäßig kontrollieren;
4) kontrollieren, ob die elektrischen Anschlüsse und die Befestigungsschrauben gut fixiert sind;
5) die Lager, die auf dem Standard modell verwendet wurden, sind vorgeschmiert und wartungsfrei; wir empfehlen aber trotzdem, diese nach zirka 3 Jahren zu ersetzen.

Für normale Inspektionen muß der Motor nicht abmontiert werden, außer wenn die Lager ausgewechselt werden sollen. In diesem Fall sollten die Operationen jedoch von geschultem Personal und mit geeignetem Werkzeug vorgenommen werden.

13.3 ENTRETIEN

Avant toute intervention, le moteur ainsi que les circuits auxiliaires et/ou accessoires doivent être déconnectés du réseau. En particulier:

contrôler l'isolement par rapport au réseau électrique

prévoir des protections appropriées contre les éventuelles parties vives sous tension.

s'assurer qu'il ne puisse pas se produire de redémarrages accidentels

Nous vous recommandons d'observer fréquemment le fonctionnement du moteur et de prévoir des inspections périodiques.
Se conformer aux instructions supplémentaires pour les moteurs à frein.
En général, nous vous conseillons de procéder comme suit:

1) contrôler que le fonctionnement est régulier et que les absorptions sont comprises à l'intérieur des valeurs indiquée sur la plaque;
2) maintenir le moteur propre et vérifier que rien ne gêne la ventilation;
3) contrôler l'état des joints d'étanchéité sur l'arbre;
4) contrôler que les branchements électriques et les vis sont bien serrés;
5) les roulements utilisés dans l'exécution standard sont du type prélubrifié et ne nécessitent aucun entretien. Il convient toutefois de les changer tous les 3 ans environ.

Pour les inspections normales, il n'est pas nécessaire de démonter le moteur, sauf pour le remplacement des roulements. Dans ce cas, les opérations devraient être effectuées par du personnel spécialisé et avec des instruments appropriés.

Motori autofrenanti con freno tipo FD e FA.

Brake motors with brake FD and FA type.

Bremsmotoren Gleichstrombremsung Mod. FD und FA

Moteurs freins avec frein type FD et FA

Regolazione del traferro

Air gap adjustment

Einstellung des Luftspalts

Reglage de l'entrefer

Allentare i dadi 6.

Regolare il traferro T agendo sulle viti 5 portandolo al valore Min. indicato in tabella (S90).

A regolazione ultimata bloccare a fondo i dadi 6 mantenendo in posizione le viti 5.

Il traferro deve essere verificato periodicamente e il suo valore deve essere compreso tra i valori min. e Max. indicati nella tabella (S90).

Unloosen nut No. 6

Set the air gap T to min. value shown in the table (S90) adjusting the screws No. 5.

When reached the air gap value lock the nuts No. 6 keeping the screws in positions No. 5

The air gap value must be checked periodically and the value must be between the min. and max. value shown in the table (S90).

Muttern 6 lösen.

Luftspalt T einstellen, indem man die Schraube 5 dreht, bis sie auf dem kleinsten Wert der Tabelle (S90) sind.

Nach dieser Einstellung die Muttern 6 gut blockieren, wobei die Schrauben 5 in ihrer Position bleiben müssen.

Der Luftspaltwert muß von Zeit zu Zeit kontrolliert werden; die Spaltöffnung muß zwischen dem Mindest- und dem Höchstwert, die in der Tabelle (S90) angegeben sind, liegen.

Desserrer les écrous 6.

Régler l'entrefer T en amenant la vis 5 à la valeur min. indiquée dans le tableau (S90).

Une fois le réglage terminé, bloquer à fond les écrous 6 en maintenant en position les vis 5.

La valeur de l'entrefer doit être vérifiée périodiquement ; elle doit être comprise entre les valeurs min. et max. indiquées dans le tableau (S90).

Valori di traferro superiori al valore Max. determinano un aumento della rumorosità e possono impedire lo sbloccaggio del freno.
In presenza della leva di sblocco, l'aumento eccessivo del traferro può portare ad un annullamento della coppia frenante dovuto alla ripresa del gioco dei tiranti della leva di sblocco.
La distanza X (gioco leva) deve essere superiore ai valori indicati in tabella (S90).

Air gap higher than the max. value increase the brake noise and may prevent from brake releasing.
When the brake release lever is fitted, the eccessive air gap may annul the brake torque due to the play in the brake release screw.
Dimension x (lever play) must respect the value shown in the table (S90).

Luftspaltwerte, die höher als der Maximalwert liegen, führen dazu, daß das Bremsgeräusch stärker wird und die Bremse eventuell nicht entsperrt wird.
Ist der Bremsentsperrungshebel vorhanden, kann eine zu starke Öffnung des Luftspaltes dazu führen, daß das Bremsdrehmoment wegen der Wiederaufnahme des Zugstangenspieles des Entsperrungshebels gleich Null wird.
Der Wert X (Hebelspiel) muß den in der Tabelle (S90) angegebenen Werten entsprechen.

Les valeurs d'entrefer supérieures à la valeur max. ont pour effet de rendre le frein plus bruyant, et peuvent en empêcher le déblocage.
En présence du levier de déblocage, l'augmentation excessive de l'entrefer peut entraîner une annulation du couple de freinage, du fait de la reprise du jeu des tirants du levier de déblocage. La dimension X (jeu levier) doit correspondre aux valeurs indiquées dans le tableau (S90).

X = Distanz (mm) zwischen der Fläche B und der Scheibenfläche A
X = *Distance (mm) entre la surface B et la surface de la rondelle A*

Parti di ricambio

Per richiedere eventuali parti di ricambio, precisare il tipo di motore e il codice indicato in targa.
Le parti commerciali unificate sono reperibili direttamente in commercio.

Spare parts

When ordering spare parts, specify the motor type and the code shown on the plate.
Standard commercial parts may be purchased directly on the market.

Ersatzteile

Will man Ersatzteile bestellen, muß die Art des Motors und die auf dem Typenschild angegebene Codenummer angegeben werden.
Die vereinheitlichten handelsüblichen Teile findet man direkt im einschlägigen Handel.

Pièces détachées

Pour commander les pièces détachées, on devra préciser le type de moteur et le code indiqué sur la plaque.
Les pièces commerciales unifiées se trouvent directement dans le commerce.

Manutenzione

In occasione della manutenzione:

- verificare che lo spessore minimo della guarnizione d'attrito non sia inferiore a 1mm;
- verificare il gioco fra disco freno e mozzo trascinatore;
- verificare che non vi sia alcun gioco fra la linguetta e la sua sede sul mozzo;
- verificare che non vi sia alcun gioco fra mozzo trascinatore e albero motore;
- verificare le parti usurate;
- registrare l'intraferro riportandolo al valore iniziale agendo sulle viti e bloccandolo con i dadi.

Maintenance

During maintenance:

- *check that the friction packing minimum thickness is not lower than 1mm;*
- *check that the play between the brake disc and the driving hub is not excessive;*
- *check the absence of play between the tongue and its housing on the hub;*
- *check the absence of play between the driving hub and the driving shaft;*
- *replace the worn parts;*
- *adjust the air-gap, taking it back to its initial value by means of the screws and lock it with the nuts.*

Instandhaltung

Bei der Instandhaltung:

- Prüfen, dass die Mindeststärke des Reibebelags nicht unter 1 mm liegt;
- Das Spiel zwischen Bremsscheibe und Mitnehmernabe prüfen;
- Prüfen, dass keinerlei Spiel zwischen Federkeil und seinem Sitz an der Nabe vorhanden ist;
- Prüfen, dass keinerlei Spiel zwischen Mitnehmernabe und Motorwelle vorhanden ist;
- Die verschlissenen Teile prüfen;
- Den Luftspalt einstellen, ihn dabei durch Betätigen der Schrauben auf den anfänglichen Wert bringen und mit den Muttern feststellen.

Entretien

Lors des opérations d'entretien :

- *Vérifier que l'épaisseur minimum du joint de friction n'est pas inférieure à 1mm ;*
- *vérifier le jeu entre le disque de freinet le moyeu d'entraînement;*
- *vérifier l'absence de jeu entre la clavette et son logement sur le moyeu ;*
- *vérifier l'absence de jeu entre le moyeu d'entraînement et l'arbre moteur ;*
- *vérifier les pièces usées ;*
- *régler l'entrefer : le ramener à sa valeur initiale au moyen des vis et le serrer au moyen des vis.*

MBS 33

Características

- Diseñado para ambientes industriales exigentes.
- Aprobación CE: cumple con directivas europeas sobre EMC.
- Cubierta y partes de acero inoxidable resistentes al ácido (AISI 316L).
- Calibrado por laser y con compensación de temperatura.
- Señales de salida: 4-20 mA
- Varios rangos de presión.
- Alta precisión.
- Conexión eléctrica a través de plug o cable.
- Presión de referencia: Presión absoluta

AVN HYDRAULIK A-S

PROFILE MAGAZINE

AVN HYDRAULIK A-S

In 1933 the founder of the AVN Group, Alfred V. Nielsen, launched his company based on the simple philosophy of "top-notch quality and flexibility to the customer's advantage". Today the AVN Group has branched out in several different directions, but the group's approach has remained unchanged. In order to deliver the best possible product, every single component has to be of the highest quality; and we must meet all the needs and demands of our customers at all times.

AVN Hydraulik A-S represents the biggest production sector within the AVN Group. Since 1978 AVN Hydraulik has been a strong partner for Danish industry, and the company has experienced steady growth in each year of its existence. The experience accumulated with regard to all types of hydraulic systems has helped AVN Hydraulik to become specialists in both individual and all-round hydraulic components and systems.

The fundamental goal of AVN Hydraulik is to meet all challenges and carry out a variety of tasks with regard to the design and development of hydraulic installations. AVN Hydraulik demands a great deal of its own suppliers, and works with some of Europe's leading manufacturers. So the customer can be sure of dealing with the best people in the business.

A MEMBER OF THE AVN GROUP

The AVN Group covers several business areas and employs a highly skilled workforce from a wide variety of specialist backgrounds. Nevertheless, the philosophy is the same everywhere within the Group: "top-notch quality and flexibility to the customer's advantage, no matter what". These days industrial customers have a wide range of delivery requirements, which is why the AVN Group gives top priority to teamwork involving all subsidiary companies. We are able to deliver our products quickly and at a good price, because the structure of the group allows us to optimise every stage in the process.

The AVN Group consists of:

Alfred V. Nielsen A-S
AVN Pneumatik A-S
AVN Elektronik A-S
AVN Hydraulik A-S
The Raben Group

AVN HYDRAULIK'S DEPARTMENTS

General Manager Jørgen Rose in conversation with an employee.

A long time ago, we discovered the advantage of working closely with our partners without losing close contact with our customers. This is why we have chosen central locations in Denmark, both on Zealand and in Jutland.

AVN Hydraulik's 36 employees in Brøndby and Silkeborg ensure that we are always able to reach our customers anywhere in Denmark very quickly. Both the head office in Brøndby and our brand-new workshop in Silkeborg are equipped with a large warehouse and excellent facilities, including advanced trial facilities and testbeds. We also have suitable equipment for measuring pressure, flow or temperature.

The company values personal and professional contact with the customer very highly. Hydraulic units often form part of a larger whole, and their role is essential for the optimum running of production systems. This is the reason why we have experienced consultants available in Jutland and on Zealand who are always ready to provide expert assistance.

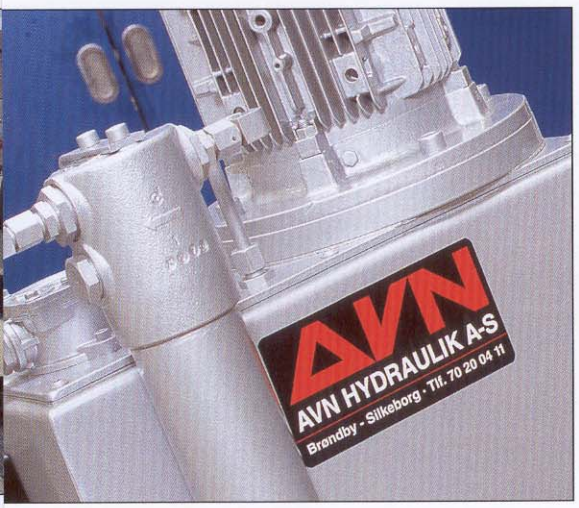
EXPERTISE

AVN Hydraulik has a well-equipped warehouse, but our expertise comprises far more than this.

Nowadays, all work carried out within the field of hydraulics requires a high degree of skill. For instance, when it comes to project planning, designing block systems, systems development, assembly and electronic control systems. And naturally, once they have been concluded our projects come complete with the necessary documentation produced on CAD equipment.

We also rely a great deal on our service department, and our sales department is always ready to provide ready solutions. It could be anything from technical details to good design ideas. AVN Hydraulik's aim is to be able to supply components and systems of high technical and aesthetic quality.

PRODUCTION AT AVN HYDRAULIK A-S

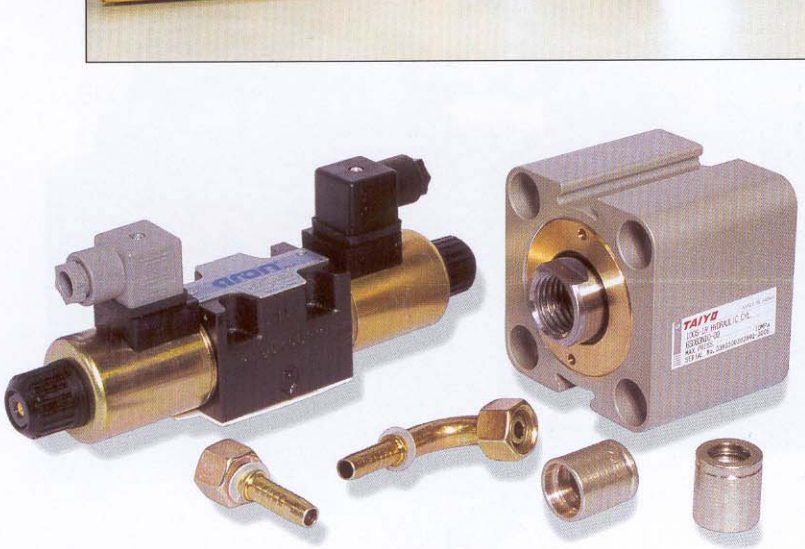


At our workshops our highly qualified staff prepare all the different systems needed, and all the equipment is tested thoroughly before it leaves the building. AVN Hydraulik is able to design and manufacture complete hydraulic power packs, which we produce in accordance with the needs and instructions of our customers. We are able to deliver these power packs on a turnkey basis in the form of complete systems with electronic controls. Our engineers are familiar with all components and systems, so they are highly proficient in ensuring that assembly and commissioning are performed correctly.

Naturally, AVN Hydraulik is able to fulfil all types of requirements, e.g. supplying equipment in particular colours that a customer may wish to work with.

The company is also able to supply all types of hydraulic components, including any specific component parts that the customer may require.

Our expertise also includes the production of hydraulic hoses tailored to meet the customer's requirements.



FROM SINGLE COMPONENTS TO ALL-ROUND SYSTEMS

The demand for modern machinery is increasing all the time, so it is crucial to assemble all the functions needed under one roof. The required expertise and tailor-made solutions are also vital factors. This means that the customer can choose a single component or the kind of reliable and carefully thought-out total system that AVN Hydraulik specialises in.

We have detailed knowledge of the total systems that we tailor to suit our customers' requirements, and when supplying them we ensure that they function optimally. Experience shows that the more complete a product is, the more satisfied the customer will be.

AVN invests a great number of resources in developing total systems, and we have gained so much useful experience from earlier projects that our expertise in the field is constantly growing.

A HEALTHY PROFILE

Our objective is simple. We aim to maintain our high level of service so that we can continue to supply our customers with high-quality products. In the future we plan to lead the field in terms of product development in our key areas of concern. This can be achieved by continuously giving further training to our employees. We value our staff very highly, and we prefer to give further training to the people who already work for us so as to ensure that our staff are always familiar with all facets of our production and service process. This means that the customer can always expect to be visited by a qualified engineer or a service-minded salesperson who is ready to provide constructive advice and suggestions.

We are absolutely convinced that it is well-qualified staff who give our company its healthy profile. Good employees help to create new opportunities, enabling us to work together to ensure stability and quality both now and in the future.

SERVICE CONTRACT - A MATTER OF COURSE

When a customer chooses to work with AVN Hydraulik, part of the procedure often involves signing a service contract. This means that the customer can be confident that everything will be carried out exactly in accordance with their own particular operating conditions. The service contract that we offer our customers is a guarantee that equipment will be maintained to a high standard and at the best possible price.

CONSULTING

Documentation,
follow-up and advice

Companies responsible for operating conditions in technical areas know how important hydraulic components are in any production process. As a result, they need to be able to rely on their suppliers even after the product has been delivered. This is why AVN Hydraulik invests so much energy in this area of service, including documentation and follow-up on customer premises.

People in charge of a company's production are aware of the value of documentation on machine cards, which we consider to be one of the most important parameters when servicing hydraulic systems. AVN Hydraulik uses the most modern tools in order to ensure that all our projects are well documented. This means that it is always possible to refer back to each part and check everything down to the smallest detail.

Our sales staff have many years' experience, and every day they give advice and perform follow-ups. Because problems are often acute and need to be dealt with speedily, all our engineers have vehicles carrying all the equipment they need so that they can quickly service machinery and carry out repairs on all equipment, irrespective of whether it is our own or someone else's.

A sense of trust between supplier and customer is vital, and AVN Hydraulik is always ready to give advice if problems arise. There is always a qualified engineer on hand ready to answer questions on the telephone.

Our mission is to deliver to our customers competitive products without any defects on time.

AFFILIATED COMPANIES

ALFRED V. NIELSEN A-S

Alfred V. Nielsen A-S have become leaders in the field of pneumatic tools, blind rivet technology and assembly.

Flexibility - Service - Quality
These are just a few of the qualities that we keep in mind as we go about our daily work. In order to live up to these qualities, it is necessary to have an able work force and large supplies of spare parts. We have both these things. Our primary customer groups are companies that work with assembly lines and production within Danish industry.

AVN PNEUMATIK A-S

AVN Pneumatik A-S – who have branches in Brøndby and Silkeborg – market some of the best pneumatic products, forming one of the widest product ranges on the market today.

Numatics pneumatic is the world leader in the area of unsealed magnetic valves, which are noted for their long service life and very high switching speed. Taiyo pneumatic is well known for its handling equipment. And ACE is the world's largest producer of hydraulic industrial shock absorbers.

Our service department can assist with the following:

Maintenance: repair and maintenance of pneumatic equipment along with the controls to match.

Control: assembly of PLC control systems, connection units or purely pneumatic controls.

Special cylinder: in our own in-house cylinder workshop we make pneumatic cylinders to measure, from Ø32 to Ø200, exactly how you want them.

AVN ELEKTRONIK A-S

AVN Elektronik A-S have activities within the fields of positioning, handling and automation. They also supply complete robots including 6-axis and SCARA robots as well as linear systems.

The construction of PLC and PC systems is an important part of AVN Elektronik's production. The main products come from several different producers who all aim to deliver products of a very high quality while maintaining competitive prices.

Warner Electric, which also includes Slo-Syn and Wichita, supply the following: a comprehensive range of auxiliary motors and stepper motors, linear linings, brakes and clutches.
LG Industrial Systems supply the following: PLC systems, operator panels and frequency transformers.

Sankyo Seiki and DENSO Robotics supply various types of robots.

Our technicians and engineers are responsible for the construction of control systems and the design of software (both standard software and software created specifically for the customer).

RABEN VÆRKTØJ A-S

For many generations, the name RABEN has been synonymous with top quality and service in connection with tools supplied to Danish trade and industry.

The RABEN Group markets traditional hand-held tools as well as more advanced equipment, particularly for the metal industry.

In recent years RABEN's range has expanded to include laser cutters, edge presses and punching machines from the world-famous TRUMPF producer.

The company is based in Herlev, and has 45 employees.

RABEN represents leading products such as PFERD, VITEX, TITEX PLUS and HAZET, a total of 14 international high-quality products.

RABEN has been part of the AVN Group since May 2000.

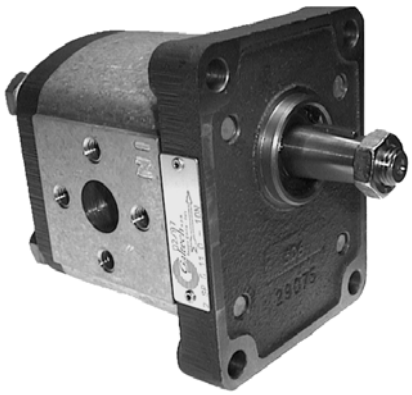
Iotti Strozzi – Galtech



Iotti Strozzi - Galtech tandhjulspumper fås i størrelser fra 1,3 til 120 cm^3/omdr.

De kan fås som venstreløb, højreløb og reversibel. Pumperne er nemme at ændre omløb på, som vist herunder.

Pumperne kan sammenbygges af to eller flere pumper.

NEG Micon 750kW Turbine Protocol Document

Revision 2.07

Final version – as implemented on site

Friday, September 28, 2001

Valid for WP3000 controllers on Oak Creek phase I

NOTE: After implementation of this protocol version it will not be possible to use remote software that is using protocol version 1.03. In other words there is no compatibility between protocol version 1.03 and 2.07.

Specification

Protocol – Asynchronous RS232, ASCII

Baud Rate – 19200

Parameters – 8 data bits, No parity, 1 stop Bit

RS232 Wiring Schematic

RS232 plug into the Controller (Wind Turbine Controller)

9 pole D-Sub Female:

Description	Pin
Rx	2
Tx	3
Gnd	5
RTS	7
CTS	8

Please add wiring between pin 7 and 8
Please do not use other pins, has to be let open.

Please be aware that there is no galvanic isolation (opto-coupler) between the wind turbine processor and the communication channel of the WP3000 controller, meaning the device connected to the communication channel has to provide the galvanic isolation part.

Data Format

Command Packet

Master to WTG

Size byte	Content	Description
1	SOH	Start of heading
3	Wtg Address	1-254; 0 = master; 255 = broadcast

49	4	Ampere	Phase Amps. L3 (1sec. Average)
53	3	Hz	Frequency in unit 1/10 Hz
56	3	Pressure	Hydraulic pressure windtips in unit 1 bar (1sec. average)
59	4	Position	Nacelle position in unit degrees
63	1	Status byte	1= turbine on-line, 0= turbine off-line
64	1	GS	Seperator
65	5	CRC16	Cyclic redundancy check
70	1	EOT	End of transmission

Status Code Telegram

WTG to Master “1”

The last 32 status codes in the WP3000.

The definition between an error code and a warning code is:
If the machine is stopped the event is treated as an error code, if the machine is not stopped the event is treated as a warning, ex. “Too low wind”.

Mita supplies Fenway with a list of status codes that can be shown as warnings on the remote system.

Byte Position	Size byte	Content	Description
0	1	SOH	Binary 1
1	3	Wtg Address	Contains leading 0s

71	1	EOT	End of transmission

T1 wind counter in unit sec. Counts when the wind speed, 10 min. average, is faster than *Start wind and slower than *Stop wind and the mechanical brake is open (output 525 high).

T2 wind counter in unit sec. Counts when the wind speed, 10 min. average, is faster than *Start wind and slower than *Stop wind.

Set time and date

Master to WTG "7"

DATA Description:

The 'Data to WTG' is only used in the 'Set time and date' command. The format is as following:

Size byte	Content	Description
1	SOH	Start of heading
3	Wtg Address	1-254; 0 = master; 255 = broadcast
1	Command Character	See Command Character Description
1	GS	Separator
6	Time	HHMMSS or ****** * = 2A hex
6	Date	YYMMDD or ****** * = 2A hex
1	ETX	End of text
5	CRC16	Cyclic redundancy check
1	EOT	End of transmission

If the data field is ****** in the time and date field the turbine returns the current time and date.

WTG to Master "7". No response if the command is a broadcast

Byte Position	Size byte	Content	Description
0	1	SOH	Binary 1
1	3	Wtg Address	Contains leading 0s
4	1	Command Character	Echo command character
5	6	Time	HHMMSS
11	6	Date	YYMMDD
17	1	GS	Separator
18	5	CRC16	Cyclic redundancy check
23	1	EOT	End of transmission

Event log

WTG to master **"8"**

Byte Position	Size byte	Content	Description
0	1	SOH	Binary 1
1	3	Wtg Address	Contains leading 0s
4	1	Command Character	Echo command character
Eventlog entry 1			
Eventlog entry 2			
Eventlog entry 3			
.			
.			
.			
Eventlog entry 50			
	1	GS	Separator
	5	CRC16	Cyclic redundancy check
	1	EOT	End of transmission

The fifty events entry in the event log is formatted as follows:
"Date and time stamp" "E or S" "Event no" "Event text" CR LF
The @ is filled with the Character E for an event in the list
The @ is filled with the Character S for a status code in the list

Due to different length of Event log texts there is no fixed length of the event log entry, the single events is separated by a CR and a LF
The total length of the telegram will typically be in the range 2500 – 4000 bytes

Worst case:

Packet size:
<SOH>xxx8(YYMMDDHHMMSS@zzzzabcdefghijklmnopqrst<CR><LF>)*50<GS><crc16><EOT> =
1 + 3+ 1 + (12 + 1+ 4 + 20 + 1 + 1) * 50 + 1 + 5 + 1 = 1962 bytes.

At 19200 baud it will take approximately 1 sec. to transmit the whole package.

Surveillance of gearbox telegram

WTG to Master (Counters for the gearbox suveillance) “9”

Byte Position	Size byte	Content	Description
0	1	SOH	Start of heading Binary 1
1	3	Wtg Address	Contains leading 0s
4	1	Command Character	Echo command character
5	6	Time	Short term gear oil hot in unit sec (updated every 3.6 sec)
11	6	Time	Long term gear oil hot in unit sec (updated every 3.6 sec)
17	6	Time	Short term bearing hot in unit sec (updated every 3.6 sec)
23	6	Time	Long term bearing hot in unit sec (updated every 3.6 sec)
29	6	Counter	Short term gear oil hot peak counter
35	6	Counter	Long term gear oil hot peak counter
41	6	Counter	Short term bearing hot peak counter
47	6	Counter	Long term bearing hot peak counter
53	1	GS	Separator
54	5	CRC16	Cyclic redundancy check
59	1	EOT	End of transmission

Power down time and times and event log telegram

WTG to Master “A”

Byte Position	Size byte	Content	Description
0	1	SOH	Start of heading Binary 1
1	3	Wtg Address	Contains leading 0s
4	1	Command Character	Echo command character
5	8	Timer	Power down time in seconds
13	8	Counter	Power down times
21	12	yymmddhhmmss	Power down log (last power up) the newest event
33	12	yymmddhhmmss	Power down log (last power down) the newest event
45	12	yymmddhhmmss	Power down log(last power up)
57	12	yymmddhhmmss	Power down log(last power down)
69	12	yymmddhhmmss	Power down log(last power up)
81	12	yymmddhhmmss	Power down log(last power down)
93	12	yymmddhhmmss	Power down log(last power up)
105	12	yymmddhhmmss	Power down log(last power down)
117	12	yymmddhhmmss	Power down log (last power up)
129	12	yymmddhhmmss	Power down log(last power down)
141	12	yymmddhhmmss	Power down log(last power up)
153	12	yymmddhhmmss	Power down log(last power down)
165	12	yymmddhhmmss	Power down log(last power up)
177	12	yymmddhhmmss	Power down log(last power down)
189	12	yymmddhhmmss	Power down log(last power up)
201	12	yymmddhhmmss	Power down log(last power down)
213	12	yymmddhhmmss	Power down log(last power up)
225	12	yymmddhhmmss	Power down log(last power down)
237	12	yymmddhhmmss	Power down log(last power up) the oldest event
249	12	yymmddhhmmss	Power down log(last power down) the oldest event
261	1	GS	Separator
262	5	CRC16	Cyclic redundancy check
267	1	EOT	End of transmission

This log is made in the uninitialized RAM (not cleared at start up). If the WP3033 is removed / disconnected from the WP3000 or the battery is changed in the WP3000 this log is lost. There is a parameter in the WP3000 to clear this log **Reset pwr.down log x* in the Service menu.
The power down times counter will be restored together with the summations in the WP3000.

Software revision and version

WTG to Master “B”

Byte Position	Size byte	Content	Description
0	1	SOH	Start of heading Binary 1
1	3	Wtg Address	Contains leading 0s

Addressing Strategy

When turbine does not answer

The response time from the wind turbine controller is less than 100 ms, which means that the handling of the retries has to be defined in the master comm. system.

The timing for the retry depends on how the master system handles the receiving of the characters. If the master system detects that no characters has been received within a delay of 100 ms, the question has to output again. Else if a CRC-16 error is recognized the question has to be output again.

NOTE: The retry handling system must be able to handle the huge Event telegram which in worst case be 2212 bytes (approx 1 sec. at 19200 baud).

CRC-16 Calculation (question)

The CRC16 calculation is calculated from WTG address to the ETX, excl. the ETX.
This routine generates a CRC-16 forward remainder of ASCII characters of 7 bit contained in 8 bit register.
CRCR is a 16 bit register which contains the result dynamically.
CRCP is a 16 bit register which contains the polynomium for the standard X^16 + X^15 + X^2 + 1 = 1 1000 0000 0000 0101 binary.
The first bit is implicitly given in the carry, CRCP = 8005 hex.

CRCRhig = MSB CRCPhig = MSB = 80 hex
CRCRlow = LSB CRCPlow = LSB = 05 hex

Pseudo code for calculation:

Character string
start: SET CRCR = 0

>>>> Char. start: SET COUNTER = 7

SET TEMP = CHARACTER * 2

SET CRCRhig = CRCRhig <XOR> TEMP

>>> shift crcr: SET CRCR = CRCR * 2

IF no carry JUMP count shift >>

SET CRCR = CRCR <xor> CRCP

>> Count shift: SET COUNTER = COUNTER - 1

IF counter not zero JUMP shift crcr >>>

SET CHARACTER = next character

IF no end of string JUMP char. start >>>>

CRC-16 Calculation (answer)

The CRC16 calculation is calculated from WTG address to the GS, excl. the GS.
This routine generates a CRC-16 forward remainder of ASCII characters of 7 bit contained in 8 bit register.
CRCR is a 16 bit register which contains the result dynamically.
CRCP is a 16 bit register which contains the polynomium for the standard X^16 + X^15 + X^2 + 1 = 1 1000 0000 0000 0101 binary.
The first bit is implicitly given in the carry, CRCP = 8005 hex.

CRCRhig = MSB CRCPhig = MSB = 80 hex
CRCRlow = LSB CRCPlow = LSB = 05 hex

Pseudo code for calculation:

Character string
start: SET CRCR = 0

>>>> Char. start: SET COUNTER = 7

SET TEMP = CHARACTER * 2

SET CRCRhig = CRCRhig <XOR> TEMP

>>> shift crcr: SET CRCR = CRCR * 2

IF no carry JUMP count shift >>

SET CRCR = CRCR <xor> CRCP

>> Count shift: SET COUNTER = COUNTER - 1

IF counter not zero JUMP shift crcr >>>

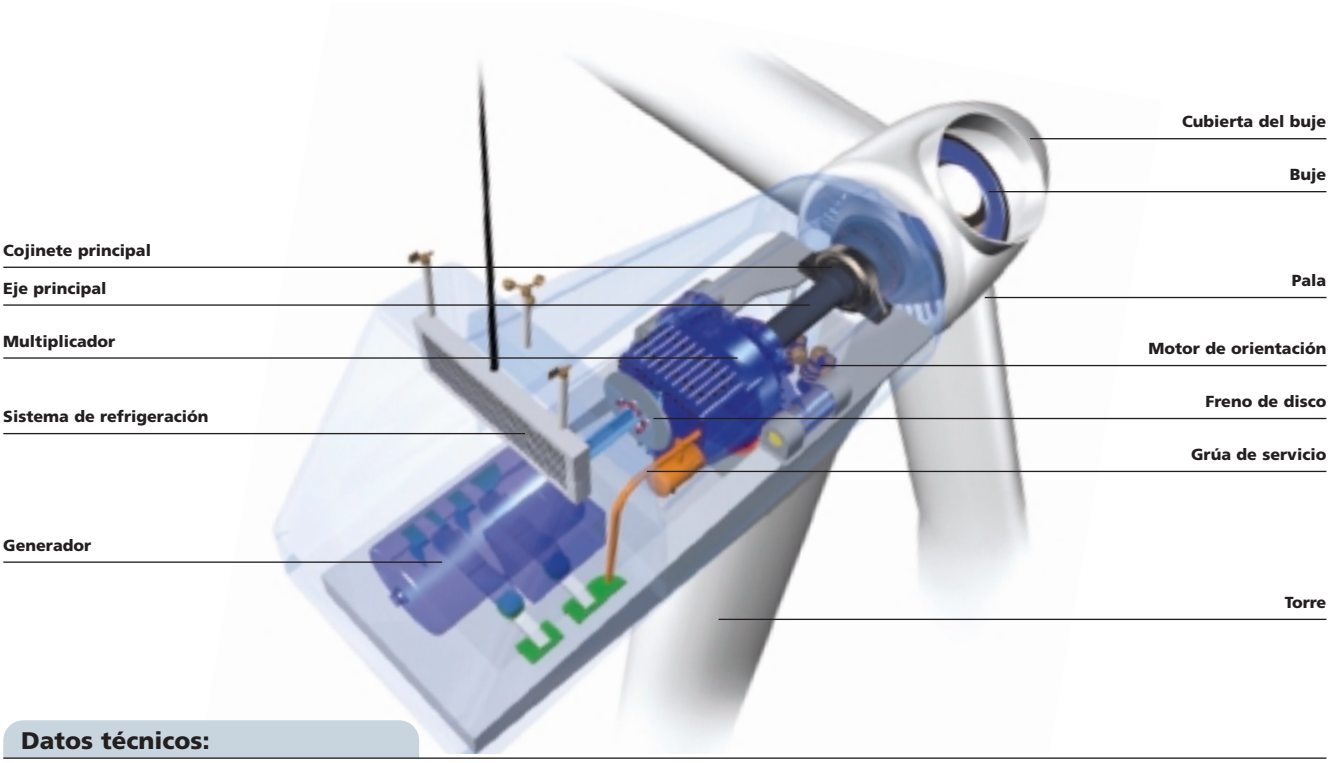
SET CHARACTER = next character

IF no end of string JUMP char. start >>>>

[NM44/750]

N·E·G MICON®

– para un sólido futuro



Datos técnicos:

Parámetros de funcionamiento

Potencia máxima:	750 kW
Regulación de potencia:	Paso fijo
Pot. máx. a vel. de viento:	16 m/s
Velocidad de arranque:	4 m/s
Velocidad de parada:	25 m/s

Rotor

Diámetro del rotor:	44 m
Área de barrida por el rotor:	1.520 m^2
Número de palas:	3
Revoluciones del rotor:	27/18 rpm
Posición del rotor:	A barlovento

Sistema de freno

Freno aerodinámico:	Hidráulico, seguro al fallo
Freno de disco:	Hidráulico, seguro al fallo

Multiplicador

Tipo:	Planetario – eje paralelo
Cociente:	1:55.6
Eje principal:	Eje y brida forjados
Cojinete principal:	Cojinete de rodillos esféricos
Refrigeración:	Intercambiador de calor con bomba

Generador

Tipo:	Asíncrono, 4-6 devanados
Voltaje nominal:	690 V
Frecuencia nominal:	50 Hz
Potencia nominal:	750/200 kW
Refrigeración:	Líquida con bomba

Sistema de orientación

Tipo:	Rodamiento de bolas
Frenos:	Frenos por fricción/freno motor
Reductores:	3 engranajes planetarios eléctricos

Torre

Tipo:	Torre cónica de acero pintada
Altura de buje:	Según especificaciones

Regulador

Tipo:	Control por ordenador
Sistema de arranque:	Suave por tiristores
Compensador de reactiva:	Compensación de plena carga
Control remoto:	Por módem

Sensores

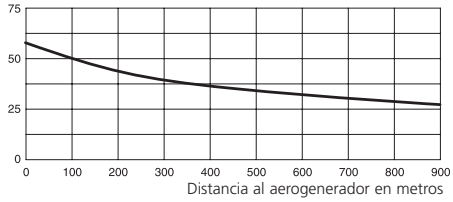
Sensores RPM:	Rotor, generador y sistema de orientación
Sensores de la temperatura:	Multiplicador, generador y regulador
Sensores térmicos:	Interruptor principal y protector de motor
Sensores de vibración:	Góndola, rotor
Meteorología:	Anemómetro, veletas y termómetro
Sistemas hidráulicos:	Presóstatos, transductor de presión

Protección contra rayos

Según la norma:	IEC 1024
Palas:	Receptores en el extremo de la pala
Góndola:	Pararrayos

Nivel de ruido:

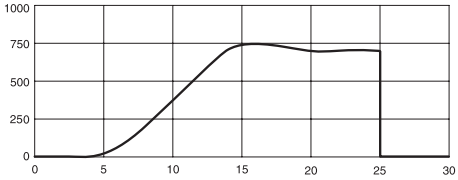
Nivel de ruido dB(A)



Distancia al aerogenerador en metros

Curva de potencia:

kW



Metros por segundo

Debe tenerse en cuenta que los gráficos de potencia están indicados en atmósferas según la norma DIN ISO 2533. Debe tenerse en cuenta que el rotor y la altura de buje han sido aprobados para mercados y clases de vientos específicos. Llámenos para más información.
NEG Micon A/S se reserva el derecho a alterar las especificaciones y a utilizar componentes de otros fabricantes sin previo aviso. Estos componentes serán de la misma calidad y estándar que los mencionados aquí.

PT100 Sensor

- The PT100 Sensors are used for flexible temperature surveillance
- Easy mounting
- Direct connection to IC/WP-Controllers
- Correction of distance via a 3-core or 4-core system

Description

PT100 is delivered in various mechanical designs for easy mounting at generators, bearings, gear box, or other places in connection with wind turbines.

The sensor compensates for the cable length between the WP or IC control unit and the PT100 sensor so that an accurate temperature measurement is achieved.

SIEK-UV1 Pull Switch/Wire

- Pull switch for detection of twisted cables
- Complete set delivered with wire and stop ball
- Part of the safety chain

Description

The SIEK_UV1 Pull Switch is used for limiting the number of times the cables are twisted in a wind turbine. Usually the pull switch is mounted as an extra detection.

Normally the software counts the number of CW/CCW via an inductive sensor, if the number is higher than x the cable will be untwisted.
If this measurement fails the pull switch is activated and it signals that the wind turbine must be stopped.
The auxiliary switches are of a positive opening type, thus suitable for safety functions.

The pull switch is often a part of the wind turbine safety chain.
Materials and components are wear resistant and protect the equipment against water and dust.

Instrucciones de Servicio

Motores trifásicos con rotor de jaula

Motores trifásicos protegidos contra explosiones

Motores monofásicos

Motores freno trifásicos

10/2001

Aclaraciones sobre las advertencias de seguridad y advertencias adicionales para motores EEx e y EEx n, motores freno, motores monofásicos y generadores

Lea estas Instrucciones de Servicio antes de transportar, montar, poner en marcha, llevar a cabo el mantenimiento o reparar motores industriales y generadores.

Estos símbolos deben llamar su atención sobre las advertencias de seguridad y las advertencias adicionales contenidas en estas Instrucciones de Servicio:

Advertencias de seguridad y garantía:

Advertencias adicionales para motores EEx e y EEx n:

Advertencias de peligro:

Por razones de protección de personas y objetos, todas las advertencias de seguridad y advertencias adicionales para motores EEx e y EEx n indicadas en estas Instrucciones de Servicio deben cumplirse rigurosamente.

Las máquinas de baja tensión tienen piezas rotativas y conductoras peligrosas, así como posiblemente superficies calientes. Todos los trabajos de transporte, montaje, conexión, puesta en marcha, mantenimiento y reparación debe efectuarlos personal técnico cualificado y responsable (observe VDE 0105; IEC 364). La utilización inadecuada puede causar graves daños a personas y objetos.

En caso de requerir más información, debe acudir inmediatamente al fabricante o a un taller autorizado.

Todos los trabajos en las conexiones eléctricas de los motores y generadores sólo pueden ser efectuados por personal cualificado.

Indicaciones generales

Campo de aplicación
Estas Instrucciones de Servicio rigen para motores y generadores asíncronos trifásicos y de corriente alterna de baja tensión con rotor de jaula y ventilación superficial, protección IP 54 e IP 55 según EN 60034 Mayores protecciones están indicadas en la placa de características.

Las máquinas de baja tensión están destinadas a instalaciones industriales. Cumplen con las normas armonizadas DIN VDE 0530/EN 60034. Para su utilización deben observarse eventuales prescripciones especiales. Los motores refrigerados por aire están diseñados para su funcionamiento en altitudes de ≤ 1000 m sobre el nivel del mar a una temperatura ambiente entre -20° C y +40° C. Las excepciones están indicadas en la placa de características.

Observe siempre las desviaciones señaladas en la placa de características. Las condiciones en el lugar de uso deben coincidir con todas las indicaciones de la placa de características.

Las máquinas de baja tensión son componentes de una máquina en el sentido de la directriz 89/393/CEE sobre máquinas. La puesta en marcha está prohibida hasta que se haya comprobado la conformidad del producto final con esta directriz (observe EN 60204-1).

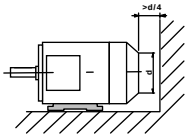
Para los motores en el modo de protección Seguridad aumentada «e» y «n» rigen además las indicaciones de las páginas 22/23.

Transporte
Si se observaran daños una vez entregadas los motores en su destino, éstos deben notificarse inmediatamente a la compañía de transportes; en caso de duda, no deben ponerse en marcha.

Cáncamos de transporte
Utilice siempre el cáncamo de transporte para levantar el motor. No añada ninguna carga adicional al motor; los cáncamos de transporte están diseñados para aguantar únicamente el peso del motor. En caso necesario, utilice medios adecuados.

Seguro de transporte
Los motores con cojinetes de rodillos cilíndricos llevan un seguro de transporte con el fin de evitar daños en sus cojinetes, el cual debe eliminarse antes de poner los motores en marcha. Cierre el orificio de fijación por medio del tapón que se suministra con el motor. El seguro de transporte debe utilizarse también en posteriores transportes del motor.

Ventilación
La distancia entre la entrada de aire del motor y paredes, componentes, etc. debe ser como mínimo 1/4 del diámetro de apertura de entrada de aire. La dirección de la corriente de aire va del lado contrario al accionamiento hacia el lado de accionamiento.
El aire de salida no debe aspirarse nuevamente por el ventilador. Mantenga las aperturas de entrada y salida de aire limpias.



Las formas constructivas con la salida de eje hacia arriba deben estar provistas en el lado de montaje con una cubierta adecuada para evitar que cuerpos extraños puedan caer en el orificio de ventilación. Esta protección no debe afectar la ventilación y no debe aspirarse nuevamente ni el aire de salida, ni el de los grupos adyacentes.

Purgadores para el agua de condensación
Los purgadores para el agua de condensación deben encontrarse también después del montaje en el lugar más bajo del motor. Deben protegerse de la suciedad. Abra los agujeros sólo para la salida del agua y ciérrelos posteriormente.

Sólo deben utilizarse tornillos M6 x 10mm.

Supresión de interferencias
Los motores cumplen los requerimientos del grado de interferencias N según VDE 0875.

Montaje y puesta en marcha

Parte mecánica

Elementos de transmisión

Utilice únicamente acoplamientos elásticos; los acoplamientos rígidos requieren una ejecución especial de los cojinetes.

Sólo deben utilizarse correas que no se carguen electrostáticamente.

Al emplear elementos de transmisión que originen cargas radiales o axiales durante el funcionamiento (p.e. poleas, ruedas dentadas, etc.) debe tenerse cuidado de no sobrepasar las cargas admisibles. Los correspondientes datos están indicados en el catálogo técnico vigente.

Actualmente se equilibran los rotores dinámicamente con media chaveta (según DIN ISO 8821).
«H» o «neutro» significa equilibrado con media chaveta
«F» significa equilibrado con chaveta completa
«N» significa sin chaveta.

El estado de equilibrado del motor está indicado en la parte frontal del eje o en la placa de características. Con ejecución con media chaveta (H), el acoplamiento debe equilibrarse asimismo con media chaveta. Mecanizar la parte sobresaliente de la chaveta.

Quite la protección anticorrosiva con un disolvente adecuado y engrase la salida de eje. Calar y decalar las poleas y acoplamientos únicamente con dispositivos adecuados, véase fig. 1-3, (¡calentar a 80-100° C!) y cubrir con una protección antiadherente. Evite tensiones inadmisibles de las correas (catálogo técnico).

No efectúe de ningún modo el montaje a presión o golpes ya que dañaría los cojinetes.

Quitar directriz

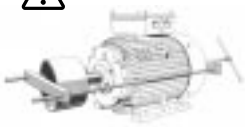


Fig. 1
Calado sin punto de centrado

Fig. 2
Calado con punto de centrado

Fig. 3
Decalado

Base
Observe el apoyo uniforme y la buena fijación de las patas o bridas, así como la alineación exacta con acoplamiento directo.

Todas las patas de fijación deben estar apoyadas en una superficie plana para evitar deformaciones de la carcasa del motor.

Evite resonancias de la base con la frecuencia de giro y doble frecuencia de la red. Gire el rotor a mano a fin de detectar posibles ruidos anormales de rozamiento. Verifique el sentido de giro con la máquina no acoplada (pág. 4 - *Vibraciones en servicio*).

Alineación
Si los motores están conectados a la máquina a accionar por medio de un acoplamiento, ambos ejes deben alinearse axial y radialmente. Los relojes comparadores deben fijarse de forma segura. Las mediciones deben efectuarse en cuatro puntos, cada uno desplazado en 90°, y girando ambos platos de acoplamiento simultáneamente.

Medición en sentido axial (fig. 4)
Iguale las diferencias colocando chapas debajo de las patas del motor. No deben sobrepasarse imprecisiones permanentes de 0,03 mm respecto a un diámetro de 200 mm.

Medición en sentido radial (fig. 5)
Iguale las diferencias desplazando o colocando chapas de forma que no se sobrepasen imprecisiones de 0,03 mm. El ajuste de la holgura axial entre los platos de acoplamiento (medida «E») debe efectuarse según las indicaciones del fabricante de los acoplamientos.

Compruebe la exactitud de alineación con la máquina en caliente.

Medición combinada en sentido axial y radial (fig. 6)
La figura 6 muestra un método relativamente sencillo para combinar ambas mediciones. Los relojes comparadores se insertan en los correspondientes taladros de las pletinas atornilladas o agarradas a los platos de acoplamiento, fijándolos p.e. con tornillos prisioneros.

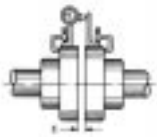

Fig. 4
Medición en sentido axial (desviación angular)

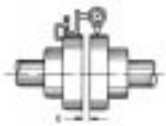

Fig. 5
Medición en sentido radial (desviación entre centros)

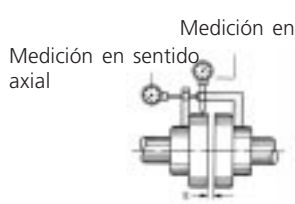

Fig. 6

Vibraciones en servicio
El nivel de vibraciones $V_{eff} \leq 3{,}5$ mm/s ($P_N \leq 15$ kW) ó 4,5 mm/s ($P_N > 15$ kW) de la máquina acoplada no acarrea inconvenientes. Cuando haya diferencias en comparación con el funcionamiento normal, p.e. temperaturas más altas, ruidos, vibraciones, averigüe la causa y consulte en caso necesario al fabricante.

No desconecte los dispositivos de seguridad, tampoco en servicio de prueba. Desconecte la máquina en caso de duda.

Eléctrico

Resistencia del aislamiento
Véase página 8.

Tensión y conexión
La fluctuación admisible entre la tensión nominal y la tensión de la red es de ± 5 %; para la frecuencia nominal se admite ± 2%. Observe las indicaciones de conexión y desviaciones señaladas en la placa de características, así como el diagrama de conexiones en la caja de bornes.

Conexión
Elija cables de conexión de una sección conforme a la intensidad nominal. Las entradas de cable no utilizadas deben cerrarse mediante tapones.

En motores EEx e sólo deben utilizarse entradas de cable y prensaestopas homologados. Los tapones ciegos existentes en las entradas de cable deben eliminarse y sustituirse por insertos de estanqueidad adecuados.

La apertura de entrada de cables es orientable en 90° ó 180°.

Todos los trabajos deberán efectuarse única y exclusivamente por personal cualificado, siempre con la máquina parada, desconectada y previamente asegurada contra una posible puesta en marcha de ésta. Esto rige también para circuitos auxiliares (p.e. resistencias de caldeo). ¡Compruebe que no tenga tensión!

La conexión de los cables de suministro eléctrico debe efectuarse de forma que asegure un contacto permanente y fiable (sin extremos de cables sueltos); utilice el terminal adecuado para los cables de conexión. Los cables de conexión deben fijarse sin tracción mecánica para evitar esfuerzos de tracción de los bornes de conexión.

¡Asegure una buena conexión del conductor de tierra!

Las distancias mínimas de seguridad entre conductores y entre estos y masa no deben sobrepasar los siguientes valores: ≤ 550 V 8 mm; ≤ 750 V 10 mm; ≤ 1100 V 14 mm.

No debe haber cuerpos extraños, suciedad ni humedad en la caja de conexiones. Cierre los orificios de entrada de los cables no utilizados y la caja misma, aislándola del polvo y del agua. Para garantizar el grado de protección deben volver a utilizarse las juntas originales para cerrar la caja de bornes.

Placa de bornes EEx e

Tamaño de motor		80-112	132	160 – 180	200-225	250 – 280
Placa de bornes	Tipo	K85580Ex	K85590Ex	90.60.8	110.70.8	250-280
Tensión asignada máx.	V	750	750	750	750	750
Intensidad asignada máx.	A	10	16	95	146	200
Sección asignada máx.	mm² unifilar	2,5	4	16	35	50
Sección asignada máx.	mm² hilo fino	4	6	25	50	70
Par de apriete ±10%	Nm	1,2	2	6	10	10
Gama de temperatura de aplicación °C		-60°C a 130°C				

Las placas de bornes deben fijarse mediante dos tornillos de fijación con arandelas de seguridad. Se montan en la carcasa o caja de conexiones con protección mínima IP 54. Las cabezas de los tornillos no deben sobrepasar la altura máxima según DIN 912.
La conexión de esta placa de bornes sólo debe efectuarla personal técnico cualificado. Los bornes de abrazadera deben apretarse fuertemente , observándo y cumpliendo los pares de apriete según DIN 46200.
Las dimensiones cumplen con la directriz europea 94/9/CE para aparatos protegidos contra explosiones, así como las normas EN 50014 y EN 50019.
En la parte posterior se hallan grabados la indentificación ATEX y el n° del certificado.

Conecte conductor de tierra aquí.

Para efectuar una prueba sin elementos de accionamiento, asegure la chaveta. En motores con freno, compruebe el buen funcionamiento del freno antes de la puesta en marcha.

Sentido de giro

Normalmente los motores son adecuados para el funcionamiento en ambos sentidos de giro. Las excepciones están indicadas en la placa de características con la correspondiente flecha. Para el sentido de giro requerido, conecte el estator según sigue:

Conexión de L1, L2, L3 a	Sentido de giro visto desde lado accionamiento
U1, V1, W1	hacia la derecha
W1, V1, U1	hacia la izquierda

Comprobación del sentido de giro, véase al lado.

Inversión del sentido de giro:

Modo de arranque y tipo de devanado	*Medida*
Arranque directo y motores de polos conmutables con devanados separados	Intercambiar dos conductores de la red en la regleta de bornes del motor
Arranque Y/Δ y motores conmutables con devanado Dahlander	Intercambiar dos conductores de la red en la alimentación de la combinación del contactor

Comprobación

Para comprobar el sentido de giro, «conecte/desconecte» brevemente el motor correctamente conectado sin estar acoplado.

Arranque en Y/Δ

Para evitar corrientes y momentos transitorios inadmisibles, espere para conmutar a Δ hasta que la intensidad de arranque de la etapa Y se haya atenuado o hasta que la aceleración haya terminado (p.e. conmutación al alcanzar la velocidad nominal).

Protección del motor

Conecte las sondas térmicas semiconductoras al disparador según el esquema de conexiones. El control eventualmente necesario del estado de las sondas térmicas debe hacerse únicamente con ayuda de un puente de medida (máx. 2,5 V).

Para obtener plena protección térmica de los motores, debe instalarse además una protección de sobrecarga térmicamente retardada (fig. 7). Los fusibles frecuentemente sólo protegen la red, pero no el motor.

Para los motores EEx e y EEx n rigen las indicaciones de las páginas 6/7 sobre protección del motor.

Ejemplo
Contactor con relé de máxima intensidad
Protección con termistor y fusible

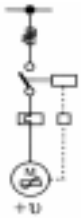

Fig. 7

Mantenimiento

Antes de efectuar cualquier trabajo en el motor o generador, desconéctelo y asegúrese de que no se ponga en marcha nuevamente.

Excepción: El reengrase de los cojinetes en motores con dispositivo de reengrase debe hacerse con el motor en marcha.

¡Atención, peligro de accidentes! ¡Vigile las partes rotatorias!

Limpieza
Los motores deben limpiarse periódicamente en la totalidad del recorrido del aire de refrigeración según el grado de suciedad.

Lubricación de los cojinetes

¡El cumplimiento de los intervalos de reengrase es vital para la seguridad de funcionamiento de los motores!

Mantenimiento de los cojinetes

Rodamientos con engrase permanente
Bajo condiciones normales los motores de 2 polos no necesitan mantenimiento durante 10.000 horas y los motores de mayor número de polos durante 20.000 horas de servicio y como máximo durante 4 años. Limpiar después los cojinetes y sus tapas con bencina o benzol. Si fuera necesario sustituya los cojinetes. Rellenar con grasa la mitad de los huecos entre las pistas y los cuerpos de rodadura así como las cámaras de grasa. Aplicar una capa fina de grasa en los pasos del eje por las tapas y escudos. Los cojinetes cerrados con engrase permanente (cojinetes 2RS y 2Z) no pueden ser lavados ni reengrasados. Han de ser sustituidos.

Utilizar para el desmontaje de los cojinetes tornillos de extracción u otros dispositivos adecuados.

Rodamientos con dispositivo de reengrase y regulador de grasa
La frecuencia de engrase y la cantidad de grasa están indicadas en la placa de características. Después de una docena de reengrases los cojinetes y sus tapas deben limpiarse con bencina o benzol.

La bencina o el benzol utilizado debe envasarse en un recipiente estanco, marcarse con la identificación «Bencina» o «Benzol» y llevarse a un depósito para residuos especiales.

Luego, con la tapa exterior abierta pero la tapa interior atornillada se inyecta grasa a través del engrasador, girando lentamente el rotor hasta que aproximadamente la mitad del hueco entre las pistas y los cuerpos de rodadura quede lleno de grasa.

Si se empleara grasa con otra base jabonosa, asegúrese de limpiar previamente los cojinetes a fondo. Todos los tipos de grasa deben cumplir los siguientes requisitos:

Punto de goteo	*aprox. 190° C*
Contenido en cenizas	*4 %*
Contenido en agua	*0,3 %*

Lubricante
Grasa K 3N según DIN 51825 (a base de litio, resistencia al agua según DIN 51807 parte 1, grado 0 ó 1). Reengrasar solamente con un tipo de grasa similar (p.e. Esso Unirex N 3, Shell-Alvania G 3, Esso-Beacon 3, Klüber HQ 72-102, etc.).

Advertencias adicionales para motores EEx e II y EEx nA II

Generalidades

El empleo de estos motores está sujeto al Reglamento Electrotécnico para Baja Tensión, Instrucción Complementaria MI BT 026 sobre instalaciones eléctricas en áreas con peligro de explosiones.
Al instalar los motores deben cumplirse las condiciones de la MI BT 041.
El grado de peligro de explosiones será determinado únicamente por las autoridades competentes.

Clase de servicio
A no ser que conste otra cosa en el certificado aplicable estos motores sólo deben emplearse para servicio permanente (S1).

Protección del motor

En motores con arranque directo, la conexión de los dispositivos protectores debe asegurar que una vez se disparen, todas las fases de alimentación queden desconectadas.

Dispositivo de protección contra sobreintensidad
Los disparadores o relés retardados en función de la corriente, deben ser ajustados para la corriente nominal del motor. Además deben ser elegidos de forma que los motores queden protegidos térmicamente incluso en caso de cortocircuito (es decir, con el rotor frenado). Esto significa que el tiempo de desconexión no es mayor que el tiempo de calentamiento t_E para la clase de temperatura correspondiente, tomando como tiempo de desconexión el que resulta de la curva característica para la relación I_A/I_N (con 20° C como temperatura inicial).

Los devanados con arranque en estrella deben pro-tegerse de forma que los disparadores o relés estén conectados en serie con las fases del devanado. La selección y el ajuste de los disparadores debe basarse sobre el valor nominal de la corriente de la fase, es decir, 0,58 veces la corriente nominal del motor. Si tal conexión no fuese posible, deben utili-zarse protectores adecuados, p.e. con control de fallo de la fase.

Sensor de temperatura (PTC)
Los sensores para el control de la temperatura de p.e. el devanado del estator, cojinetes, refrigerante, deben conectarse a través de bornes especiales previstos para tal fin en la caja de conexiones principal o a través de varias cajas de conexiones auxiliares.Los sensores de temperatura deben conectarse según el esquema de conexiones vigente. Para la conexión observe las indicaciones en la página 20/21 „Conexión".

Para motores EEx e y EEx n sólo deben utilizarse disparadores homologados por una entidad de ensayo oficial.

Resistencias de caldeo
Potencia de caldeo y tensión de conexión: Véase placa característica del motor. Las resistencias de caldeo deben conectarse a través de bornes especiales en la caja de conexiones principal o a través de una caja de conexiones auxiliar, según el esquema de conexiones vigente. Para la conexión observe las indicaciones en la página 20/21 „Conexión". No conecte las resistencias de caldeo antes de desconectar el motor. Durante el funcionamiento del motor, las resistencias de caldeo deben estar desconectadas.

Arranque en condiciones extremas
Los motores para arranque en condiciones extremas (tiempo de aceleración > 1,7 · tiempo t_E) deben protegerse con un control de aceleración según las indicaciones del certificado de conformidad.

Instrucciones de reparación

Los trabajos de reparación dentro del periodo de garantía requieren la aprobación previa del fabricante.

Generalidades
Recomendamos emplear en las reparaciones únicamente repuestos originales.

Para motores EEx e y EEx n:
Utilice únicamente piezas de repuesto originales.

Trabajos de reparación generales
Pertenecen a éstos todos los trabajos que no afectan a la protección contra explosiones y puedan realizarse sin tener en cuenta las prescripciones sobre instalaciones en áreas con peligro de explosiones:
p.e. renovación de juntas,
reparación o sustitución de ventiladores o directrices,
sustitución de cojinetes,
cambio de la placa de bornes.

Trabajos de reparación especiales
Estos son trabajos que influyen sustancialmente en la protección contra explosiones, p.e. especialmente todas las reparaciones en devanados del rotor o estator. Si estos trabajos no fuesen llevados a cabo por nosotros, los procedimientos adecuados deben verificarse por un experto autorizado.

Toda reparación de este tipo debe indicarse según DIN EN 50019 en una placa de características adicional.

Indicaciones para el almacenamiento

Para los motores almacenados durante un tiempo prolongado antes de su utilización (p.e. motores de reserva) debe observarse lo siguiente:

Lugar de almacenamiento
Asegúrese de que los motores se guarden en un lugar seco, sin polvo y con un mínimo de vibraciones (Veff ≤ 0,2 mm/s) (daños en cojinetes parados). Temperatura ambiente +10° C a +40° C, humedad relativa del aire <50 %.

Seguro de transporte
En los motores con cojinetes de rodillos cilíndricos, asegure el rotor por medio del seguro de transporte para proteger los motores contra la formación de marcas debido a vibraciones. Los motores que se suministran sobre amortiguadores de vibraciones deben almacenarse con éstos puestos.

Si hay poleas, acoplamientos, etc. montados sobre las salidas del eje, monte en lo posible el seguro de transporte y coloque los motores sobre amortiguadores de vibraciones.

⚠ *Utilice siempre el seguro de transporte o los amortiguadores de vibraciones para posterio-res transportes.*

Compruebe antes de la puesta en marcha:

Cojinetes
Antes de la puesta en marcha de un motor almacenado durante tiempo prolongado (más de 4 años), deben comprobarse los cojinetes.

En motores sin dispositivo de reengrase, la grasa debe renovarse o los cojinetes sustituirse lo más tarde después de 2 años de almacenamiento.

⚠ *El más mínimo signo de corrosión reduce considerablemente la vida de los cojinetes. Si los cojinetes no requieren ser sustituidos, engráselos de nuevo.*

⚠ *Para el tipo/cantidad de grasa, véase la placa de características (en el motor) y el capítulo «Lubricación de los cojinetes, Lubricante» en la pág. 6 de estas Instrucciones de Servicio.*

Los motores con dispositivo de reengrase deben reengrasarse lo más tarde después de 2 años con la doble cantidad de grasa que la indicada en la placa de características. Durante este proceso el rotor debe girarse. Si los motores son almacenados durante más de 4 años, la grasa debe ser sustituida.

El rotor debe ser girado mensualmente en aprox. 30 grados para evitar huellas de presión en los cojinetes debidas a la carga estática.

⚠ *Para girar el rotor, afloje, pero no quite el seguro de transporte. Vuelva a apretar éste una vez concluido el proceso de rotación.*

Resistencia del aislamiento

⚠ *Antes de la puesta en marcha mida la resistencia de aislamiento. Con valores ≤ 1kW por voltio de tensión nominal, seque el devanado.*

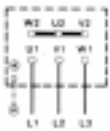
Mida con un inductor de manivela (tensión continua máx. = 630 V) la resistencia del aislamiento de cada fase con relación a tierra, hasta que el valor de medición se mantenga constante. La resistencia del aislamiento en devanados nuevos es > 10 MΩ. Los devanados húmedos muestran valores de resistencia considerablemente inferiores.

Si a temperatura ambiente se midiera menos de 0,5 MΩ, seque el devanado, no debiendo éste sobrepasar una temperatura de 80° C. Secar mediante resistencia de caldeo o calefactor, o aplicar una tensión alterna del 5-6 % de la tensión nominal del motor (conéctese en D) en los bornes U1 y V1 del estator. Repetir la medición. El motor puede ponerse en marcha cuando el valor se halle por encima de 0,5 MΩ.

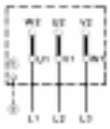
Los valores de la resistencia del aislamiento dependen de la temperatura. Valores orientativos: Al aumentar/reducir la temperatura del devanado en 10K, el valor de la resistencia se duplica/reduce a la mitad.

Esquemas de conexiones

Motores trifásicos con rotor de jaula



Conexión estrella



Conexión triángulo

Conexión al interruptor estrella-triángulo

Motores trifásicos de polos conmutables

En conexión Dahlander: En la designación del tipo, el número de polos más alto = velocidad más baja va primero (p.e. AM 250...8/4)

Con 2 devanados separados: En la designación del tipo, el número de polos más bajo = velocidad más alta va primero (p.e. AM 250 ... 4/8).

Para motores de polos conmutables, véanse los esquemas de conexiones incluidos en la caja de conexiones del motor.

Standard Quality

The strictness of our quality control assures the flawless operation and reliability of our products. That our quality scale fulfils your demands is confirmed by the certificate awarded by the TÜV-CERT Certification body of TÜV Rheinland and the CERMET, a Certification body authorized by SINCERT.

TÜV CERT

CERTIFICATE

The TÜV CERT Certification Body of TÜV Anlagentechnik GmbH

hereby certifies in accordance with TÜV CERT procedures that

AEG Fábrica de Motores, S.A.

Carretera de Castellar, 225

E-08228 Terrassa (Barcelona)

has established and applies a quality system for

Design/development, production and servicing of: Asynchronous electric three-phase and single-phase cage motors for low voltage, frame sizes 56 – 315, to EN/IEC 60034

An audit was performed.

Report No. 78859

Proof has been furnished that the requirements according to

DIN EN ISO 9001:1994

are fulfilled.

The certificate is valid until: June 2003

Certificate Registration No. 00 100 78859

CERMET

QUALITY SYSTEM CERTIFICATE

N° 033

THIS IS TO CERTIFY THAT THE QUALITY ASSURANCE SYSTEM OF THE COMPANY

LAFERT S.p.A.

Via Kennedy, 43 - San Donà di Piave VE

ITALY

CONFORME TO THE

ISO 9001-94 STANDARD

FOR THE FOLLOWING PRODUCTS/SERVICES:

THREE-PHASE, MONOPHASE AND SELF-BRAKING ASYNCHRONOUS MOTORS

This certificate consists of 4 pages. The enclosed data sheet supplies details on the field of application. The maintenance of competence of the certification is dependent upon the observance of the agreement stipulated in CERMET.

General Manager

Flaviano Trippetti, Engineer

CERMET - 40068 S. Lazzaro di Savena (BO), Via Aldo Moro 32

CE Marking

Our three-phase induction motors comply with the requirements of the following international standard:

IEC 60034

as well as with the Low Voltage Directive 73/23 (1973), modified by the Directive 93/68 (1993) and the EMC-Directive 89/336.

The above named products comply with the requirements of the EC Directive Machines 89/392. In accordance with this Directive induction motors are components and intended solely for integration into other machines. Commissioning is forbidden until conformity of the end product with this Directive is proved!

The CE symbol was applied for the first time in 1995.

The safety instructions in the Operation Manual of the manufacturer and EN 60204-1 have to be observed.

CEMEP Voluntary Agreement

Motors covered by this agreement are defined as totally enclosed fan-cooled (normally IP 54 or IP 55), three-phase AC squirrel cage induction motors 1.1 to 90 kW, with 2 or 4 poles, rated for 400 V-line, 50 Hz, duty class S1. (Standard design can be interpreted as design N according to EN 60034-12 and HD 231). They are divided in three classes of efficiency levels, defined by 2 values of full load efficiency per output, designated eff1, eff2 and eff3.

All motors with standard rating included in this catalogue comply with efficiency class eff2 and bear the corresponding label on the rating plate. For efficiency data at 50%, 75% and full load, please refer to the electrical data tables.

The motors comply with the relevant standards and regulations, especially:

Motors to special regulations:

- Motors to VIK regulations (German Society for Industrial Energy and Power Stations) to VIK recommendation *Technical Requirements April 1999*
- Motors with UL and/or CSA approval (performance data on request)
- Motors with CUL_{US} ($_{C}UR_{US}$) approval

The motors can furthermore be designed according to the stipulations for floating installations of the most important classification societies. For further details see our technical catalogue *Three-phase motors for marine applications.*

The motors are designed for operation at altitudes ≤ 1000 m above sea-level and at ambient temperatures of up to 40° C. Exceptions are indicated on the rating plate.

Permissible temperature rises to various standards

[2] Only with special approval

The motors conform to degree of protection IP 55 to IEC 60034-5. Higher protection on request.

The standard design for horizontal mounting is suitable for indoor and protected outdoor installation, climate group MODERATE (see page 15) (temperature of coolant -20° to +40° C).

For unprotected outdoor installation or severe climatic conditions (moisture category wet, climate group WORLDWIDE, extremely dusty site conditions, aggressive industrial atmosphere, danger of storm rain and coastal climate, danger of attack by termites, etc.), as well as vertical mounting, special protective measures are recommended, such as:

- Protective cowl (for vertical *shaft-down* motors)
- For vertical *shaft-up* motors additional bearing seal and flange drainage
- Special paint finish
- Treatment of winding with protective moisture-proof varnish
- Anti-condensation heating (possibly winding heating)
- Condensation drain holes

The special measures to be applied have to be agreed with the factory once the conditions of installation have been settled.

The corresponding conditions of installation have to be clearly indicated in the order.

Tolerances

For industrial motors to EN 60034-1, certain tolerances must be allowed on guaranteed values, taking into consideration the necessary tolerances for the manufacture of such motors and the materials used. The standard includes the following remarks:

1. It is not intended that guarantees necessarily have to be given for all or any of the items involved. Quotations including guaranteed values subject to tolerances should say so, and the tolerances should be in accordance with the table.
2. Attention is drawn to the different interpretation of the term guarantee. In some countries a distinction is made between guaranteed values and typical or declared values.
3. Where a tolerance is stated in only one direction, the value is not limited in the other direction.

Values for	Tolerance
Efficiency (η) (by indirect determination)	- 0.15 (1 - η) at $P_N \leq 50$ kW - 0.1 (1 - η) at $P_N > 50$ kW
Power factor ($\cos \varphi$)	$\frac{1 - \cos \varphi}{6}$, minimum 0.02, maximum 0.07
Slip (s) (at rated load and at working temperature)	± 20 % of the guaranteed slip at $P_N \geq 1$ kW ± 30 % of the guaranteed slip at $P_N < 1$ kW
Breakaway starting current (I_A) (in the starting circuit envisaged)	+ 20 % of the guaranteed starting current (no lower limit)
Breakaway torque (M_A)	- 15 % and + 25 % of the guaranteed breakaway torque (+ 25 % may be exceeded by agreement)
Pull-up torque (M_S)	- 15 % of the guaranteed value
Pull-out torque (M_K)	- 10 % of the guaranteed value (after allowing for this tolerance, M_K/M_N not less than 1.6)
Moment of inertia (J)	± 10 % of the guaranteed value

Mechanical tolerances

According to IEC 72-1, the following tolerances on mechanical dimensions of electric motors are permitted:

Parameter	Code	Tolerances	
Shaft length	H	- up to 250 - over 250	0,5 mm 1 mm
Diameter of shaft end	D-DA	- from 11 to 28 mm - from 38 to 48 mm - from 55 to 100 mm	j6 k6 m6
Hub key width	F-FA		h9
Flange spigot	N	- up to 132 - over size 132	j6 h6

Note: The holes at the shaft end conform with DIN 332

Degrees of protection

Degrees of protection for mechanical machines are designated in accordance with IEC 60034-5 by the letters **IP** and two characteristic numerals.

First numeral: Protection against contact and ingress of foreign bodies

IP	Description
0	No special protection
1	Protection against solid foreign bodies larger than 50 mm (Example: inadvertent contact with the hand)
2	Protection against solid foreign bodies larger than 12 mm (Example: inadvertent contact with the fingers)
3	Protection against solid foreign bodies larger than 2.5 mm (Example: Wires, tools)
4	Protection against solid foreign bodies larger than 1 mm (Example: Wires, bands)
5	Protection against dust (harmful deposits of dust)
6	Complete protection against dust. Is not described for electrical machines to IEC 34-5.

Second numeral: Protection against ingress of water

IP	Description
0	No special protection
1	Protection against vertically falling water drops (condensation)
2	Protection against dropping water when inclined by up to 15°
3	Protection against waterspray at up to 60° from vertical
4	Protection against water splashed from any direction
5	Protection against water projected by a nozzle from any direction
6	Protection against heavy seas or water projected in powerful jets
7	Protection when submerged between 0.15 and 1 m
8	Protection when continuously submerged in water at conditions agreed between the manufacturer and the user.

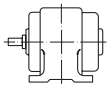
Mounting arrangements

Mounting arrangements for rotating electrical machines are designated according to IEC 60034-7, *Code I* (in brackets Code II).

Our motors are available with the mounting arrangements listed below, depending on design and frame size. Motors with aluminium frame are equipped with removable feet that allow easy change of mounting arrangement.

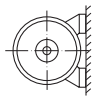
Foot mounting

IM B3 (IM 1001)



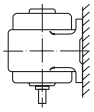
IM B6 (IM 1051) *

IM B7 (IM 1061) *

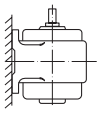


IM B8 (IM 1071) *

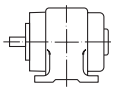
IM V5 (IM 1011) *



IM V6 (IM 1031) *



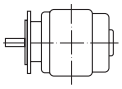
IM B34 (IM 2101)



Flange type C to DIN 42 948 at drive end

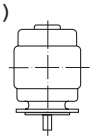
Flange mounting

IM B5 (IM 3001)



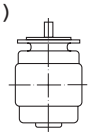
Flange type A to DIN 42 948 at drive end

IM V1 (IM 3011)



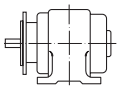
Flange type A to DIN 42 948 at drive end

IM V3 (IM 3031)



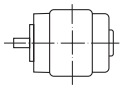
Flange type A to DIN 42 948 at drive end

IM B35 (IM 2001)



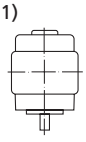
Flange type A to DIN 42 948 at drive end

IM B14 (IM 3601)



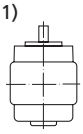
Flange type C to DIN 42 948 at drive end

IM V18 (IM 3611)



Flange type C to DIN 42 948 at drive end

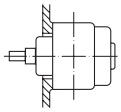
IM V19 (IM 3631)



Flange type C to DIN 42 948 at drive end

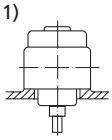
Motors without endshield

IM B9 (IM 9101)



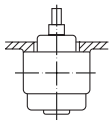
without endshield and without ball bearings on drive end

IM V8 (IM 9111)



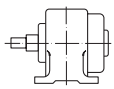
without endshield and without ball bearings on drive end

IM V9 (IM 9131)



without endshield and without ball bearings on drive end

IM B15 (IM 1201)



without endshield and without ball bearings on drive end

* From frame size 225 on request

It is essential to state the desired mounting arrangement when ordering, as the constructive design depends partly on the mounting arrangement.

Terminal boxes

The location of the terminal box in standard design is on top; on the right or on the left are possible.

For motors with mountings IM B6, IM B7, IM B8, IM V5, IM V6 the location of the terminal box is related to an IM B3 mounting.

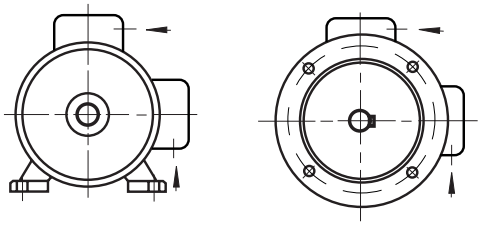
The position of the entry openings can be adjusted to suit the existing connection facilities by turning through 90°. Should special accessories be used (temperature detectors, anti-condensation heating, etc.) please enquire.

For motors in standard design, the cable gland does not belong to our scope of delivery.

For plastic terminal boxes, only plastic glands may be used (shock protection).

When using screened leads, a metal terminal box is required.

Direction of cable entries



Frame size	Degree of protection	Thread for cable entry [1]		Connection for temperature detector		Max. cable section	Terminal thread	Max. external cable diam.

Paint finish

Normal finish

Suitable for climate group **Moderate** to DIN 600 721-2-1, e.g. indoor and outdoor installation
for short periods: up to 100 % rel. humidity at temperatures up to +30° C
continuously: up to 85 % rel. humidity at temperatures up to +25° C

Special finish K1

Suitable for climate group **Worldwide** to DIN 600 721-2-1, e.g. outdoor installation in corrosive chemical and marine atmospheres
for short periods: up to 100 % rel. humidity at temperatures up to +35° C
continuously: up to 98 % rel. humidity at temperatures up to +30° C

Special finishes (on request)

- Special finish K2 (additional treatment of internal motor parts)
- Special paint for exposure to the action of alkalis
- Special finishes to customers' requirements

Bearings

Classification of bearings (standard design) [1]
Ball bearings to ISO15 (DIN 625)

*not interchangeable with standard motors

Belt drive

The data apply only to the normal drive end shaft extension of IM B3 motors with one speed.

Calculation of belt drive:

$$F_R = \frac{19120 \cdot P \cdot k}{D_1 \cdot n}$$

F_R = Radial shaft load in N
P = Output in kW
n = Speed in min^{-1}
D_1 = Pulley diameter in m
k = Belt tension factor, varying with the type of belt, assumed to be approximately:
3-4 for normal flat belt without idler pulley
2-2.5 for normal flat belt with idler pulley
2.2-2.5 for V-belt
For exact data apply to the belt manufacturer.

Lubrication and maintenance of bearings

Bearings of standard motors up to frame size 250 have permanent lubrication. Bearing grease K3N to DIN 51 825 (e.g. KLÜBER ASONIC GHY72, ESSO UNIREX N3 or similar) is used.

Maintenance-free life for motors with permanent lubrication at ambient temperature of 40° C and service at 50 Hz:

2 and 4/2 pole motors 10,000 h
4 and more pole motors 20,000 h, but not more than 4 years.

From frame size 280 upwards the motors are equipped with regreasing device and grease slinger (possible from frame size 160 at extra cost).

First lubrication is made with grease K3N to DIN 51 825 (lithium-based, water resistant to DIN 51 807 part 1: grade 0 or 1).

For motors with regreasing device, regreasing interval and required quantity of grease is indicated on the nameplate.

For regreasing please observe the Operating Instructions.

Where unfavourable conditions prevail (e.g. high ambient temperature, dusty conditions, corrosive atmosphere, operation by frequency converter), relubrication should be carried out more frequently.

Lubricating nipples

Flat lubricating nipples M 10x1 to DIN 3404.

Cooling

Surface cooling, independent of the direction of rotation.

Motors type AM available without internal fan as type AG, e.g. for installation in a directed air stream (outputs on request).

Vibration

The amplitude of vibration in electric motors is governed by EN 60034-14 *Mechanical vibration of rotating electrical machines with shaft heights 56 and larger - methods of measurement and limits.*

Standard motors are designed to vibration class N (normal). Vibration class R (reduced) and vibration class S (special) are available at extra cost.

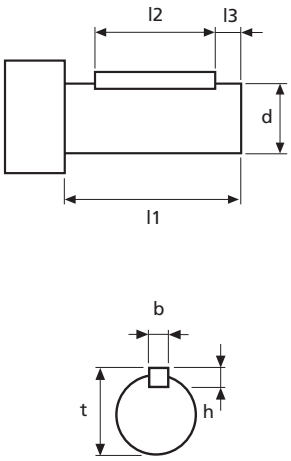
Pole-changing motors in Dahlander connection can only be supplied in vibration class N.

Rotors are at present dynamically balanced with **half** key fitted as per DIN ISO 8821. Other balancing only on request.

The motors are identified as follows:

"H" or "blank" means balanced with *half key*
"F" means balanced with *full key*
"N" means *no key*

Position and dimensions of key



Frame size	d x l1	b x h	l2	l3	t
56	9 x 20	3 x 3	15	2.5	10.2
63	11 x 23	4 x 4	15	4	12.5
71	14 x 30	5 x 5	20	5	16
80	19 x 40	6 x 6	30	6	21.5
90	24 x 50	8 x 7	40	6	27
100	28 x 60	8 x 7	50	6	31
112	28 x 60	8 x 7	50	6	31
132	38 x 80	10 x 8	70	5	41
160	42 x 110	12 x 8	100	5	45
180	48 x 110	14 x 9	100	5	51.5
200	55 x 110	16 x 10	100	5	59
225 2 poles	55 x 110	16 x 10	100	5	59
225 4 poles	60 x 140	18 x 11	110	10	64
250 2 poles	60 x 140	18 x 11	110	10	64
250 4 poles	65 x 140	18 x 11	110	10	69
280 2 poles	65 x 140	18 x 11	100	10	69
280 4 poles	75 x 140	20 x 12	100	10	79.5
315 2 poles	65 x 140	18 x 11	125	7.5	69
315 4 poles	80 x 170	22 x 14	140	10	85

Dimensions in mm
For larger shafts in special design the dimensions l2 and l3 are maintained.

Anti-condensation heater

On request, motors which due to strong temperature fluctuations are exposed to condensation during standstill, can be fitted against surcharge with an anti-condensation heater (space heater).

For supply voltage and heater rating please refer to the following table:

Frame size	Supply voltage (V)	Heater rating per motor (W)
112 - 160	110 or 230	40
180 - 225	"	50
250 - 280	"	65
315	"	99

During operation of the motor, the heating must be switched off.

Noise

The noise level of an electrical machine is determined by measuring the sound pressure level in accordance with curve A of the sound level meter to EN 60651 and is indicated in dB (A).

The permitted noise levels of electrical machines are fixed in EN 60034-9 (IEC 34-9). The noise level of our motors is well below these limit values.

Air-borne sound measurements are carried out in an anechoic testing chamber to EN 21680.

Speed corresponding to a mains frequency of 50 Hz and the number of poles.

Measures for noise reduction

With special measures noise level can be reduced (special fan, noise reducing hood, etc.).

Noise levels

The noise values listed below refer to 50 Hz at rated voltage with a tolerance of up to + 3 dB(A). Values for pole-changing motors on request. For 60 Hz supply values are 3-5 dB(A) higher.

Sound pressure level L_{pA} and sound power level L_{WA} for three-phase squirrel-cage motors

Frame size	2 pole		4 pole		6 pole		8 pole

In enquires and orders for spare parts please state always:
Designation of spare part, motor type, mounting arrangement, motor serial number (Product No. when available)
Enquires and orders cannot be handled without these data.

Rated voltage

For the rated voltage of the motors, EN 60 034-1 allows a tolerance of ± 5 %. According to IEC 60038, the mains voltages may have a tolerance of ± 10 %.

Therefore the motors are designed for the following rated voltage ranges (exceptions are shown in the data tables):

Mains voltage to DIN IEC 38	Rated voltage range of motor
230 V ± 10%	218-242 V ± 5%
400 V ± 10%	380-420 V ± 5%
690 V ± 10%	655-725 V ± 5%

Within the rated motor voltage range, the permissible maximum temperature is not exceeded. When the motors are operated at the limits of the voltage tolerance, the permissible overtemperature of the stator winding may be exceeded by 10 K.

For frame sizes 56 to 132 nameplates are marked with the maximum rated currents within the stated voltage ranges.

For motors in 500 V, 50 Hz design, as well as all abnormal voltages, no voltage range is marked. The voltage tolerances to EN 60034-1 apply.

Rated frequency

50 Hz motors can also be operated on 60 Hz mains, provided the mains voltage increases proportionally to the frequency. The relative values for starting and breakaway torque remain nearly unchanged and slightly increase for the starting current. The rated speed increases by the factor 1.2 and output by factor 1.15. Should a motor designed for 50 Hz be operated at 60 Hz without the voltage being increased, the rated output of the motor cannot be increased. Under these operating conditions, rated speed increases by factor 1.2. The relative values for starting and breakaway torque are reduced by factor 0.82 and for starting current by factor 0.9.

Additionally to the voltage range for 50 Hz operation, single-speed motors in frame sizes 56 to 315 are also marked with the voltage range for 60 Hz operation.
Example:

Frame sizes 56-132

Frame sizes 160-315

Rated current

The rated currents listed in the data tables apply to an operating voltage of 400 V. The conversion to other operating voltages, with output and frequency remaining unchanged, is to be made as follows:

Nominal voltage (V)	230	380	**400**	440	500	660	690
Conversion factor x I_N	1.74	1.05	**1.0**	0.91	0.80	0.61	0.58

Rated torque

$$\text{Rated torque in Nm} = 9550 \times \frac{\text{Rated voltage in kW}}{\text{Rated speed in min}^{-1}}$$

Output

The outputs stated in this catalogue are for constant load in continuous running duty S1 according to EN 60034-1, based on an ambient temperature of 40° C and installation at altitudes up to 1000 m above sea level.

For severe operating conditions, e.g. high switching rate, long run-up time or electric braking, a thermal reserve is necessary, which could call for higher thermal class or the use of a motor with a higher rating. In these cases we recommend to enquire with detailed information on the operating conditions.

Overload

At operating temperature three-phase motors are capable of withstanding an overload for 15 seconds at 1.5 times the rated torque at rated voltage. This overload is according to EN 60034-1 and will not result in excessive heating.

Utilizing thermal class F, motors can be operated continuously with an overload of 12 %. Nevertheless this is not valid for motors which to catalogue are utilized to thermal class F.

Connection

Motor output at 50 Hz	230 V Δ 400 V Y	400 V Δ 690 V Y	500 V Y	500 V Δ	690 V Δ

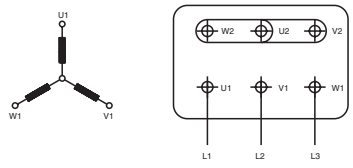
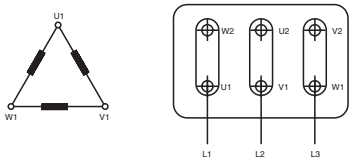
Connection diagrams





Windings of standard three-phase motors can be connected either in star or delta connection.

Star connection

A star connection is obtained by connecting W2, U2, V2 terminals to eachother and the U1, V1, W1 terminals to the mains. The phase current and voltage are:

Iph = In ; Uph = Un / $\sqrt{3}$

where In is the line current and Vn the line voltage referred to the star connection.

Delta connection

A delta connection is obtained by connecting the end of a phase to the beginning of the next phase.

The phase current Iph and the phase voltage Uph are:

Iph = In / $\sqrt{3}$; Uph = Un

where In and Un are referred to the delta connection.

Star-delta starting

Star-delta starting allows a peak current reduction, ensuring however that the peak torque obtained is bigger than the resistant torque. Actually, it should be noted that the torque of an induction squirrel-cage motor is directly proportional to the square of the voltage. Motors whose rated voltage with delta connection corresponds to the mains voltage, can be started with the star-delta method.

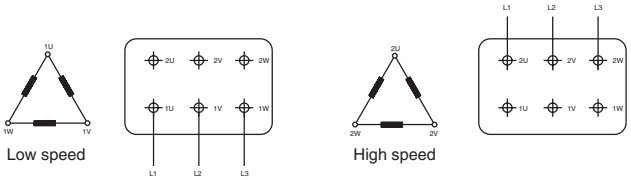
All motors can be supplied with windings designed for star-delta starting (for example: 400 V Δ / 690 V Y).

Pole-changing motors

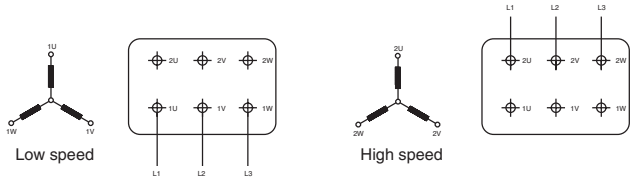
Standard pole-changing motors are designed for single voltage and direct-on-line starting (special design for Y-Δ-connection on request).

When the ratio between the two speeds is from 1 to 2, the standard motors have one single winding (Dahlander connection). For the other speeds, the motors have two separate windings.

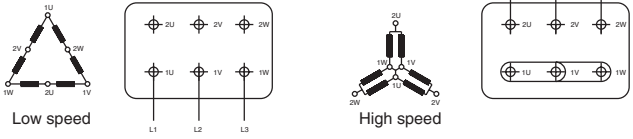
AM/AMV - two separate windings △/△



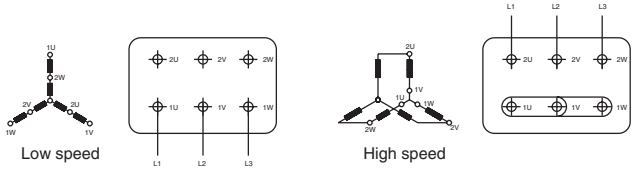
AM/AMV - two separate windings Y/Y



AM - Dahlander connection △/YY



AMV - Dahlander connection Y/YY



Insulation and temperature rise

Class F insulation to EN 60034-1 is used throughout.

In standard design motors are intended for operation at 40° C ambient temperature with class B temperature rise only, with an overtemperature limit of 80 K. This also applies for the rated voltage range to IEC 60038. Exceptions are shown on the data tables.

Temperature rise (ΔT^*) and maximum temperatures at the hottest points of the winding (T_{max}) according to the temperature classes of EN 60034-1.

	ΔT^*	T_{max}
Class B	80 K	125° C
Class F	105 K	155° C
Class H	125 K	180° C

*Measurement by resistance method

Output reduction at ambient temperatures over 40° C

Ambient temperature	45° C	50° C	55° C	60° C
Reduction of nominal output to approx.	95 %	90 %	85 %	80 %

When a winding is utilized to temperature class F (105K), no output reduction is required up to an ambient temperature of 60° C. *This does not apply to motors which in their standard design are already utilized to thermal class F.*

Installation at altitudes of more than 1000 m above sea level (see also EN 60034-1)

Altitude of installation	2000 m	3000 m	4000 m
At 40°C ambient temperature and thermal class B Rated output reduced to approx.	92 %	84 %	76 %
At 40°C ambient temperature and thermal class F Rated output reduced to approx.	89 %	79 %	68 %
Full nominal output to data tables with thermal class B and ambient temperature of	32° C	24° C	16° C
Full nominal output to data tables with thermal class F and ambient temperature of	30° C	19° C	9° C

Starting rate

The permissible number of starts per hour can be taken as given in the table below, provided the following conditions are met:

Additional moment of inertia ≤ moment of inertia of the rotor: load torque rising with the square of the speed up to nominal torque; starts at even intervals.

Shaft height	Permissible No. of starts per hour for 2p		
	= 2	= 4	≥ 6
56 - 71	100	250	350
80 - 100	60	140	160
112 - 132	30	60	80
160 - 180	15	30	50
200 - 225	8	15	30
250 - 315	4	8	12

For permissible number of starts for larger and pole-changing motors please consult us, indicating the complete operating conditions.

Thermal protection

The decision on a particular type of thermal protection should be taken according to the actual operating conditions. Motors may be protected by means of current-dependent thermal protection switches, overcurrent relays and temperature detectors.

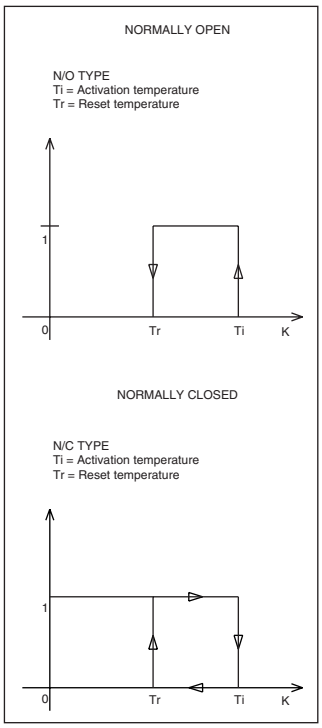
Thermal protection is possible as follows:

- Thermal protection switch with bimetal release
- Thermistor protection with semiconductor temperature detectors (PTC) in the stator winding in connection with release (if required, with additional motor protection switch).
- Bimetal temperature detector as N/C or N/O in the stator winding (if required, with additional motor protection switch).
- Resistance thermometer for monitoring winding and bearing temperature.

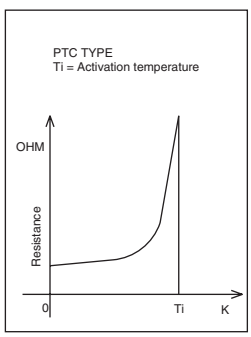
Should protection of the motor be required, we install protection switch with bimetal release up to frame size 112 and semiconductor temperature detectors in motors ≥ 132.

Although there are motors available from stock with built-in semiconductor temperature detector, a special remark has to be made in the enquiry or order when motor protection is required.

Operating specifications
Thermal cut-out



Operating specifications
of the thermistors



Examples of connection

	Protection method	Protection
	Motor protection switch with thermal and electromagnetic overcurrent release	against: • Overload in continuous service • Locked rotor
	Contactor with overcurrent relay Thermistor protection and fuse	in service against: • Overload in continous service • Long starting and braking periods • High switching rate in case of fault against: • Obstruction of cooling • Increased ambient temperature • Single-phase operation • Frequency fluctuations • Switching against locked rotor
	Semiconductor temperature detector with release	in service against: • Overload in continous service • Long starting and braking periods • High switching rate in case of fault against: • Obstruction of cooling • Increased ambient temperature • Single-phase operation • Frequency fluctuations • Switching against locked rotor

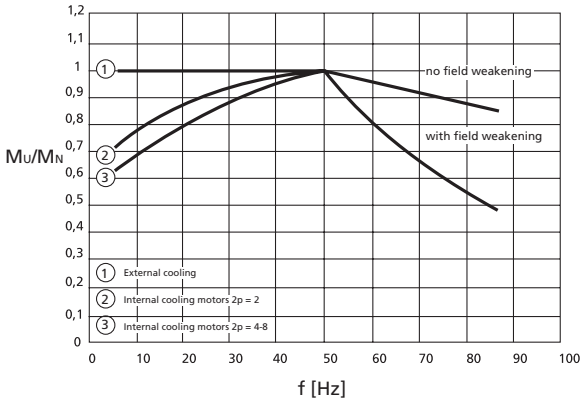
Three-phase cage motors driven by frequency converters

The motors frame sizes 90 upwards in standard design are suitable for operation on static frequency converters, taking into account the following remarks:

- Maximum converter output voltage 500V at peak voltages $\hat{U} \leq 1460V$ and $du/dt \leq 13$ kV/us. For higher converter output voltages or stresses, a special insulation is required.
- With square characteristic of the load torque, motors can be driven with their rated torque.
- For constant torque, the rated torque of motors with internal cooling must be reduced due to reduced cooling air inlet. Depending on the control range, the use of an external fan would be advisable.
- The motors frame sizes 90 – 112 are suitable for a maximum output frequency of the converter of 60 Hz (e.g. applications with square torque, control range 1 : 10, such as pumps and fans). For higher frequencies, a special range with type designation AMI is available on request. From frame size 132 upwards, motors designed Δ/Y 230/400 V, 50 Hz can be operated in delta with a maximum frequency of 87 Hz (observe mechanical limit speed).
- For motors frame size 315 we recommend an insulated bearing at the non-drive end.

The motors frame size 56 – 80 can be operated on single-phase converters up to maximum 60 Hz. (Special range with type designation AMI for operation on three-phase converters with output voltage ≥ 400 V and output frequency > 60 Hz).

The electrical values and dimensions of the range AMI in frame size 56 to 112 are identical to AM motors (see data tables pages 36-49).



Thermal maximum-torque curve for approximate determination of the required torque reduction with constant load torque curve

Noise

Depending on the operating point and converter type, converter-fed motors produce between approx. 4 - 10 dB(A) higher noise values than when supplied from the mains. For motors driven with a frequency over 50 Hz, more fan noise is produced. We recommend the use of an external fan.

Degree of protection

Depending on the accessories used.

Mechanical limit speeds

For motors of standard design, the following maximum operating speeds are permitted:

Frame size	2p = 2 min $^{-1}$	2 p = 4 - 8 min $^{-1}$
56-112 [1)]	3600	1800
132-180	6000	6000
200	5000	5000
225	4500	4500
250	4300	4300
280	4300	3800
315 S/M	4300	3600
315 L	3600	3600

[1)] Higher speeds with special range AMI

Vibration amplitude

When operating at high speeds (according to frequency > 60 Hz) a reduced vibration amplitude "R" to DIN ISO 2373/DIN VDE 0530, part 14 may be required, measured at a mains frequency of 50 Hz or 60 Hz and sinusoidal mains voltage.

Accessories

Motors are available with the following accessory:
· *Encoder* with internal or external cooling

Encoder (standard design)

Supply voltage U_B	5 V	
Pulses per revolution	500-2048	
Outputs	2 signals with rectangular pulses A, B 2 signals with inverted rectangular pulses A, B zero pulse and inverted zero pulse	
Pulse displacement between	outputs	90°
Output amplitude	U_{High}	2.5 V
	U_{Low}	0.5 V
Maximum frequency	100 kHz	
Maximum speed	3,000 (6,000) min $^{-1}$	
Temperature range	-20°C to + 85°C	
Degree of protection	IP 54	

Motors for normal continuous duty (S1) and normal operating conditions

Quotation (if submitted)	No./Date
Quantity	Units
Designation	Type
Output (for pole-changing motors, outputs referred to speeds)	kW
Speed (for pole-changing motors, outputs referred to outputs)	min^{-1}
Direction of rotation (viewed on shaft extension)	
Mounting arrangement (to IEC 60034-7)	
Degree of protection, motor/terminal box (to IEC 60034-5)	
Mains voltage	V
Mains frequency	Hz
Method of starting (direct-on-line or Y-Δ)	
Location of terminal box	
Machine to be driven	

Dimensions of cables, if these differ from those allocated by VDE 0100, referred to an ambient temperature of 40° C, or when aluminium conductors are used. It should be stated when parallel connected conductors are used.

Type designation

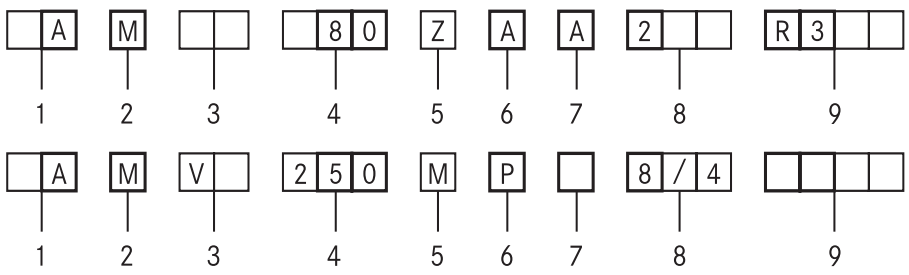
Apart from other information, it is necessary to specify the exact type designation in all enquiries, when ordering spare parts or replacement motors or when asking for documentary information.

The type designation of our motors comprises 9 points of reference, each of which may consist of several letters and/or numerals. The meaning of each symbol can be seen from the following table. For motors not included in our standard range, special symbols may be used which are not listed here.

Meaning of the symbols

Ref. point	Meaning	Description of symbols used for our motors				
1	Type of motor	A	Asynchronous motor			
2	Cooling	M G MFV	Surface cooled with external fan, cooling fins Surface cooled without external fan, cooling fins Surface cooled with forced ventilation, cooling fins			
3	Type of motor	blank V H HE I	Three-phase motor Three-phase pole-changing motor for driving fans Three-phase motor, efficiency to EPACT regulations Three-phase motor, efficiency eff 1 to CEMEP Voluntary Agreement Special design for three-phase motor driven with frequency converter			
4	Shaft centre height	56, 63, 71, 80, 90, 100, 112, 132,160, 180, 200, 225, 250, 280, 315				
5	Frame length	Z S M L	 Mechanical dimension (short) Mechanical dimension (medium) Mechanical dimension (long)			
6	Mechanical design and output value	A B C D	Frame size 56-112	Stage of development	X,P,J Y,R,L Z,V,T	Frame size 132-315
7	Frame material and/or stage of development	A G E	Aluminium frame Cast iron frame Stage of development			
8	Number of poles	2 4 6 8	4/2 8/4 4/6 6/8			
9	Special features	R3	High resistance rotor			

Examples



Three-phase squirrel cage motors designed for range of rated voltage 380-420 V ± 5% - 50 Hz

EFF 2

For mains voltage to IEC 60038 400 V ± 10% - 50 Hz

1) Temperature rise to class F

***** Higher output (progressive motor)

Three-phase squirrel cage motors designed for range of rated voltage 380-420 V ± 5% - 50 Hz

EFF 2

For mains voltage to IEC 60038 400 V ± 10% - 50 Hz

Temperature rise to class B

1) Temperature rise to class F

***** Higher output (progressive motor)

Three-phase squirrel cage motors designed for range of rated voltage 380-420 V ± 5% - 50 Hz

For mains voltage to IEC 60038 400 V ± 10% - 50 Hz

Temperature rise to class B

1) Same mounting dimensions 225S

Motors from frame size 132 upwards, with double marking

Pole-changing squirrel-cage motors for fan drives designed for range of rated voltage 380-420 V ± 5% - 50 Hz

For mains voltage to IEC 60038 400 V ± 10% - 50 Hz

The LS16 standard optic power is a multimode fibre optic interface which is converting RS232 signal into optic fibre and vice versa. The LS16 is for communication between wind turbines, weather stations and park PC's.

- DIN plug (11-poled) connector for mounting in the power panel and connection of supply.
- Specified for 50/125µm, 62.5/125µm, 100/140µm and 200µm PCS fibre optic cable.
- Power supply, which can be either AC or DC, offers total switchmode galvanic separation.
- Fibreoptic communication offers total galvanic separation.
- Optic power level selectable with STANDARD/HIGH switch.
- Configuration in park selectable with NO LOOP/LOOP switch (Master/Slave).
- The LS16 is produced in accordance with demands in the DS/EN ISO 9001-standard. It complies with EMC demands such as the EN61000-6-2 (Industry), the EN61000-6-4 (Industry) and the EN61000-4-5 (Surge).

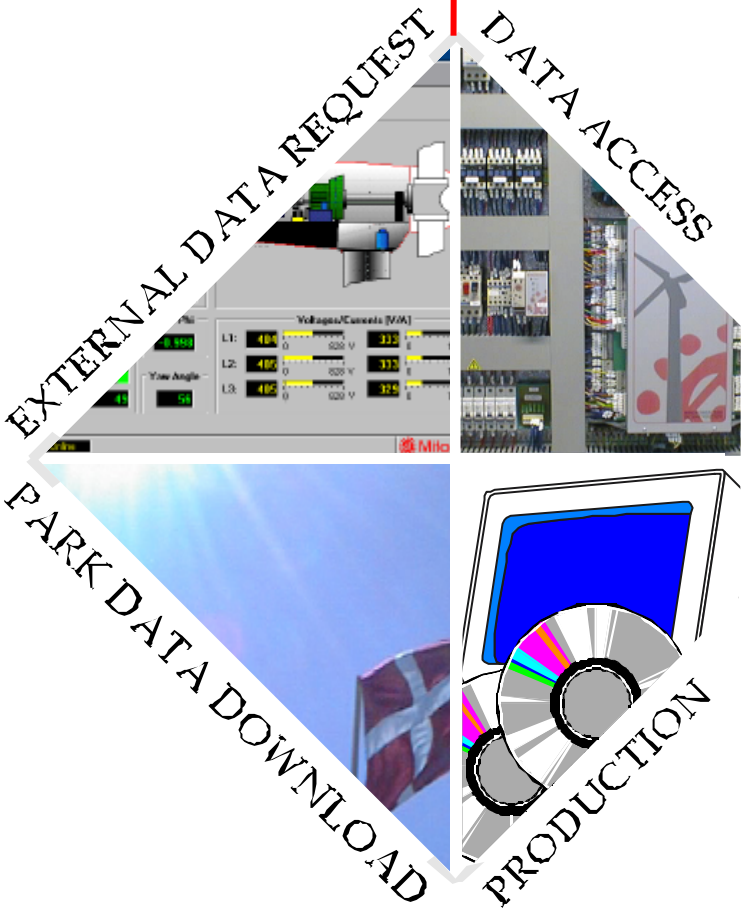
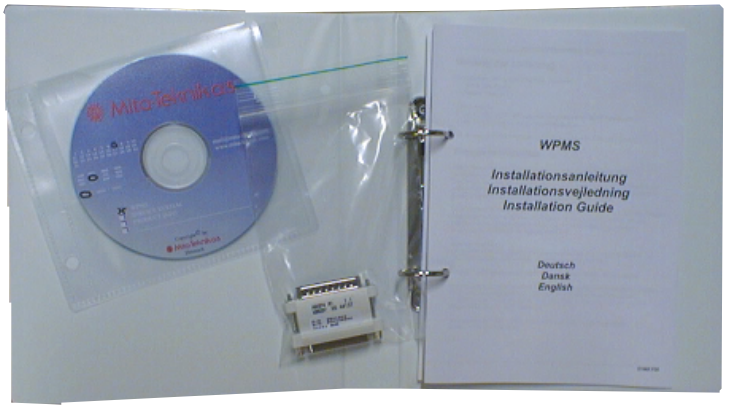
WPMS -
WindPower Management System



System Structure

The modular structure of the WPMS enables you to customise the system according to yourneeds. Thebasic module is easily extended by a variety of advanced functions-merely by adding release access codes. The contents of a basic program package is the following:installation guide, CD, dongle (hardwarelock) and on-line manual.

Toinstall the program package, you only have to follow the automatic installation guide,which will lead you through all stages of the installation. Extensions are activated by entering the release access code, which i s delivered by Mita-Teknik or bythewindturbinemanufacturer.



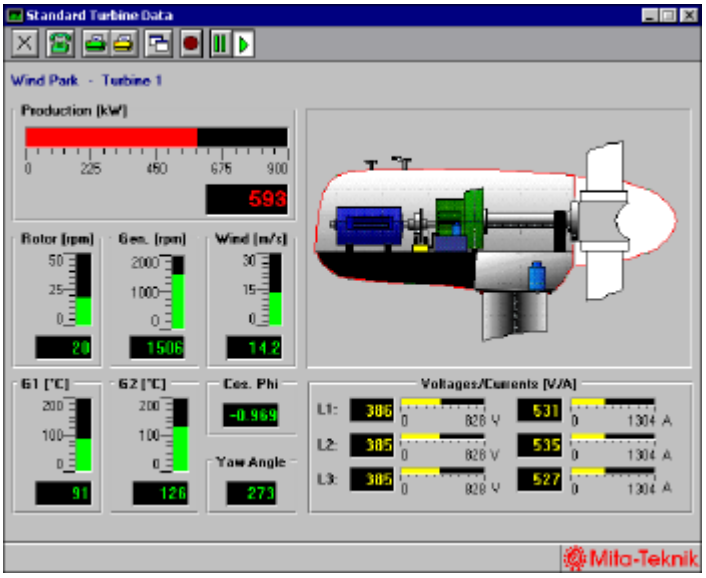
TheWPMS Basic System can be extended with

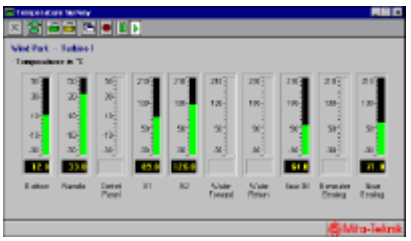
- External Data Request
- Data Access
- Control Panel
- Park Control Panel
- Wind Power Data
- Autocall
- Alarm Call Forwarding-SMS
- Alarm Call Forwarding-OPS
- Alarm Call Forwarding-WPMS
- Park Redirection
- Park Data Download
- Park Monitor
- Advanced Reporting Tool (ART)
- Remote Display WP2000 R/O
- Remote Display WP2000 R/W
- Remote Display WP3000 R/O
- Remote Display WP3000 R/W
- Weather Station

Welcome to our worldwide concept of quality

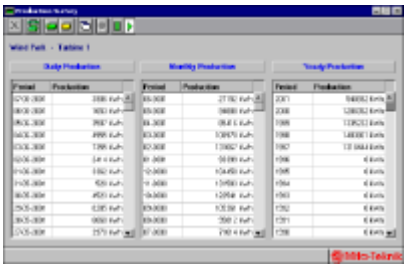
WPMS Basic System

The WindPower Management System is developed especially for the efficient and professional monitoring of all types of wind turbines. Theprogram gives the user the possibility of on-line surveillance, alarm reception, remote control and graphic presentation of operational data. The user-friendliness of the program has been given very high priority andisreflected in theflexibility of the graphical user interface. In the following text the WindPower ManagementSystem will be referred to as the WPMS.





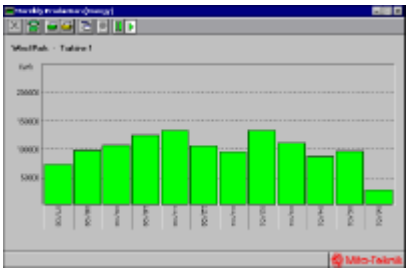
Temperature survey-on line



Production survey

The basic program package contains all the on-line and statistical data needed by the owner of a wind turbine or a small scale wind park.The basic program package gives you on-line access to the following data:

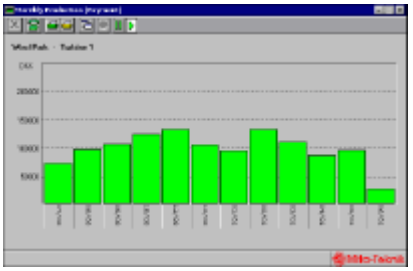
- Production and wind data
- Temperatures
- Currents, voltages and power factor.
- Number of revolutions etc.



Monthly production (kWh)

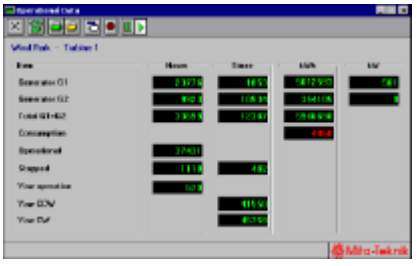
Graphs and tables showing a variety of data are also available with the basic program package, e.g.:

- Production statistics going years, months and days back
- Detailed operation statistics of the last24 hours
- Status and event lists
- Summary of status and error messages
- Operation hours of a numbe of units in the wind turbine.



Monthly production ($)

Functions such as reliable alarm reception, advanced printing facilities and communication surveillance are also part of the package.

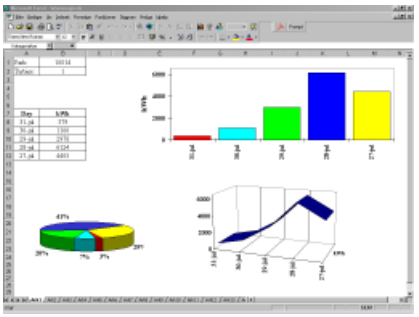


Operational d ata-on-line

Extend the WPMS Basic System

The WPMS Basic System can be extended dependent on your requirements. With our large choice of extension modules WPMS can supply you with a variety of intelligent functionsmaking it easier to monitor wind turbine operation.Access is given to statistical functions,remote control, parameter settings, automatic data collection and alarm management throughthe dongle release codes. In the following the extension modules will be described one by one:

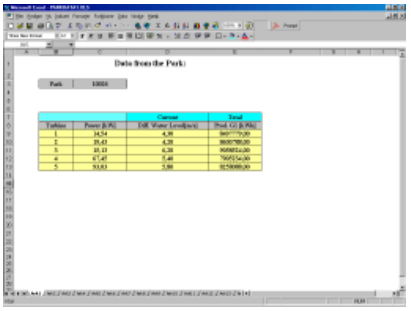
External Data Request



Module for the generation of user-defined reports and high-quality analyses. The module gives you the possibility of placingon-line wind turbine data in a spreadsheet,like for example the MSEXCEL. When the module is used in combination with the WP3000DATAACCESS-1 module, almost infinite possibilities of designing reports, analyses and diagrams are at your disposal. Data aredevided into groups of operational data, summaries, events, stall curves, digital input signals and a number of interval data. Data are shown as actual values or data collected from a log in the WINDPOWER computer.

P/N.:9842101

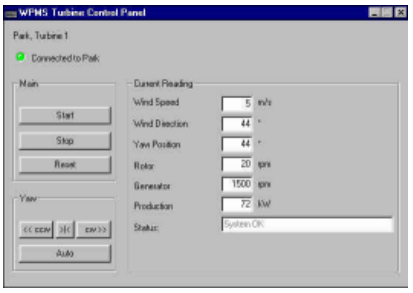
DataAccess-1



This module gives you access to data saved in the WP3000 computer. The module is to be used together with WPMS External Data Request or Autocall every time access to stored data is needed.

P/N.:9842401

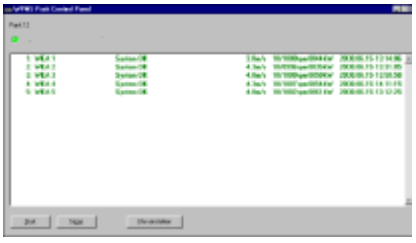
Control Panel



Module for the manual remote control of a wind turbine. You can start, stop, andyaw by means of this control panel. Besides the remote control functions, operational data such as wind speed, wind direction, yaw angle, number of generator androtor revolutions, the production and status of thewindturbine are shown.

P/N.:9842103

Park Control Panel



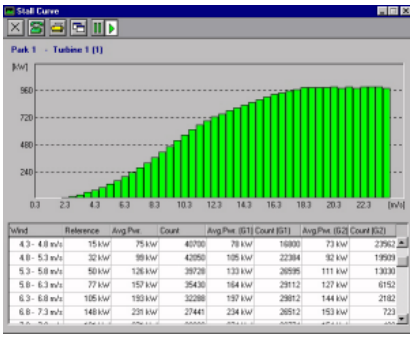
Module for the on-line presentation of wind turbines in a park. You can start, stop and set the clock by means of this control panel. Besides the remote control functions; the status of the wind turbine, the generator- and rotor revolutions, and wind speeds are shown.

P/N.:9842152

Wind Power Data

Module for the on-line presentati on of wind turbine power curves. You can select 3 power curvesintheWP3000computer and also chose the design by double-clicking on the mouse. The included STALL REFERENCE CURVE EDITOR shows the theoretical POWER CURVE, and enables a comparison with the current POWER CURVE.

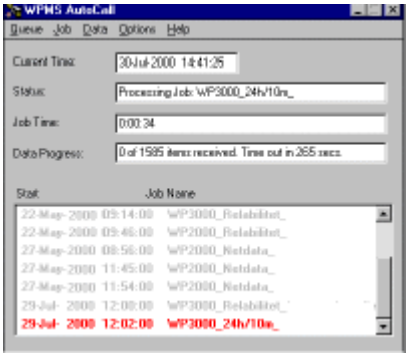
P/N.:Customer specified number



Autocall

This module has been developed for users,like park owners and company service personnel, who collect a large amount of statistical data from a number of wind turbines. With this module you can specify the wind turbine, the data to be collected, the time of collection and the intervals. The program automatically collects the data which can be processed in MS ACCESS™ and MS EXCEL.

P/N.:9842104



Remote Display WP2000/WP3000

Module for monitoring a wind turbine with a WP2000 computer or a WP3000 computer. The module isavailable in two versions, R/O or R/W:

Read Only R/O

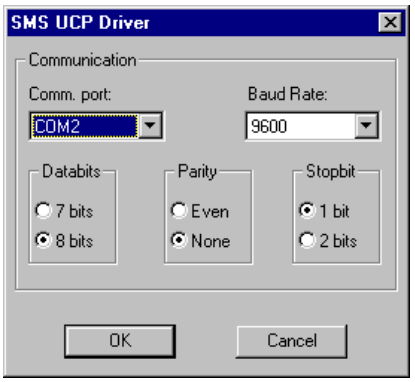
Wind turbine data are shown but commands cannot be issued and parameters cannot be changed. This module is mainly used by sales persons, wishing to present the possibilities of rendering professional assistance via modem.

Read and Write R/W

Wind turbine data are presented. Furthermore commands can be issued and parameters can be changed. This module is mainly used by service personnel and gives exactly the same functions as the display in a wind turbine.

P/N.:Customer specified numbers

Extend the WPMS Basic System



Alarm Call Forwarding

These modules are especially used in parks with for example a park-PC.

Alarm Call Forwarding via SMS

Module for reception of alarm calls. Alarm calls are saved and re-transmitted as SMS (Short Message Service) to mobile telephone.
P/N.:9842114

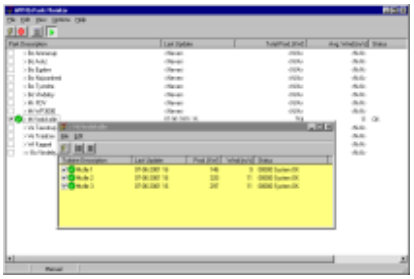
Alarm Call Forwarding via OPS

Module for reception of alarm calls. Alarm calls are saved and re-transmitted via the OPS system.
P/N.:9842112

Alarm Call Forwarding via WPMS

Module for reception of alarm calls. Alarm calls are saved and re-transmitted to another computer with a WPMS system.
P/N.:9842115

Park Monitor

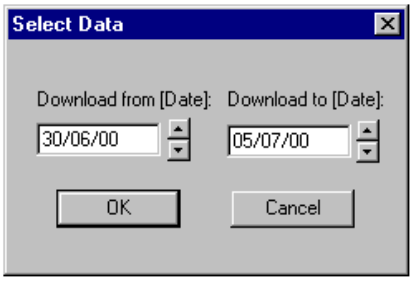


This module isused for the surveillance of one or more parks. With the Park Monitor module the operational data and thestatus of parks and wind turbines are automatically collected (from the WPMSdatabase). Reports of the actual operational status may also be generated and printed out.
P/N.:9842106

WeatherStation

Module for presentation of data from a IC1000 weather station. With this module you are given access to weather data such as wind speed, wind direction, temperature, atmospheric pressure, rainfall, and lightning frequency. Via the WPMS EXTERNAL DATA REQUEST and the WPMS AUTOCALL modules, summarised data, going as far back as 20 years, can be collected and presented.
P/N.:9842130

Park Redirection

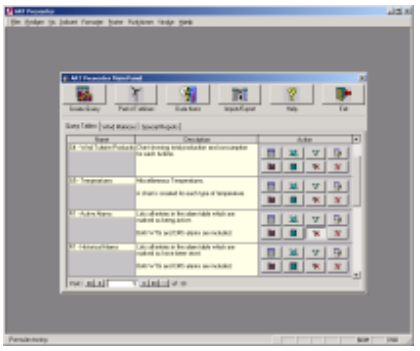


Module for collecting data via modem from one or more wind turbines in a park. The module is used in a Park-PC.
P/N.:9842105

Park Data Download

This module is used for transmission of collected data on a Park-PC to another PC. The data may be processed using MSACCESS™ or MSEXCEL
P/N.:9842106.

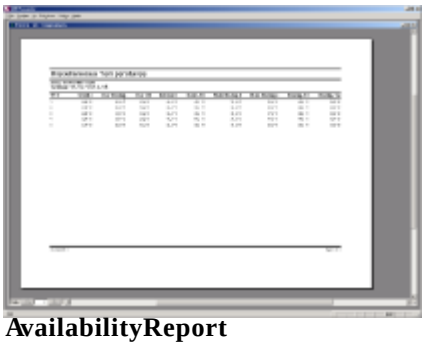
ART (Advanced Reporting Tool)
This module is an extension to the WPMS AUTOCALL module. The module exports data collected by AUTOCALL to a MSACCESS data base. When data have been exported, a userfriendly environment in the ACCESS database enables the user to design his or her own reports and graphs. When designing statistics the user is guided through every step of the way. As the calculation of statistics may be very consuming, it is possible to let the program work at night and have the resultready and printed in the morning. Statistics can be displayed in tables, reports, graphs or in MSEXCEL.
P/N.:9842122



MainxScreen

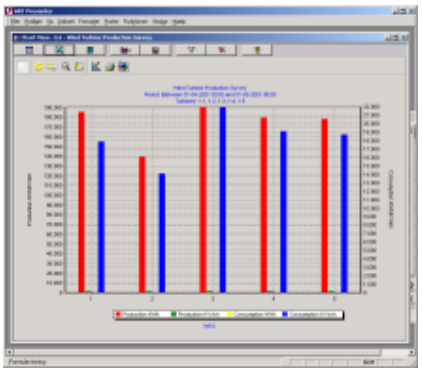
Examples of ART Reports

Availability Reports
Availability is the percentage of the time that the wind turbine operates or is ready to operate. Availability can be calculated from a number of data collected from the single turbine. The data will be collected using WPMS Autocall and can be presented in ART reports.



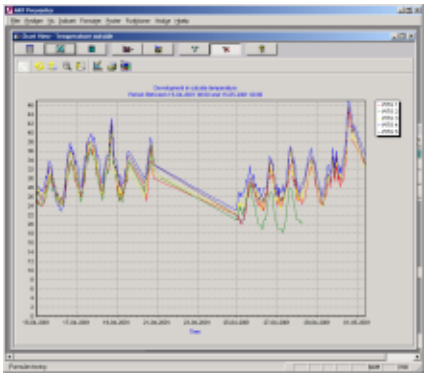
AvailabilityReport

Graphical Presentation of e.g. Production
Using the WPMS ART Module you can have a quick survey of a number of wind turbine data. For example energy production and consumption for a certain period. Each column section represents a wind turbine.



Production

Graphical Presentation of the Development in e.g. Temperatures
During optimisation and analyses it is often important to follow the development of the collected data. This data screen is also collected within a certain period, which is shown in the report.



TemperatureDevelopment

You can download the commercial version of WPMS at:

Mita-Teknik a/s

WPMS -
WEB Browser System

WPMS WEB Browser System

System Description

Mita-Teknik has just released a new web server solution for online presentation of wind turbine data. The solution covers surveillance of both single wind turbines and wind farms.

Traditionally the user-access to wind turbine data is made through modem, which enables the user to access all available data and operate the wind turbine. This requires a SCADA system per user.

The web server solution is especially developed for manufacturers, plan offices and operators wanting to give their customers an extra appreciation and added value.
With the new web server solution you can offer your customers and joint owners internet-access to production data daily, monthly and yearly.

Furthermore, the web server provides online-access to an animated graphical park view and single turbine data. Additional data can be added if the task requires so.

In order to protect data from unauthorized access the user has to perform a login procedure. The operation is browser based and very user-friendly.

Flexibility has a high priority in the system design. It is possible to customize the system with your own logo, park logos and backgrounds on the graphical park view. The overall lay-out is generic and made in neutral colours.

Hardware Configuration

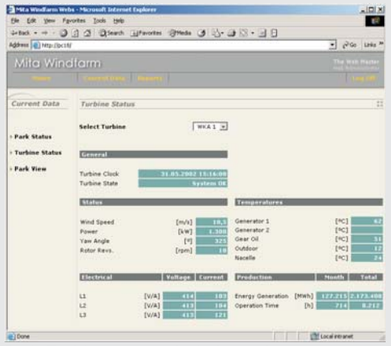
The hardware configuration depends on the location of the server. It is possible to place the server directly in the park, at the manufacturer/the operator or on an external WEB hotel. Mita-Teknik will assist with this task.

Complete Solutions

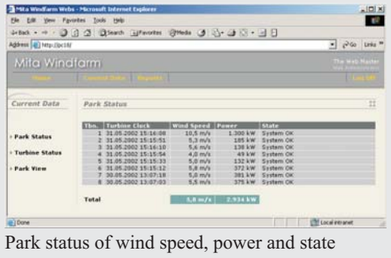
Everybody knows that an easy and fast installation saves both time and money and consequently we have chosen only to offer package solutions pre-configured by Mita-Teknik.

On-Site Installation

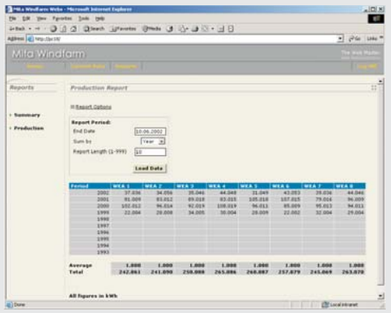
Mita-Teknik can provide a turn-key solution.



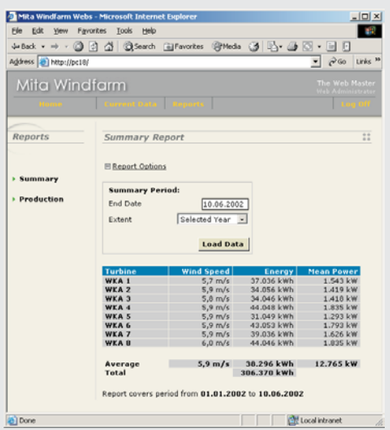
Park/Turbine status of wind speed, temperatures electrical values, and production



Park status of wind speed, power and state



Production report total and avarage for the turbines

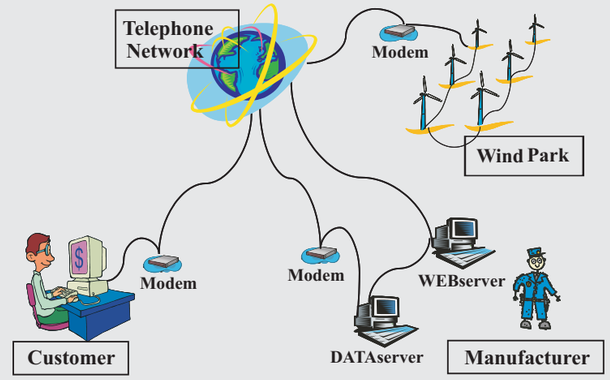


Summary report of wind speed, production and mean power

WPMS WEB Browser System

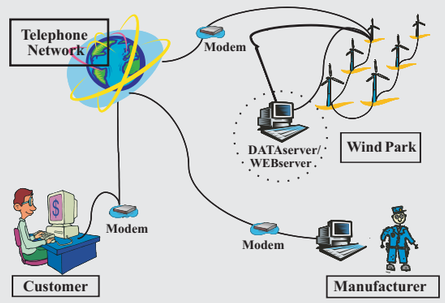
Three Solutions for WEB Browser System

1. Server at Manufacturer

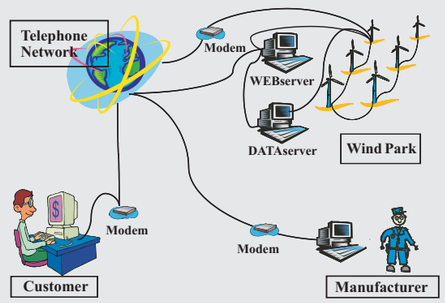


2. Server in Wind Park

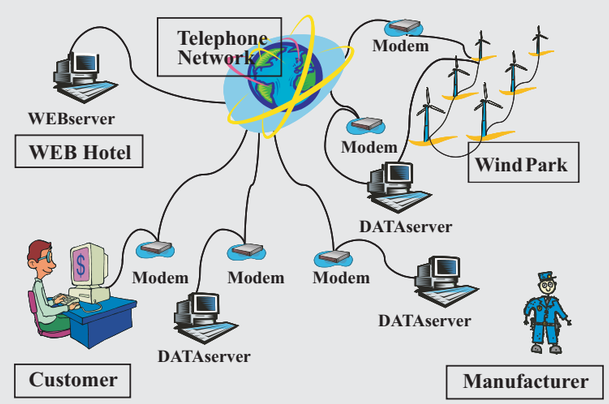
WEB Server with integrated DATA server



WEB Server with separate DATA server

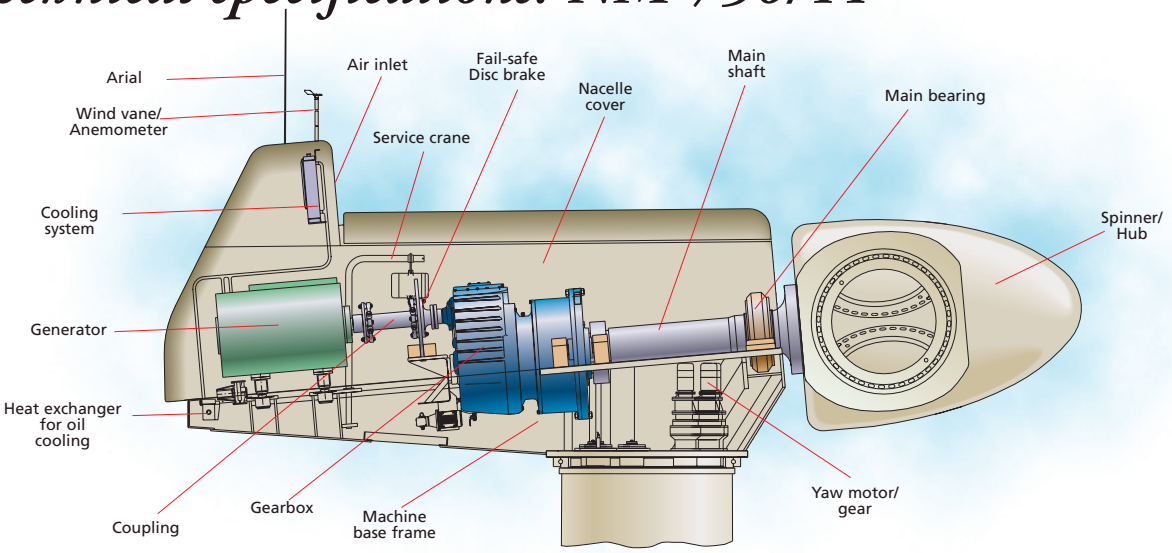


3. Server at WEB Hotel



FLEXIBLE STRUCTURE • CUSTOMISED DESIGN • COMPETITIVE • PACKAGE SOLUTIONS • USERFRIENDLY

Technical specifications: NM 750/44



Operational parameters

Nominal output	750 kW
Power regulation	Stall
Nominal wind speed	16 m/s
Cut-in	4 m/s
Cut-out	25 m/s

Rotor

Rotor diameter	44 m
Rotor swept area	1520 m^2
Number of blades	3
Rotor revolutions	27/18 rpm
Rotor placing	Upwind rotor

Brake system

Blade tip air brake	Hydraulic, fail-safe
Disc brake	Hydraulic, fail-safe

Drive train

Gear type	Planetary - parallel axle
Ratio	1:55,6
Main shaft	Forged shaft and flange
Main bearing	Spherical roller bearing
Cooling	Heat exchanger with pump

Generator

Type	Asynchronous, 4/6 pole
Nominal voltage	690 V
Nominal frequence	50 Hz
Name plate rating	750/200 kW
Cooling	Liqued-cooled with pump

Yaw system

Type	Ball bearing
Yaw brake	Friction brake/motor brake
Yaw motor/gear	3 electrical planetary gears

Tower

Type	Conical, steel, painted
Hub height	40/46/50/55 m

Controller

Type	Computer controlling
Cut in system	Soft by thyristors
Capacitor bank	No-load compensated
Remote control	By modem

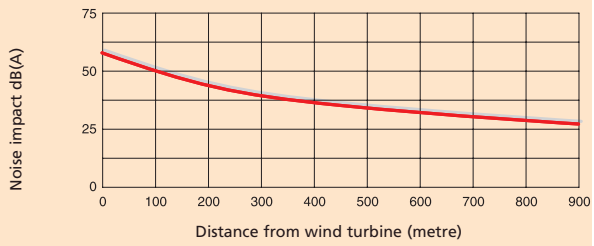
Sensors

RPM sensors	Rotor, generator, yaw system
Temperature sensors	Gear, generator, controller
Thermal sensors/warning	Main switch, engine protection
Vibration sensor	Nacelle, rotor
Meteorology	Anemometer, wind vanes, thermometer
Hydraulic systems	Pressure sensitive switches, pressure transducer

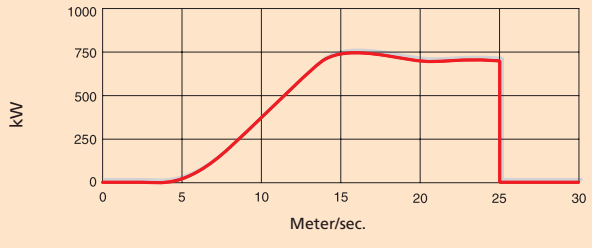
Lightning protection

According to standard	IEC 1024
Blades	Receptor in the blade tips
Nacelle	Arial

Noise level



Power curve



DANAK Reg.nr. 5001
Certified firm according to DS/EN ISO 9001 by Det Norske Veritas, Danmark A/S

Please note that the power curve has been noted at standard atmospheric density according to DIN ISO 2533.

Please note that the rotor and the hub heights have been approved for specific markets and wind classes – please call for further information. Note that the turbine is also available in a 60Hz version.

HAWKER OLDHAM BATTERIES

STANDBY BATTERIES

SERIES EG 207

Installation, operating and maintenance instructions

SAFETY PRECAUTIONS

Handing

The EG 207 batteries are supplied charged ; they must be unpacked carefully. Avoid all short-circuit between opposite polarity poles as the cell will produce very high short-circuit currents.

Keep Flames Away

In case of accidental overcharge a flammable gas can leak off the safety vent.
Discharge any possible static electricity from clothes by touching an earth connected part.

Tools

Use tools with insulated handles. Do not place or drop metal objects on top of the battery. Remove rings, wristwatch and articles of clothing with metal parts that might come in contact with the battery terminals.

RECEIVING THE SHIPMENT

Unpack the batteries immediately upon arrival. Do not overturn the package. Inspect for possible damage in shipment. Make sure that no small package is thrown out together with the packing material.

Warning

The batteries contain sulphuric acid retained in microfibre separators. Batteries with broken lids or containers may loose small amounts of acid when deformed. Wear rubber gloves when handing broken batteries.

STORAGE

Store the battery at a dry, clean and preferably cool location.
As the batteries are supplied charged, storage time is limited. In order to easily charge the batteries after prolonged storage, it is advised not to store it more than
6 months at 20°C,
4 months at 30°C,
2 months at 40°C.
A refreshing charge shall be performed after this time at 2.23V/cell at 20°C. for 96 hours or until the charged current does not vary for a 3 hour period.
Failure to observe these conditions may result in greatly reduced capacity and service life.

INSTALLATION

The battery should be installed in a clean, dry area. It does not give off corrosive gas in normal operation and therefore can be installed together with other electrical equipment. It is important that the battery is mounted firmly.

Temperature

Avoid placing the battery in a hot place or behind a sunny window. The battery will give the best performance and service life when working at a temperature between 20° C and 25° C.

Ventilation

Under normal conditions the gas release is negligible and natural ventilation is sufficient for cooling purposes and inadvertant overcharge, enabling batteries to be used safety in offices and equipment.

Mounting

OLDHAM battery racks are recommended for proper installation. Assemble the rack according to instructions. Place the battery blocks or cells on the rack and arrange the positive and the negative terminals for connection according the wiring diagram. Check that all contact surfaces are clean and apply the block or cell connectors and the poles screws. Tighten the screws securely. Follow the polarity to avoid short circuiting of cell groups. Finally connect the battery terminals.

Pole screw Tightening

The maximum torque load of intercell connector bolts is 23 Nm (2.3 Mkg) to 25 Nm (2.5 Mkg). A loose connector can cause trouble during discharge or charge and occurate voltage drop and important heating, which can cause damage to the battery and/or persons. Finally put on the connector covers.

CELLS IN PARALLEL STRINGS

EG 207 cells of the same ampere hour rating may be connected in parallel to give higher current capability. One must not exceed 4 parallel strings. However, precautions must be taken : equipotential wiring is required ; that means connectors are designed such that the current is distributed equally between each string.

CHARGE

Float Voltage

The recommended float/charge voltage is 2.23 V per cell at 20° C.
When the average ambient temperature deviates more than ± 5° C from the reference, it is recommended to adjust the float voltage as follows :
2.35 V.p.c. at 0° C
2.28 V.p.c. at 10° C
2.23 V.p.c. at 20° C(reference T°C)
2.20 V.p.c. at 30° C
2.17 V.p.c. at 35° C
Due the phenomena of gas recombination a difference of ± 2.5% for an individual cell voltage can be observed. However the total voltage of the battery shall be within the limits stated above.

Charging Current

For maximum service life, EG 207 batteries should only be used with current limited constant potential float chargers, current limited to 0.3 C_{10}. However if the utilization assures a depth of discharge (DOD) below 40% of the rated capacity, the charging current limits itself and a current limitation may be omitted.

Fast Recharge

The battery may be recharged at 2.35V per cell with a current limited to 0.3 C_{10}. Fast charging should be stopped after approx. 10 or 15 hrs.

Quality of the charging current under floating voltage

The nature of the charging current has an influence on the life expectancy of the batteries. The rms value of the alterning component (fundamental and harmonics) must not exceed 0.1C_{10} on continuous charge.

State of Charge

The battery state of charge can be determined approximately by measuring the open circuit voltage after the battery has been a rest for a minimum of 24 hours.

State of charge	Voltage
100%	2.13 V.p.c.
70%	2.09 V.p.c.
50%	2.06 V.p.c.
20%	2.02 V.p.c.

DISCHARGING

End of Discharge Voltage according to the discharge time

The end of discharge voltage must be limited to the values listed below :

Discharge time (t)	End voltage (Volts)
1h < t < 5h	1.70 V
5h < t < 8h	1.75V
8h < t < 24h	1.80V

A low voltage disconnect or timer is recommended to prevent deep discharge.
Special attention shall be given to pilot lights that are not automatically disconnected at end of discharge.

Discharged Cells

EG 207 batteries must not be left in a discharged condition after supplying the load, but must be immediately returned to float recharge mode.
Failure to observe these conditios may result in greatly reduced service life and unreliability.

Accidental deep discharged

The battery must then be recharged with 2.23 V/cell, with a current imperatively limited to 0.1C_{10} capacity in order to prevent excessive heating. As the internal resistance is high in the beginning, a minimum charge of 96 hours is necessary.

important notice : this type of deep discharge will provoke a premature deterioration of the battery and a not negligible effect on the life expectancy.

The effect of temperature on capacity

Correction factor of the capacity, according to the temperature, the reference temperature being 20°C.

Discharge time (hour)	End voltage (Volt)	Temperature °C				
		-10°C	0°C	10°C	20°C	30°C
1	1.67	0.39	0.59	0.80	1	1.05
3	1.75	0.55	0.70	0.85	1	1.05
5	1.77	0.60	0.74	0.87	1	1.04
10	1.80	0.60	0.74	0.87	1	1.04

MAINTENANCE/CHECKS

EG 207 are maintenance free, sealed, lead acid batteries and do not have to be topped up.
The containers and lids shall be kept dry and free from dust. Cleaning must be done exclusively with a wet cotton cloth.
Every month, check that total voltage at battery terminals is (N x 2.23 V) for a temperature of 20° C. (N being the number of cells in the battery).
Once a year, it is necessary to effect a reading of the voltages of cells constituting the battery.
It is necessary to keep a logbook in which the measured values can be noted as well as power cuts, discharge tests, etc. An autonomy control can be effected once a year.

SPECIAL APPLICATIONS

Whenever the EG 207 is used for special applications such as cycling or under extreme ambients conditions please contact our SALES OFFICE for recommendations.

TECHNICAL DATA OF CHARGING WITH A CONSTANT VOLTAGE

Type	Ah/10hrs	Recommended charging current (A)
2 EG 200	200	20
2 EG 250	250	25
2 EG 300	300	30
2 EG 350	350	35
2 EG 420	420	42
2 EG 490	490	49
2 EG 600	600	60

STANDBY POWER SYSTEMS

Stationary batteries - Safety precautions and maintenance

• Safety

1) Remember : NO SMOKING is the rule in battery rooms.
2) Always wear protecting glasses, gloves and preferably protective clothing.
   ELECTROLYTE IS A CORROSIVE SULPHURIC ACID SOLUTION.
3) TO AVOID ELECTROSTATIC CHARGES AND EXPLOSION RISKS, whether cells are dry or full, charged or discharged, they can always contain explosive gases (hydrogen and oxygen) which can, in presence of a spark or flame, cause an explosion. It is therefore forbidden :
   - to smoke in battery rooms
   - to create electric sparks
   - to use soldering equipment
   - to use portable machines plugged into an electric plug
   - to wear clothes likely to acquire an electrostatic charge (nylon)
   - to use unprotected tools
   - to keep metallic objects near the battery (to avoid spark formation).

   If the preceding safety conditions are fulfilled, "discharge " yourself regurarly into the earth by touching a metallic part (door, water pipe, etc.) in order to eliminate electrostatic charges acquired while working on the battery, such as : taking off protection caps or covers, checking voltage, etc.
4) Take care not to create accidental short-circuits by dropping a metallic object on intercell connectors.

• Equipment

- Densimeter
- Thermometer
- Filler
- Voltmeter

• Maintenance

- Keep containers, lids and battery room perfectly clean.
- Wipe out salt and acid stains on terminals, connections and lids with a wet sponge.
- Never clean containers and lids with solvents, detergents, oil or similar products.
- Wash vent plugs periodically (about once every 2 years) in clean water and dry them before putting them back on the battery.

• Every month :

1) Check total voltage at battery terminals. It must equal : N x U where N = number of battery cells
   U = floating voltage per cell
   to be applied according to cell type and annual average room temperature.
2) Measure voltage, specific gravity and temperature of a few reference cells.
3) Check electrolyte levels.
4) Measure room temperature.

• Every quarter :

1) Measure total voltage of battery and ambient temperature.
2) Measure all cells voltages.
3) Measure specific gravity of a few cells with varying voltages as well as electrolyte level and temperature.
4) Apply equalizing charge.
   AN AUTONOMY TEST CAN BE APPLIED ONCE OR TWICE A YEAR.

• Water topping up

- Filling up with distilled or de-ionized water must be carried out on a charged battery, before electrolyte reaches minimum level.
- When adding water, never exceed maximum level.
- Time intervals between two water topping up vary from 1 to 3 years, in terms of :
  - type of alloy
  - cell type
  - room temperature
  - battery age.
- After having checked electrolyte levels, it is necessary to apply an equalizing charge to homogenize electrolyte until nominal specific gravity is obtained.

INTRODUCCION

Los cargadores Saft Nife de la serie SLR, estan diseñados para una vida útil larga y una gran confiabilidad en operacion continua para aplicaciones comerciales e industriales Esto se logra mediante un amplio programa que incluye una ingenieria de diseño muy prudente, el empleo de tecnicas de inducción modernas y programas de prueba del tipo de unidades en serie.

Hemos preparado este manual de instrucciones y paquete de documentación para familiarizar al usuario con esta unidad y que sirva como una guía para su propio uso y mantenimiento Para asegurar una operación libre de problemas, el usuario debera familiarizarse con el contenido de este manual.

Este documento se puede aplicar a todos los cargadores Saft Nife de la serie SLR. Incluye declaraciones breves acerca de las opciones disponibles. Si existen algunas de ellas, osu información se incluye actualizada en la última sección de este manual.

Aprovechamos la ocasión para agradecerle la preferencia por los productos SAFT NIFE.

1.0 PROPOSITO FUNCIONAL

1.1 Descripcion

El cargador de baterias Saft Nife es controlado mediante SCR's para proporcionar una fuente de alimentacion de CD idónea y altamente estable para cargar baterias de Níquel-Cadmio, Plomo - Calcio y Plomo - Antimonio.

Las características que incluye son:

- carga a voltaje constante
- control de limitación de corriente
- interruptor manual de flotación/régimen alto con regreso automático.
- control automatico de carga
- arranque lento
- mantenimiento mínimo

1.2 Especificaciones

Características nominales de entrada

VOLTAJE	:	120,208 o 240 Vca (dependiendo del rango de cd)
TOLERANCIA	:	de +10% a -10%
FRECUENCIA	:	57-63 Hz
FASE	:	Monofásico

Características nominales de salida

VOLTAJE NOMINAL	MAXIMO	
12	16.0	Vcd
24	32.0	Vcd
48	63.0	Vcd
120	154.0	Vcd

Rango de voltaje en cd:
Flotación del 80% al 135% del cd nominal
Régimen Alto del 80% al 135% del cd nominal

Estabilidad de Voltaje (estático) : +/- 0.5%
Bajo las siguientes condiciones:
del 1 al 100% de la carga con
+/- 10% de variación de voltaje de entrada
+/- 5% de variación en la frecuencia

Rizo de salida : Un máximo del 2% del voltaje nominal de cd cuando se conecta a una bateria de capacidad en Amperes-hora de por lo ménos cuatro veces el régimen de corriente de salida del cargador.

Corriente : 5, 10, 20, 30, 50, 75 o 100 Acd (modelos 12, 24 y 48 Vcd)
5, 10, 15, 30 o 50 Acd (modelos 120 Vcd)

Límite de Corriente :
Ajustable de 20% al 100% de la corriente nominal de cd

Estabilidad de Corriente :
+/- 2% de la corriente de límite

1.3 CONTROLES

- Boton de régimen alto manual
- Potenciómetro de voltaje en flotación
- Potenciómetro de voltaje en régimen alto
- Potenciómetro de límite de corriente

1.4 INDICADORES

- Voltmetro de cd, 3" tolerancia 2%
- Ampermetro de cd, 3" tolerancia 2%
- Indicador de encendido verde LED
- Indicador de régimen alto ambar LED

1.5 CONDICIONES AMBIENTALES

Temperatura Ambiente	:	de -10 C a +40 C
de Operación	:	de +40 C a +55 C se reduce la corriente nominal a razon de 1.25% /1 C
de Almacenamiento	:	de -25 C a + 70 C
Altitud	:	1000 msnm de 1000 a 4000 m con una reducción a razon de 6.7% /1000 m
Humedad Relativa	:	95% sin condensación
Enfriamiento	:	por convección

1.6 PROTECCIONES

Para la entrada de CA cuenta con un dispositivo termo-magnético contra sobrecargas
Para la salida de CD un fusible
Supresores de tensión en CA y CD
Circuito de Arranque lento
Protección contra inversión de polaridad en bateria

1.7 GENERALIDADES

1.7.1 Magnéticas

Clase : 155 C
Temperatura de aislamiento mínima : 185 C
Voltaje de ruptura en aislamientos : 2500 Vrms mínimos

1.7.2 Alambrado

Aislamiento : 600 V
Todos los cables estan identificados bajo especificaciones NEC, NFPA - 70

1.7.3 Gabinete

Tipo : NEMA - 1 con ventilacion
Terminacion : Pintura Epoxica
Color : Gris ASA 61
Panel : Azul Cadmio
Terminación bastidor : Dicromato de Zinc amarillo

1.7.4 Pruebas

Evaluado de acuerdo a NEMA RI - 2

1.7.5 Respuesta en la salida

Cambio en la carga	Un elemento unico (L/LC) filtro en la carga de la bat.	
10 - 100%	-5%	250 ms
100 - 10%	+5%	70 ms

2.0 OPCIONES

1) Una tarjeta de alarmas con las opciones siguientes:
- LED indicador de falla de CA
- LED indicador de alto voltaje de CD
- LED indicador de bajo voltaje de CD
- LED indicador de + a tierra
- LED indicador de - a tierra
- LED indicador de falla del rectificador
- Interruptor para prueba de LED's/restablecimiento
- Relevador de alarma común

Especificaciones para los contactos del relevador
CA : 240 Vca, 5 A, 480 VA, FP= 1.0
CD : 100 Vcd, 5 A, 120 W, Resistivos

2) Compensación de temperatura en la bateria
3) Límite de corriente en la bateria
4) Compartimiento de carga (cargadores en paralelo)
5) Contactos de alarmas. Arriba mencionadas 6 alarmas

3.0 INSTALACION Y ALAMBRADO

3.1 Instalación

Coloque el cargador en el lugar deseado, de acuerdo al dibujo dimensional mostrado en la última sección del manual. Evite los lugares en donde se encuentren equipos que generen calor, mucha suciedad o humedad. Todos los gabinetes deberán ser montados verticalmente. Mantenga distancias de ventilación segun se muestra en el dibujo (por ejmplo: 51mm en la parte posterior y 254 mm en la superior e inferior). NO BLOQEE LAS RANURAS DE VENTILACION.

3.1.1 Gabinetes de pared

Instale las unidades que se colocan en la pared utilizando tornillos de 1/4" de diametro o más grandes de acuerdo al peso de la unidad y del material de la pared. Con los tornillos en su lugar (hoyos de montaje), instale el gabinete. Abra la puerta para poder tener acceso a los tornillos y poder ajustarlos.

3.1.2 Gabinetes de piso

Los gabinetes para montaje en piso Saft Nife se pueden mover facilmentemediante el uso de un patín hidraulico. Observe que las placas de ventilación son removibles, dando acceso al elemento de izaje para tirar de él suavemente.

3.2 Inspección

Antes de efectuar cualquier conexión al cargador, se debera verificar lo siguiente:
1) La placa de especificaciones de operación para asegurar que la alimentacion de CA de entrada y la bateria corresondan a los parámetros del cargador.

2) Que todas las fuentes de alimentación de llegada al cargador esten apagadas

3) Que las protecciones de CA y CD del cargador esten desactivadas

4) Que todos los desechos dentro y alrededor del equipo hayan sido eliminados.

3.3 Conexiones

La entrada de cableado al gabinete se efectúa normalmente por el fondo. Los conductos pueden ser conectados en la tapa, parte posterior o a los lados según se requiera. Para una adecuada conexión de las entradas refierase al esquema del cargador, al final del manual Instale y alambre la bateria de acuerdo al diagrama de distribución proporcionado por el fabricante de la bateria.
Cuando se hagan conexiones al cargador utilice cables del calibre adecuado para la corriente de salida del cargador, listada en la placa de datos característicos del cargador. Refiérase al diagrama esquemático del cargador.
Si la bateria esta colocada a una destancia considerable del cargador, los cables deberan elegirse para una caida de voltaje mínima y para la corriente de salida máxima de CD.

3.3.1 Conexiones de la carga y de la bateria

Con las fuentes de alimentación al cargador y las protecciones de CA y CD apagadas, haga las siguientes conexiones:
- Para evitar accidentes, observe la polaridad adecuada.
- Alambre la terminal de +Vcd y la terminal positiva de la carga a la terminal positiva de la bateria
- Alambre la terminal de -Vcd y la terminal negativa de la carga a la terminal negativa de la bateria

Refiérase al diagrama del cargador, conforme se requieran conexiones no estandares.

NOTA. La carga de CD se deberá conectar a las terminales de la bateria y nó a las terminales del cargador. Esto es vital para aplicaciones que requieren de altas corrientes.

3.3.2 Conexión de la alimentación de CA

Verifique la linea de CA, sus valores de voltaje, frecuencia y fase deberan adecuarse a las especificaciones segun se lista en la placa de caracteristicas del cargador, localizada al frente. La línea

de CA debera ser la adecuada para permitir el manejo de máxima capacidad de corriente, segun se indica en las características del interruptor de entrada. Conecte la entrada de CA a las terminales indicadas en la secuencia de fase correcta. Asegúrece de conectar la terminal de tierra (GND).

PRECAUCION : Las celdas cargadas, contienen mucha energia almacenada y se deberá tener cuidado cuando use herramientas metálicas alrededor de la bateria para evitar cortos.

3.4 Controles opcionales

3.4.1 Compensación de temperatura en la bateria (de inserción en tarjeta principal)

Este circuito compensa el voltaje de salida de la unidad a una temperatura relativa de la bateria en un rango de -0.18% / C de -20 C a +50 C, reduciendo a 0% / C en un rango de -40 C a + 80 C respectivamente. Esta opción puede ser usada para compensar el voltaje del cargador.
Esta opción auxilia al cargador de baterias reduciendo el consumo de agua e incrementando la vida de las baterias. El sensor externo se monta en la bateria y se alambra hacia la unidad.

3.4.2 Límite de corriente de bateria y compartimiento de la carga. (de inserción en tarjeta principal)

3.4.2.1 Límite de corriente de bateria

El amplificador de límite de corriente de bateria, en conjunto con un SHUNT (conectado en serie a la bateria) permite un control de la corriente de carga de bateria, independiente del circuito de límite de corriente principal. Esta función se aplica normalmente cuando la corriente total de salida es demasiado grande para la bateria (por ejemplo una bateria pequeña)

3.4.2.2 Compartimiento de carga

El compartimiento de carga permite a dos o más cargadores operar en paralelo dentro del 10% uno del otro sin alambrado adicional.

3.4.3 Tarjetas de alarmas opcionales

La tarjeta de alarmas, cuando de suministra, provee un medio de anunciarse mediante un relevador de alarma remota para las siguientes funciones:

3) Que las protecciones de CA y CD del cargador esten desactivadas

4) Que todos los desechos dentro y alrededor del equipo hayan sido eliminados.

3.3 Conexiones

La entrada de cableado al gabinete se efectúa normalmente por el fondo. Los conductos pueden ser conectados en la tapa, parte posterior o a los lados según se requiera. Para una adecuada conexión de las entradas refierase al esquema del cargador, al final del manual Instale y alambre la bateria de acuerdo al diagrama de distribución proporcionado por el fabricante de la bateria.
Cuando se hagan conexiones al cargador utilice cables del calibre adecuado para la corriente de salida del cargador, listada en la placa de datos característicos del cargador. Refiérase al diagrama esquemático del cargador.
Si la bateria esta colocada a una destancia considerable del cargador, los cables deberan elegirse para una caida de voltaje mínima y para la corriente de salida máxima de CD.

3.3.1 Conexiones de la carga y de la bateria

Con las fuentes de alimentación al cargador y las protecciones de CA y CD apagadas, haga las siguientes conexiones:
- Para evitar accidentes, observe la polaridad adecuada..
- Alambre la terminal de +Vcd y la terminal positiva de la carga a la terminal positiva de la bateria
- Alambre la terminal de -Vcd y la terminal negativa de la carga a la terminal negativa de la bateria

Refiérase al diagrama del cargador, conforme se requieran conexiones no estandares.

NOTA. La carga de CD se deberá conectar a las terminales de la bateria y nó a las terminales del cargador. Esto es vital para aplicaciones que requieren de altas corrientes.

3.3.2 Conexión de la alimentación de CA

Verifique la linea de CA, sus valores de voltaje, frecuencia y fase deberan adecuarse a las especificaciones segun se lista en la placa de características del cargador, localizada al frente. La línea

de CA debera ser la adecuada para permitir el manejo de máxima capacidad de corriente, segun se indica en las características del interruptor de entrada. Conecte la entrada de CA a las terminales indicadas en la secuencia de fase correcta. Asegúrece de conectar la terminal de tierra (GND).

PRECAUCION : Las celdas cargadas, contienen mucha energia almacenada y se deberá tener cuidado cuando use herramientas metálicas alrededor de la bateria para evitar cortos.

3.4 Controles opcionales

3.4.1 Compensación de temperatura en la bateria (de inserción en tarjeta principal)

Este circuito compensa el voltaje de salida de la unidad a una temperatura relativa de la bateria en un rango de -0.18% / C de -20 C a +50 C, reduciendo a 0% / C en un rango de -40 C a + 80 C respectivamente. Esta opción puede ser usada para compensar el voltaje del cargador.
Esta opción auxilia al cargador de baterias reduciendo el consumo de agua e incrementando la vida de las baterias. El sensor externo se monta en la bateria y se alambra hacia la unidad.

3.4.2 Límite de corriente de bateria y compartimiento de la carga. (de inserción en tarjeta principal)

3.4.2.1 Límite de corriente de bateria

El amplificador de límite de corriente de bateria, en conjunto con un SHUNT (conectado en serie a la bateria) permite un control de la corriente de carga de bateria, independiente del circuito de límite de corriente principal. Esta función se aplica normalmente cuando la corriente total de salida es demasiado grande para la bateria (por ejemplo una bateria pequeña)

3.4.2.2 Compartimiento de carga

El compartimiento de carga permite a dos o más cargadores operar en paralelo dentro del 10% uno del otro sin alambrado adicional.

3.4.3 Tarjetas de alarmas opcionales

La tarjeta de alarmas, cuando de suministra, provee un medio de anunciarse mediante un relevador de alarma remota para las siguientes funciones:

El nivel de la alarma de conexion a tierra esta fijado a 10 mA o 100 ohm/V. La indicacion de la alarma puede ser medida utilizando un voltmetro, conectado entre TP1 (0V) y TP70 para conexiones a tierra POS., y TP80 para conexiones a tierra NEG. Para iniciar las alarmas, utilice una resistencia de un valor adecuado, conectada de la salida positiva de CD a tierra para la conexion a tierra POS. y de la salida negativa a tierra para la conexion a tierra NEG.

El valor de la resistencia se puede calcular utilizando la formula

R = VCD NOM x 100 ohm

Cuando ocurre una alarma, el voltaje en los puntos de prueba sera aproximadamente de 8V. El tiempo de retardo en la alarma esta fijo a 4 segundos.

3.3.5 Falla del Rectificador

Simule una falla del rectificador abriendo el circuito de entrada de CA, o eliminando el fusible de salida de CD. Después de aproximadamente 15 segundos, se encendera el LED H80 que se encuentra en el control principal, y después de 2 segundos mas, se encendera el LED H90 localizado en la tarjeta de alarma.

3.3.6 Prueba de Lamparas/Restablecimiento

Reconecte la carga y utilice el boton pulsador del indicador de prueba/restablecimiento localizado en la tarjeta de alarma para restablecer todas las alarmas.

- Falla de CA
- Alto voltaje de CD
- Bajo voltaje de CD
- Fuga a tierra de +
- Fuga a tierra de -
- Falla del rectificador

El indicador local de cada alarma es suministrado por LED's individuales, montados en la tarjeta de alarmas.

3.4.4 Contactos de alarmas remotas selectivas

Se suministran contactos individuales tipo 'C' para las 6 alarmas arriba mencionadas.
Rango de los contactos 0.6A, 125 Vca, 2 A, 30 Vcd
0.6A, 125 Vcd

4.0 Instrucciones de operación

4.1 Generalidades

El voltaje de salida y la corriente del cargador son ajustados desde fábrica para satisfacer las especificaciones de carga de bateria, por lo que generalmente no se requiere de ajustes posteriores. En caso de ser necesario efectuar algun ajuste, consulte la sección 6.0 para detalles de ajuste.

4.2 Puesta en marcha

La operación adecuada del cargador de baterias requiere que todo el alambrado de entrada/salida, bateria o carga (si la hay) sea conectado adecuadamente segun la sección 2.0. Una vez completado el alambrado, inserte el fusible de salida (si lo quitó previamente). El voltaje de la bateria se indicara en el voltmetro de salida. Encienda el interruptor de entrada de CA y el cargador debera incrementar lentamente su voltaje de salida hasta alcanzar el nivel establecido o el límite de corriente.
El cargador arrancara en el modo de flotación. Conmute el cargador hacia el modo de régimen alto para permitir la carga de la bateria, por el período de tiempo especificado por el fabricante de la bateria. Después que éste tiempo se ha completado, el cargador regresa automáticamente al modo de flotación. Con esto se evita sobrecargar la bateria y por ende algun daño a la misma. Esta función es controlada automáticamente por el Control Automático de Carga (CAC) o manualmente mediante el boton de 'régimen alto programado'

4.3 Apagado

Apague el cargador utilizando el interruptor de CA y observe que no existe corriente en la salida. El

voltaje de salida estará indicandose una vez que el fusible de salida de CD ha sido instalado.

4.4 Operación

Durante la operación normal, el cargador compensara la carga adquirida de la bateria por el regulador.
Los cargadores recargarán automáticamente la bateria en 'régimen alto' después de una descarga. Una carga periódica en el modo de régimen alto se podría requerir en algunos casos (por ejemplo en un sistema de alerta).
La función de régimen alto puede ser activada oprimiendo el boton iluminado como 'régimen alto programado'
El cargador regresará automáticamente a flotación después de 6 horas.

PRECAUCION : NUNCA DEJE EL CARGADOR EN EL MODO DE 'REGIMEN ALTO' POR MAS TIEMPO DEL RECOMENDADO POR EL FABRICANTE DE LA BATERIA. UNA SOBRECARGA OCASIONARA QUE LA BATERIA GASIFIQUE (POR ELECTROLISIS). ESTO CONSUMIRA EL AGUA REDUCIENDO EL NIVEL DE ELECTROLITO Y PUEDE SER CONTRAPRODUCENTE PARA LA VIDA DE LA BATERIA.

4.5 Controles

En el panel frontal se encuentran botones de contacto e indicadores. Uno de ellos es el control manual del modo de operación: 'Régimen Alto Programado'

'Regimen Alto Manual'
Presione momentáneamente el boton para inicializar el temporizador de CAC. Para cancelarlo presione por 3 segundos y luego suelte el botón pulsador

NOTA : El tiempo programado de régimen alto (6 hrs) se incrementará por el tiempo que el cargador permanezca en límite de corriente.
Después de haberse completado el tiempo inicializado por el boton pulsador, el cargador regresará a flotación

4.6 Verificación de operación funcional

4.6.1 Prueba del estado de la carga de la bateria

El estado aproximado del estado de la carga de la bateria puede ser determinado mediante una verificación sencilla.

1) Conmute el cargador a 'régimen alto'
2) Observe que la unidad entre en límite de corriente (en el ampermetro de salida)
3) Si el cargador permanece en el límite de corriente

por mas de 36 segundos, la bateria demanda la carga de régimen alto. Si la bateria ya está cargada adecuadamente, el cargador abandonará el modo de límite de corriente (esto se manifiesta como la disminución en la corriente de bateria o a la salida del cargador) . Presione y mantenga por 3 segundos el boton de régimen alto para restablecer el cargador a su modo de flotación. Si el cargador se encuentra en límite de corriente, aún cuando se oprima el boton, el cargador no regresará al modo de flotación.

4.7 Verificaciones periódicas

4.7.1 Voltajes de Flotación/ Régimen Alto

Los voltajes de flotación y régimen alto deberán ser verificados periódicamente (semestralmente) para el cumplimiento de los requerimientos establecidos en la seccion 6.0

4.7.2 La bateria

La bateria es una parte importante de su sistema que se le deberá proporcionar mantenimiento regularmante segun recomendación del fabricante. Se deberá poner especial cuidado en el nivel de electrólito en las celdas ventiladas.

5.0 Operación y descripción de circuitos

5.1.1 Bosquejo del rectificador

El cargador SLR convierte la potencia de CA a CD, controlando el voltaje y corriente de salida. Esto permite que la unidad funcione como un cargador de baterias Se pueden utilizar varias funciones de control para lograr satisfacer los requerimientos de las baterias y las cargas, mejorando el funcionamiento y ayudar a la carga automática.

5.1.2 Operación del cargador SLR

(Observe la figura 5.1.a) El voltaje de CA se aplica al embobinado primario del transformador de potencia a traves del interruptor de CA. El transformador aisla galvánicamente el voltaje principal de CA de los voltajes del secundario elevándolo o disminuyéndolo a los niveles requeridos.
El embobinado secundario esta conectado a un puente rectificador controlado de onda completa, compuesto por

dos tiristores, dos diodos y un diodo freewheeling. El puente controlado por fase convierte la señal de CA no regulada a un voltaje de CD regulado. El puente se conecta a través de una inductancia L1 y un ampermetro (o derivador) al negativo de salida. Y a través de un fusible F1 a la terminal positiva de salida.
Para el control del voltaje y la corriente, se utilizan dos lazos de realimentación independientes. Sólo una de ellas esta activa a la vez.

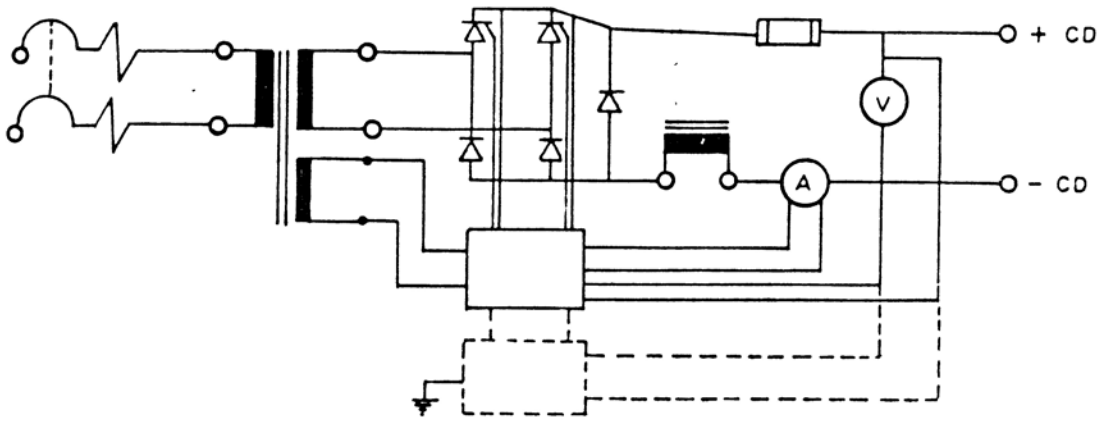

Fig. 5.1.a Cargador de baterias típico SLR

El voltaje de CD es realimentado a la tarjeta de control, encargándose de su regulación en ambos modos flotación y régimen alto. Ambos niveles pueden ser ajustados en la tarjeta de control. El rectificador opera normalmente en el modo de flotación. El modo de régimen alto puede ser operado de manera automático (mediante un temporizador interno) o manualmente mediante la presión del pulsador de régimen alto.

En este modo el rectificador es controlado mediante un control automático de carga existente en la tarjeta de control. Si la demanda de corriente en la salida excede la característica nominal, el rectificador conmutará del modo de voltaje constante al modo de corriente constante. El voltaje alcanzado en el derivador SH (proporcional a la corriente de salida) es sensado y procesado por un amplificador de límite de corriente en la tarjeta de control. El cargador regula su salida de voltaje y corriente mediante el control del puente de tiristores. El puente está diseñado como un rectificador de onda completa y los tiristores determinan la cantidad de corriente proporcionada a la salida. El tiristor está apagado y enciende hasta que le aplican un pulso de disparo en la compuerta. Una vez disparado, el tiristor permanece conduciendo en su polaridad directa hasta que la corriente que fluye por él, es cero.

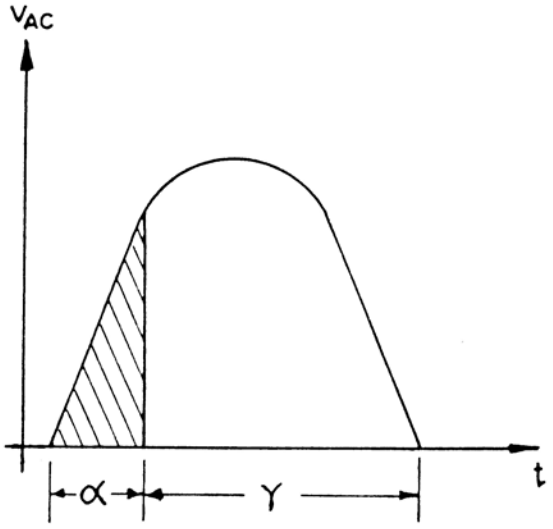

Fig.5.1.b Control del Angulo de fase

El control de ángulo de fase se reliza mediante la variación del retardo en los pulsos de disparo con ello tambien se varía la cantidad de energia disponible en las terminales de salida. Si se requiere de mucha corriente el pulso de disparo comenzará incrementando durante el

medio ciclo de la onda senoidal y viceversa. El voltaje de salida se compensa por éste método tambien.

5.2 Descripción del circuito de control

5.2.0 Generalidades

La tarjeta de control regula automáticamente la salida de voltaje y de corriente dentro de los límites establecidos por los potenciómetros de la tarjeta. Opera retardando el pulso de disparo respecto del cruce por cero de la alimentación de CA, con el fin de controlar el ángulo de conducción de los SCR's.
Los potenciómetros de la tarjeta permiten ajustes independientes de 'Flotación', 'Régimen Alto' y Límite de Corriente.

5.2.1 Fuente de alimentación

De los embobinados aislados del transformador principal, se proporcionan 20 Vca al puente D1-D4 y C1 filtra la CA rectificada. La resistencia R1 y el zener regulador DZ1 proporcionan un voltaje de 15 Vcd para la circuitería de control. TP5 es usado como punto de prueba común para todas las mediciones de voltaje.

5.2.2 Sincronización

Los diodos D5 y D6 rectifican la señal de CA, produciendo un nivel de CD no filtrado, el divisor resistivo R2-R3 El transistor Q1 sensa el rizo de CA y enciende cuando el voltaje de CD es mayor que el Vbe del transistor e inversamente cuando este cae abajo de Vbe. Por tanto un pulso de 0.5 ms es generado en cada cruce por cero. El pulso positivo es aplicado a Q2, el cual enciende y reseta al integrador en el cruce por cero.

5.2.3 Amplificador de voltaje de error y referencia de voltaje.

U1 forma el corazón de una referencia de voltaje interna, de presición y un amplificador de voltaje de error. La referencia de voltaje (+7 Vcd) esta disponible del pin 6 y es usado en otras secciones de la circuiteria.
Para la regulación del voltaje de salida, una muestra del voltaje (ajustable) se toma del divisor de resistencias y es aplicado al -Ve del amplificdor de error, comparándolo con una referencia de voltaje fija. La diferencia (error) es amplificado 100 veces y aplicado al modulador.
El ajuste de voltaje de flotación es llevado a cabo por el potenciómetro P1 y el ajuste de régimen alto por P2 cuando el pin 39 es cortocircuitado al pin 25.

5.2.4 Amplificador de corriente de error

U2a, esta configurado como un amplificador diferencial para reforzar la señal de corriente de salida del SHUNT en cualquier modo único, finalizado o diferenciado.
La señal de corriente amplificada es aplicada a la entrada -Ve del amplifacador de corriente U2b, con una referencia ajustable en la entrada +Ve. La señal de error amplificada se aplica al modulador.

5.2.5 Modulador

La función del modulador es controlar el ángulo de conducción de los SCR's. Opera produciendo un retrazo en los pulsos de encendido respecto al cruce por cero de CA. Este retrazo es aproximádamante igual a la proporción inversa del voltaje de control en su entrada (S'MOD).
U2c junto con sus componentes asociados forma un generador de rampa no lineal. El generador de rampa no lineal ayuda a agrupar las características de transferencia del circuito de control a la respuesta del filtro de entrada puente/inductor. El generador de rampa es reseteado en cada cruce por cero por el circuito de sincronización.
La modulación del corrimiento de fase de la señal de control es producida por un muestreo natural en U2d, el cual compara la rampa negativa con la señal de control. Una señal de habilitación al circuito de encendido es generado, cuando la rampa de voltaje es ligeramente inferior al voltaje de control.
El voltaje de control de la entrada del modulador (S' MOD) es determinada por la condición 'OR' del amplificador del voltaje de error, amplificador de corriente de error, arranque lento o capacitor limitador de voltaje. Cualquiera de éstos circuitos pueden operar para reducir el tiempo de conducción de los SCR's.

5.2.6 Arranque lento

El capacitor C11 forma el corazón del circuito de arranque lento. La velocidad de crecimiento del voltaje a través del capacitor, producida por la corriente de carga que fluye a traves de R49, es aplicada al transistor Q3 y a la terminal de modulación. El tamaño del capacitor determina la velocidad de crecimiento de la corriente de salida del cargador, la cual es aproximadamente lineal.

5.2.7 Limitador de voltaje

Las resistencias R48 y R50 forman una red divisora de voltaje la cual es efectivamente alambrada a través del capacitor del filtro de entrada. El rango de voltaje es llevado a cabo por el uso de una resistencia en serie

R48. Cuando el voltaje a través de R50 desarrolla aproximadamente 13.5 V. El diodo zener DZ4 inicia la - - conducción, por tanto polariza al LED dentro del optoacoplador U3. Esto provoca que conduzca el transistor dentro de U3, ocasionando una reducción del ángulo de conducción de los SCR's, a través de Q3 de la terminal del modulador.

5.2.8 Circuito de encendido

El circuito de encendido entrega un tren de pulsos al SCR cuando está habilitado. El transistor Q5 (conmutador de potencia), Q4 sensor de corriente y el transformador de pulsos T1 están configurados como un oscilador de relajación auto-oscilante a una frecuencia aproximada de 10 KHz. El transistor Q4, cuando enciende (por el comparador U2d), deshabilita el circuito de disparo. D17 en el devanado secundario rectifica el pulso de salida y lo aplica a los SCR's a través de unas resistencias de compartimiento de corriente R46 y R47.

5.2.9 Control automático de carga. (CAC) Tarjeta de Inserción.

El amplificador operacional U1a sensa el límite de corriente monitoreando el amplificador de voltaje de error en la forma tradicional. El LED DS1, indica la condición de límite de corriente. El capacitor C4, junto con U1d forma un simple circuito de retrazo de tiempo. El retrazo de tiempo es seleccionado por la reisitencia R13a-c (haciendo una selección apropiada como se indica en el esquemático). U3 suministra el voltaje de referencia para la tarjeta.
U2c y U2d estan configurados como un candado R-S. El cual es activado por una transición positiva de U1b. El candado puede ser activado tambien por una señal externa de pulsadores momentáneos (o cortocircuitando TP a TP sobre la tarjeta de circuito impreso PCB).
El reset es afectado manteniendo la señal activa (manteniendo el reset de la PB) por mas de dos segundos.
Cuando el candado esta activo, el temporizador U4 es activado y una instrucción de régimen alto es dado a través de Q2 y Q3. El temporizador se habilita para contabilizar el tiempo, cuando la señal de límite de corriente es eliminada. El período de tiempo es ajustado para 6,10 o 15 horas por la selección de R17/R18 (6 hrs es lo estándar).

NOTA. El cargador no regresará a flotación cuando la botonera manual de régimen alto es presionada, si la unidad esta en límite de corriente.
Las funciones de control opcionales, estan disponibles como tarjetas de inserción, las cuales son insertadas sobre la tarjeta de control de fase. Los sensores requeridos por cada opción estan alambrados al conector de la

tarjeta de control.

5.3.1 Compensación de temperatura en la bateria (CTB). Tarjeta de inserción opcional.

El sensor usado es un termistor de 10K NTC montado en una cápsula terminal de cobre plateado. Normalmente es montada en un conector intercelda. Esto suministra un verdadero sensor de temperatura de bateria. El voltaje de salida es cambiado en un rango de 0.18%/ (sobre el rango de -20 A + 50 C con una compensación reducida en los extremos.
La señal del termistor es linealizada y amplificada por el puente resistivo R1-4 y U1a e invertido por U1b. La señal de temperatura compenzada es aplicada a través de Vrt a la tarjeta principal (La cual viene a ser dominante) U1c esta configurado como un comparador para verificar la integridad del termistor. Con un termistor en circuito abierto, U1c enciende Q1, inhibiendo la compensación de temperatura forzando Vrt a una temperatura simulada de + 30 C. Al mismo tiempo el LED local , DS1 esta encendido.
Lo siguiente es suministrado solamente con 4111-70-12335 01 (opciones no estándares) U1d suministra una alarma para temperatura alta de bateria a través de Q3. al mismo tiempo inhibe cualquier cambio a régimen alto, (forza el regreso del cargador a flotación) hasta que la bateria se enfría. El suministro de P1 permite ajustes a la alarma la temperatua.

5.3.2 Amplificador de corriente de bateria y compartimiento de carga. Tarjeta de inserción

Amplificador de corriente de bateria.

U1a esta configurado como un amplificador de corriente diferencial, el cual amplifica la señal de corriente de bateria del shunt. La señal de corriente amplificada es aplicada al amplificador de corriente de error con una referencia ajustable de P1. La salida a través de D1 es aplicada a el modulador en la tarjeta principal.
Usando esta opción permite un control independiente de la corriente de bateria, aparte de la corriente del sistema, y puede ser requerida cuando la salida del cargador es grande en relación a la bateria. En tales casos esta opción tambien proporciona una acción correcta del control CAC (un ejemplo de tales aplicaciones puede ser en cargas "grandes" con bateria "pequeñas").

Compartimiento de carga.

El circuito lo comprende U1c,d dónde U1c actúa como un amplificador de error amplificando el error (diferencia en una corriente local y una corriente de un cargador

remoto). El cual es usado para ajustar el amplificador de voltaje de error y consecuentemente el voltaje de salida del cargador. Un potenciómetro P2, es usado para inicializar el balance del cargador para sistemas en paralelo.

6.0 Ajustes.

El cargador de bateria es embarcado y armado de fábrica para el sistema de baterias especificando, de tal forma que no se requieran ajustes adicionales cuando se ponga en operación. Sin embargo, si fueran necesarios los ajustes, la sección siguiente debera utilizarse como una guía.

6.1 Herramientas.

- Herramientas de alineación para potenciómetros o un desarmador plano pequeño.
- Un voltímetro de precisión o multímetro digital (precisión + 1% o mejor)
- Un diagrama de la tarjeta de control (fig. 6.0.a)

El voltmetro deberá ser conectado a través de las terminales de salida de CD del cargador.

6.2 Voltaje en Flotación.

6.2.1 Verificacion del voltaje de flotación.

Verifique que el cargador este en modo de flotación, observando que la lampara de 'Régimen Alto' esté apagada. Si el cargador está en el modo de 'Régimen Alto' regréselo a Flotación presionando y liberando el boton de 'Régimen Alto'. No será posible regresarlo a Flotación si el cargador está en el modo de Límite de Corriente.

NOTA: Con el cargador a menos de plena carga, el voltaje de 'Flotación' deberá ser de 1.40 a 1.42 volts, por celda, para baterias de Níquel-Cadmio, o 2.17 a 2.25 volts por celda para baterias de plomo, dependiendo de las especificadiones del fabricante.

Si el voltaje es el adecuado, continue con el párrafo 6.3.

6.2.2 Ajuste del Voltaje en Flotación.

- Verifique que el cargador no esté produciendo la corriente de salida total (No en límite de corriente).
- Reduzca la carga si es necesario.
- Observe el voltmetro mientras efectúa los ajustes.
- Para incrementar el voltaje de salida, ajuste el potenciómetro de Flotación en sentido horario (CW) en

pequeños incrementos hasta que se logre el voltaj
deseado.
- Para disminuir el voltaje de salida, ajuste e
potenciómetro de flotación en sentido antihorario (CCW
en pequeños incrementos hasta que se logre el voltaj
deseado.
- Permita que el voltaje se estabilice despues de cad
incremento antes de continuar.

6.3 Voltaje en Régimen Alto.

6.3.1 Verificación del voltaje en Régimen Alto.

Conmute el cargador a 'Régimen Alto' presionando y
liberando el boton/lámpara de 'Régimen Alto'. La lámpar
de 'Régimen Alto' se iluminará. Permita que el voltaje d
salida y la corriente se estabilice.

NOTA: Con el cargador a una carga menor a la carg
plena, el voltaje en Regimen Alto debera se 1.52 volt
por celda o mayor (1.55V/C estándar) para baterias d
niquel-cadmio o 2.33 volts por celda para baterias d
plomo-ácido, dependiendo de las recomendaciones del
fabricante de la bateria.

6.3.2 Ajuste del Voltaje en Régimen Alto.

Verifique que la carga no esté produciendo una corrient
a plena carga (no en límite de corriente).

- Reduzca la carga si es necesario.
- Observe el voltmetro mientras efectúa ajustes.
- Para aumentar el voltaje de salida, ajuste el
potenciómentro de 'Régimen Alto' en sentido horario (CW)
en pequeños incrementos, hasta lograr el voltaje deseado.
- Para disminuir el voltaje de salida, ajuste el
potenciómetro de 'Régimen Alto' en sentido antihorario
(CCW) en pequeños incrementos hasta lograr el voltaje
deseado.
- Permita que el voltaje se estabilice despues de cada
incremento antes de continuar.
- Cuando quede ajustado adecuadamente, regrese el
cargador al modo de 'Flotación' presionando y liberando
el boton de 'Régimen Alto'.
- Observe que se apague la lámpara de 'Régimen Alto'.

6.4 Ajuste de control automático de carga.

P1 sobre la tarjeta 4111-70-12334-XX ajusta el punto en
el cual el control automático de carga es activado por el
límite de corriente del cargador. Este viene ajustado de
fábrica, pero si un nuevo ajuste de la tarjeta es
requerido, incremente la carga hasta que el límite de
corriente sea alcanzado y ajuste P1 hasta que el LED DS1

encienda.

6.5 Sistema de Límite de Corriente.

6.5.1 Verificacion del Límite de Corriente de bateria (opción) 4111-70-12333-XX.

- Remueva todas las cargas del cargador excepto la bateria.
- Conmute el cargador a 'Régimen Alto' y monitoree la corriente de salida. Esta corriente deberá seguir las recomendaciones del fabricante.

NOTA: Si la bateria esta descargada, una carga adicional a las terminales de la bateria puede ser requerida. Si se desea ajustar el límite de corriente a un valor diferente, o para ajustar una nueva tarjeta, use el siguiente procedimiento.

6.5.2 Ajuste del límite de corriente de bateria.

- Gire el potenciómentro de límite de corriente P1 completamente en sentido horario en la tarjeta 4111-70-12333-XX.
- Aplique la carga que ligeramente exceda el límite de corriente (en las terminales de bateria).
- Observando el amperímetro ajuste P1 en sentido antihorario hasta el límite de corriente deseado.
- Incremente la carga debiendose mantener la misma corriente (aproximadamente).

Si desea ajustar el límite de corriente a un valor menor o ajustar una tarjeta de control nueva, utilice el procedimiento siguiente.

6.5.3 Verificacion del límite de corriente del sistema

PRECAUCION : EL LIMITE DE CORRIENTE VIENE AJUSTADO DE FABRICA AL 100% DE LA CORRIENTE NOMINAL DE SALIDA. NO INTENTE EXCEDER LA CORRIENTE NOMINAL MAXIMA, DEFINIDA EN LA PLACA DE CARACTERISTICAS DEL CARGADOR, YA QUE CONDICIONES INADECUADAS DAÑARIAN AL CARGADOR.

- Incremente la corriente de carga mientras observa el voltmetro de CD. (La carga deberá ser tomada de las terminales de la carga si la opción de límite de corriente de bateria esta aplicada).
- Observe la corriente a la cual el voltaje de salida comienza a disminuir.

6.5.4 Ajuste de Límite de Corriente del Sistema.

PRECAUCION: NO EXCEDA LAS CARACTIRISTICAS NOMINALES DE LA CORRIENTE DE PLACA.

- Gire el potenciómetro de Límite de Corriente completamente en sentido horario (CW).
- Aplique una carga ligeramente mayor que la establecida como nominal (En las terminales de la carga si la opción de límite de corriente de bateria es aplicable).
- Observando el amperímetro, ajuste el potenciómetro del límite de corriente.

6.6 Opción.Compartimiento de carga. Tarjeta P2. 4111-70-12333-XX

Ajusta la corriente entre dos cargadores en paralelo. Este viene ajustado de fábrica, pero si un nuevo ajuste o reajuste es requerido, el siguiente procedimiento deberá ser usado:
- Remueva la bateria y ajuste la carga a un 50% del total
- Ajuste los cargadores a sus voltajes de 'flotación' y despues a 'régimen alto' para que sean los mismos, usando un voltmetro digital.
- Ajuste P2 ligeramente en un cargador y después en el otro, en un ajuste fino hasta que sean iguales (25% por cargador).

6.7 Opción. Compensación de Temperatura en bateria. 4111-70-12333-XX.

Esta tarjeta no requiere ajuste. (P1 no es usado). DS1 indica un termistor abierto.

7.0 Procedimiento de búsqueda de fallas

Las Cartas de Diagnóstico para búsqueda de fallas han sido preparadas para ayudar a aislar la falla en el caso de una falla del cargador. En casos de mal funcionamiento, primero verifique lo siguiente:

a) Todas las conexiones entre celdas y entre contenedores, deben ser de positivo a negativo (en serie), y deben estar sujetos de forma segura.
b) Las conexiones entre la bateria y el cargador son positivo a positivo, negativo a negativo (en paralelo) y deben estar sujetos de forma segura.
c) Voltajes en las celdas individuales. En el modo de flotación estas lecturas de voltaje deberán ser 1.40 a 1.42 volts por celda para baterias de níquel cadmio o 2.17 a 2.25 por celda para plomo ácido. Si hay una variación mayor de 0.05 volts entre celdas con las lecturas más alta y más baja, cargue la bateria en régimen alto durante 24 hrs para igualar voltajes y vuelva a verificar.
d) El voltaje y la frecuencia de CA de entrada, deben cumplir con la entrada de diseño del cargador segun

se muestra en la placa de características nominales.

Despues de verificar si todas las conexiones externas estan correctas, los voltajes en las celdas estan dentro de las tolerancias y el voltaje y la frecuencia de CA en la entrada son iguales a los del cagador. Efectúe detenidamente un análisis en cada bloque y proceda segun lo indicado por el resultado.

S I N T O M A	ACCION CORRECTIVA
El fusible de CD se quema inmediatamante.	Refierase al diagrama de diagnostico # 1
El breaker de la red, abre inmediatamente.	Refierase al diagrama de diagnostico # 2
No hay potencia de salida	Refierase al diagrama de diagnostico # 3
El rectificador opera continuamente en el modo de límite de corriente o el voltaje de salida esta incorrecto.	Refierase al diagrama de diagnostico # 4

NOTA : SE DEBERA TENER CUIDADO EN TODO TIEMPO, PARA EVITAR EL CONTACTO CON CIRCUITOS VIVOS.

7.1 Verificación del ensamble del puente

Para cargadores de 100 A de salida o menores se utiliza modulos de SCR/DIODO. Todas las conexiones se hacen a través de las terminales de los módulos. Para verificar la existencia de un corto circuito, primero desconecte la alimentación de la red de CA que viene de la entrada abriendo el circuito interruptor de CA. Utilice un ohmetro o un multímetro en la escala de baja resistencia y verifique ambas direcciones a través de las componentes. Si se indica un corto circuito, desconecte los alambres para aislar la componente dañada. Un SCR en forma individual indicará un circuito abierto en ambas direcciones Para verificar la compuerta, desconecte la terminal de color blanco (compuerta) y verifique la resistencia de compuerta a cátodo (blanco a rojo) con el ohmetro/multimetro. Las resistencias varían pero típicamente estan dentro del rango de 30 a 100 OHMS en ambas direcciones Tambien verifique la resistencia de compuerta a ánodo, deberá ser esencialmente circuito abierto.
Para los diodos, verifique la resistencia de ánodo a cátodo. La resistencia deberá ser baja de ánodo a cátodo y alta de cátodo a ánodo.

Refiriendose al diagrama esquemático, las componentes deberán cumplir con lo siguiente:

CA1	-	(+) TY1	ALTA	(-)	-	(+)	D3	ALTA
(+)	-	CA1 TY1	ALTA	(+)	-	(-)	D3	BAJA
CA2	-	(+) TY2	ALTA	(-)	-	CA1	D1	ALTA

9.0 Manteniminento

Los cargadores de bateris Saft Nife no emplean ninguna parte móvil mas que los potenciómetros de ajuste y los medidores indicadores utilizados para las alarmas. No se requiere de ningún mantenimiento adicional, al necesario para eliminar el polvo del cargador, las verificaciones periódicas y los ajustes durante la vida de la unidad.

Todas las componentes magnéticas, reisitencias, capacitancias y semiconductores se han seleccionado prudentemente para un período de vida largo.

Se deberá verificar regularmente el estado aproximado de la carga de la bateria. Esto se podrá lograr mediante el procedimiento siguiente:

1) Inicie una carga rápida presionando el boton de régimen alto.
2) Observe que el cargador entre en límite de corriente (en el amperímetro de salida)
3) Si el cargador permanece en límite de corriente por más de 36 segundos, la bateria requiere entonces de una carga en régimen alto. Si la bateria ya ha sido cargada en forma adecuada, el cargador dejará el modo de límite de corriente (obsevada por la disminución de la corriente en la bateria ó a la salida del cargador.
4) Cancele la carga manual en régimen alto si la bateria no requiere de la carga.

Además, regularmente se deberá proporcionar mantenimiento a la bateria como lo indica el fabricante. Se deberá poner atención especial en el nivel de electrólito de las celdas con ventilación. Tambien se deberán verificar los voltajes de 'Flotación' y 'Régimen Alto' semestralmente para que estén de acuerdo a las características mencionadas en la sección 6.0

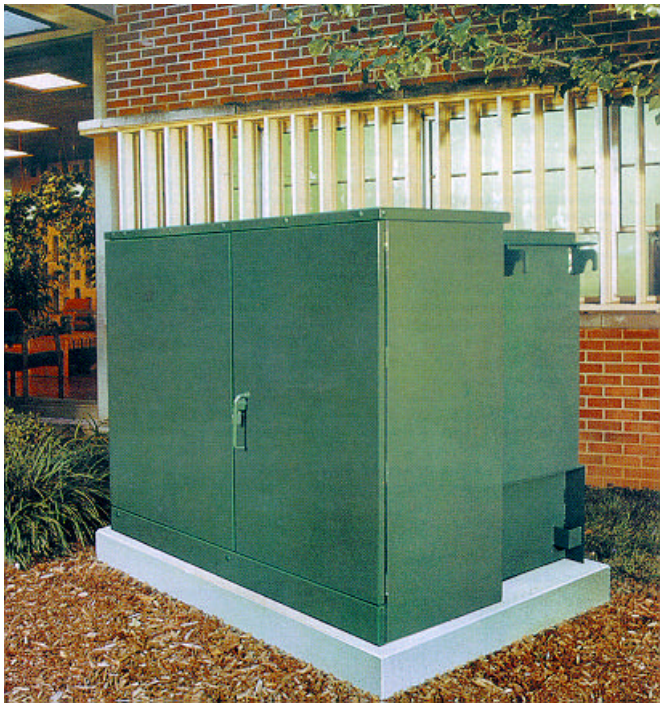
GE Commercial Transformer



Three-Phase Padmounted Transformers

Three-phase COMPAD® Transformers (75-5000 kVA)

COMPAD CONSTRUCTION

COMPAD® oil-immersed transformers are padmounted compartmental-type transformers. Designed for outdoor installation on a concrete pad, the transformers provide underground power distribution to commercial, industrial and institutional loads.

GE COMPAD Transformers are available with oil, R'Temp and silicone insulation fluids. Oil is generally the standard choice for outdoor applications where flash and fire points are not an issue. For applications requiring less-flammable liquids, R'Temp and silicone insulation fluids are generally required. Internal switching in not available in GE silicone fluid-insulated transformers. R'Temp is generally the standard choice when switching is required.

APPROXIMATE FLASH AND FIRE POINTS ARE AS FOLLOWS:

	OIL	R'TEMP	SILICONE
Flash Point	145C	238C	268C
Fire Point	165C	311C	371C

Featuring tamper- and weather-resistant construction for safety, these transformers meet ANSI security requirements. All live parts are completely enclosed in lockable high- and low-voltage compartments, which are interlocked for safety once a user-installed padlock is added.

These power-distribution packages are designed in a neat, clean, modern style and painted olive-green color (Munsell 7GY 3.29/1.5) for pleasing appearance and to harmonize with most surroundings.

Three-phase COMPAD transformers are furnished with an enclosure consisting of high- and low-voltage sections, separated by a steel barrier bolted in place. The low-voltage compartment door is equipped with a steel rod handle with provisions for padlocking. User-installed padlocks are required to complete the cabinet security system. In addition, the doors are so arranged that accessibility to the high-voltage compartment can only be gained after opening the low-voltage compartment door and releasing a captive screw. Cables enter and exit the compartment sections from below, through openings in the mounting pad.

The high- and low-voltage cabinet sections are completely removable with all screws and bolts accessible from inside the compartments. The transformer tank is constructed so that it can be lifted, rolled, slid, or skidded into place on a pad without disturbing the cables.

Standard Ratings

Three-phase COMPAD transformers are rated 75 through 5000 kVA, 60 hertz, 65C rise, up through 34500 GrdY/19920 150 kV BIL with low-voltage ratings of 208Y/120 and 240 delta through 1500 kVA, 480 delta through 3000 kVA, 480 wye/277 through 3750 kVA, 2400 to 7200 delta or wye from 750 kVA through 5000 kVA.

Units comply with ANSI Standards C57.12.22 for live-front application and C57.12.26 for separable insulated high-voltage connector application.

Kilovolt ampere ratings are based upon not exceeding 65C average temperature rise above 30C average ambient with a maximum ambient not to exceed 40C.

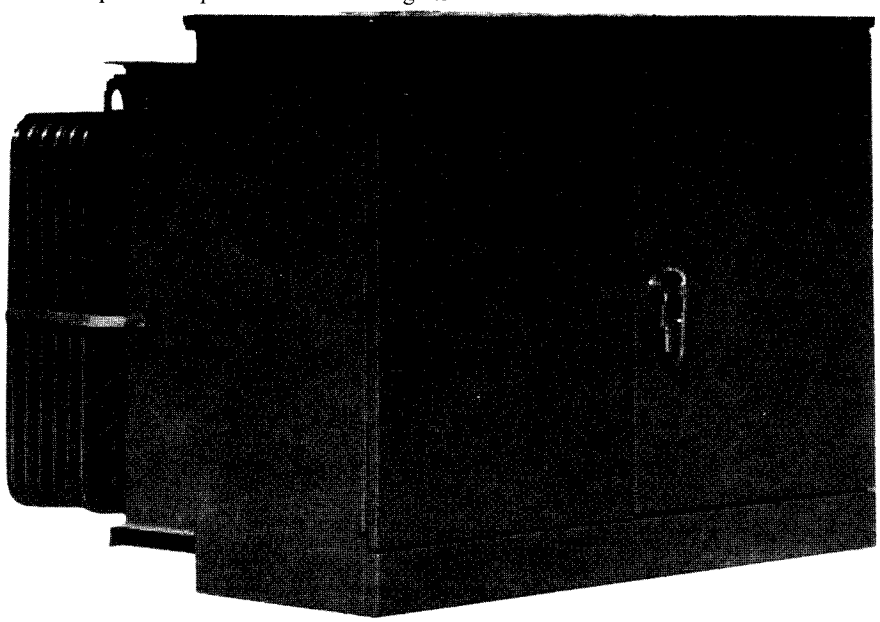
Standard kilovolt ampere ratings are as follow:

75 kVA	500 kVA	2500 kVA
112.5 kVA	750 kVA	3000 kVA
150 kVA	1000 kVA	3750 kVA
225 kVA	1500 kVA	5000 kVA
300 kVA	2000 kVA	

Standard high-voltage basic insulation levels (BIL) for common high-voltage ratings are as follow:

2400 delta or wye 60 kV BIL
4160 delta or wye 60 kV BIL
4800 delta or wye 60 kV BIL
7200 delta or wye 75 kV BIL
8320 delta or wye 75 kV BIL
12000 delta or wye 95 kV BIL
12470 delta or wye 95 kV BIL
13200 delta or wye 95 kV BIL
13800 delta or wye 95 kV BIL
14400 delta or wye 95 kV BIL
16340 delta or wye 95 kV BIL
22860 GrdY/13200 125 kV BIL
23900 GrdY/13800 125 kV BIL
24940 GrdY/14400 125 kV BIL
*34500 GrdY/19920 150 kV BIL

*Also available at 125 kV BIL.



Standard Features and Accessories

STANDARD TESTS PERFORMED

Each GE distribution transformer receives the following tests as required by ANSI Standards. Tests are made in accordance with the ANSI Test Code C57.12.00/C57.12.90, latest revision, and are available by transformer serial number at no charge.

1. No-load loss
2. Exciting current at rated voltage
3. Polarity check
4. Ratio check
5. Dielectric tests at low frequency (high- and low-voltage in accordance with TABLE 1)
   a. For delta high-voltage transformers:
      Applied potential test and induced-potential test
   b. For grounded wye transformers:
      Induced-potential test only
6. Mechanical leak test

In addition to the above required tests, GE performs the following:

1. Load loss
2. Impedance
3. Production line impulse test (in accordance with TABLE 1)

ANSI DESIGN TESTS (NON-STANDARD)

The following tests are performed on new GE transformers with electrical or thermal design configuration:

1. Temperature rise
2. Impulse
3. Short-circuit test*
4. Resistance measurement
5. Audible sound level
6. Dielectric breakdown
7. Mechanical
   -Lifting
   -Pressure

*Not a design test. Listed in ANSI Test Code C57.12.00/C57.12.90 as "other."

Losses and Impedance

The total losses of a transformer shall be the sum of the excitation losses (no-load losses) and the load losses.

The losses represented by test of a transformer or transformers on a given order shall not exceed the specified losses by more than the percentage listed in TABLE 18 (in accordance with ANSI Test Code C57.12.00, latest revision).

TABLE 1

Transformer Rating	BIL Test (Full wave) (kV)	Low-frequency Test (Hi-pot) (kV)
2400/4160Y	60	19
4800/8320Y	75	26
12470GrdY/7200	95	-
7620/13200Y	95	34
13200GrdY/7620	95	-
12000	95	34
13200/22860Y	125	40
14400/24940Y	125	40
24940GrdY/14400	125	-
19920/34500Y	125	40
34500GrdY/19920	125	-
19920/34500Y	150	50
34500GrdY/19920	150	-

NOTE: Transformers may be provided with taps for voltages above the rated voltage values shown in TABLE 1 without increasing the insulation class.

TABLE 1A
Tolerances for Three-phase Transformer Losses

No. of Units on One Order	Basis of Determination	Percentage	
		No-load Losses	Total Losses

2 or More	Each Unit	10	6
2 or More	Average of All Units	0	0

COMPAD® Standard Core-and-coil Construction

Where craftsmanship and manufacturing expertise meet.

Each COMPAD® transformer starts with the careful selection of compatible materials. The five-legged core-and-coil assembly — the heart of the transformer — represents years of research and development efforts directed at improving and developing materials and techniques that result in long, reliable transformer life. For example, a patented metallurgical bonding and specially developed insulation materials contribute to the transformer designed to give you the most efficient operation possible.

A The coils are clamped axially, top and bottom, to prevent shifting under short-circuit conditions.

B The layer insulation paper is coated with a thermal setting adhesive that during the oven-curing process bonds the winding and interlayer insulation into a solid structure.

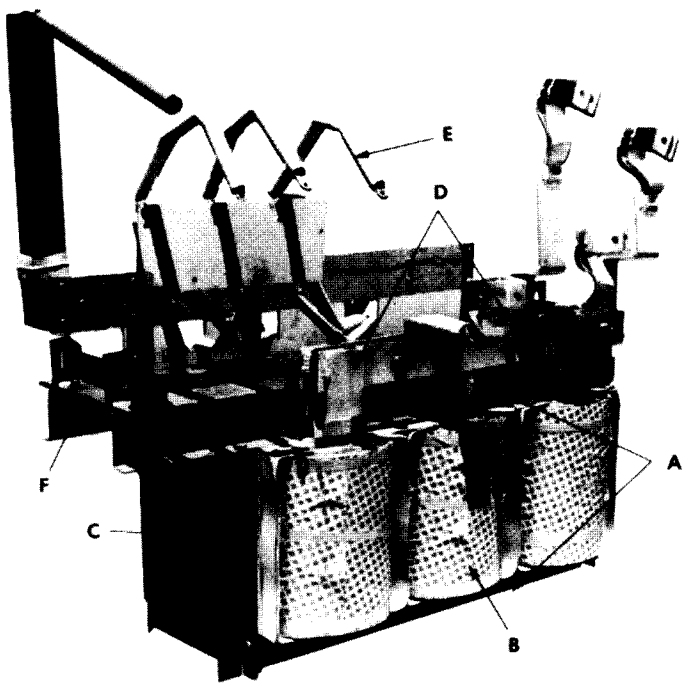
C The transformer core is cradled and retained, minimizing mechanical stresses.

D Transition joints in low-voltage bus structure and leads are welded.

E High- and low-voltage leads are flexible to minimize damage that could result from forces due to short-circuits and shipping.

F Firm positioning of interior assembly within tank is assured by bolting at top corners of the assembly.

G Five-legged core is standard on all COMPAD transformers.



This construction allows use of wye-wye connections to avoid ferroresonance problems and minimize tank heating. Every completed COMPAD transformer is placed in a vacuum chamber where air and moisture are removed before filling tank to proper level with clean, dry de-aerated oil.

GE is the leader in the design and manufacturing of high-efficiency, low-loss transformers. We offer a full range of efficiencies designed to match individual customer costs-of-energy criteria. GE has the product to meet industry needs – from standard efficiency, for customers who purchase on a first-cost basis, to high efficiency and ultra-efficient transformers, for customers who use EEI loss-evaluation methodology or purchase high-efficiency transformers.

The ULTRA Efficient Amorphous Core Transformer technology consists of a new class of metal that has no crystaline structure. The amorphous atomic structure is more easily magnetized and demagnetized 50 to 60 cycles per second in a transformer core resulting in 70 to 85% lower core losses than transformers with silicone steel cores. The combination of GE's advanced core technology, proven coil construction and patented manufacturing processes has resulted in a high-quality, extremely reliable, ultra-efficient transformer offering.

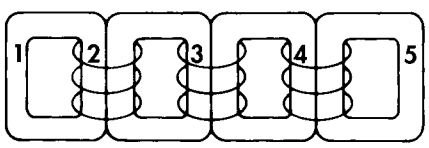
Fully processed grain-oriented silicon core steel is machine-cut and wound, then formed in a rectangular shape. Core quality and characteristics are improved by this method, which also results in less handling damage and more positive core-and-coil alignment. The annealing process eliminates any stress in the core during the fabrication process and results in reduced core losses and improved COMPAD transformer performance.

Enameled primary wire and full-width secondary strip are layered with paper insulation to form COMPAD coils. The strip is edge-conditioned to eliminate sharp edges and burrs that could penetrate paper layer insulation and cause turn-to-turn failures. Proper tension is maintained during the winding process to produce tight, compact coils that assure uniform electrical characteristics and superior resistance to short-circuit forces.

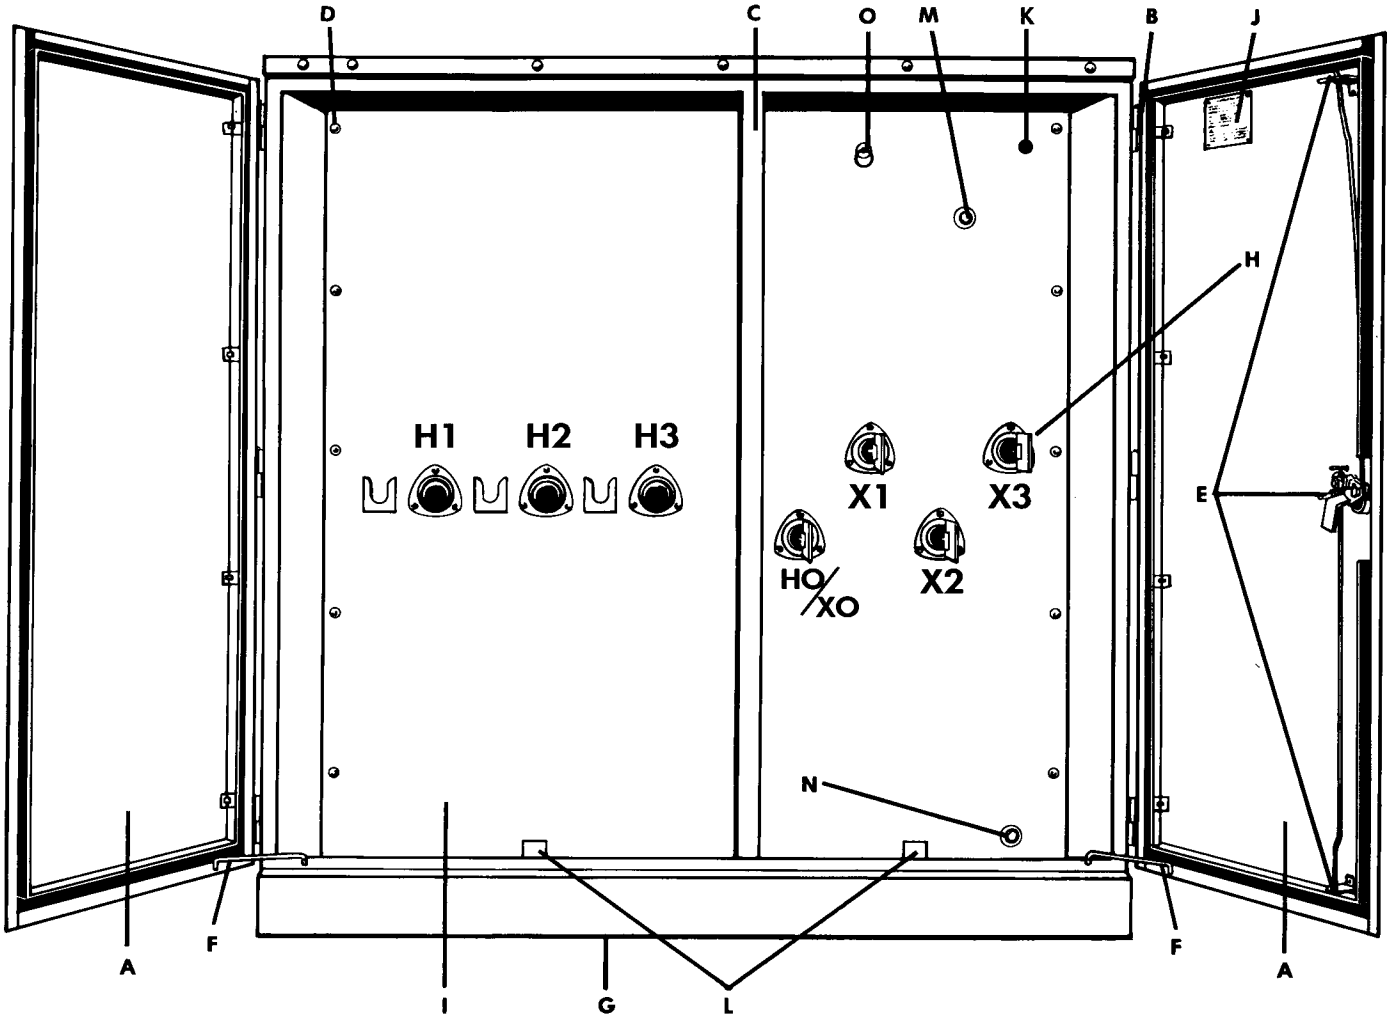
High-voltage coils are wound with conductor that is shaved, drawn and formed into rectangular wire. An enamel coating is applied to thoroughly cleaned wire and cured in successive coatings to assure uniform thickness. The techniques used assure positive bonding of enamel to conductor.

Each unit also goes through final electrical tests – load and no-load losses, exciting current, polarity and ratio checks, dielectric tests at low frequency, impedance test, impulse testing – and results are recorded.

G



Standard Features



A Easily removable compartment doors give authorized personnel added access to compartment interior. A special padlocking provision gives shearing action to the padlock hasp. Double right-angle bends are formed at all points where the doors come together with compartment structure, providing a unit that meets ANSI security requirements.

B Stainless-steel hinges and $^{3}/_{8}$-inch pins inhibit corrosion.

C A rigid, steel partition separates high- and low-voltage compartments to give added strength and safety. This partition acts as a groundplane and reduces the possibility of a voltage potential building up on the partition.

D All-bolted compartment construction permits one-person removal of side panel sections; allows easy, on-site replacement; and affords maximum working space during cabling.

E Three-point latching (shown in open position) of low-voltage door with recurved rod securely wedges top, middle and bottom for a tight, rigid fit free from vibration. Door handle of cold rolled steel permits easy and convenient operation. A bearing on the handle prevents binding.

F Sturdy, captive hold-open devices hold COMPAD® doors in the open position, then store conveniently in transformer door.

G Low sill height affords greater access to cabling area. Transformer sill is easily removed to facilitate installation. Sill construction combined with the front panels, side panels and middle partition provides a rigid cabinet.

H High-quality, low-voltage bushings with bolt-on blades are standard through 300 kVA and on 500 kVA, 480Y/277. Threaded-stud secondary bushings are furnished on RUS units through 300 kVA and 500 kVA, 480Y/277.

I Transformer tank is welded from cover to base for maximum structural strength and leak-free seals. All welds are 100% leak tested.

J The permanent nameplate is conveniently located on the inside surface of the low-voltage door. Nameplate is large and easy to read with cables in place. Permanent serial number identification is also stamped over low-voltage bushings, supplementing serial number on nameplate.

K The filling plug consists of a one-inch NPT opening to the transformer front plate and furnished with a one-inch pipe plug.

L The ANSI tank ground pads consist of one (1) $^{1}/_{2}$ to 13-inch tapped hole in 75 to 500 kVA and two (2) $^{1}/_{2}$ to 13-inch tapped holes in 750 to 2500 kVA units.

M Liquid-level indication consists of a flange with a $^{1}/_{2}$-inch NPT opening welded to the tank wall and a $^{1}/_{2}$-inch pipe plug. It is located at the 25C insulating-oil level with this level indicated by stencil marking on the tank wall.

N One-inch drain valve and sampler on all units 75 to 5000 kVA.

O Qualitrol 202 Series (or equal) automatic pressure-relief device.

Standard Features

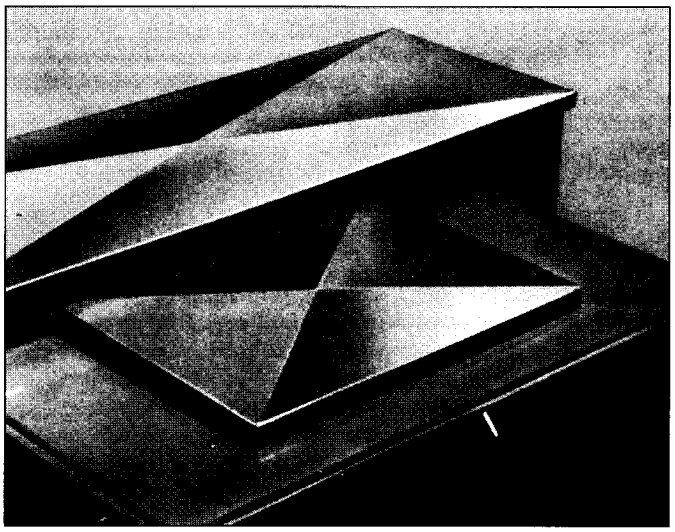
One 7.6-inch by 19-inch handhole in the transformer tank cover is provided on all units. The handhole is sealed with a reusable, one–piece molded nitrile rubber gasket with metal stops to prevent damage to the gasket from overcompression.

Access to the tank handhole is provided only after removing the false cover that is mechanically interlocked with the compartment cover. No nuts or bolts can be removed or loosened without first gaining access to the transformer compartment.

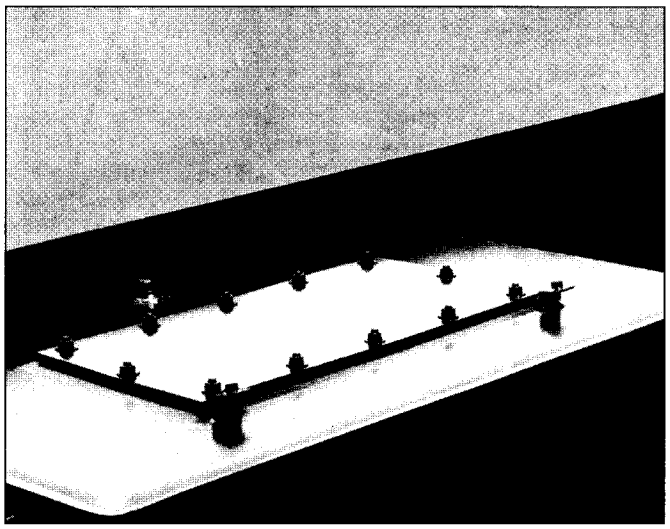
The high-voltage door is held closed by captive stainless-steel bolts, accessible only after the low-voltage door is opened. A planned operation is therefore required prior to gaining entrance to the high-voltage compartment.

The low-voltage door has three-point latching and provisions for padlocking. A captive and recessed pentahead bolt is provided for additional security of the low-voltage door.

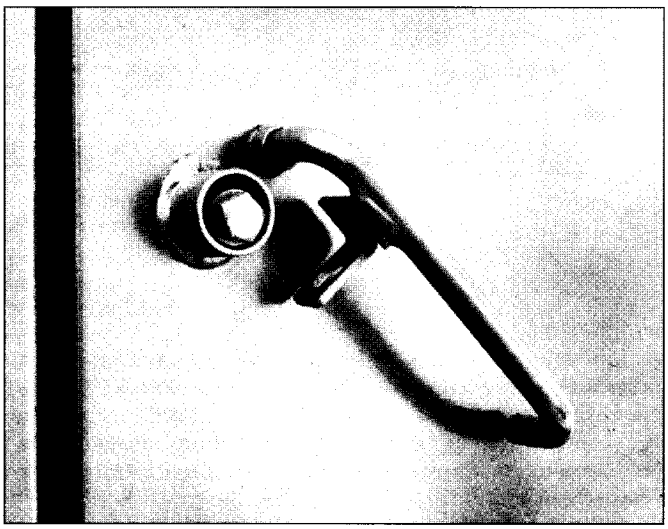
(An optional hexhead bolt is available in place of the standard pentahead bolt when specified.)



False cover over handhole can be easily removed after removing nuts inside cabinet.



Handhole featuring one-piece nitrile gasket with built-in gasket stops.

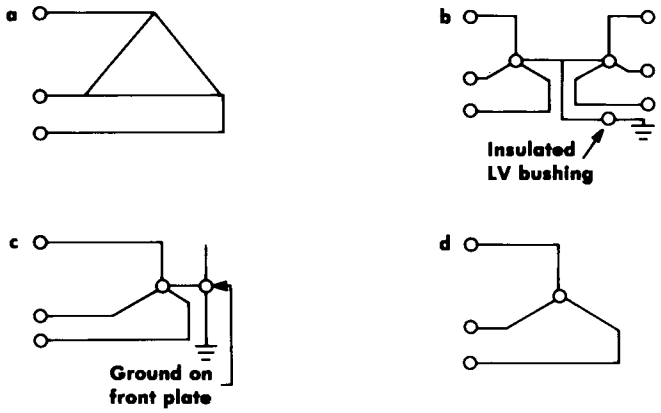


Low-voltage door handle. Padlock cannot be engaged until bolt is seated.

Standard Connections

Units may be: (a) delta-connected; (b) grounded wye-connected having primary neutral connected (bolted) internally to the secondary neutral which is an insulated low-voltage bushing externally grounded to the tank front plate; (c) grounded wye-connected having neutral grounded (bolted) internally to the tank front plate; (d) wye-connected with internally isolated neutral.

It is recommended that the grounded wye (GrdY) rating be specified with the primary neutral connected to the secondary neutral. For wye-wye applications where the secondary neutral cannot be grounded, the recommendation is to provide the transformer with the primary neutral grounded (bolted) internally to the tank front plate.



For livefront radial feed, three high-voltage porcelain bushings are furnished as standard. Line connections H1, H2, and H3 are identified by stencil markings on the tank front plate.

Porcelain high-voltage bushings equipped with tin-plate terminals are furnished on 75-5000 kVA COMPAD® transformers with livefront construction. The bushings are made of wet-process porcelain and are clamped externally to the wall of the transformer tank. Reusable nitrile rubber gaskets seal the bushings to the tank wall and the terminals to the porcelain.

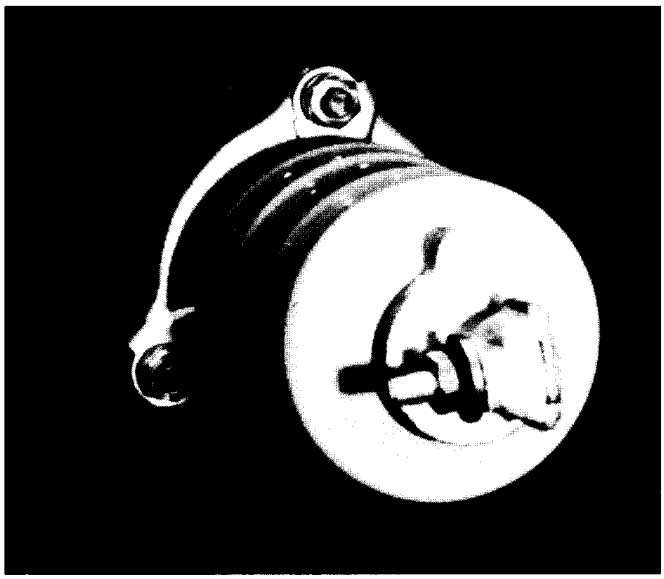
Radial-feed units, 75-500 kVA, have clamp-type terminals for No. 8 through 2/0 cable sizes as shown in photo A. Radial-feed units, 750-5000 kVA, and all loop-feed units, 75-5000 kVA, are equipped with three-hole blade terminals (9/16-inch diameter holes) as shown in photo B. Livefront construction meets the latest revision of ANSI C57.12.22 requirements for padmounted compartmental type, self-cooled, three-phase distribution transformers, 5000 kVA and below.

In both types of bushings, the high-voltage cable terminals are oriented for vertical take-off of primary cables entering the compartment from below.

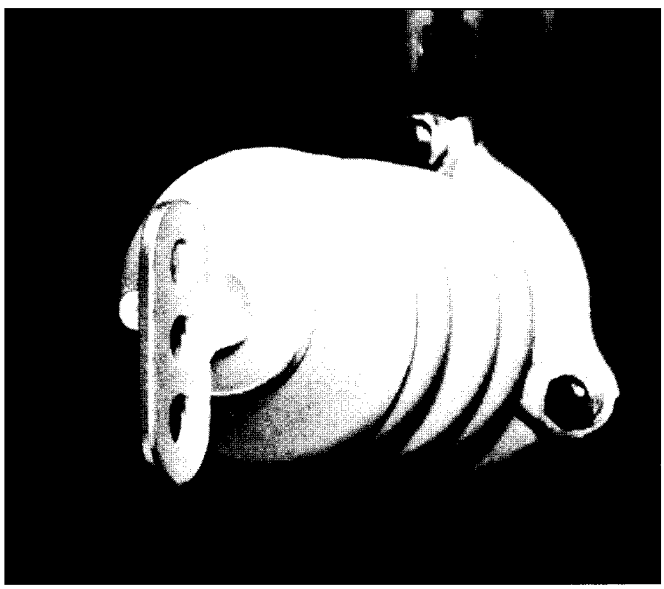
Where separable insulated high-voltage connectors for radial feed are desired on COMPAD transformers, as shown in photo C, GE offers three (3) universal bushing wells for radial feed, six (6) universal bushing wells for loop feed as standard.

The separable insulated high-voltage connector system construction (deadfront) meets the latest revision of ANSI C57.12.26 requirements for padmounted compartmental type, self-cooled, three-phase distribution transformers, 5000 kVA and below.

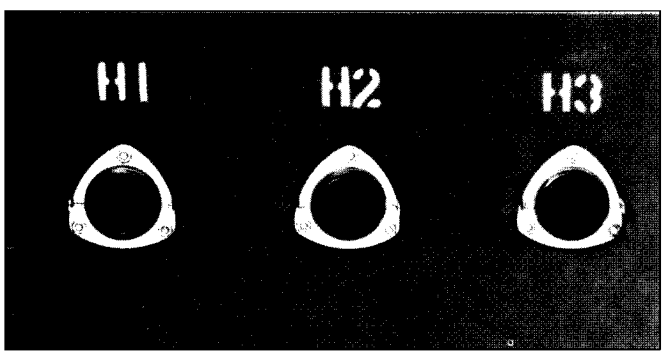
High-voltage Bushings, Live Front



A. Externally clamped high-voltage bushing, 75-500 kVA radial feed only.



B. High-voltage bushing with three-hole blade, 750-5000 kVA radial feed, and 75-5000 kVA loop feed.



C. High-voltage bushing wells, 75-5000 kVA radial feed.

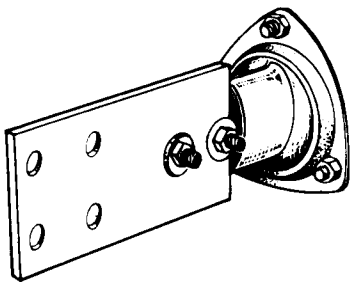
Standard Secondary Bushings Arrangements

The secondary bushing location on the extreme left of the low-voltage compartment can be either; (a) the neutral connection on wye ratings; (b) the common neutral connection (primary and secondary HO-XO) for grounded wye-grounded wye ratings; (c) the 120-Volt midtap connection in one phase of the low-voltage 240-Delta connection; or (d) the low-voltage neutral connection for delta rated high-voltage and grounded wye low-voltage ratings. The neutral bushing is an insulated porcelain bushing with an external ground strap connecting the blade to the tank wall.

The low-voltage bushing terminal is a tin-plated spade-type and is arranged for vertical-takeoff of outgoing cables. The low-voltage "H" blades, having 9/16-inch holes on $1^{3}/_{4}$-inch centers, are provided with the "H" blades as listed in the following table as standard.

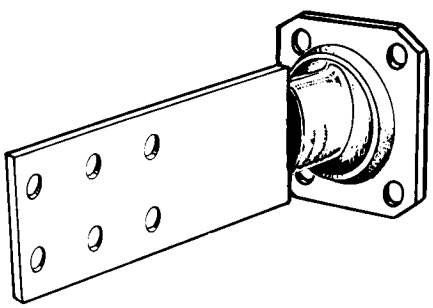
(4) Hole Blades

kVA Rating	Low-Voltage Rating (Volts)
75-300	208Y/120
75-500	240
75-500	480,480Y/277

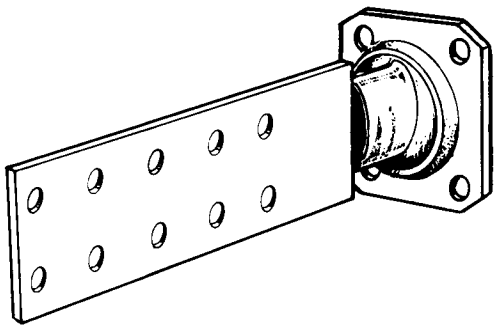


(6) Hole Blades

kVA Rating	Low-Voltage Rating (Volts)
500	208Y/120
750	240
750-1500	480, 480Y/277

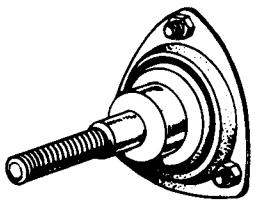


kVA Rating	Low-Voltage Rating (Volts)
750-1000	208Y/120
1000	240
2000-2500	480, 480Y/277



NOTE : 3000-5000 kVA are normally supplied with 10- to 18-hole low-voltage spades.

RUS stud type secondary bushings are available as a standard offering when so specified. Sizes and availability per the following table.



Availability Table

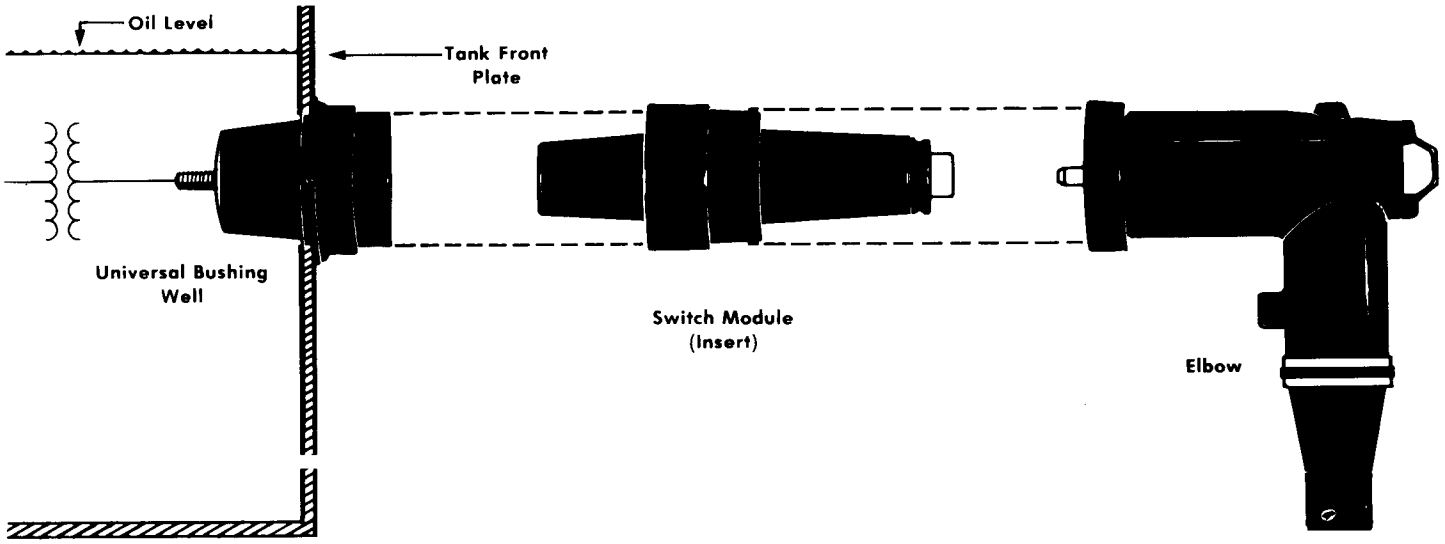
kVA	Voltage Rating	Standard Stud Size (In Inches)
75-150	480 and below	$^{5}/_{8}$-11 x 1¼
225-300	480 and 480Y/277	$^{5}/_{8}$-11 x 1¼
225-300	208Y/120	1-14 x 1¼
500	480Y/277	1-14 x 1¾
500	208Y/120	Not Available
750 and above	All Voltages	Not Available

Optional Features and Accessories

SEPARABLE INSULATED HIGH-VOLTAGE CONNECTOR CONSTRUCTION (ANSI C57.12.26)

There are two different deadfront interfaces available in the industry.

200 amp rated devices



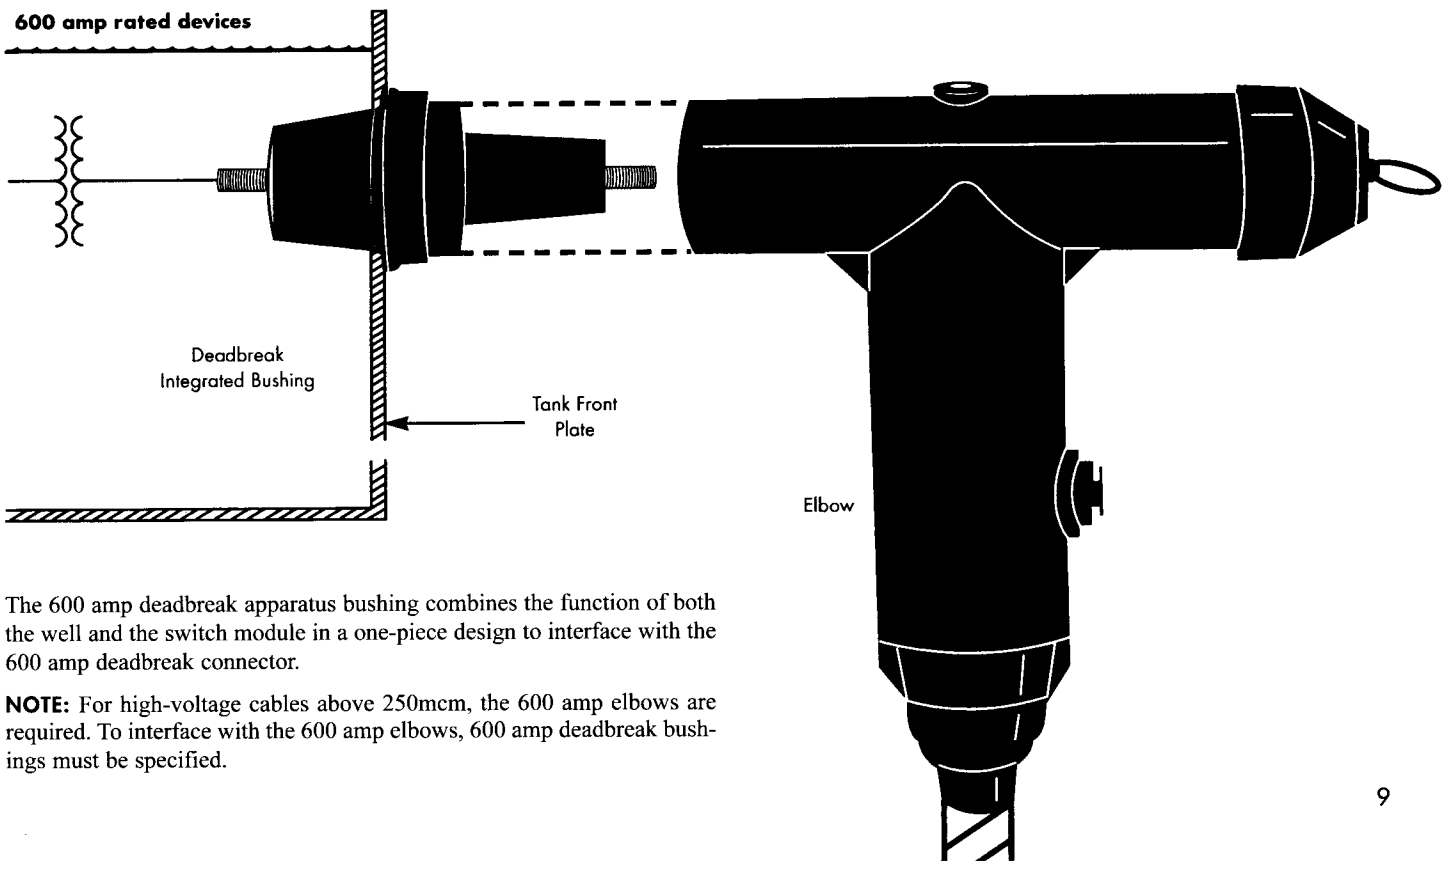
The bushing well is designed for the termination of primary winding leads in liquid-filled padmounted transformers. The bushing mating interface conforms to the ANSI/IEEE Standard 386, latest revision, for separable insulated connectors and will accept inserts complying to the standard.

The switch module is rated 200 amperes and is designed to fit into bushing wells meeting the requirements of figure 1 of ANSI/IEEE Standard 386, latest revision. The switch module is sized according to the high-voltage rating at either 15 kV class or 25 kV class.

The molded shield elbow interfaces with either the switch module or the integrated bushing to provide the basic connector system. The elbow is sized according to the high-voltage class (15 kV or 25 kV) plus the cable insulation diameter and cable conductor size.

NOTE: 200 amp elbows can accept a maximum high-voltage cable size of 250mcm. For high-voltage cables 250mcm and below, specify the 200 amp high-voltage wells to interface with the 200 amp inserts and elbows.

600 amp rated devices



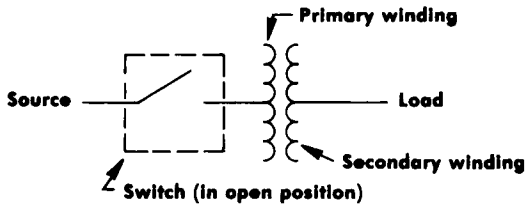
The 600 amp deadbreak apparatus bushing combines the function of both the well and the switch module in a one-piece design to interface with the 600 amp deadbreak connector.

NOTE: For high-voltage cables above 250mcm, the 600 amp elbows are required. To interface with the 600 amp elbows, 600 amp deadbreak bushings must be specified.

Optional Oil Switching

Radial Feed Switch – 300 amp

The 300 amp radial-feed, two-position internal oil switch is a two-position, gang-operated loadbreak switch, hook stick-operable, that uses a manually charged over-toggle storing spring assembly that is independent of operator speed. The spring-loaded activating mechanism ensures quick loadbreak and loadmake operation. It can be used to de-energize the transformer. The operating handle and nameplate are located in the high-voltage compartment.



Loop-feed Switch–300 amp

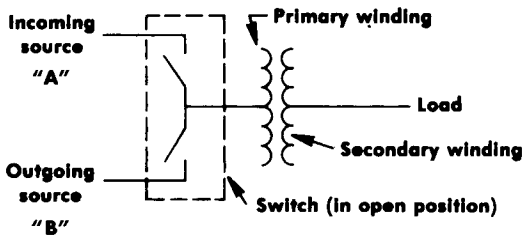
The loop-feed switch arrangement consists of two (2) two-position under-oil gang-operated switches. It may be used for sectionalizing and loop connections such as selection of power sources in a loop-feed primary distribution system; isolating faulted cables or transformers; or isolating transformers for changeout or maintenance. Six high-voltage bushings are furnished with a typical arrangement. Three bushings are identified as "A" source and three as "B" source. Switch positions are as follow:

1. Both pointers in CLOSED position. This position permits loop-feed for adjacent transformers.

2. Left-hand pointer in CLOSED position; right-hand pointer in OPEN position. In this position, only one side of the loop ("A" bushings) is connected to the transformer windings.

3. Left-hand pointer in OPEN position; right-hand pointer in CLOSED position. In this position, only one side of the loop ("B" bushings) is connected to the transformer windings.

4. Both pointers in OPEN position. In this connection, both sides of the loop ("A" and "B"bushings) are disconnected, thereby isolating and de-energizing the transformer windings from the loop-feed system.



Loop/Radial Switch – 300 amp

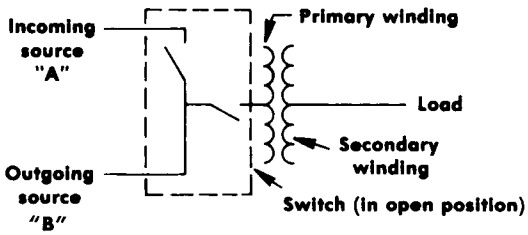
The two (2) two-position loadbreak switches may be provided for use as a combination of the loop and radial switch functions. The combination consists of a transformer switch (Line B) and a LOOP switch (Line A). The positions are as follow:

1. Both pointers in CLOSED position. This position closes the loop by connecting line "A" to line "B" and connects the transformer to the loop.

2. Left-hand pointer in CLOSED position; right-hand pointer in OPEN position. In this position, the transformer is disconnected from the loop and the loop is closed.

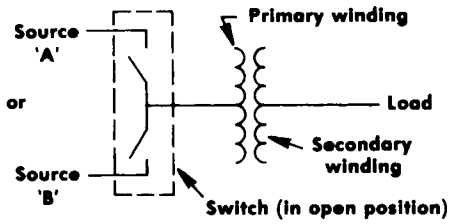
3. Left-hand pointer in OPEN position; right-hand pointer in CLOSED position. In this position, the loop is open and the transformer is connected to source "B".

4. Both pointers in OPEN position. In this connection, the transformer is de-energized and the loop is open.



Alternate-source Switch – 300 amp

The alternate feed switch is used for the selection of either of the two voltage sources to energize the transformer. An interlock on the switch handle allows the transformer to be energized only from one source at a time. (Source "A" or source "B".)



Optional Oil Switching

Loop Switch with ON/OFF Radial Switch

This combination combines the functions of the loop-switch operations, allowing the transformer to be de-energized and allowing either loop to be de-energized.

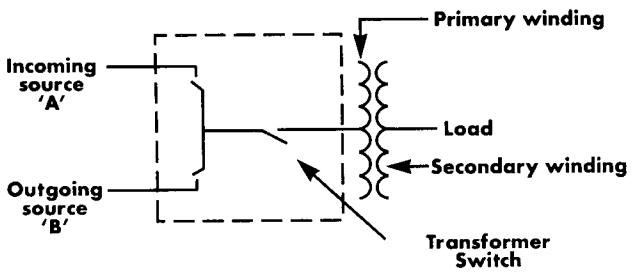


TABLE 2
Oil Switch Ratings

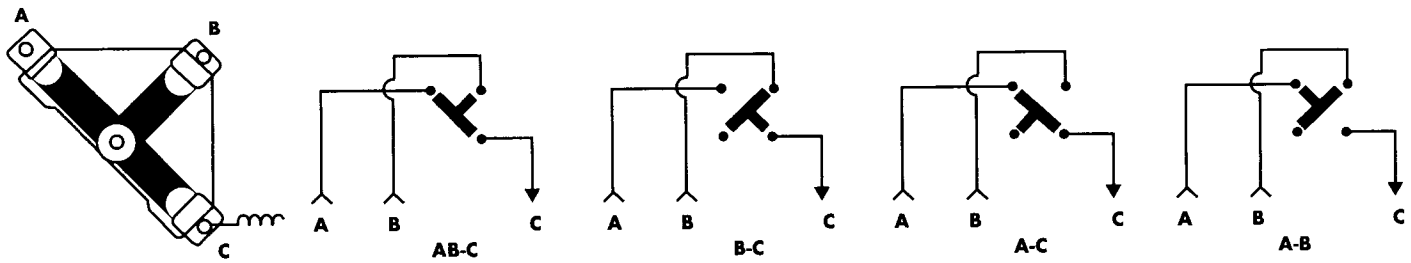
	Two-position		"T" Blade/"V" Blade	
Maximum kV	38	15	25	35
kV BIL	150	95	125	150
One-minute withstand	70	34	40	50
Maximum continuous and loadbreak amps	300	600	300	200
Momentary and fault close				
RMS-SYM-amps	12000	10000	10000	10000
RMS-ASYM-amps	19000	10000	10000	10000

'T' Blade Sectionalizing Switch

The "T" blade hot stick-operable sectionalizing switch rotates 360 degrees in either direction for alternate-source selection. A spring-loaded activating mechanism ensures quick loadbreak action and positive contact engagement through all positions. Switching can be accomplished in $^1/_2$ to $^1/_3$ cycles, which minimizes power outages.

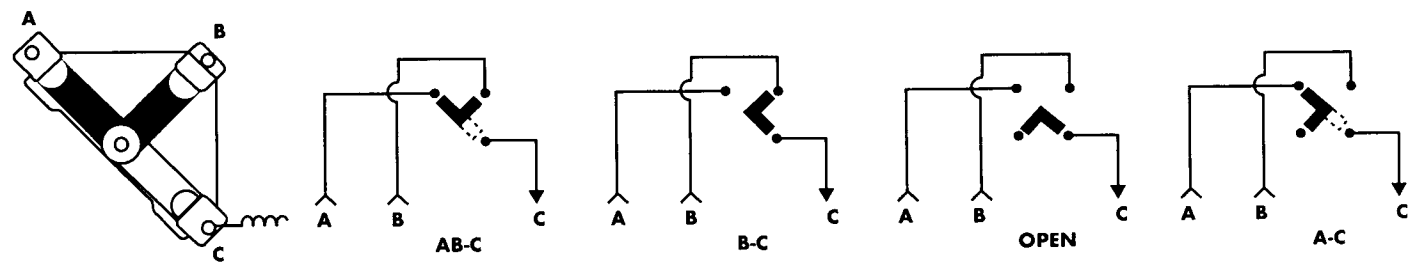
'T' Blade Functions

"T" Blade Switch allows the loop to be energized while the transformer is de-energized.



'V' Blade Function

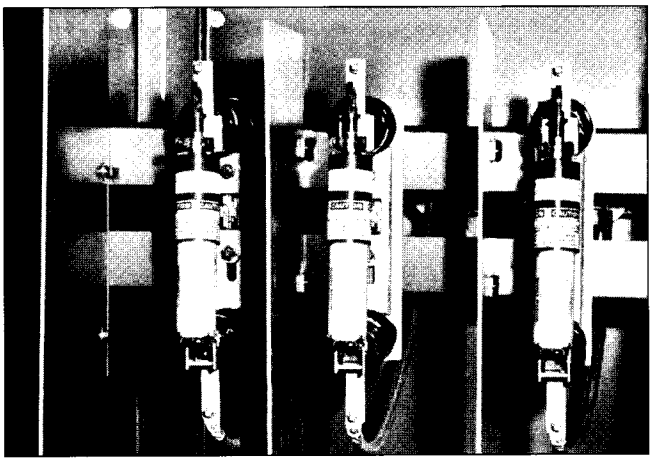
"V" Blade Switch allows the loop plus the transformer to be de-energized at the same time.



NOTE: Internal switching is not available with silicone fluid.

Optional Radial Air Switch

Fused air switches or blade disconnects can be located in the primary cabinet. The fuses are current-limiting type with an interrupting capacity of 50,000 amps, and are individually operable with a hook stick. The fuse supports are mounted on rigid support rails that extend across the compartment in front of the primary bushings. Non-hygroscopic barriers are placed phase-to-phase and phase-to-ground to increase the effective air dielectric.



Radial feed fused air switches.

NOTES: 1. Fuse selection is based on 30C outside ambient and a minimum loading of 145% for eight (8) hours following 100% load for eight (8) hours. In addition, each fuse tabulated meets minimum inrush requirements of 12xN for 0.1 second and 25xN for 0.01 second.

2. The heavy line in the tabulation is drawn to the right of the largest available fuse that meets the above requirements. If the customer is willing to accept reduced overloads, fuses to the right of the line may be used to extend the range. The reduced overload is indicated. Inrush requirements are met.

3. Parallel fuses are designated by "2x" in TABLE 3.

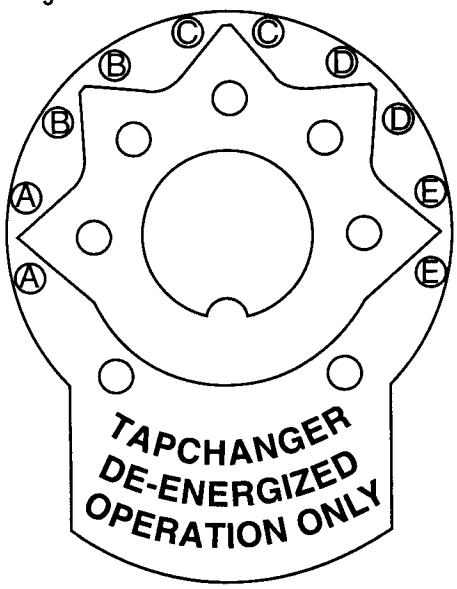
Optional Accessories

Tap-changer Control



A tap-changer control for external operation is a standard feature on all COMPAD® transformers whenever taps are furnished. The control switch is located either in the high-voltage or low-voltage compartments. The five-position, 150 amp tap-changer positions are easily changed by pulling out the spring-loaded handle, turning it to the desired position, and allowing the pointer to drop into the slotted index plate. The padlockable operating handle provides greater leverage and can be operated by hook stick or by hand. The tapchanger is for de-energized operation ONLY.

NOTE: 150 amp tap-changer is standard. A 300 amp tap-changer is available for applications greater than 150 amps.

Dual-voltage or Delta-wye Switch

When dual voltage (series-multiple or delta-wye) is specified, the control handle is brought out through the front plate for external operation when the transformer is DE-ENERGIZED. This feature allows an economical means of uprating to higher system voltage, as well as eliminating the need for replacing transformers when changing system voltage.

The padlockable, hot stick-operable control handle is springloaded, providing a positive indication of voltage switching. It is normally located in the high-voltage compartment and provides external operation, eliminating the necessity of opening the transformer to change links on a terminal board.

Optional Accessories

EXPULSION FUSES (FAULT-SENSING)

Primary oil-immersed expulsion fuses are sized at approximately three times rated primary current. Their function is to remove a faulted transformer from the line in the remote case of an internal failure. Access to the fuses is through a 7.6 by 19-inch handhole located in the tank cover. See TABLE 3 for IC rating of the fuses. For application data, see TABLE 4 (below).

NOTES: 1. Upper number is fuse curve.
2. Lower number is times normal current fuse will carry for 300 seconds in 150° oil.

Optional Accessories

BAYONET FUSING

The GE BAYONET fusing devise is an externally removable fuse-holder available with either a fault-sensing or an overload-sensing expulsion fuse. The fuseholder is hot stick-operable and is capable of breaking transformer load current.

Fuses are removable without lifting hood.

Drip shields to contain oil are standard with bayonet fuses.

NOTES: 1. Applications based on 200% of transformer loading for two hours and 160% loading for seven hours based on thermal characteristics of transformer.

2. Application meets inrush requirements of 12 times transformer rated current for 0.1 second.

A = Fusing Available
N/A = Fusing Not Available

*Use will result in some loss of overload capacity.

**Must be GrdY/GrdY system with less than 50% delta loading or delta voltages 17000.

N/A = Fusing Not Available

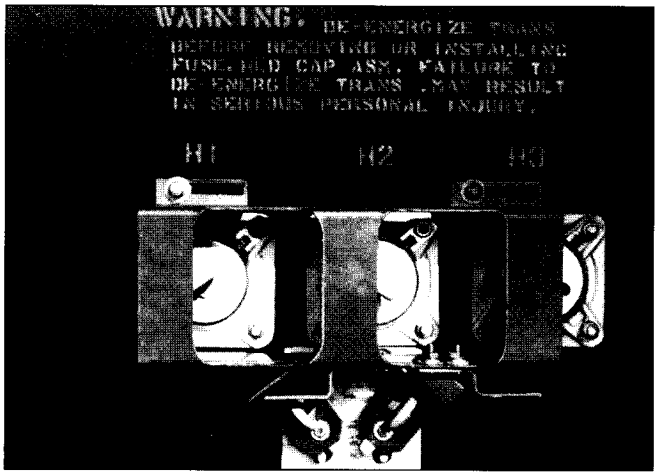
Optional Accessories

NON-LOADBREAK DRY-WELL CURRENT-LIMITING FUSEHOLDER

This feature combines the proven interrupting capability of general-purpose, current-limiting fuses in air-insulated, oil-sealed, dry-well fuseholders. These fuseholders are available on both live-front and on units equipped with separable insulated high-voltage connectors, and are easily operable with a hotstick. The non-loadbreak fuseholder assembly has an integral warning notice and safety baffle to warn against removal of the fuse while transformer is energized. The non-loadbreak fuseholders can also be mechanically interlocked with a loadbreak switch (as shown).

Once transformer is DE-ENERGIZED by operation of loadbreak switch, safety baffle can be moved permitting easy access to fuses.

Non-loadbreak fuseholders are available at maximum voltage ratings of 8.3, 15.2 and 21.1 kV, and with impulse withstands of 95-, 125-, and 150-kV BIL respectively.



Non-loadbreak dry-well fuseholders with baffle and switch interlock in closed position.

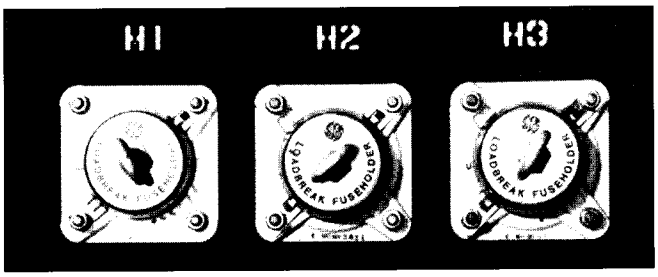
NOTES: 1. Fuse selection based on 30C outside embient and a loading of 150% for eight hours following 100% load.
2. Each fuse meets inrush requirements of 12xN for 0.1 second.
3. Oil switch with parallel fuseholders refer to the factory.
4. Parallel fuses are designated by "2x" in above table.

Optional Accessories

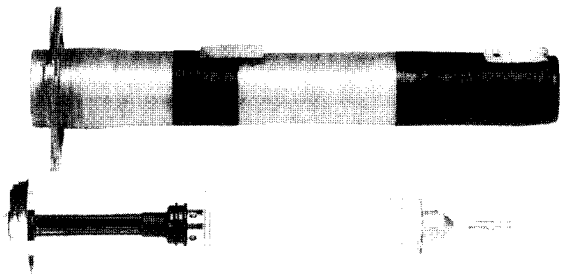
LOADBREAK DRY-WELL FUSEHOLDER

This fuseholder is similar to the non-loadbreak model with the addition of an integral loadbreak switching device. The switching device utilizes the rod-and-bore principle to accomplish loadbreak within the fuseholder.

Available ratings are 8.3 kV (maximum) at 95-kV BIL and 15.2 kV (maximum) at 125-kV BIL.



Loadbreak dry-well fuseholders.



Draw out assemblies for loadbreak dry-well fuseholders.

2. Each fuse meets inrush requirements of 12xN for 0.1 second.
3. Oil switch with parallel fuseholders refer to the factory.
4. Parallel fuses are designated by "2x" in above table.
5. When double barrel fuses are provided, the top set are loadbreak, the bottom set are non-loadbreak.

Optional Accessories

OIL SUBMERSIBLE PROTECTOR

The Oil Submersible Protector (OSP) is a partial range current-limiting fuse that is used in series with an expulsion fuse to provide full range protection. The OSP is designed to clear high-current faults (up to 50,000 amperes symmetrical) and the expulsion link to clear low-current faults. These fuses are located under oil beneath the transformer handhole. Either internal expulsion fuses or "bayonets" are available as the series expulsion fuse.

The bayonet or the internal expulsion fuse is available for replacement. The OSP fuse is not available for replacement without removing the main tank cover.

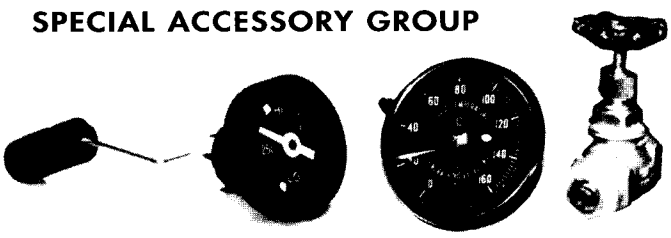
NOTES: •The upper number in the box is either the load-sensing bayonet fuse or the expulsion fuse model number.
•The lower number in the box is the back-up oil-immersed, current-limiting fuse (OSP) number.
•The OSP fusing is not available on dual-voltage units.

SPECIAL ACCESSORY GROUP



This accessory group includes the dial-type thermometer, liquid-level gage, one-inch drain valve, one-half inch sampling device and provision for vacuum-pressure gage. These are available as a complete group or as individual items. A description of each is covered under items 1-5.

1. Dial-type Thermometer

This thermometer is direct stem-mounted in a close well, located on the frontplate of the transformer to indicate the top-liquid temperature. The well is threaded into a 1/2-inch NPT fitting that is welded to the transformer tank wall so that the thermometer can be removed without breaking the tank seal. The thermometer has a slave-hand which is moved by the indicating hand to indicate maximum temperature. The thermometer dial reads 0° through 160° C.

Optional Accessories

2. Liquid-level Gage

This gage has a vertical face and is gasket mounted to the front plate of the transformer, inside the low-voltage compartment. The liquid-level gage dial reads LO-25C-HI.

3. Drain Valve

This is a one-inch globe-type valve furnished with a half-inch NPT standard pipe plug in the outer end. It is furnished as a standard on all units.

4. Sampling Device

This device is threaded into the one-half inch NPT opening normally occupied by the drain plug. In addition to serving as a plug, it provides for quick and easy sampling of the transformer oil. This sampler, when furnished, is located in the end of the drain valve. It is furnished as a standard on all kVA sizes.

5. Provision for Vacuum-pressure Gage

This consists of a flange with one-quarter inch NPT opening welded to the tank wall in the air space above the oil and is supplied with a one-quarter inch pipe plug.

6. ANSI Tank Ground Pads

Two-hole tank ground pads supplied on units rated 750-2500 kVA are optional on units 500 kVA and below. They are stainless steel with an unpainted surface. One pad is located in the high- and low-voltage compartments, and each pad has two $^1/_2$- 13-inch tapped holes on $1^3/_4$-inch centers.

7. Pressure Vacuum Gage

This gage is located in the low-voltage compartment above the bushings in the air space. This gage measures the internal pressure with dial readings from -10 PSIG to +10 PSIG.

8. Automatic Pressure Relief Device

The pressure relief device is located on the low-voltage tank wall above the bushings in the air space. This device relieves excessive internal tank pressure. The device opens at 10 PSIG ± 2 PSIG and reseals at a positive pressure.

9. Internal Lightning Arrestors

GE metal oxide distribution-type arrestors are housed and directly connected inside the transformer tank. These arrestors meet the requirements of ANSI C62.11, latest revision, and NEMA LA1, latest revision.

This arrestor concept enhances reliability through the elimination of external environment-related failure factors. Padmounted transformers and underground cable are adequately protected economically, while maintaining the integrity of ANSI C57.12.26 for separable insulated high-voltage connector construction.

The kV ratings normally supplied are listed in the following table.

Lightning Arrestors

Lightning arrestors with HV ratings are normally supplied when transformer is ordered "with arrestors." Other ratings of lightning arrestors will be supplied upon request.

High Voltage (Line-to-Line)	Transformer Primary Connection			
	Delta (Arrestor kV)		Grd-Wye (Arrestor kV)	
	External	Internal	External	Internal
2400	3	3	3	3
4160	6	6	3	3
4800	6	6	6	6
12000	12	12	9	10
12470	15	15	9	10
13200§	15	15	10	10
13800	15	15	10	12
14400	15	15	12	15
22900GrdY	-	-	18	18
24940GrdY	-	-	21	18
34500GrdY	-	-	27	27

§ Most systems with this voltage are connected wye with a solid grounded neutral, and arrestor indicated will provide maximum protection in such cases.

10. External Lightning Arrestors

Distribution-type direct connected lightning arrestors are supplied through 35 kV grounded wye on live-front designs only and when three-phase COMPAD® is ordered with arrestors. Unless otherwise specified, the kV rating of the arrestor normally supplied is listed in the above table.

11. Elbow Valve Arrestor

An elbow valve arrestor (available from others) provides surge protection for underground distribution circuits where transformers with separable insulated high-voltage connectors are utilized. Three would be used on radially fed six-bushing pad-mounted transformers utilizing the other three separable insulated high-voltage connectors for the incoming line.

12. Current Transformer Provisions

GE type JAB-0 and JKY-0 current transformers are designed to fit the low-voltage bushings, therefore provisions for these are standard.

Provisions for other types of current transformers or potential transformers consist of a plate mounted below the low-voltage bushings.

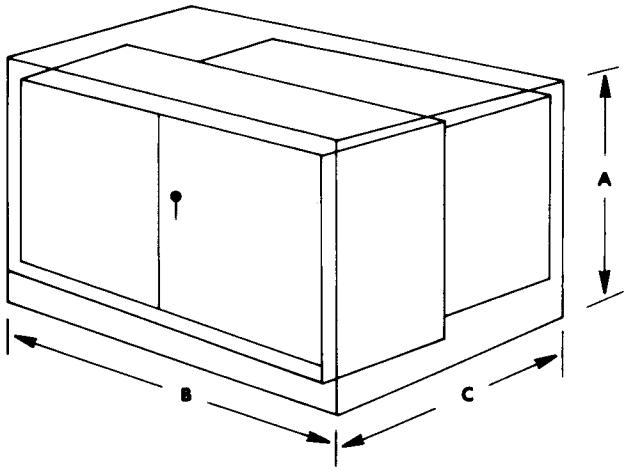
When provisions for both current and potential transformers are required, we offer a plate below the secondary bushings for the current transformers and a plate above the secondary bushings for the potential transformers.

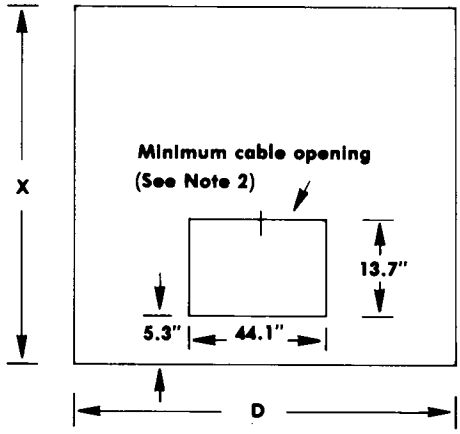
13. Molded-Case Circuit Breakers

A single-mounted, secondary molded-case circuit breaker with a maximum rating of 3000 amperes is available on all COMPAD transformers. The breaker is channel-mounted in the low-voltage compartment.

Panelboards containing molded-case circuit breakers are also available where application requirements do not exceed 1200 amperes and a "27X" maximum height. For space restrictions or further information consult GE's Electrical Distribution and Control Sales Division.

Mechanical and Electrical Data





NOTES: 1. In some cases (particularly larger kVAs), the radiation will extend beyond the pad. If this is not acceptable, substitute the "B" and "C" dimensions for the "D" and "X" dimensions, respectively, to determine an optimum pad size.

2. High- and low-voltage compartments are **not** symmetrical. Since cable opening shown is minimum, adequate space may not be available on some configurations.

Maximum Dimensions +

General Construction Features

Units shall be constructed in accordance with ANSI Standard C57.12.26 (latest revision).

All characteristics, definitions, terminology, and voltage designations and tests, except as otherwise specified herein, shall be in accordance with the following American National Standard Requirements, Terminology, and Test Code for Distribution, Power, and Regulating Transformers:

- •General Requirements, C57.12.00 (IEEE Std 462) (latest revision).
- •Terminal Markings and Connections, C57.12.70 (latest revision).
- •Terminology, C57.12.80, including Supplement C57.12.80a (latest revision).
- •Test Code, C57.12.90 (IEEE Std. 262) (latest revision).

The pad-mounted, compartmental-type transformer shall consist of the transformer tank with high- and low-voltage cable terminating compartment. The transformer tank and compartment shall be assembled as an integral unit for mounting on a pad. There shall be no exposed screws, bolts, or other fastening devices which are externally removable. There shall be no openings through which foreign objects such as sticks, rods, or wires might contact live parts. There shall be means for padlocking the compartment door(s). The construction shall limit the entry of water (other than flood water) into the compartment so as not to impair the operation of the transformer.

Full-height, air-filled incoming and outgoing terminal compartments with hinged doors shall be located side-by-side separated by a steel barrier, with the incoming compartment on the left. The high-voltage (incoming) compartment will be accessible only after the door to the low-voltage (outgoing) compartment has been opened. To facilitate making connections and permit cable pulling, the doors and compartment hood shall be removable. Removable door sill on compartments shall be provided to permit rolling or skidding of unit into place over conduit studs in foundation.

The compartments will have hinged doors equipped for latching in the open position. The high-voltage compartment door will have a fastening device which is accessible only through the low-voltage compartment.

The hinge assemblies shall be made of corrosion-resistant material. Stainless-steel hinge pins of 3/8-inch minimum diameter will be provided.

Both compartment doors must be capable of being secured with a single padlock having a maximum 1/2-inch diameter shackle.

Lifting provisions in accordance with ANSI Standards shall be provided.

Jacking and rolling provisions shall be provided.

The instruction nameplate is to be located in the low-voltage portion of the compartment and shall be readable with cables in place. Where the nameplate is mounted on a removable part, the manufacturer's name and transformer serial number shall be permanently affixed to a non-removable part.

Transformer tank shall be sealed-tank construction with a welded main cover.

A bolted tamper-resistant handhole shall be provided in the tank cover for access to internal connections.

Provisions for tank grounding shall be supplied in both the high-voltage and low-voltage compartments. These provisions shall consist of:

(1) 500 kVA and below: 1/2-13 UNC tapped hole 7/16-inch deep.
(2) 750 kVA and above: (2) 1/2-13 UNC tapped holes 1/2-inch deep.

Low-voltage bushings shall be tinned, spade-type with 9/16-inch holes spaced on 1 3/4-inch centers in accordance with the Latest Revisions of ANSI.

For wye-wye connected units the high-voltage and low-voltage neutrals shall be connected internally and brought out through a bushing located in the secondary compartment.

Unless otherwise specified, the incoming primary section shall be equipped with three 200-ampere bushing wells in accordance with ANSI Standard C119.2.

Optional Primary (separable insulated high-voltage connector) bushings:

A. Three (3) 200-ampere bushing wells equipped with 200 ampere loadbreak switch modules.
B. Three (3) 200-ampere loadbreak integrated bushings (com bines the functions of bushing well and switch module).
C. Three (3) 600-ampere deadbreak bushings.

Optional primary (separable insulated high-voltage connector) bushings for looped primary cable systems or primary selective systems:

A. Six (6) 200-ampere bushing wells in accordance with ANSI Standard C119.2.
B. Six (6) 200-ampere bushing wells equipped with 200-ampere loadbreak switch modules.
C. Six (6) 200-ampere loadbreak integrated bushing (combines the functions of bushing well and switch module).
D. Six (6) 600-ampere deadbreak bushings.

The following accessories are to be provided on all units.

(1) One-inch filling provision.
(2) One-inch drain provision.
(3) Liquid level indication.

Guide Form Specification — Three-phase Pad-mounted Transformer Equipped with Separable Insulated High-voltage Connectors

Optional Equipment
(To be Indicated on Inquiry)
Overcurrent Protection

(Only ONE of the following can be specified) Check preceding fuse charts for availability.

Select only one (If desired) **Overcurrent Protection**

☐Three internally mounted, oil-immersed, expulsion fuses accessible through the tank handhole.
☐Three Bayonet-type, oil-immersed, expulsion fuses accessible through the primary compartment. The fuses shall be removable using a hot stick, (without disassembly of the primary cabinet) for external replacement of fuse cartridges.
☐Three current-limiting fuses in NON-LOADBREAK, dry-well fuseholders. The fuseholder must accept either GE or McGraw Edison general-purpose, distribution current-limiting fuses with an interrupting capacity of 50,000 amperes. The fuseholders shall be located in the primary compartment and be hot-stick operable for external replacement of the fuses.
☐Three current-limiting fuses in LOADBREAK, dry-well fuseholders. The fuseholder must accept either GE or McGraw Edison general-purpose, distribution current-limiting fuses with an interrupting capacity of 50,000 amperes. The fuseholders shall be located in the primary compartment and be hot-stick operable for external replacement of the fuses. The loadbreak fuseholder must be capable of interrupting a minimum of 100 amperes.
☐A combination of oil-immersed, current-limiting fuses and internally mounted, oil-immersed, expulsion fuses coordinated to provide full-range protection with the expulsion fuse clearing low-current faults and the current-limiting fuse clearing high-current faults up to 50,000 amperes.
☐A combination of oil-immersed, current-limiting fuses and Bayonet oil-immersed, expulsion fuses coordinated to provide full range protection with the expulsion fuse clearing low-current faults and the current-limiting fuse clearing high-current faults up to 50,000 amperes.

Radial Feed Switch – 300 amp

☐Provide an internal, oil-immersed, gang-operated, two-position (ON/OFF), loadbreak, manually operated switch. The switch must be capable of switching transformer full-load current. The switch handle shall be located in the primary compartment and must be hot stick-operable.

Loop-feed Switch – 300 amp

☐Provide one loop-feed, internal, oil-immersed, gang-operated, loadbreak, manually operated switch for a looped primary cable system. The switch shall be either two (2) two-position switches or a four-position switch. The switch must be capable of switching 200, 400 or 600 amperes to permit sectionalizing of the looped system. The switch handles shall be located in the primary compartment and must be hot stick-operable. Six primary bushings will be provided.

Loop/Radial Switch – 300 amp

☐Provide switch consisting of two (2) two-position, oil-immersed, loadbreak, manually operated switches combining the loop- and radial-switch functions consisting of a transformer switch and a loop switch.

Alternate-source Switch – 300 amp

☐Provide a primary selective switch to permit energizing transformer from either of two primary sources (but not both). The alternate source switch shall consist of two internal, oil-immersed, gang-operated, two-position (ON/OFF), manually operated, loadbreak switches with a mechanical interlock to prevent closing both sources. The switch must be capable of switching transformer full-load current. The switch handles shall be located in the primary compartment and must be hot stick-operable. Six primary bushings will be provided.

Loop Switch with ON/OFF Radial Switch

☐This combination unites the functions of the loop-switch operations, allowing the transformer to be de-energized and allowing either loop to be de-energized.

'T' Blade, 'V' Blade Sectionalizing Switches

☐"T" Blade Switch allows the loop to be energized while the transformer is de-energized.

☐"V" Blade Switch allows the loop plus the transformer to be de-energized at the same time.

Additional Accessories
ANY of the following accessories can be specified:

Select items required

☐One-inch drain valve and sampler (standard on 750 kVA and above).
☐Special accessory group consisting of:
a. One-inch drain valve and sampler,
b. Dial-type thermometer,
c. Liquid-level gauge and
d. Provisions (1/4" NPT) for vacuum/pressure gauge.
☐Pressure-vacuum gauge.
☐Internal lightning arrestors.
☐Single, secondary, molded-case circuit breaker with a maximum rating of 3000 amperes; channel mounted in the low-voltage compartment. (Accessories mounted in low-voltage compartment may be covered by this device.)
☐Molded-case circuit-breaker panel board for 1200 amperes maximum and "27X" maximum height; channel mounted in the low-voltage compartment. (Accessories mounted in low-voltage compartment may be covered by this device.)
☐Low-voltage busway entrance through secondary compartment cover. See page 26 for details.

General Construction Features

Units shall be constructed in accordance with ANSI Standard C57.12.22 (latest revision).

All characteristics, definitions, terminology, and voltage designations and tests, except as otherwise specified herein, shall be in accordance with the following American National Standard Requirements, Terminology, and Test Code for Distribution, Power, and Regulating Transformers:

- •General Requirements C57.12.00 (IEEE Std. 462) (latest revision).
- •Terminal Markings and Connections, C57.12.70 (latest revision).
- •Terminology, C57.12.80, including Supplement C57.12.80a (latest revision).
- •Test Code, C57.12.90 (IEEE Std. 262) (latest revision).

The pad-mounted, compartmental-type transformer shall consist of the transformer tank with high- and low-voltage cable terminating compartment. The transformer tank and compartment shall be assembled as an integral unit for mounting on a pad. There shall be no exposed screws, bolts, or other fastening devices which are externally removable. There shall be no openings through which foreign objects such as sticks, rods, or wires might contact live parts. There shall be means for padlocking the compartment door(s). The construction shall limit the entry of water (other than flood water) into the compartment so as not to impair the operation of the transformer.

Full-height, air-filled incoming and outgoing terminal compartments with hinged doors shall be located side-by-side separated by a steel barrier, with the incoming compartment on the left. The high-voltage (incoming) compartment will be accessible only after the door to the low-voltage (outgoing) compartment has been opened. To facilitate making connections and permit cable pulling, the doors and compartment hood shall be removable. Removable door sill on compartments shall be provided to permit rolling or skidding of unit into place over conduit studs in foundation.

The compartments will have hinged doors equipped for latching in the open position. The high-voltage compartment door will have a fastening device which is accessible only through the low-voltage compartment.

The hinge assemblies shall be made of corrosion-resistant material. Stainless-steel hinge pins of 3/8-inch minimum diameter will be provided.

Both compartment doors must be capable of being secured with a single padlock having a maximum 1/2-inch diameter shackle.

Lifting provisions in accordance with ANSI Standards shall be provided.

Jacking and rolling provisions shall be provided.

The instruction nameplate is to be located in the low-voltage portion of the compartment and shall be readable with cables in place. Where the nameplate is mounted on a removable part, the manufacturer's name and transformer serial number shall be permanently affixed to a non-removable part.

Transformer tank shall be sealed-tank construction with a welded main cover.

A bolted tamper-resistant handhole shall be provided in the tank cover for access to internal connections.

Provisions for tank grounding shall be supplied in both the high-voltage and low-voltage compartments. These provisions shall consist of:

(1) 500 kVA and below: 1/2-13 UNC tapped hole 7/16-inch deep.
(2) 750 kVA and above: (2) 1/2-13 UNC tapped holes 1/2-inch deep.

Low-voltage bushings shall be tinned, spade-type with 9/16-inch holes spaced on 1 3/4-inch centers in accordance with the Latest Revisions of ANSI.

For wye-wye connected units the high-voltage and low-voltage neutrals shall be connected internally and brought out through a bushing located in the secondary compartment.

Unless otherwise specified, the incoming primary section shall be equipped with three primary (live-front) porcelain bushings. The bushing terminals shall be:

(1). 500 kVA and below: clamp-type terminals for #8 solid through 2/0 stranded cable.
(2). 750 kVA and above: three-hole blade terminals.

The terminals shall be oriented for vertical cabling from below.

The following Accessories are to be provided on all units.

(1). One-inch filling provision.
(2). One-inch drain provision.
(3). Liquid-level indication.

Guide Form Specification — Live-front Three-phase Pad-mounted Transformer Equipped for Application

Optional Equipment
(To be Indicated on Inquiry)
Overcurrent Protection

(Only ONE of the following can be specified) Check preceding fuse charts for availability.

Select only one (If desired) **Overcurrent Protection**

☐Three internally mounted, oil-immersed, expulsion fuses accessible through the tank handhole.

☐Three Bayonet-type, oil-immersed, expulsion fuses accessible through the primary compartment. The fuses shall be removable using a hot-stick, (without disassembly of the primary cabinet) for external replacement of fuse cartridges.

☐Three current-limiting fuses in NON-LOADBREAK, dry-well fuseholders. The fuseholder must accept either GE or McGraw Edison general-purpose, distribution current-limiting fuses with an interrupting capacity of 50,000 amperes. The fuseholders shall be located in the primary compartment and be hot-stick operable for external replacement of the fuses.

☐Three current-limiting fuses in LOADBREAK, dry-well fuseholders. The fuseholder must accept either GE or McGraw Edison general-purpose, distribution current-limiting fuses with an interrupting capacity of 50,000 amperes. The fuseholders shall be located in the primary compartment and be hot-stick operable for external replacement of the fuses. The loadbreak fuseholder must be capable of interrupting a minimum of 100 amperes.

☐A combination of oil-immersed, current-limiting fuses and internally mounted, oil-immersed, expulsion fuses coordinated to provide full-range protection with the expulsion fuse clearing low-current faults and the current-limiting fuse clearing high-current faults up to 50,000 amperes.

☐A combination of oil-immersed, current-limiting fuses and Bayonet oil-immersed, expulsion fuses coordinated to provide full range protection with the expulsion fuse clearing low-current faults and the current-limiting fuse clearing high-current faults up to 50,000 amperes.

An Arc Strangler® fused switch assembly consisting of single-pole units equipped with McGraw-Edison type NX® current-limiting fuse/switch capable of breaking 200 amperes of load current and interrupting up to 50,000 amperes of fault current. (Do not specify when specifying oil switches).

Radial Feed Switch – 300 amp

☐Provide an internal, oil-immersed, gang-operated, two-position (ON/OFF), loadbreak, manually operated switch. The switch must be capable of switching transformer full-load current. The switch handle shall be located in the primary compartment and must be hot stick-operable.

Loop-feed Switch – 300 amp

☐Provide one loop-feed, internal, oil-immersed, gang-operated, loadbreak, manually operated switch for a looped primary cable system. The switch shall be either two (2) two-position switches or a four-position switch. The switch must be capable of switching 200, 400 or 600 amperes to permit sectionalizing of the looped system. The switch handles shall be located in the primary compartment and must be hot stick-operable. Six primary bushings will be provided.

Loop/Radial Switch – 300 amp

☐Provide switch consisting of two (2) two-position, oil-immersed, loadbreak, manually operated switches combining the loop- and radial-switch functions consisting of a transformer switch and loop switch.

Alternate-source Switch – 300 amp

☐Provide a primary selective switch to permit energizing transformer from either of two primary sources (but not both). The alternate source switch shall consist of two internal, oil-immersed, gang-operated, two-position (ON/OFF), manually operated, load break switches with a mechanical interlock to prevent closing both sources. The switch must be capable of switching transformer full-load current. The switch handles shall be located in the primary compartment and must be hot stick-operable. Six primary bushings will be provided.

Loop Switch with ON/OFF Radial Switch

☐This combination unites the functions of the loop-switch operations, allowing the transformer to be de-energized and allowing either loop to be de-energized.

'T' Blade, 'V' Blade Sectionalizing Switches

☐"T" Blade Switch allows the loop to be energized while the transformer is de-energized.

☐"V" Blade Switch allows the loop plus the transformer to be de-energized at the same time.

Additional Accessories
ANY of the following accessories can be specified:

Select items required

☐One-inch drain valve and sampler (standard on 750 kVA and above).

☐Special accessory group consisting of:
a. One-inch drain valve and sampler,
b. Dial-type thermometer,
c. Liquid-level gauge and
d. Provisions (1/4" NPT) for vacuum/pressure gauge.

☐Pressure-vacuum gauge.

☐Internal lightning arrestors.

☐Single, secondary, molded-case circuit breaker with a maximum rating of 3000 amperes; channel mounted in the low-voltage compartment. (Accessories mounted in low-voltage compartment may be covered by this device.)

☐Molded-case circuit-breaker panel board for 1200 amperes maximum and "27X" maximum height; channel mounted in the low-voltage compartment. (Accessories mounted in low-voltage compartment may be covered by this device.)

☐Low-voltage busway entrance through secondary compartment cover. See page 26 for details.

Outline and Typical Mechanical Data

Low-voltage Bus-Duct Entrance Provisions for Three-phase Pad-mounted Transformers 75-5000 kVA

NOTES: 1. Not available in combination with panelboard secondary.
2. Details shown are for coordination with GE Electrical Distribution and Control Sales busway only.
3. Transformer cabinet will support reasonable weight. However, the user is cautioned to use discretion in the assembly and employ separate support means when the need is evident.

SIDE ENTRANCE

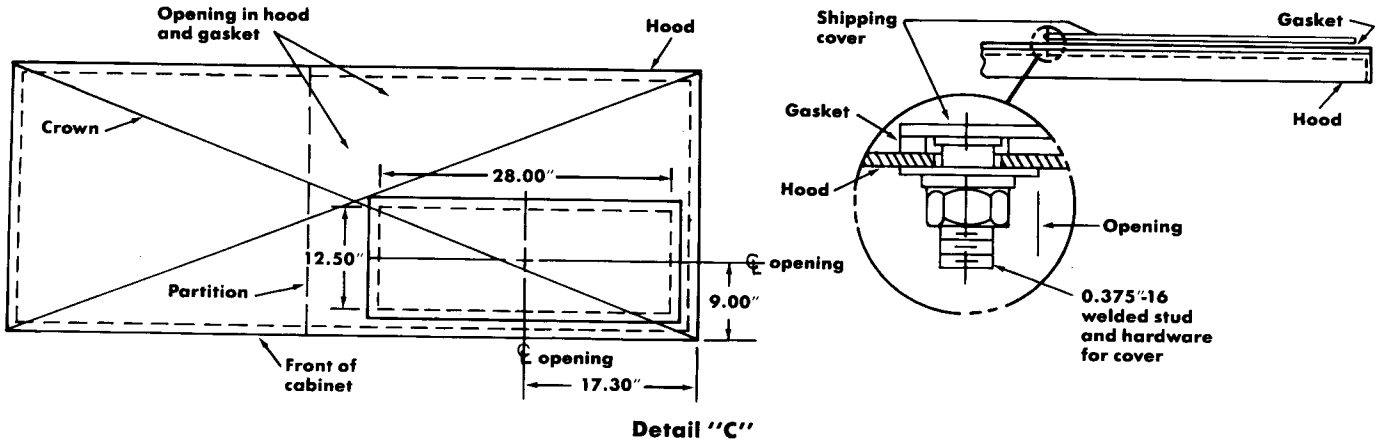
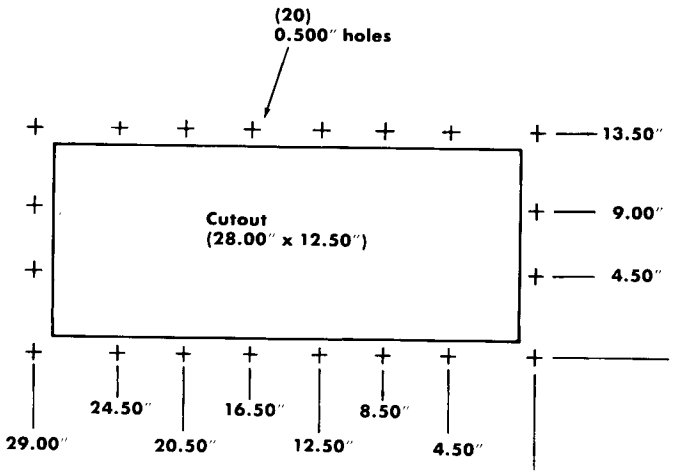
Bus Duct Entrance Provisions

TYPICAL ENTRANCE DETAILS (Top Shown)



BOLT HOLE PATTERN FOR TOP AND SIDE ENTRANCE



Important Features

- Less flammable R'Temp or silicone insulation available as options.
- Test reports by transformer serial number.
- Steel barrier between high- and low-voltage compartments.
- Bolted-on handhole cover with tamper-resistant hood standard on transformer tank cover.
- Zinc-oxide under-oil distribution lightning arrestors mounted inside transformer tank.
- Five-legged core construction.
- Optional low-loss, high-efficiencies design flexibility to decrease total owning costs.

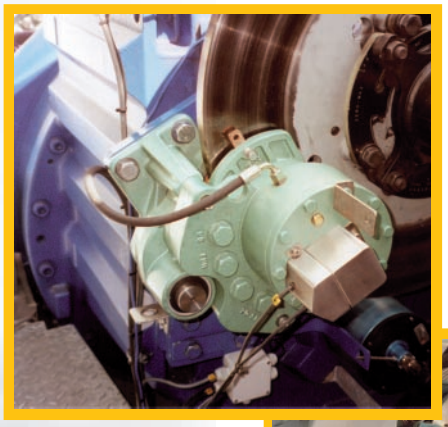
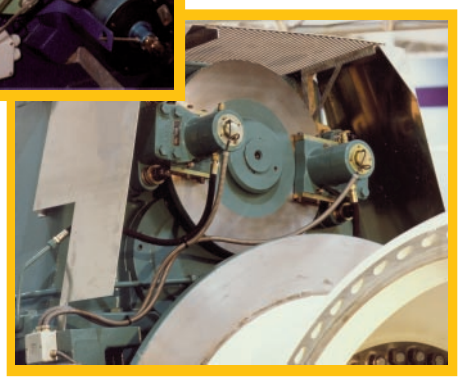
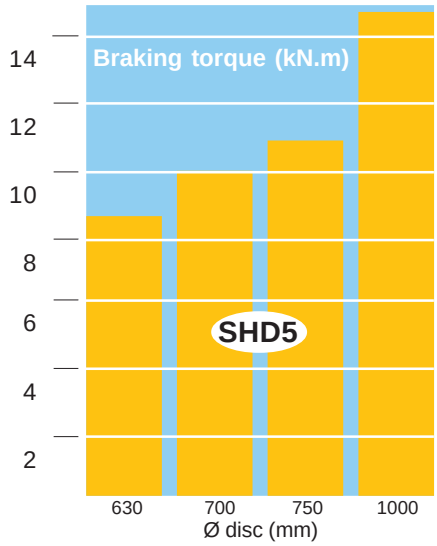
SHD5 caliper for Windmills



left:
SHD5 caliper - gearbox of a 900 kW windmill



2xSHD /high speed drive (600 kW wind turbine)



SIME-Stromag introduces the **WACS** - self **W**ear **A**djustment and **C**entering **S**ystem. The SHD5 caliper features both **automatic air gap centering** and **self wear compensation**, for easy maintenance and reduced costs.

The SHD5 caliper is a fail-safe single-spring hydraulical caliper, designed for high speed shaft drives of windturbines.
The SHD5 delivers high energy braking and is designed to be installed directly onto the drive line gear box.

Main characteristics:	***Advantages:***
Torque stability	Protection of windmill's mechanical components
Single-spring design	Installation onto the gear box is possible
Special braking spring design	Low torque loss /mm. of lining wear
Few moving parts	Reliable assembly
Large area linings	Lower operating temperature, longer lining life
Linings installation in **shoes axis**	No caliper displacement to replace linings
Positive lining fastening	Easy replacement
Wear proving switch	Preventive maintenance - safer operation
Option: **WACS**(*) -**W**ear **A**djustment **C**entering **S**ystem	Constant torque over lining life, reduced costs
Option: **DM** -Manual release	Easier installation and maintenance

(*) *Patent pending*

Disc brake

Technical data and dimensions

Caliper SHD5W

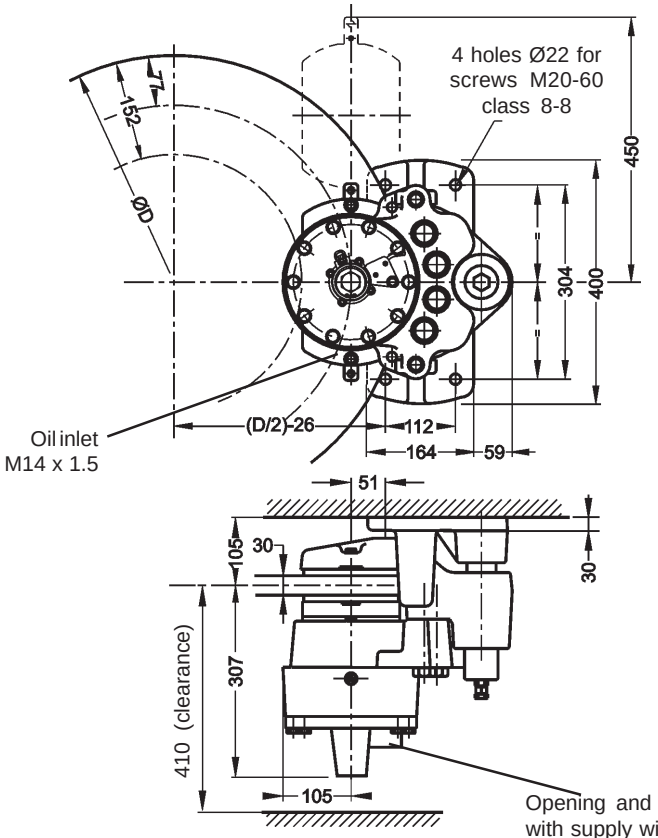
Fail safe braking
Braking by spring application
Hydraulic release
Opening proving switch
Lining wear proving switch
Temperature detection of the linings
Automatic lining wear compensation (WACS)

Working conditions:
- Ambient temperature: -20°C to +60°C
- Relative humidity ≤ 70%
- Dust in atmosphere ≥ 65µ

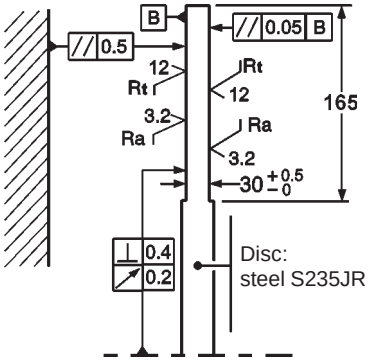
Other conditions, consult SIME.

Use:
- Emergency stopping brake in case of overspeed or loss of electrical supply

Options:
- Manual release tool (DM)
- Positive braking
- Detection of full lining wear
- Switch for PLC
- Marine protection
- Factory scaling of the braking force to [BF-10%]



Installation instructions:



Opening and wear proving switches with supply wires: 3 x 0.75 mm² and length 2 m

Weight: 105 kg
Torque and effort values are subject to a variation of ±10%
Response time at nominal torque ≤ 0.3s
Maximum working pressure: 200 bars

Designation	Caliper		SHD5W-6	SHD5W-5	SHD5W-4	SHD5W-3	SHD5W-2	SHD5W-1

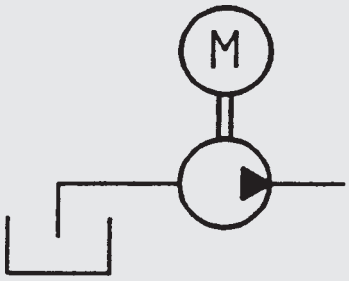
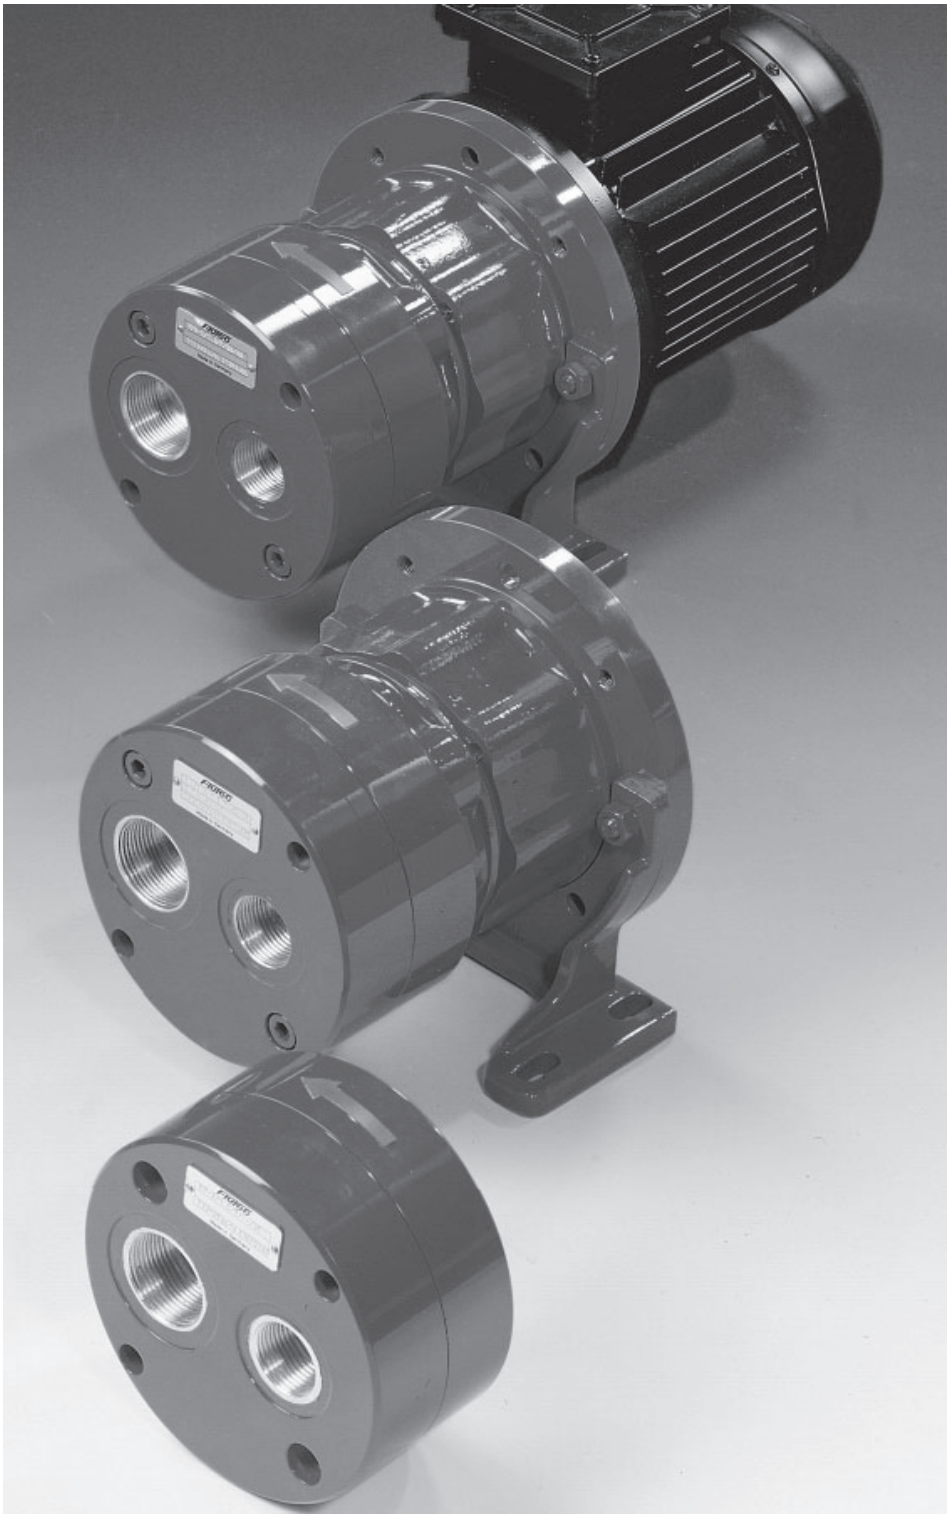
HYDAC INTERNATIONAL

Feed Pumps
Low-Noise Series





FEED PUMP SERIES VP

1. GENERAL

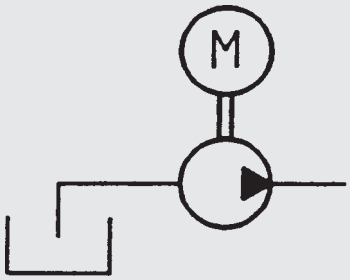
The VP series of feed pumps are low-noise, single-stroke vane pumps with constant flow rate.

By using a dampened bell housing (PT) a reduction in noise level is achieved.

1.1. AREAS OF APPLICATION

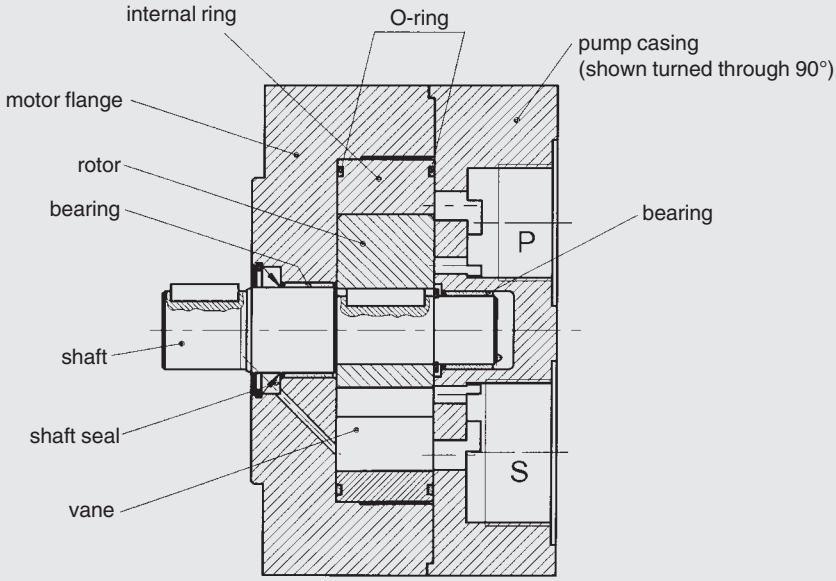
– filter circuits
– cooling circuits
– lubrication applications
– pump transfer units

1.2. SYMBOL



2. DESCRIPTION

2.1. DIAGRAMMATIC ILLUSTRATION



2.2. NOTES ON INSTALLATION

Pressure differentials (flow rate losses)

$$\Delta p\ [bar] = 5.84 \times \frac{l\ [m]}{d^4\ [mm]} \times Q\ [l/min] \times \gamma\ [mm^2/s]$$

– effect of the internal diameter on the flow rate losses using the following example values:
l = 1m; Q = 150 l/min; γ = 200mm²/s

	Internal diameter (mm)		
	di_1(38)	di_1(32)	di_1(25)
Δp (bar/m)	0.084	0.167	0.45

– Only applicable for straight pipes
– Additional threaded connections and pipe bends increase the flow rate losses

Notes:
– as few threaded connections as possible
– few pipe bends; if required use large radius
– difference in height between pump and oil level as small as possible
– hoses must be suitable for a vacuum of min. 5000 mmW (e.g. hoses to be steel reinforced)
– do not reduce piping cross-section predetermined by the threaded connection.

3. MODEL CODE

VPBM - 2 / 1.0 / P / 90/40 / 1.5/400-50

	132	5.5 kW					●	●
	132	7.5 kW						●

(Please note: max. pressure 16 bar)

Motor output and voltage (n = 1500 rpm)
(only for VPBM)

Motor version: B5

Size 2:	**Motor output**	**Nominal current (for 400V - 50 Hz)**
	0.75 kW	2.1 A
	1.5 kW	3.8 A

Size 3:	**Motor output**	**Nominal current (for 400 V - 50 Hz)**
	2.2 kW	5.0 A
	4 kW	9.0 A
	5.5 kW	12.3 A
	7.5 kW	16.3 A

Standard voltages and frequencies for 3-phase motors

Motor output 0.75 KW - 4 KW

380 - 420 V star/220 - 240 V delta - 50 Hz
440 - 480 V star/254 - 277 V delta - 60 Hz (motor output x 1.15)

Motor output 5.5 KW - 7.5 KW

660 - 720 V star/380 - 420 V delta - 50 Hz
760 - 830 V star/440 - 480 V delta - 60 Hz (motor output x 1.15)

4. TECHNICAL SPECIFICATIONS

4.1. OPERATING PRESSURE
16 bar max.

4.2. SUCTION PRESSURE
-0.4 bar max. for mineral oil

4.3. FLUID
Mineral oil
to DIN 51524, parts 1 and 2
Permissible contamination
≤ NAS 12

4.4. FLUID TEMPERATURE
-20° C to +80° C
for mineral oil

4.5. VISCOSITY
See graphs

4.6. AMBIENT TEMPERATURE
-20°C to +40°C

4.7. MOUNTING POSITION
Preferably horizontal

4.8. REVOLUTIONS
min. 1000 rpm
max. 2000 rpm
Direction of rotation: clockwise
(when looking at motor fan wheel)

4.9. WEIGHTS

VP - 2:			5.0 kg
VP - 3:			13.0 kg
VPB - 2:			8.5 kg
VPB - 3	2.2 - 4	kW:	18.0 kg
VPB - 3	5.5 - 7.5	kW:	19.5 kg
VPBM - 2	0.75	kW:	18.0 kg
VPBM - 2	1.5	kW:	24.0 kg
VPBM - 3	2.2	kW:	39 kg
VPBM - 3	4	kW:	49 kg
VPBM - 3	5.5	kW:	60 kg
VPBM - 3	7.5	kW:	79 kg

4.10. DRIVE (ONLY VPBM)

Type of drive:	electric motor
Type of current:	three-phase
Output and voltage:	see model code
Safety type:	IP54
Insulation class:	F

4.11. VOLUMETRIC EFFICIENCY:
>90% (at ν=40 mm²/s)

4.12. NOISE LEVELS IN dB(A)

	ccm/rev	1bar	6bar	10bar
Size 2	20	57	60	63
	30	60	61	64
	40	61	62	64
Size 3	70	62	64	67
	100	66	67	69
	130	68	69	70

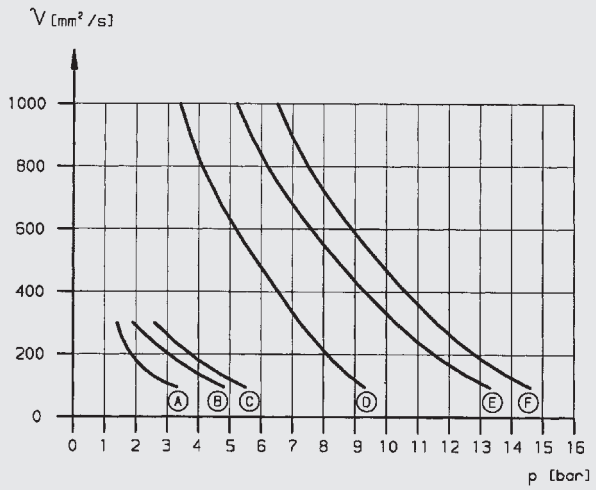
Test fluid: ISOVG46 at 40° C

Measured with dampened bell housing.

The noise levels are only a guide as acoustic properties of a room, connections, viscosity and reflections have an effect on the noise level.

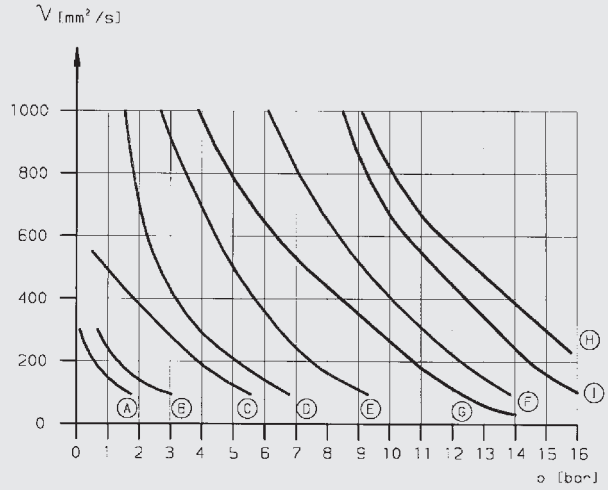
4.13. GRAPHS (n = 1500 rpm)

VP-2



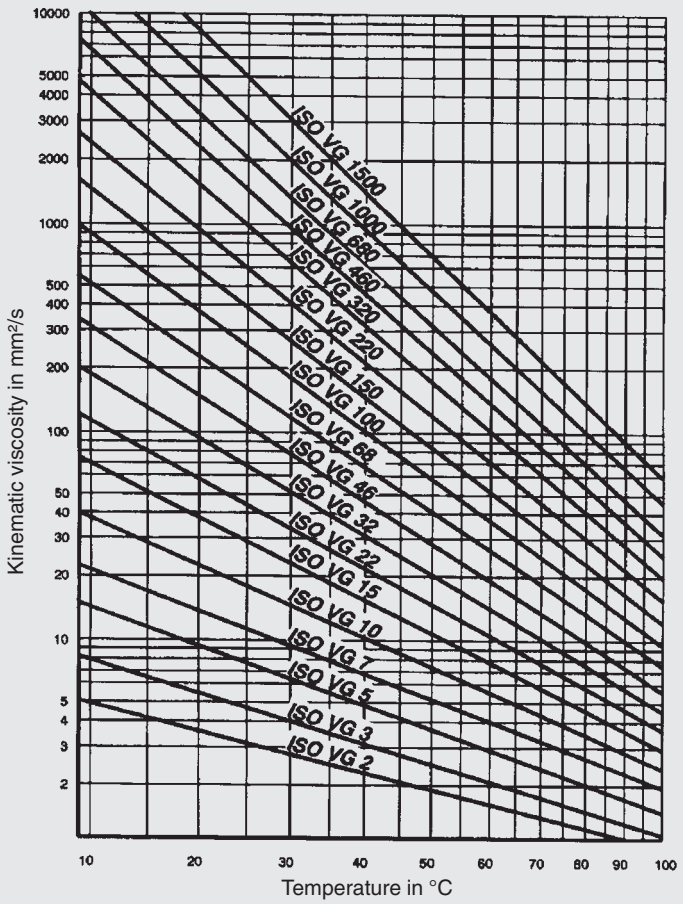
Ⓐ 40 cm³/rev-0.75 kW Ⓓ 40 cm³/rev-1.5 kW
Ⓑ 30 cm³/rev-0.75 kW Ⓔ 30 cm³/rev-1.5 kW
Ⓒ 20 cm³/rev-0.75 kW Ⓕ 20 cm³/rev-1.5 kW

VP-3

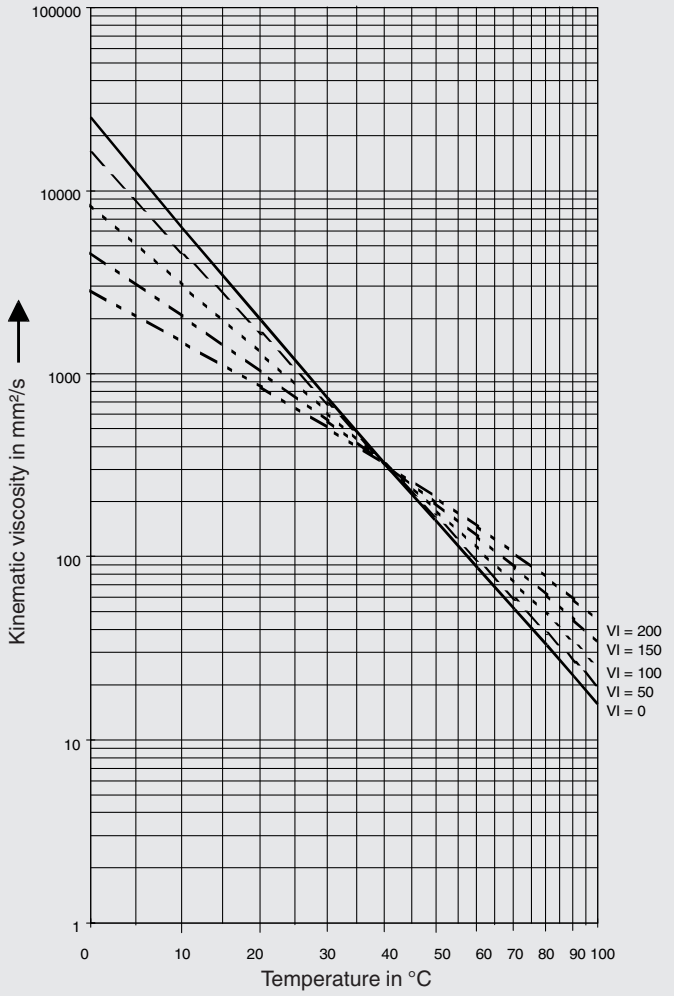


Ⓐ 130 cm³/rev-2.2 kW Ⓓ 130 cm³/rev-4.0 kW Ⓖ 130 cm³/rev-5.5 kW
Ⓑ 100 cm³/rev-2.2 kW Ⓔ 100 cm³/rev-4.0 kW Ⓗ 130 cm³/rev-7.5 kW
Ⓒ 70 cm³/rev-2.2 kW Ⓕ 70 cm³/rev-4.0 kW Ⓘ 100 cm³/rev-5.5 kW

4.14. VISCOSITY-TEMPERATURE GRAPH to DIN 51519 viscosity index 50



4.15. VISCOSITY-TEMPERATURE GRAPH Viscosity Index 0 to 200 Oil ISO VG 320

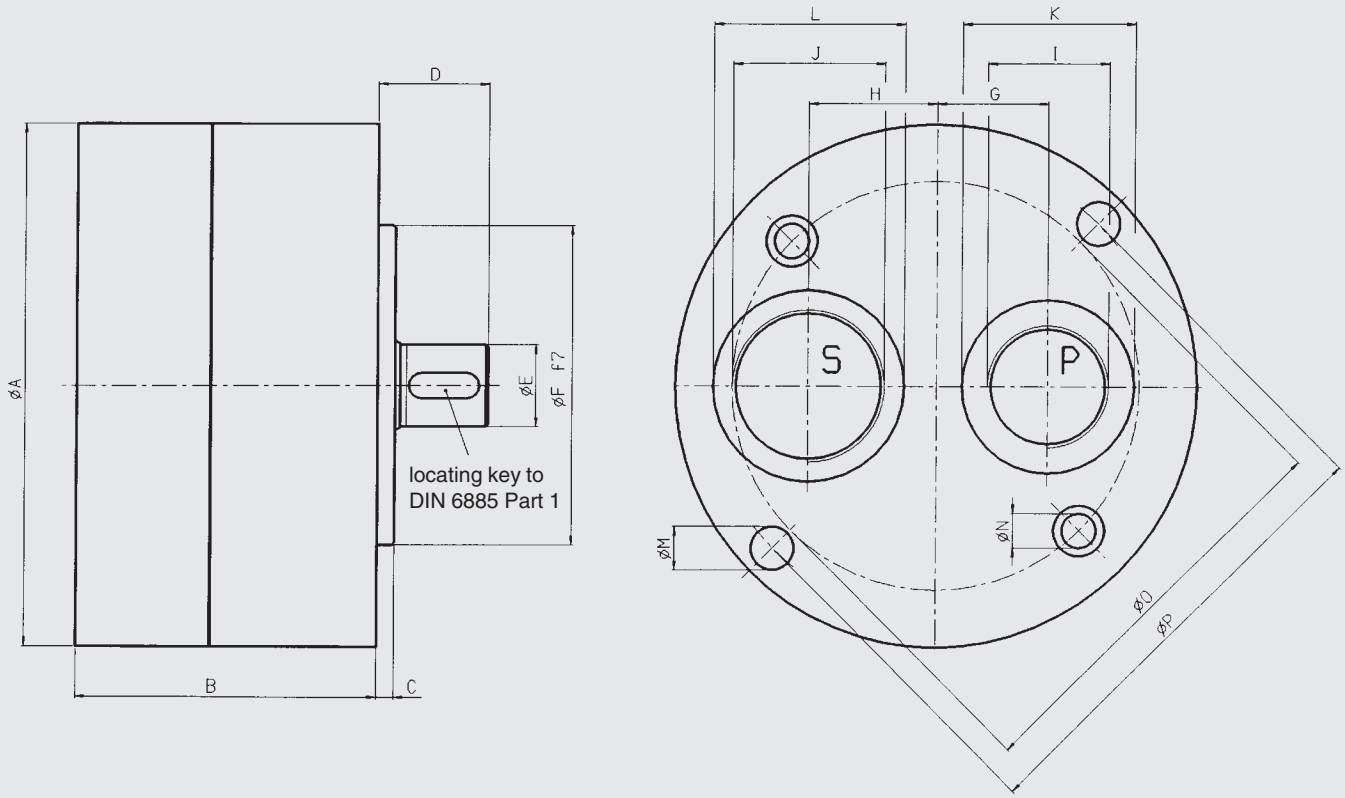


The viscosity index (VI) indicates how much the viscosity of the oil changes with temperature.
The higher the viscosity index, the smaller the change in viscosity in relation to the temperature.

⇒ Oils with a high viscosity index have a lower viscosity at low temperatures than oils with a low viscosity index.

5. DIMENSIONS

VP



Size	Flow rates l/min at 1500 rpm	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P

INTRODUCCION

Los cargadores Saft Nife de la serie SLR, estan diseñados para una vida útil larga y una gran confiabilidad en operacion continua para aplicaciones comerciales e industriales Esto se logra mediante un amplio programa que incluye una ingenieria de diseño muy prudente, el empleo de tecnicas de inducción modernas y programas de prueba del tipo de unidades en serie.

Hemos preparado este manual de instrucciones y paquete de documentación para familiarizar al usuario con esta unidad y que sirva como una guía para su propio uso y mantenimiento Para asegurar una operación libre de problemas, el usuario debera familiarizarse con el contenido de este manual.

Este documento se puede aplicar a todos los cargadores Saft Nife de la serie SLR. Incluye declaraciones breves acerca de las opciones disponibles. Si existen algunas de ellas. osu información se incluye actualizada en la última sección de este manual.

Aprovechamos la ocasión para agradecerle la preferencia por los productos SAFT NIFE.

1.0 PROPOSITO FUNCIONAL

1.1 Descripcion

El cargador de baterias Saft Nife es controlado mediante SCR's para proporcionar una fuente de alimentacion de CD idónea y altamente estable para cargar baterias de Níquel-Cadmio, Plomo - Calcio y Plomo - Antimonio.

Las características que incluye son:

- carga a voltaje constante
- control de limitación de corriente
- interruptor manual de flotación/régimen alto con regreso automático.
- control automatico de carga
- arranque lento
- mantenimiento mínimo

1.2 Especificaciones

Características nominales de entrada

VOLTAJE	:	120,208 o 240 Vca (dependiendo del rango de cd)
TOLERANCIA	:	de +10% a -10%
FRECUENCIA	:	57-63 Hz
FASE	:	Monofásico

Características nominales de salida

VOLTAJE	NOMINAL	MAXIMO	
	12	16.0	Vcd
	24	32.0	Vcd
	48	63.0	Vcd
	120	154.0	Vcd

Rango de voltaje en cd:
Flotación del 80% al 135% del cd nominal
Régimen Alto del 80% al 135% del cd nominal

Estabilidad de Voltaje (estático) : +/- 0.5%
Bajo las siguientes condiciones:
del 1 al 100% de la carga con
+/- 10% de variación de voltaje de entrada
+/- 5% de variación en la frecuencia

Rizo de salida : Un máximo del 2% del voltaje nominal de cd cuando se conecta a una bateria de capacidad en Amperes-hora de por lo ménos cuatro veces el régimen de corriente de salida del cargador.

Corriente : 5, 10, 20, 30, 50, 75 o 100 Acd (modelos 12, 24 y 48 Vcd)
5, 10, 15, 30 o 50 Acd (modelos 120 Vcd)

Límite de Corriente :
Ajustable de 20% al 100% de la corriente nominal de cd

Estabilidad de Corriente :
+/- 2% de la corriente de límite

1.3 CONTROLES

- Boton de régimen alto manual
- Potenciómetro de voltaje en flotación
- Potenciómetro de voltaje en régimen alto
- Potenciómetro de límite de corriente

1.4 INDICADORES

- Voltmetro de cd, 3" tolerancia 2%
- Ampermetro de cd, 3" tolerancia 2%
- Indicador de encendido verde LED
- Indicador de régimen alto ambar LED

1.5 CONDICIONES AMBIENTALES

Temperatura Ambiente	:	de -10 C a +40 C
de Operación	:	de +40 C a +55 C se reduce la corriente nominal a razon de 1.25% /1 C
de Almacenamiento	:	de -25 C a + 70 C
Altitud	:	1000 msnm de 1000 a 4000 m con una reducción a razon de 6.7% /1000 m
Humedad Relativa	:	95% sin condensación
Enfriamiento	:	por convección

1.6 PROTECCIONES

Para la entrada de CA cuenta con un dispositivo termo-magnético contra sobrecargas
Para la salida de CD un fusible
Supresores de tensión en CA y CD
Circuito de Arranque lento
Protección contra inversión de polaridad en bateria

1.7 GENERALIDADES

1.7.1 Magnéticas

Clase : 155 C
Temperatura de aislamiento mínima : 185 C
Voltaje de ruptura en aislamientos : 2500 Vrms mínimos

1.7.2 Alambrado

Aislamiento : 600 V
Todos los cables estan identificados bajo especificaciones NEC, NFPA - 70

1.7.3 Gabinete

Tipo	: NEMA - 1 con ventilacion
Terminacion	: Pintura Epoxica
Color	: Gris ASA 61
Panel	: Azul Cadmio
Terminación bastidor	: Dicromato de Zinc amarillo

1.7.4 Pruebas

Evaluado de acuerdo a NEMA RI - 2

1.7.5 Respuesta en la salida

Cambio en la carga	Un elemento unico (L/LC) filtro en la carga de la bat.	
10 - 100%	-5%	250 ms
100 - 10%	+5%	70 ms

2.0 OPCIONES

1) Una tarjeta de alarmas con las opciones siguientes:
- LED indicador de falla de CA
- LED indicador de alto voltaje de CD
- LED indicador de bajo voltaje de CD
- LED indicador de + a tierra
- LED indicador de - a tierra
- LED indicador de falla del rectificador
- Interruptor para prueba de LED's/restablecimiento
- Relevador de alarma común

Especificaciones para los contactos del relevador
CA : 240 Vca, 5 A, 480 VA, FP= 1.0
CD : 100 Vcd, 5 A, 120 W, Resistivos

2) Compensación de temperatura en la bateria
3) Límite de corriente en la bateria
4) Compartimiento de carga (cargadores en paralelo)
5) Contactos de alarmas. Arriba mencionadas 6 alarmas

3.0 INSTALACION Y ALAMBRADO

3.1 Instalación

Coloque el cargador en el lugar deseado, de acuerdo al dibujo dimensional mostrado en la última sección del manual. Evite los lugares en donde se encuentren equipos que generen calor, mucha suciedad o humedad. Todos los gabinetes deberán ser montados verticalmente. Mantenga distancias de ventilación segun se muestra en el dibujo (por ejmplo: 51mm en la parte posterior y 254 mm en la superior e inferior). NO BLOQEE LAS RANURAS DE VENTILACION.

3.1.1 Gabinetes de pared

Instale las unidades que se colocan en la pared utilizando tornillos de 1/4" de diametro o más grandes de acuerdo al peso de la unidad y del material de la pared. Con los tornillos en su lugar (hoyos de montaje), instale el gabinete. Abra la puerta para poder tener acceso a los tornillos y poder ajustarlos.

3.1.2 Gabinetes de piso

Los gabinetes para montaje en piso Saft Nife se pueden mover facilmentemediante el uso de un patín hidraulico. Observe que las placas de ventilación son removibles, dando acceso al elemento de izaje para tirar de él suavemente.

3.2 Inspección

Antes de efectuar cualquier conexión al cargador, se debera verificar lo siguiente:
1) La placa de especificaciones de operación para asegurar que la alimentacion de CA de entrada y la bateria corresondan a los parámetros del cargador.

2) Que todas las fuentes de alimentación de llegada al cargador esten apagadas

3) Que las protecciones de CA y CD del cargador esten desactivadas

4) Que todos los desechos dentro y alrededor del equipo hayan sido eliminados.

3.3 Conexiones

La entrada de cableado al gabinete se efectúa normalmente por el fondo. Los conductos pueden ser conectados en la tapa, parte posterior o a los lados según se requiera. Para una adecuada conexión de las entradas refierase al esquema del cargador, al final del manual Instale y alambre la bateria de acuerdo al diagrama de distribución proporcionado por el fabricante de la bateria.
Cuando se hagan conexiones al cargador utilice cables del calibre adecuado para la corriente de salida del cargador, listada en la placa de datos característicos del cargador. Refiérase al diagrama esquemático del cargador.
Si la bateria esta colocada a una destancia considerable del cargador, los cables deberan elegirse para una caida de voltaje mínima y para la corriente de salida máxima de CD.

3.3.1 Conexiones de la carga y de la bateria

Con las fuentes de alimentación al cargador y las protecciones de CA y CD apagadas, haga las siguientes conexiones:
- Para evitar accidentes, observe la polaridad adecuada.
- Alambre la terminal de +Vcd y la terminal positiva de la carga a la terminal positiva de la bateria
- Alambre la terminal de -Vcd y la terminal negativa de la carga a la terminal negativa de la bateria

Refiérase al diagrama del cargador, conforme se requieran conexiones no estandares.

NOTA. La carga de CD se deberá conectar a las terminales de la bateria y nó a las terminales del cargador. Esto es vital para aplicaciones que requieren de altas corrientes.

3.3.2 Conexión de la alimentación de CA

Verifique la linea de CA, sus valores de voltaje, frecuencia y fase deberan adecuarse a las especificaciones segun se lista en la placa de características del cargador, localizada al frente. La línea

de CA debera ser la adecuada para permitir el manejo de máxima capacidad de corriente, segun se indica en las características del interruptor de entrada. Conecte la entrada de CA a las terminales indicadas en la secuencia de fase correcta. Asegúrece de conectar la terminal de tierra (GND).

PRECAUCION : Las celdas cargadas, contienen mucha energia almacenada y se deberá tener cuidado cuando use herramientas metálicas alrededor de la bateria para evitar cortos.

3.4 Controles opcionales

3.4.1 Compensación de temperatura en la bateria (de inserción en tarjeta principal)

Este circuito compensa el voltaje de salida de la unidad a una temperatura relativa de la bateria en un rango de -0.18% / C de -20 C a +50 C, reduciendo a 0% / C en un rango de -40 C a + 80 C respectivamente. Esta opción puede ser usada para compensar el voltaje del cargador.
Esta opción auxilia al cargador de baterias reduciendo el consumo de agua e incrementando la vida de las baterias. El sensor externo se monta en la bateria y se alambra hacia la unidad.

3.4.2 Límite de corriente de bateria y compartimiento de la carga. (de inserción en tarjeta principal)

3.4.2.1 Límite de corriente de bateria

El amplificador de límite de corriente de bateria, en conjunto con un SHUNT (conectado en serie a la bateria) permite un control de la corriente de carga de bateria, independiente del circuito de límite de corriente principal. Esta función se aplica normalmente cuando la corriente total de salida es demasiado grande para la bateria (por ejemplo una bateria pequeña)

3.4.2.2 Compartimiento de carga

El compartimiento de carga permite a dos o más cargadores operar en paralelo dentro del 10% uno del otro sin alambrado adicional.

3.4.3 Tarjetas de alarmas opcionales

La tarjeta de alarmas, cuando de suministra, provee un medio de anunciarse mediante un relevador de alarma remota para las siguientes funciones:

3) Que las protecciones de CA y CD del cargador esten desactivadas

4) Que todos los desechos dentro y alrededor del equipo hayan sido eliminados.

3.3 Conexiones

La entrada de cableado al gabinete se efectúa normalmente por el fondo. Los conductos pueden ser conectados en la tapa, parte posterior o a los lados según se requiera. Para una adecuada conexión de las entradas refierase al esquema del cargador, al final del manual Instale y alambre la bateria de acuerdo al diagrama de distribución proporcionado por el fabricante de la bateria.
Cuando se hagan conexiones al cargador utilice cables del calibre adecuado para la corriente de salida del cargador, listada en la placa de datos característicos del cargador. Refiérase al diagrama esquemático del cargador.
Si la bateria esta colocada a una destancia considerable del cargador, los cables deberan elegirse para una caida de voltaje mínima y para la corriente de salida máxima de CD.

3.3.1 Conexiones de la carga y de la bateria

Con las fuentes de alimentación al cargador y las protecciones de CA y CD apagadas, haga las siguientes conexiones:
- Para evitar accidentes, observe la polaridad adecuada..
- Alambre la terminal de +Vcd y la terminal positiva de la carga a la terminal positiva de la bateria
- Alambre la terminal de -Vcd y la terminal negativa de la carga a la terminal negativa de la bateria

Refiérase al diagrama del cargador, conforme se requieran conexiones no estandares.

NOTA. La carga de CD se deberá conectar a las terminales de la bateria y nó a las terminales del cargador. Esto es vital para aplicaciones que requieren de altas corrientes.

3.3.2 Conexión de la alimentación de CA

Verifique la linea de CA, sus valores de voltaje, frecuencia y fase deberan adecuarse a las especificaciones segun se lista en la placa de características del cargador, localizada al frente. La línea

de CA debera ser la adecuada para permitir el manejo de máxima capacidad de corriente, segun se indica en las características del interruptor de entrada. Conecte la entrada de CA a las terminales indicadas en la secuencia de fase correcta. Asegúrece de conectar la terminal de tierra (GND).

PRECAUCION : Las celdas cargadas, contienen mucha energia almacenada y se deberá tener cuidado cuando use herramientas metálicas alrededor de la bateria para evitar cortos.

3.4 Controles opcionales

3.4.1 Compensación de temperatura en la bateria (de inserción en tarjeta principal)

Este circuito compensa el voltaje de salida de la unidad a una temperatura relativa de la bateria en un rango de -0.18% / C de -20 C a +50 C, reduciendo a 0% / C en un rango de -40 C a + 80 C respectivamente. Esta opción puede ser usada para compensar el voltaje del cargador.
Esta opción auxilia al cargador de baterias reduciendo el consumo de agua e incrementando la vida de las baterias. El sensor externo se monta en la bateria y se alambra hacia la unidad.

3.4.2 Límite de corriente de bateria y compartimiento de la carga. (de inserción en tarjeta principal)

3.4.2.1 Límite de corriente de bateria

El amplificador de límite de corriente de bateria, en conjunto con un SHUNT (conectado en serie a la bateria) permite un control de la corriente de carga de bateria, independiente del circuito de límite de corriente principal. Esta función se aplica normalmente cuando la corriente total de salida es demasiado grande para la bateria (por ejemplo una bateria pequeña)

3.4.2.2 Compartimiento de carga

El compartimiento de carga permite a dos o más cargadores operar en paralelo dentro del 10% uno del otro sin alambrado adicional.

3.4.3 Tarjetas de alarmas opcionales

La tarjeta de alarmas, cuando de suministra, provee un medio de anunciarse mediante un relevador de alarma remota para las siguientes funciones:

El nivel de la alarma de conexion a tierra esta fijado a 10 mA o 100 ohm/V. La indicacion de la alarma puede ser medida utilizando un voltmetro, conectado entre TP1 (0V) y TP70 para conexiones a tierra POS., y TP80 para conexiones a tierra NEG. Para iniciar las alarmas, utilice una resistencia de un valor adecuado, conectada de la salida positiva de CD a tierra para la conexion a tierra POS. y de la salida negativa a tierra para la conexion a tierra NEG.

El valor de la resistencia se puede calcular utilizando la formula

R = VCD NOM x 100 ohm

Cuando ocurre una alarma, el voltaje en los puntos de prueba sera aproximadamente de 8V. El tiempo de retardo en la alarma esta fijo a 4 segundos.

3.3.5 Falla del Rectificador

Simule una falla del rectificador abriendo el circuito de entrada de CA, o eliminando el fusible de salida de CD. Después de aproximadamente 15 segundos, se encendera el LED H80 que se encuentra en el control principal, y después de 2 segundos mas, se encendera el LED H90 localizado en la tarjeta de alarma.

3.3.6 Prueba de Lamparas/Restablecimiento

Reconecte la carga y utilice el boton pulsador del indicador de prueba/restablecimiento localizado en la tarjeta de alarma para restablecer todas las alarmas.

- Falla de CA
- Alto voltaje de CD
- Bajo voltaje de CD
- Fuga a tierra de +
- Fuga a tierra de -
- Falla del rectificador

El indicador local de cada alarma es suministrado por LED's individuales, montados en la tarjeta de alarmas.

3.4.4 Contactos de alarmas remotas selectivas

Se suministran contactos individuales tipo 'C' para las 6 alarmas arriba mencionadas.
Rango de los contactos 0.6A, 125 Vca, 2 A, 30 Vcd
0.6A, 125 Vcd

4.0 Instrucciones de operación

4.1 Generalidades

El voltaje de salida y la corriente del cargador son ajustados desde fábrica para satisfacer las especificaciones de carga de bateria, por lo que generalmente no se requiere de ajustes posteriores. En caso de ser necesario efectuar algun ajuste, consulte la sección 6.0 para detalles de ajuste.

4.2 Puesta en marcha

La operación adecuada del cargador de baterias requiere que todo el alambrado de entrada/salida, bateria o carga (si la hay) sea conectado adecuadamente segun la sección 2.0. Una vez completado el alambrado, inserte el fusible de salida (si lo quitó previamente). El voltaje de la bateria se indicara en el voltmetro de salida. Encienda el interruptor de entrada de CA y el cargador debera incrementar lentamente su voltaje de salida hasta alcanzar el nivel establecido o el límite de corriente.
El cargador arrancara en el modo de flotación. Conmute el cargador hacia el modo de régimen alto para permitir la carga de la bateria, por el período de tiempo especificado por el fabricante de la bateria. Después que éste tiempo se ha completado, el cargador regresa automáticamente al modo de flotación. Con esto se evita sobrecargar la bateria y por ende algun daño a la misma. Esta función es controlada automáticamente por el Control Automático de Carga (CAC) o manualmente mediante el boton de 'régimen alto programado'

4.3 Apagado

Apague el cargador utilizando el interruptor de CA y observe que no existe corriente en la salida. El

voltaje de salida estará indicandose una vez que el fusible de salida de CD ha sido instalado.

4.4 Operación

Durante la operación normal, el cargador compensara la carga adquirida de la bateria por el regulador. Los cargadores recargarán automáticamente la bateria en 'régimen alto' después de una descarga. Una carga periódica en el modo de régimen alto se podría requerir en algunos casos (por ejemplo en un sistema de alerta). La función de régimen alto puede ser activada oprimiendo el boton iluminado como 'régimen alto programado' El cargador regresará automáticamente a flotación después de 6 horas.

PRECAUCION : NUNCA DEJE EL CARGADOR EN EL MODO DE 'REGIMEN ALTO' POR MAS TIEMPO DEL RECOMENDADO POR EL FABRICANTE DE LA BATERIA. UNA SOBRECARGA OCASIONARA QUE LA BATERIA GASIFIQUE (POR ELECTROLISIS). ESTO CONSUMIRA EL AGUA REDUCIENDO EL NIVEL DE ELECTROLITO Y PUEDE SER CONTRAPRODUCENTE PARA LA VIDA DE LA BATERIA.

4.5 Controles

En el panel frontal se encuentran botones de contacto e indicadores. Uno de ellos es el control manual del modo de operación: 'Régimen Alto Programado'

'Regimen Alto Manual'
Presione momentáneamente el boton para inicializar el temporizador de CAC. Para cancelarlo presione por 3 segundos y luego suelte el botón pulsador

NOTA : El tiempo programado de régimen alto (6 hrs) se incrementará por el tiempo que el cargador permanezca en límite de corriente.
Después de haberse completado el tiempo inicializado por el boton pulsador, el cargador regresará a flotación

4.6 Verificación de operación funcional

4.6.1 Prueba del estado de la carga de la bateria

El estado aproximado del estado de la carga de la bateria puede ser determinado mediante una verificación sencilla.

1) Conmute el cargador a 'régimen alto'
2) Observe que la unidad entre en límite de corriente (en el ampermetro de salida)
3) Si el cargador permanece en el límite de corriente

por mas de 36 segundos, la bateria demanda la carga de régimen alto. Si la bateria ya está cargada adecuadamente, el cargador abandonará el modo de límite de corriente (esto se manifiesta como la disminución en la corriente de bateria o a la salida del cargador) . Presione y mantenga por 3 segundos el boton de régimen alto para restablecer el cargador a su modo de flotación. Si el cargador se encuentra en límite de corriente, aún cuando se oprima el boton, el cargador no regresará al modo de flotación.

4.7 Verificaciones periódicas

4.7.1 Voltajes de Flotación/ Régimen Alto

Los voltajes de flotación y régimen alto deberán ser verificados periódicamente (semestralmente) para el cumplimiento de los requerimientos establecidos en la seccion 6.0

4.7.2 La bateria

La bateria es una parte importante de su sistema que se le deberá proporcionar mantenimiento regularmante segun recomendación del fabricante. Se deberá poner especial cuidado en el nivel de electrólito en las celdas ventiladas.

5.0 Operación y descripción de circuitos

5.1.1 Bosquejo del rectificador

El cargador SLR convierte la potencia de CA a CD, controlando el voltaje y corriente de salida. Esto permite que la unidad funcione como un cargador de baterias Se pueden utilizar varias funciones de control para lograr satisfacer los requerimientos de las baterias y las cargas, mejorando el funcionamiento y ayudar a la carga automática.

5.1.2 Operación del cargador SLR

(Observe la figura 5.1.a) El voltaje de CA se aplica al embobinado primario del transformador de potencia a traves del interruptor de CA. El transformador aisla galvánicamente el voltaje principal de CA de los voltajes del secundario elevándolo o disminuyéndolo a los niveles requeridos.
El embobinado secundario esta conectado a un puente rectificador controlado de onda completa, compuesto por

dos tiristores, dos diodos y un diodo freewheeling. El puente controlado por fase convierte la señal de CA no regulada a un voltaje de CD regulado. El puente se conecta a través de una inductancia L1 y un ampermetro (o derivador) al negativo de salida. Y a través de un fusible F1 a la terminal positiva de salida.
Para el control del voltaje y la corriente, se utilizan dos lazos de realimentación independientes. Sólo una de ellas esta activa a la vez.

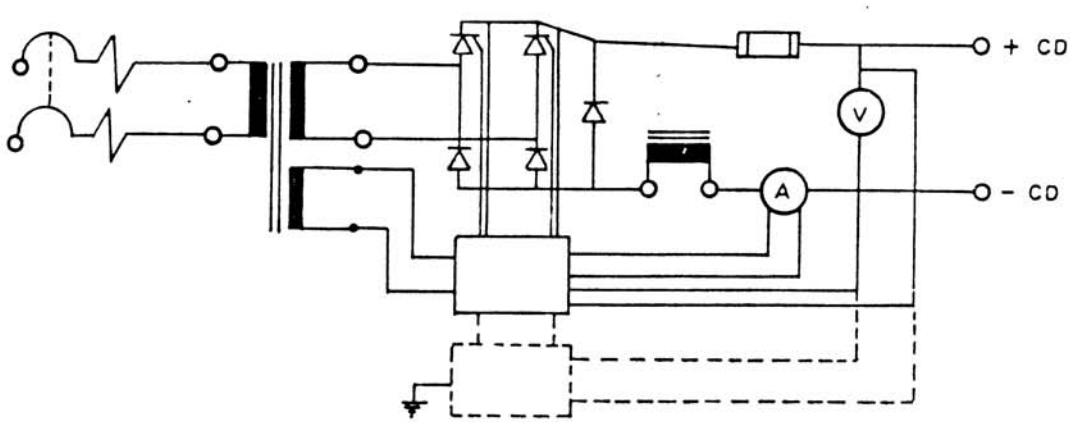

Fig. 5.1.a Cargador de baterias típico SLR

El voltaje de CD es realimentado a la tarjeta de control, encargándose de su regulación en ambos modos flotación y régimen alto. Ambos niveles pueden ser ajustados en la tarjeta de control. El rectificador opera normalmente en el modo de flotación. El modo de régimen alto puede ser operado de manera automático (mediante un temporizador interno) o manualmente mediante la presión del pulsador de régimen alto.

En este modo el rectificador es controlado mediante un control automático de carga existente en la tarjeta de control. Si la demanda de corriente en la salida excede la característica nominal, el rectificador conmutará del modo de voltaje constante al modo de corriente constante. El voltaje alcanzado en el derivador SH (proporcional a la corriente de salida) es sensado y procesado por un amplificador de límite de corriente en la tarjeta de control. El cargador regula su salida de voltaje y corriente mediante el control del puente de tiristores. El puente está diseñado como un rectificador de onda completa y los tiristores determinan la cantidad de corriente proporcionada a la salida. El tiristor está apagado y enciende hasta que le aplican un pulso de disparo en la compuerta. Una vez disparado, el tiristor permanece conduciendo en su polaridad directa hasta que la corriente que fluye por él, es cero.

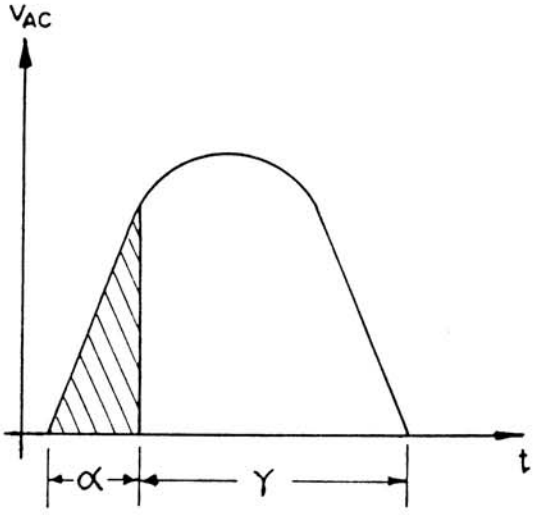

Fig.5.1.b Control del Angulo de fase

El control de ángulo de fase se reliza mediante la variación del retardo en los pulsos de disparo con ello tambien se varía la cantidad de energia disponible en las terminales de salida. Si se requiere de mucha corriente el pulso de disparo comenzará incrementando durante el

medio ciclo de la onda senoidal y viceversa. El voltaje de salida se compensa por éste método tambien.

5.2 Descripción del circuito de control

5.2.0 Generalidades

La tarjeta de control regula automáticamente la salida de voltaje y de corriente dentro de los límites establecidos por los potenciómetros de la tarjeta. Opera retardando el pulso de disparo respecto del cruce por cero de la alimentación de CA, con el fin de controlar el ángulo de conducción de los SCR's.
Los potenciómetros de la tarjeta permiten ajustes independientes de 'Flotación', 'Régimen Alto' y Límite de Corriente.

5.2.1 Fuente de alimentación

De los embobinados aislados del transformador principal, se proporcionan 20 Vca al puente D1-D4 y C1 filtra la CA rectificada. La resistencia R1 y el zener regulador DZ1 proporcionan un voltaje de 15 Vcd para la circuitería de control. TP5 es usado como punto de prueba común para todas las mediciones de voltaje.

5.2.2 Sincronización

Los diodos D5 y D6 rectifican la señal de CA, produciendo un nivel de CD no filtrado, el divisor resistivo R2-R3 El transistor Q1 sensa el rizo de CA y enciende cuando el voltaje de CD es mayor que el Vbe del transistor e inversamente cuando este cae abajo de Vbe. Por tanto un pulso de 0.5 ms es generado en cada cruce por cero. El pulso positivo es aplicado a Q2, el cual enciende y reseta al integrador en el cruce por cero.

5.2.3 Amplificador de voltaje de error y referencia de voltaje.

U1 forma el corazón de una referencia de voltaje interna, de presición y un amplificador de voltaje de error. La referencia de voltaje (+7 Vcd) esta disponible del pin 6 y es usado en otras secciones de la circuiteria.
Para la regulación del voltaje de salida, una muestra del voltaje (ajustable) se toma del divisor de resistencias y es aplicado al -Ve del amplificdor de error, comparándolo con una referencia de voltaje fija. La diferencia (error) es amplificado 100 veces y aplicado al modulador.
El ajuste de voltaje de flotación es llevado a cabo por el potenciómetro P1 y el ajuste de régimen alto por P2 cuando el pin 39 es cortocircuitado al pin 25.

5.2.4 Amplificador de corriente de error

U2a, esta configurado como un amplificador diferencial para reforzar la señal de corriente de salida del SHUNT en cualquier modo único, finalizado o diferenciado. La señal de corriente amplificada es aplicada a la entrada -Ve del amplifacador de corriente U2b, con una referencia ajustable en la entrada +Ve. La señal de error amplificada se aplica al modulador.

5.2.5 Modulador

La función del modulador es controlar el ángulo de conducción de los SCR's. Opera produciendo un retrazo en los pulsos de encendido respecto al cruce por cero de CA. Este retrazo es aproximádamante igual a la proporción inversa del voltaje de control en su entrada (S'MOD).
U2c junto con sus componentes asociados forma un generador de rampa no lineal. El generador de rampa no lineal ayuda a agrupar las características de transferencia del circuito de control a la respuesta del filtro de entrada puente/inductor. El generador de rampa es reseteado en cada cruce por cero por el circuito de sincronización.
La modulación del corrimiento de fase de la señal de control es producida por un muestreo natural en U2d, el cual compara la rampa negativa con la señal de control. Una señal de habilitación al circuito de encendido es generado, cuando la rampa de voltaje es ligeramente inferior al voltaje de control.
El voltaje de control de la entrada del modulador (S' MOD) es determinada por la condición 'OR' del amplificador del voltaje de error, amplificador de corriente de error, arranque lento o capacitor limitador de voltaje. Cualquiera de éstos circuitos pueden operar para reducir el tiempo de conducción de los SCR's.

5.2.6 Arranque lento

El capacitor C11 forma el corazón del circuito de arranque lento. La velocidad de crecimiento del voltaje a través del capacitor, producida por la corriente de carga que fluye a traves de R49, es aplicada al transistor Q3 y a la terminal de modulación. El tamaño del capacitor determina la velocidad de crecimiento de la corriente de salida del cargador, la cual es aproximadamente lineal.

5.2.7 Limitador de voltaje

Las resistencias R48 y R50 forman una red divisora de voltaje la cual es efectivamente alambrada a través del capacitor del filtro de entrada. El rango de voltaje es llevado a cabo por el uso de una resistencia en serie

R48. Cuando el voltaje a través de R50 desarrolla aproximadamente 13.5 V. El diodo zener DZ4 inicia la - - conducción, por tanto polariza al LED dentro del optoacoplador U3. Esto provoca que conduzca el transistor dentro de U3, ocasionando una reducción del ángulo de conducción de los SCR's, a través de Q3 de la terminal del modulador.

5.2.8 Circuito de encendido

El circuito de encendido entrega un tren de pulsos al SCR cuando está habilitado. El transistor Q5 (conmutador de potencia), Q4 sensor de corriente y el transformador de pulsos T1 están configurados como un oscilador de relajación auto-oscilante a una frecuencia aproximada de 10 KHz. El transistor Q4, cuando enciende (por el comparador U2d), deshabilita el circuito de disparo. D17 en el devanado secundario rectifica el pulso de salida y lo aplica a los SCR's a través de unas resistencias de compartimiento de corriente R46 y R47.

5.2.9 Control automático de carga. (CAC) Tarjeta de Inserción.

El amplificador operacional U1a sensa el límite de corriente monitoreando el amplificador de voltaje de error en la forma tradicional. El LED DS1, indica la condición de límite de corriente. El capacitor C4, junto con U1d forma un simple circuito de retrazo de tiempo. El retrazo de tiempo es seleccionado por la reisitencia R13a-c (haciendo una selección apropiada como se indica en el esquemático). U3 suministra el voltaje de referencia para la tarjeta.
U2c y U2d estan configurados como un candado R-S. El cual es activado por una transición positiva de U1b. El candado puede ser activado tambien por una señal externa de pulsadores momentáneos (o cortocircuitando TP a TP sobre la tarjeta de circuito impreso PCB).
El reset es afectado manteniendo la señal activa (manteniendo el reset de la PB) por mas de dos segundos.
Cuando el candado esta activo, el temporizador U4 es activado y una instrucción de régimen alto es dado a través de Q2 y Q3. El temporizador se habilita para contabilizar el tiempo, cuando la señal de límite de corriente es eliminada. El período de tiempo es ajustado para 6,10 o 15 horas por la selección de R17/R18 (6 hrs es lo estándar).

NOTA. El cargador no regresará a flotación cuando la botonera manual de régimen alto es presionada, si la unidad esta en límite de corriente.
Las funciones de control opcionales, estan disponibles como tarjetas de inserción, las cuales son insertadas sobre la tarjeta de control de fase. Los sensores requeridos por cada opción estan alambrados al conector de la

tarjeta de control.

5.3.1 Compensación de temperatura en la bateria (CTB). Tarjeta de inserción opcional.

El sensor usado es un termistor de 10K NTC montado en una cápsula terminal de cobre plateado. Normalmente es montada en un conector intercelda. Esto suministra un verdadero sensor de temperatura de bateria. El voltaje de salida es cambiado en un rango de 0.18%/ (sobre el rango de -20 A + 50 C con una compensación reducida en los extremos.
La señal del termistor es linealizada y amplificada por el puente resistivo R1-4 y U1a e invertido por U1b. La señal de temperatura compenzada es aplicada a través de Vrt a la tarjeta principal (La cual viene a ser dominante) U1c esta configurado como un comparador para verificar la integridad del termistor. Con un termistor en circuito abierto, U1c enciende Q1, inhibiendo la compensación de temperatura forzando Vrt a una temperatura simulada de + 30 C. Al mismo tiempo el LED local , DS1 esta encendido.
Lo siguiente es suministrado solamente con 4111-70-12335 01 (opciones no estándares) U1d suministra una alarma para temperatura alta de bateria a través de Q3. al mismo tiempo inhibe cualquier cambio a régimen alto, (forza el regreso del cargador a flotación) hasta que la bateria se enfría. El suministro de P1 permite ajustes a la alarma la temperatua.

5.3.2 Amplificador de corriente de bateria y compartimiento de carga. Tarjeta de inserción

Amplificador de corriente de bateria.

U1a esta configurado como un amplificador de corriente diferencial, el cual amplifica la señal de corriente de bateria del shunt. La señal de corriente amplificada es aplicada al amplificador de corriente de error con una referencia ajustable de P1. La salida a través de D1 es aplicada a el modulador en la tarjeta principal.
Usando esta opción permite un control independiente de la corriente de bateria, aparte de la corriente del sistema. y puede ser requerida cuando la salida del cargador es grande en relación a la bateria. En tales casos esta opción tambien proporciona una acción correcta del control CAC (un ejemplo de tales aplicaciones puede ser en cargas "grandes" con bateria "pequeñas").

Compartimiento de carga.

El circuito lo comprende U1c.d dónde U1c actúa como un amplificador de error amplificando el error (diferencia en una corriente local y una corriente de un cargador

remoto). El cual es usado para ajustar el amplificador de voltaje de error y consecuentemente el voltaje de salida del cargador. Un potenciómetro P2, es usado para inicializar el balance del cargador para sistemas en paralelo.

6.0 Ajustes.

El cargador de bateria es embarcado y armado de fábrica para el sistema de baterias especificando, de tal forma que no se requieran ajustes adicionales cuando se ponga en operación. Sin embargo, si fueran necesarios los ajustes, la sección siguiente debera utilizarse como una guía.

6.1 Herramientas.

- Herramientas de alineación para potenciómetros o un desarmador plano pequeño.
- Un voltímetro de precisión o multímetro digital (precisión + 1% o mejor)
- Un diagrama de la tarjeta de control (fig. 6.0.a)

El voltmetro deberá ser conectado a través de las terminales de salida de CD del cargador.

6.2 Voltaje en Flotación.

6.2.1 Verificacion del voltaje de flotación.

Verifique que el cargador este en modo de flotación, observando que la lampara de 'Régimen Alto' esté apagada. Si el cargador está en el modo de 'Régimen Alto' regréselo a Flotación presionando y liberando el boton de 'Régimen Alto'. No será posible regresarlo a Flotación si el cargador está en el modo de Límite de Corriente.

NOTA: Con el cargador a menos de plena carga, el voltaje de 'Flotación' deberá ser de 1.40 a 1.42 volts, por celda, para baterias de Níquel-Cadmio, o 2.17 a 2.25 volts por celda para baterias de plomo, dependiendo de las especificadiones del fabricante.

Si el voltaje es el adecuado, continue con el párrafo 6.3.

6.2.2 Ajuste del Voltaje en Flotación.

- Verifique que el cargador no esté produciendo la corriente de salida total (No en límite de corriente).
- Reduzca la carga si es necesario.
- Observe el voltmetro mientras efectúa los ajustes.
- Para incrementar el voltaje de salida, ajuste el potenciómetro de Flotación en sentido horario (CW) en

pequeños incrementos hasta que se logre el voltaje deseado.
- Para disminuir el voltaje de salida, ajuste el potenciómetro de flotación en sentido antihorario (CCW) en pequeños incrementos hasta que se logre el voltaje deseado.
- Permita que el voltaje se estabilice despues de cada incremento antes de continuar.

6.3 Voltaje en Régimen Alto.

6.3.1 Verificación del voltaje en Régimen Alto.

Conmute el cargador a 'Régimen Alto' presionando y liberando el boton/lámpara de 'Régimen Alto'. La lámpara de 'Régimen Alto' se iluminará. Permita que el voltaje de salida y la corriente se estabilice.

NOTA: Con el cargador a una carga menor a la carga plena, el voltaje en Regimen Alto debera se 1.52 volts por celda o mayor (1.55V/C estándar) para baterias de niquel-cadmio o 2.33 volts por celda para baterias de plomo-ácido, dependiendo de las recomendaciones del fabricante de la bateria.

6.3.2 Ajuste del Voltaje en Régimen Alto.

Verifique que la carga no esté produciendo una corriente a plena carga (no en límite de corriente).

- Reduzca la carga si es necesario.
- Observe el voltmetro mientras efectúa ajustes.
- Para aumentar el voltaje de salida, ajuste el potenciómentro de 'Régimen Alto' en sentido horario (CW) en pequeños incrementos, hasta lograr el voltaje deseado.
- Para disminuir el voltaje de salida, ajuste el potenciómetro de 'Régimen Alto' en sentido antihorario (CCW) en pequeños incrementos hasta lograr el voltaje deseado.
- Permita que el voltaje se estabilice despues de cada incremento antes de continuar.
- Cuando quede ajustado adecuadamente, regrese el cargador al modo de 'Flotación' presionando y liberando el boton de 'Régimen Alto'.
- Observe que se apague la lámpara de 'Régimen Alto'.

6.4 Ajuste de control automático de carga.

P1 sobre la tarjeta 4111-70-12334-XX ajusta el punto en el cual el control automático de carga es activado por el límite de corriente del cargador. Este viene ajustado de fábrica, pero si un nuevo ajuste de la tarjeta es requerido, incremente la carga hasta que el límite de corriente sea alcanzado y ajuste P1 hasta que el LED DS1

encienda.

6.5 Sistema de Límite de Corriente.

6.5.1 Verificacion del Límite de Corriente de bateria (opción) 4111-70-12333-XX.

- Remueva todas las cargas del cargador excepto la bateria.
- Conmute el cargador a 'Régimen Alto' y monitoree la corriente de salida. Esta corriente deberá seguir las recomendaciones del fabricante.

NOTA: Si la bateria esta descargada, una carga adicional a las terminales de la bateria puede ser requerida. Si se desea ajustar el límite de corriente a un valor diferente, o para ajustar una nueva tarjeta, use el siguiente procedimiento.

6.5.2 Ajuste del límite de corriente de bateria.

- Gire el potenciómentro de límite de corriente P1 completamente en sentido horario en la tarjeta 4111-70-12333-XX.
- Aplique la carga que ligeramente exceda el límite de corriente (en las terminales de bateria).
- Observando el amperímetro ajuste P1 en sentido antihorario hasta el límite de corriente deseado.
- Incremente la carga debiendose mantener la misma corriente (aproximadamente).

Si desea ajustar el límite de corriente a un valor menor o ajustar una tarjeta de control nueva, utilice el procedimiento siguiente.

6.5.3 Verificacion del límite de corriente del sistema

PRECAUCION : EL LIMITE DE CORRIENTE VIENE AJUSTADO DE FABRICA AL 100% DE LA CORRIENTE NOMINAL DE SALIDA. NO INTENTE EXCEDER LA CORRIENTE NOMINAL MAXIMA, DEFINIDA EN LA PLACA DE CARACTERISTICAS DEL CARGADOR, YA QUE CONDICIONES INADECUADAS DAÑARIAN AL CARGADOR.

- Incremente la corriente de carga mientras observa el voltmetro de CD. (La carga deberá ser tomada de las terminales de la carga si la opción de límite de corriente de bateria esta aplicada).
- Observe la corriente a la cual el voltaje de salida comienza a disminuir.

6.5.4 Ajuste de Límite de Corriente del Sistema.

PRECAUCION: NO EXCEDA LAS CARACTIRISTICAS NOMINALES DE LA CORRIENTE DE PLACA.

- Gire el potenciómetro de Límite de Corriente completamente en sentido horario (CW).
- Aplique una carga ligeramente mayor que la establecida como nominal (En las terminales de la carga si la opción de límite de corriente de bateria es aplicable).
- Observando el amperímetro, ajuste el potenciómetro del límite de corriente.

6.6 Opción.Compartimiento de carga. Tarjeta P2. 4111-70-12333-XX

Ajusta la corriente entre dos cargadores en paralelo. Este viene ajustado de fábrica, pero si un nuevo ajuste o reajuste es requerido, el siguiente procedimiento deberá ser usado:
- Remueva la bateria y ajuste la carga a un 50% del total
- Ajuste los cargadores a sus voltajes de 'flotación' y despues a 'régimen alto' para que sean los mismos, usando un voltmetro digital.
- Ajuste P2 ligeramente en un cargador y después en el otro, en un ajuste fino hasta que sean iguales (25% por cargador).

6.7 Opción. Compensación de Temperatura en bateria. 4111-70-12333-XX.

Esta tarjeta no requiere ajuste. (P1 no es usado). DS1 indica un termistor abierto.

7.0 Procedimiento de búsqueda de fallas

Las Cartas de Diagnóstico para búsqueda de fallas han sido preparadas para ayudar a aislar la falla en el caso de una falla del cargador. En casos de mal funcionamiento, primero verifique lo siguiente:

a) Todas las conexiones entre celdas y entre contenedores, deben ser de positivo a negativo (en serie), y deben estar sujetos de forma segura.
b) Las conexiones entre la bateria y el cargador son positivo a positivo, negativo a negativo (en paralelo) y deben estar sujetos de forma segura.
c) Voltajes en las celdas individuales. En el modo de flotación estas lecturas de voltaje deberán ser 1.40 a 1.42 volts por celda para baterias de níquel cadmio o 2.17 a 2.25 por celda para plomo ácido. Si hay una variación mayor de 0.05 volts entre celdas con las lecturas más alta y más baja, cargue la bateria en régimen alto durante 24 hrs para igualar voltajes y vuelva a verificar.
d) El voltaje y la frecuencia de CA de entrada, deben cumplir con la entrada de diseño del cargador segun

se muestra en la placa de características nominales.

Despues de verificar si todas las conexiones externas estan correctas, los voltajes en las celdas estan dentro de las tolerancias y el voltaje y la frecuencia de CA en la entrada son iguales a los del cagador. Efectúe detenidamente un análisis en cada bloque y proceda segun lo indicado por el resultado.

S I N T O M A	ACCION CORRECTIVA
El fusible de CD se quema inmediatamante.	Refierase al diagrama de diagnostico # 1
El breaker de la red, abre inmediatamente.	Refierase al diagrama de diagnostico # 2
No hay potencia de salida	Refierase al diagrama de diagnostico # 3
El rectificador opera continuamente en el modo de límite de corriente o el voltaje de salida esta incorrecto.	Refierase al diagrama de diagnostico # 4

NOTA : SE DEBERA TENER CUIDADO EN TODO TIEMPO, PARA EVITAR EL CONTACTO CON CIRCUITOS VIVOS.

7.1 Verificación del ensamble del puente

Para cargadores de 100 A de salida o menores se utiliza modulos de SCR/DIODO. Todas las conexiones se hacen a través de las terminales de los módulos. Para verificar la existencia de un corto circuito, primero desconecte la alimentación de la red de CA que viene de la entrada abriendo el circuito interruptor de CA. Utilice un ohmetro o un multímetro en la escala de baja resistencia y verifique ambas direcciones a través de las componentes. Si se indica un corto circuito, desconecte los alambres para aislar la componente dañada. Un SCR en forma individual indicará un circuito abierto en ambas direcciones Para verificar la compuerta, desconecte la terminal de color blanco (compuerta) y verifique la resistencia de compuerta a cátodo (blanco a rojo) con el ohmetro/multimetro. Las resistencias varían pero típicamente estan dentro del rango de 30 a 100 OHMS en ambas direcciones Tambien verifique la resistencia de compuerta a ánodo, deberá ser esencialmente circuito abierto.
Para los diodos, verifique la resistencia de ánodo a cátodo. La resistencia deberá ser baja de ánodo a cátodo y alta de cátodo a ánodo.

Refiriendose al diagrama esquemático, las componentes deberán cumplir con lo siguiente:

CA1	-	(+) TY1	ALTA	(-)	-	(+)	D3	ALTA
(+)	-	CA1 TY1	ALTA	(+)	-	(-)	D3	BAJA
CA2	-	(+) TY2	ALTA	(-)	-	CA1	D1	ALTA

9.0 Manteniminento

Los cargadores de bateris Saft Nife no emplean ninguna parte móvil mas que los potenciómetros de ajuste y los medidores indicadores utilizados para las alarmas. No se requiere de ningún mantenimiento adicional, al necesario para eliminar el polvo del cargador, las verificaciones periódicas y los ajustes durante la vida de la unidad.

Todas las componentes magnéticas, reisitencias, capacitancias y semiconductores se han seleccionado prudentemente para un período de vida largo.

Se deberá verificar regularmente el estado aproximado de la carga de la bateria. Esto se podrá lograr mediante el procedimiento siguiente:

1) Inicie una carga rápida presionando el boton de régimen alto.
2) Observe que el cargador entre en límite de corriente (en el amperímetro de salida)
3) Si el cargador permanece en límite de corriente por más de 36 segundos, la bateria requiere entonces de una carga en régimen alto. Si la bateria ya ha sido cargada en forma adecuada, el cargador dejará el modo de límite de corriente (obsevada por la disminución de la corriente en la bateria ó a la salida del cargador.
4) Cancele la carga manual en régimen alto si la bateria no requiere de la carga.

Además, regularmente se deberá proporcionar mantenimiento a la bateria como lo indica el fabricante. Se deberá poner atención especial en el nivel de electrólito de las celdas con ventilación. Tambien se deberán verificar los voltajes de 'Flotación' y 'Régimen Alto' semestralmente para que estén de acuerdo a las características mencionadas en la sección 6.0

1.0 ESPECIFICACIONES

1.1 Introduccion

La tarjeta de alarma se realizo para poder efectuar una supervisi basica de los cargadores de bater a de una fase tipo SLR Saft NIFE. Pa indicar la condicion de alarma se cuenta con lamparas indicador individuales (LED), conectadas a un grupo integral de alarma de conexi remota mediante relevadores. El restablecimiento y la prueba del LED se logra mediante un boton localizado en la tarjeta.

1.2 La entrada a partir de la señal de salida de CD

De la salida de CD:	Voltaje Nominal de CD	-25%	+40%
Rango Estandar:	12V	4111-70-12332-01	
	24V	4111-70-12332-02	
	48V	4111-70-12332-03	
	120V	4111-70-12332-04	
Corriente:	Max. 85 mA		

1.3 Entrada a partir de la señal de alimentacion de CA

A partir de la tarjeta de control:	20VCD
Corriente:	Max. 40 mA

1.4 Alarmas y Ajustes

1.4.1 Alarma de Falla de CA

-Sin ajuste, fijo a -30%, +/-10% de la entrada nom. de CA
-10% de histéresis
-Alarma con retardo de 4 segundos

1.4.2 Alto Voltaje

-Ajuste 0-150% del Voltaje nom. de CD
-Ajuste del potenciometro R20
-Sin histéresis
-Alarma con retardo de 4 segundos

1.4.3 Bajo Voltaje

-Ajuste 0-150% del Voltaje nom. de CD
-Ajuste del potenciometro R40
-Sin histéresis
-Alarma con retardo de 4 segundos

1.4.4 Alarma de conexion a tierra de las polaridades positi
negativa

-Sin ajuste, fija a 10 mA (100 Ohm/V)
-Sin histéresis
-Alarma con retardo de 4 segundos

1.4.5 Falla del Rectificador

-Sin ajuste, entrada digital
-Sin histéresis
-Alarma con retardo de 4 segundos

1.5 Salidas del Relevador de Alarma Comun

CA: 240V 5A 480VA carga resistiva
CD: 100V 5A 120W carga resistiva

1.6 Interfaz

Entradas externas: Las posiciones 7 y 4 del bloque de termi
Un cable planar de 10 posiciones. DIN (usado con la tar
relevadores opcionales)

1.7 Medio Ambiente

Temperatura:	Operacion:	-10 a +55 grados C
	Almacenamiento:	-40 a +70 grados C
Humedad:	al 95% sin condensacion	

1.8 Mecanicas

Montaje: En el panel frontal sobre gu as de tarjetas
Acceso: En el frente para todos los ajustes
Dimensiones: PCB : 110X 160 mm

2.0 OPERACION Y DESCRIPCION DE LOS CIRCUITOS

Parte No. : 4111-70-12332-XX
Dibujo No.: 4111-65-87239-00

2.1 Generalidades

La tarjeta de alarma tiene 6 alarmas de sujecion independiente con indicacion de LED, conectada a un relevador comun de alarma.

Falla de CA
Alto Voltaje
Bajo Voltaje
Falla de conexion a tierra de la polaridad positiva
Falla de conexiòn a tierra de la polaridad negativa
Falla del Rectificador

La fuente de alimentacion esta dividida en dos partes, del lado de CD y del lado de CA. La fuente de alimentacion de CA es utilizada por el relevador comun y como un sensor para las fallas principales. La de CD es utilizada para la alimentacion de los circuitos en las tarjetas.

.2 Fuente de Alimentacion y Referencia

Alimentacion de potencia de CD (X1:09) para la tarjeta de alarma, es alimentada desde la salida del rectificador. El nivel de voltaje de alimentacion de 9V (TP2), es proporcionado por un regulador lineal consistente de transistores, V34 y circuitos asociados.

Un voltaje de referencia de 5V proporcionado por N1 puede ser medido en TP3.

.3 Falla de CA

El voltaje de entrada de CA es sensado en el secundario, de bajo voltaje del transformador principal, a través de MH2-10 y MH2-11 en la tarjeta principal de control. El voltaje de CA es rectificado por V1 y V3 en la tarjeta de control, y filtrado por C1 y sensado por un disparador inversor Schmitt D2f en la tarjeta tarjeta de alarma. El nivel de la alarma es fijado al 70% de la entrada nominal de CA. La histéresis es fijada al 10% mediante R17.

El estado de la alarma puede ser medido en TP10 (alarma = señal alta). Para el tiempo de retardo e indicacion, vea la seccion 2.8.

4 Alarma de Alto Voltaje

La entrada de sensado de voltaje esta en X1:09, la misma que la entrada de CD a la tarjeta de alarma. El voltaje de CD es dividido en la tarjeta mediante la resistencia R60-63. R22 es utilizada como una entrada comun para ambas alarmas de alto y bajo voltaje. El nivel de la alarma de alto voltaje es establecido mediante el ajuste del potenciometro R20 (Vref) comparado con el voltaje sensado en N2a.

No se añade la histéresis en la tarjeta. La señal de alarma puede ser medida en TP20 (alarma= señal alta). Para el tiempo de retardo y la indicacion, vea la seccion 2.8.

2.5 Alarma de Bajo Voltaje

La entrada de sensado de voltaje esta en X1:09, la misma que la entrada de CD a la tarjeta de alarma. El voltaje de CD es dividido en la tarjeta mediante la resistencia R60-63. R22 es utilizada como una entrada comun para ambas alarmas de alto y bajo voltaje. El nivel de la alarma de bajo voltaje es establecido mediante el ajuste del potenciometro R40 (Vref) y comparado con el voltaje sensado en N2b.

No se añade la histéresis en la tarjeta. La señal de alarma puede ser medida en TP40 (alarma= señal alta). Para el tiempo de retardo y la indicacion, vea la seccion 2.8.

2.6 Alarma de conexion a tierra de las polaridades positiva y negativa

La falla de conexion a tierra es fijada a 10 mA o 100 Ohm/V y no es ajustable. El voltaje de salida rectificado es dividido a la mitad del voltaje mediante las resistencias R50-53 y amplificada en corriente por una etapa de emisor seguidor V50. La terminal del sensado de voltaje esta en X1:09, la misma que la entrada de CD a la tarjeta de alarma. El voltaje de CD es dividido en la tarjeta por las resistencias R60-63. Puesto que X1:08 (tierra) esta conectada al punto central de R50-53, el detector de ventana, formado por N2c y N2d, sensa una diferencia de voltaje y se va a alto cuando la falla de conexion a tierra excede 10 mA. Una falla de conexion a tierra de la polaridad positiva puede ser medida en TP70, y la negativa en TP80.

No se añade la histéresis en la tarjeta. Para el tiempo de retardo y la indicacion, vea la seccion 2.8.

2.7 Falla del Rectificador

La alarma de falla del rectificador es sensada en la tarjeta de control principal. Después de un retardo de tiempo de 15s, la entrada de la tarjeta de alarma X1:7 baja para indicar una alarma de falla del rectificador.

No se añade histeresis en la tarjeta. Para el tiempo de retardo y la indicacion vea la seccion 2.8.

2.8 Circuitos de alarma

Los circuitos de alarma para cada una de las alarmas mencionadas son idénticos, por lo que se utilizara una alarma de falla de CA como ejemplo, las alarmas operan como sigue:

Normal Todas las lamparas de las alarmas estan apagadas y el relevador de alarma K1 esta energizado.

-Coloque la tarjeta en el rectificador y encienda la alimentacion de energ a.
-Verifique el voltaje TP1 - TP2 = 9V
-Verifique VREF TP1 - TP3 = 5V
-Verifique la prueba y restablecimiento del LED.

3.3 Funcional

3.3.1 Alarma de Falla de CA

El nivel de la alarma esta fijado al 70% del CA nominal. Conecte un voltmetro entre TP1 (0V) y TP10 la cual es la terminal de prueba de falla de CA.
Cortocircuite TP11 a 0V como simulacion de la alarma. Cuando ocurra una alarma, el voltaje en TP10 es aproximadamente de 8V. El tiempo de retardo en la alarma esta fijado a 4 segundos.

3.3.2 Alarma de Alto Voltaje

EL nivel de la alarma esta ajustado mediante el potenciometro R20. Conecte un voltmetro entre TP1 (0V) y TP20 la cual es la terminal de prueba de alto voltaje. Cuando ocurre una alarma, el voltaje en TP20 es aproximadamente de 8V. El rango de ajuste es 0-150% del voltaje nominal de salida de CD. Gire el potenciometro R20 completamente en sentido horario. Ajuste la salida del cargador al nivel deseado de alarma ya sea con el potenciometro de flotacion o el de carga rapida que se encuentra en la tarjeta de control. Gire lentamente R20 en sentido antihorario hasta que aparezca la alarma. El tiempo de retardo en la alarma esta fijo a 4 segundos. Reajuste el voltaje de salida rectificado.

3.3.3 Alarma de Bajo Voltaje

Para establecer esta alarma sera necesario un banco de capacitores adecuado o una bater a descargada, siendo una bater a cargada no permitira que el voltaje disminuya a un nivel deseado. La alarma se ajusta con el potenciometro R40. Conecte un voltmetro entre TP1 (0V) y TP40 la cual es la terminal de prueba de la alarma de bajo voltaje. Cuando ocurre una alarma, el voltaje en TP40 es aproximadamente de 8V. El rango de ajuste es de 0-150% del voltaje nominal de salida de CD. Gire completamente el R40 en sentido antihorario. Ajuste la salida del rectificador al nivel deseado de alarma ya sea con el potenciometro de flotacion o de carga rapida localizado en la tarjeta de control principal. Gire lentamente el potenciometro en sentido horario hasta que se active la alarma. El tiempo de retardo en la alarma esta fijado en 4 segundos. Reajuste el voltaje de salida del rectificador.

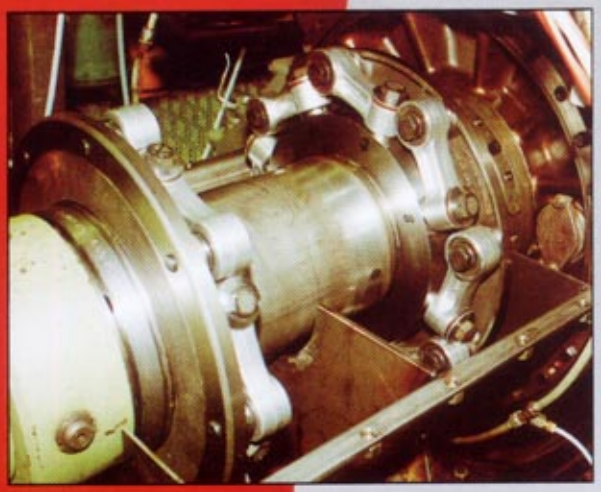
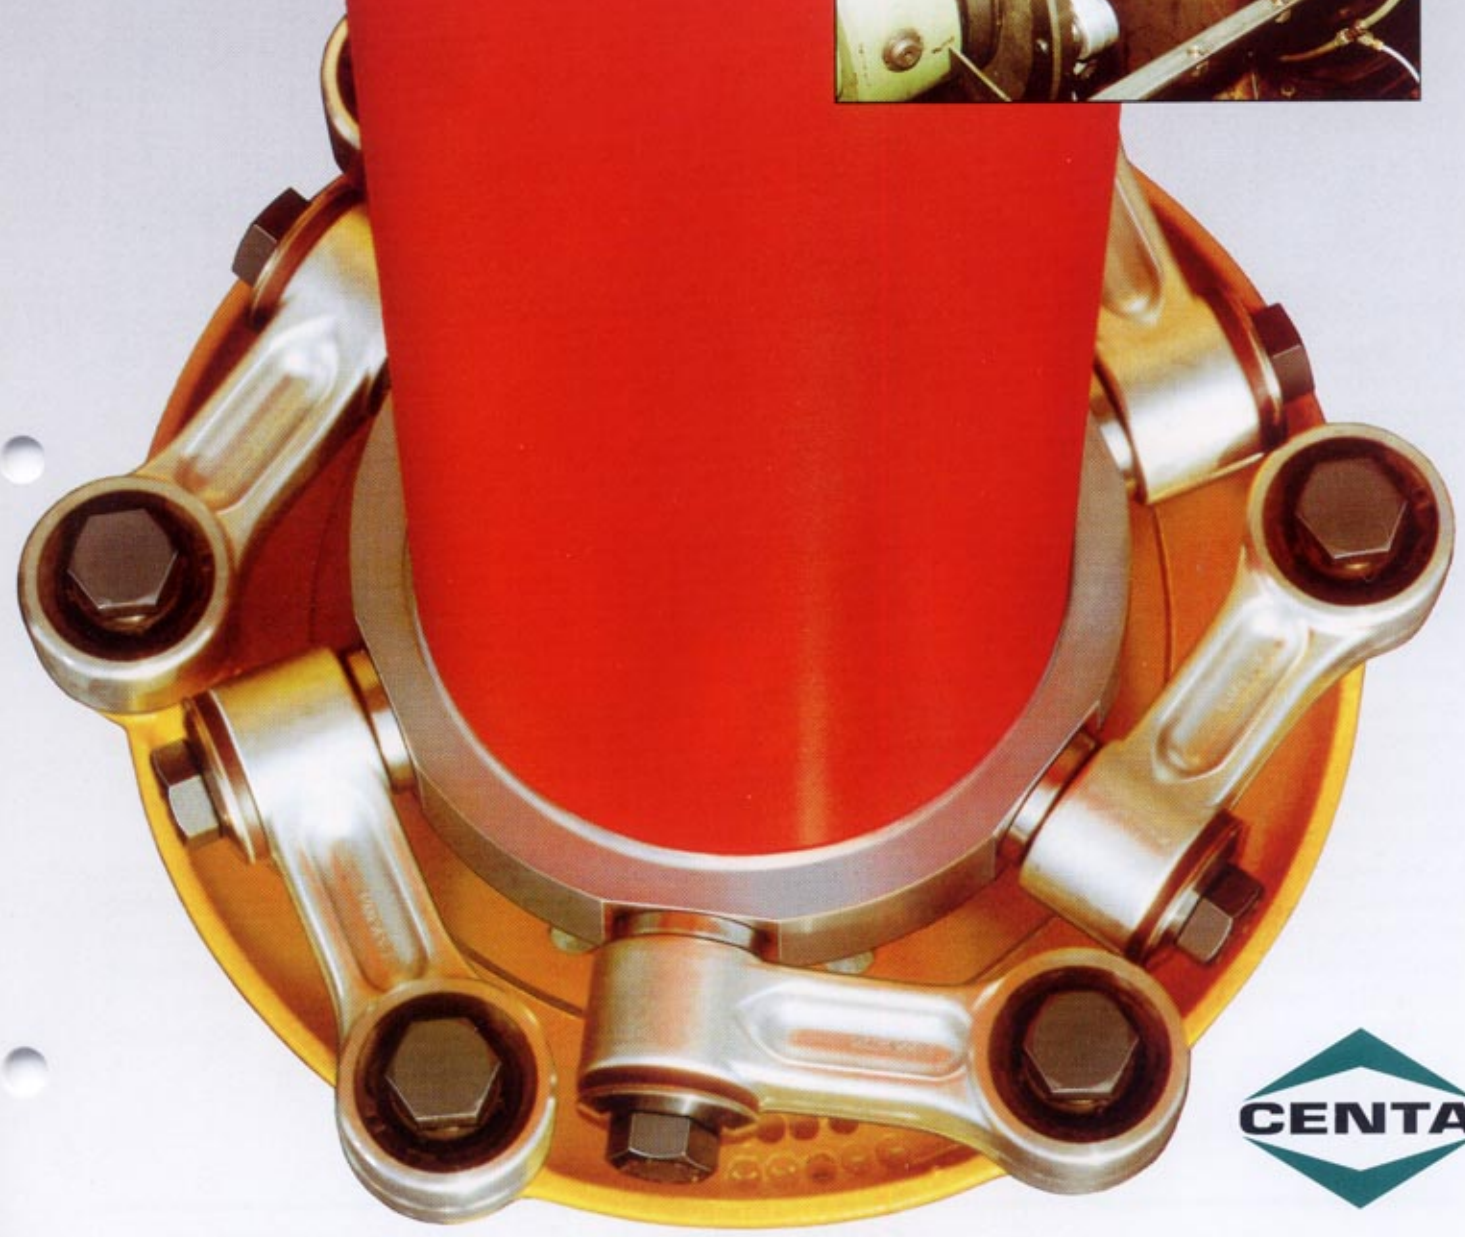
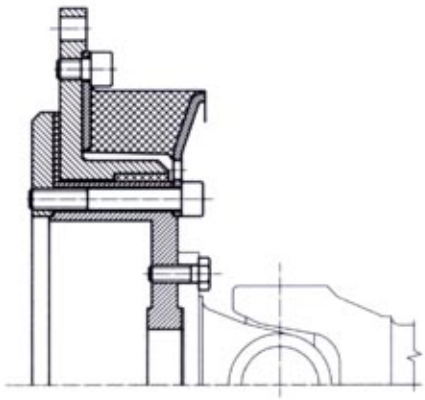
CENTALINK®

The silent driveshaft





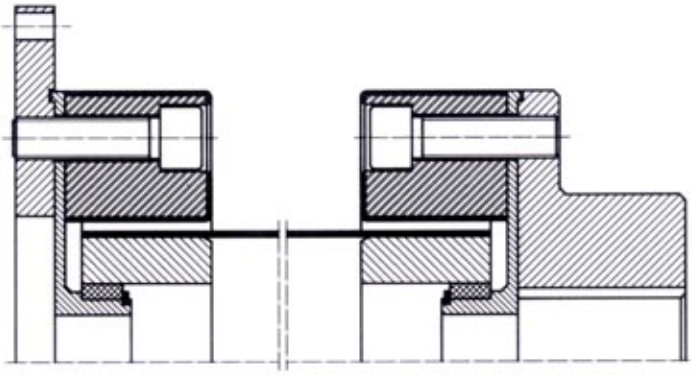
CENTA



CENTA couplings for similar application areas
CENTA-Kupplungen für ähnliche Einsatzgebiete

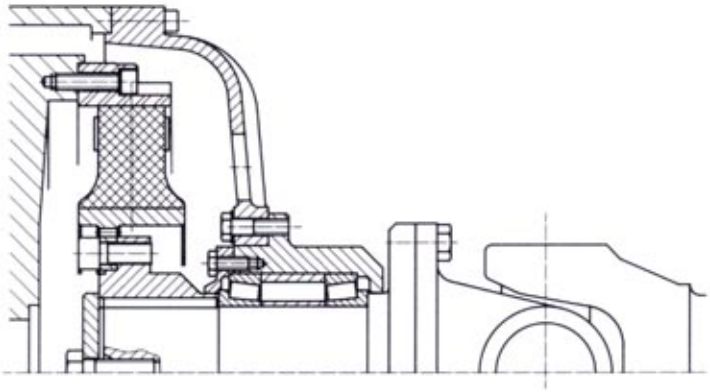
CENTAX-V torsionally damping intermediate coupling for U-joint shafts, well proven over 5 years with thousands of applications.
T_{KN} = 0,23 — 50 kNm
Catalog CX-V

CENTAX-V drehelastische dämpfende Vorschaltkupplungen für Kardanwellen, seit 5 Jahren tausendfach bewährt.
T_{KN} = 0,23 ... 50 KNm
Katalog CX-V



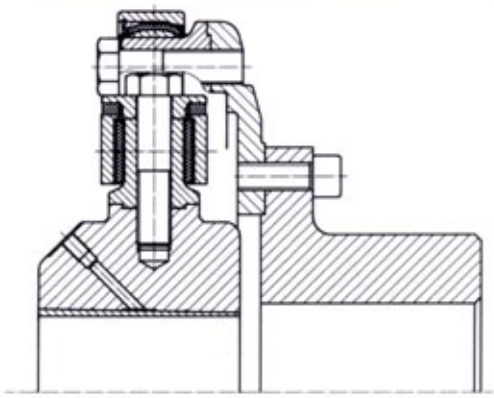
CENTAFLEX, series A — Types G and GZ
Torsionally soft, very flexible in all directions, free of backlash and wear, ideal for Diesel engines, for flywheel and front P.T.O's.
Million times proven over 23 years.
T_{KN} = 0,1 — 2,5 KNm
Catalog CF-A

CENTAFLEX, Baureihe A, Bauform G und GZ
drehelastisch, spielfrei, große Verlagerungsfähigkeit in jeder Richtung, ideal für Dieselmotore, seit 23 Jahren millionenfach bewährt.
T_{KN} = 0,1 ... 2,5 KNm
Katalog CF-A



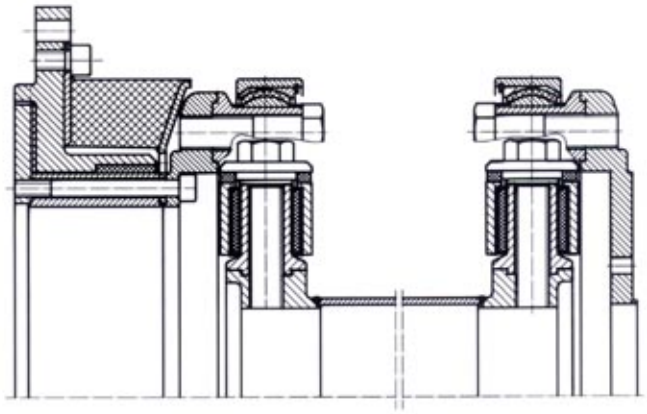
CENTA FH bearing housing
with torsionally flexible coupling (CENTAX or CENTAMAX) for use with diesel engines and U-joint shafts. The bearings in the flange housing protect the crankshaft of the diesel engine from all harmful forces due to the use of cardan shafts.
T_{KN} = 0,8 — 20 kNm
For SAE-housings sizes 2, 1, 0, 00 Catalog CX-V

CENTA-FH Flanschlagergehäuse
mit drehelastischer Kupplung (CENTAX oder CENTAMAX) zur Verbindung von Dieselmotoren mit Kardanwellen. Die Lagerung im Flanschgehäuse schützt die Kurbelwelle des Dieselmotors vor allen schädlichen Kräften aus der Kardanwelle.
T_{KN} = 0,8 ... 20 KNm
Für SAE Gehäuse Größen 2, 1, 0, 00 Katalog CX-V



Single **CENTALINK-joint**
flexible in axial and angular directions, yet radially stiff, forms the second bearing for shafts with only one bearing, e.g. water jet drives.
T_{KN} = 2,5 — 125 kNm

Einzelnes **CENTALINK-Gelenk**
Axial- und winkelbeweglich, jedoch radial steif, bildet gleichzeitig die 2. Lagerstelle für Wellen mit nur einer Lagerung, z. B. Wasser-Jet-Antriebe.
T_{KN} = 2,5 ... 125 KNm



CENTALINK combined with torsionally flexible CENTAX-elements

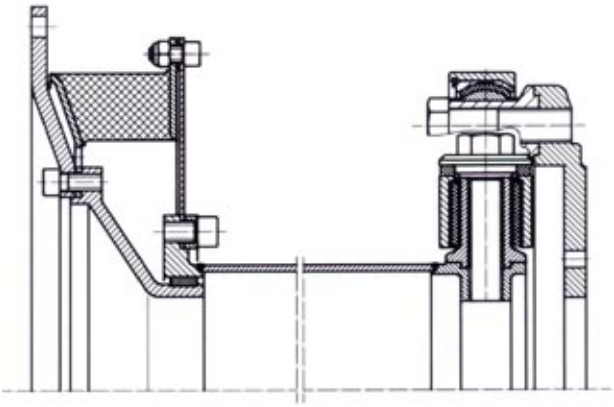
Kombinationen von CENTALINK mit drehelastischen CENTAX-Kupplungen

CENTALINK shaft with torsionally damping CENTAX-V intermediate coupling

T_{KN} = 2,5 — 50 kNm

CENTALINK-Gelenkwelle mit drehelastischer dämpfender CENTAX-V Vorschaltkupplung

T_{KN} = 2,5 ... 50 KNm



Single CENTALINK joint with highly flexible CENTAX element and membrane.

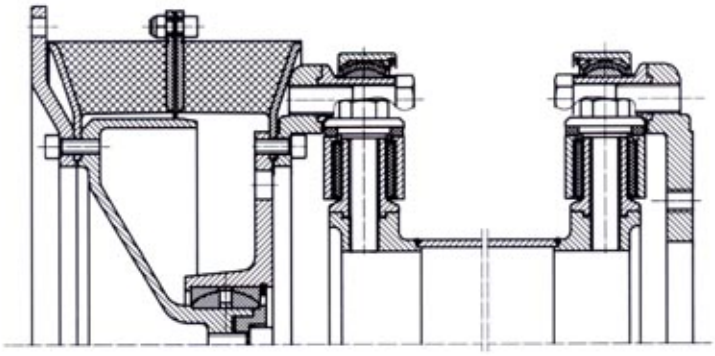
Simple, low cost solution for drives with moderate angular or radial misalignment

T_{KN} = 2,5 — 25 kNm

Einzelnes CENTALINK-Gelenk mit drehelastischem CENTAX-Element und Membran.

Einfache, preiswerte Lösung für Antriebe mit mäßigen winkeligen bzw. radialen Verlagerungen

T_{KN} = 2,5 ... 25 KNm

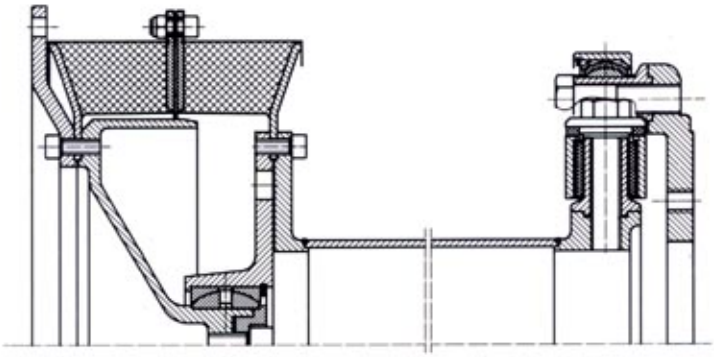


CENTALINK-shaft with twin element CENTAX coupling for high torsional flexibility and for large misalignments

T_{KN} = 2,5 — 25 kNm

CENTALINK-Gelenkwelle mit 2-reihiger CENTAX-Kupplung für hohe Drehelastizität und für große Verlagerungen

T_{KN} = 2,5 ... 25 KNm



Single CENTALINK-joint with twin element CENTAX coupling for high torsional flexibility and for moderate misalignments

T_{KN} = 2,5 — 25 kNm

Einzelnes CENTALINK-Gelenk mit 2-reihiger CENTAX-Kupplung für hohe Drehelastizität und für mäßige Verlagerungen

T_{KN} ... 2,5 — 25 KNm

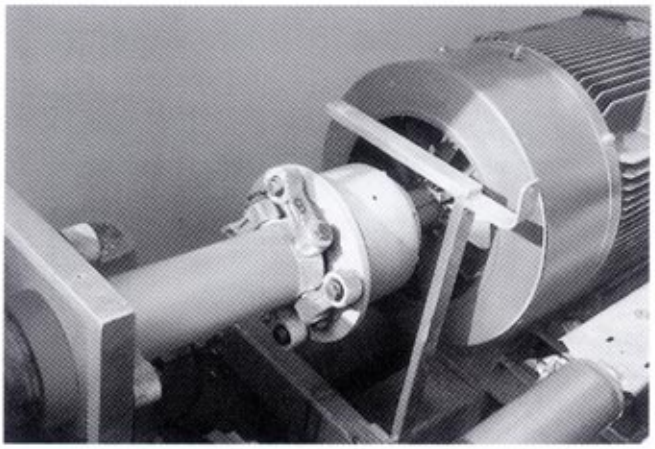
Einsatzbeispiele

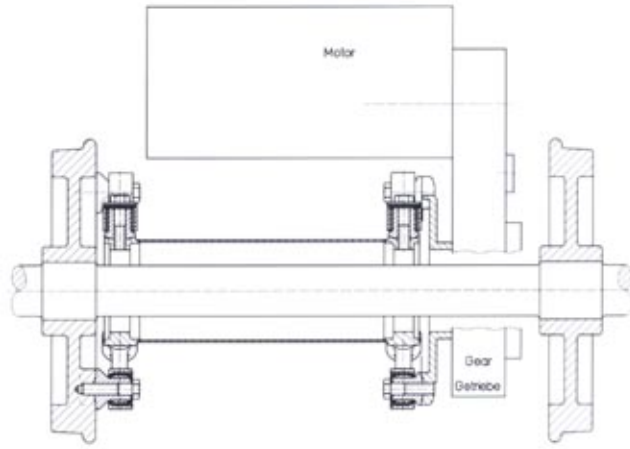
CENTALINK-joint with highly flexible CENTAX-coupling size 65 for ship main propulsion.
MAN 2842 - 700kW/2300 rpm.

CENTALINK-Gelenk mit hochelastischer CENTAX-Kupplung Größe 65 für Schiffshauptantrieb.
MAN 2842 - 700 kW/2300 min^{-1}.



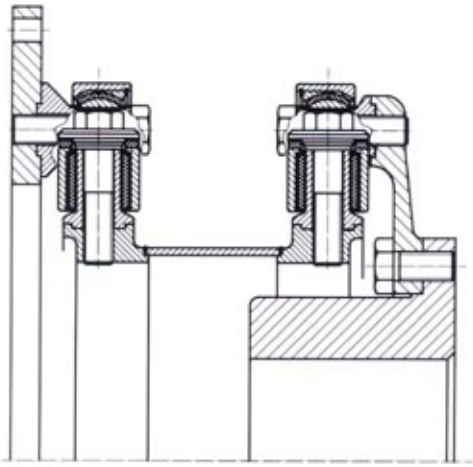
CENTALINK shaft size 55 in 500 kW windturbine.

CENTALINK-Gelenkwelle in 500 kW Windkraftwerk.

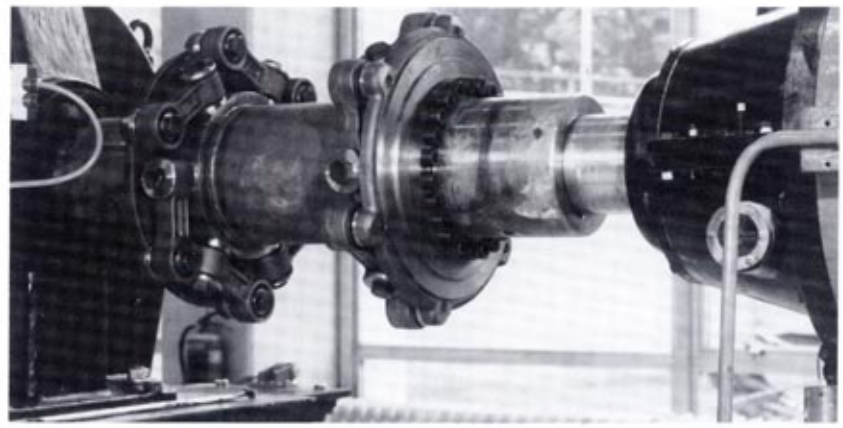


CENTALINK in axle drive of a rail car.

CENTALINK in Achsantrieb eines Schienenfahrzeuges.



CENTALINK
short version
Kurzbauform



CENTALINK between gear and pump.
These drives in an office building of the Dutch government were originally rigidly mounted and they caused big problems with noise and vibration.
Therefore the drives were subsequently placed on very soft flexible mounts and CENTALINK flexible shafts were installed. These modifications completely solved the problems. The CENTALINK shafts compensate for all types of misalignment and they interrupt the transmission of structure-born noise.

CENTALINK zwischen Getriebe und Pumpe.
Diese Antriebe in einem Bürogebäude der holländischen Regierung waren früher starr gelagert und verursachten große Probleme infolge von Schwingungen und Geräuschen.
Daher wurde der Antrieb nachträglich hochelastisch gelagert und CENTALINK Gelenkwellen eingebaut. Damit waren alle Probleme gelöst. Die CENTALINK Gelenkwellen gleichen alle Verlagerungen aus und sie unterbrechen die Übertragung von Körperschall.

Schraubenqualität

Werte basieren auf max. Fertigbohrung
Maße in mm

The connecting dimensions of these flanged hubs suit the CENTALINK shafts and mostly conform with the standards. To increase the transmittable torque we have increased the quantity of fasteners. The normal pattern for the holes remains, but we have added further holes, for the link-flanges as well as for the flanged hubs.

If required, the hubs can be provided with finish bore and keyway according to DIN 6885 or with involute spline, with taper bore and keyway or taper bore for oil-injection-fit. Then the hubs will be balanced with quality Q 6.3

Unless otherwise specified, the hubs will be delivered prebored and unbalanced.

Die Anschlußmaße dieser Flanschnaben passen zu den CENTALINK Gelenkwellen und sie entsprechen weitgehend der Norm. Zur Erhöhung des übertragbaren Drehmomentes haben wir jedoch die Schraubenanzahl erhöht. Das genormte Bohrbild wurde übernommen, zusätzlich wurden jedoch weitere Löcher gebohrt, sowohl bei den Flanschnaben als auch bei den Gelenkwellenflanschen.

Falls gewünscht, können die Naben mit Fertigbohrung und Nut nach DIN 6885 oder mit Evolventenprofil oder mit Konusbohrung und Nut, oder auch für Ölpreßverband, geliefert werden. Dann werden die Naben mit Wuchtgüte Q 6.3 gewuchtet.

Ohne Angaben zur Bohrung werden die Naben vorgebohrt und ungewuchtet geliefert.

For series FO a standard flange on one side is intended, while on the other side an existing plain flange can be used.

In order to ensure the necessary space for movement is available the axial bushes are elongated. Thus specially tailored series can be easily designed.

* The connecting dimension are to metric standards.
It is important that the value of clamping force is checked to ensure that the torque can be transmitted. If necessary larger standard flanges can be used. When using CENTA flanged hubs the torque capacity is increased using a higher quantity of fastener (please see page 12).

** To be agreed

Bei der Bauform FO ist auf einer Seite der Standardflansch vorgesehen, während auf der anderen Seite ein vorhandener, planer Flansch mitbenutzt werden kann.

Um den nötigen Freiraum für Verlagerungen zu gewährleisten, sind die axialen Buchsen entsprechend verlängert. Damit können auf einfache weise maßgeschneiderte Sonderbauformen realisiert werden.

* Die Anschlußmaße entsprechen der DIN-Norm.
Die Dimensionierung der Verschraubung ist daraufhin zu überprüfen, ob das zu übertragende Drehmoment reibschlüssig übertragen wird. Nötigenfalls sind größere genormte Anschlüsse vorzusehen.
Bei Verwendung der CENTA Flanschnaben ist das übertragbare Drehmoment durch eine höhere Schraubenanzahl erhöht.
Sehen Sie bitte Seite 12.

** Nach Bedarf

The series FF is the normal series and includes 2 flanges, which can be similar or different in design. Furthermore, if required, standard flanged hubs (page 12) or other special hubs, flanges or adapters can be provided.

* The connecting dimensions are to metric standards.
It is important that the value of clamping force is checked to ensure that the torque can be transmitted. If necessary larger standard flanges can be used. When using CENTA flanged hubs the torque capacity is increased using a higher quantity of fastener (please see page 12).

** To be agreed

Die Bauform FF ist die Normalbauform und sie beinhaltet 2 Flansche, die gleich oder unterschiedlich ausgebildet sein können. Dazu kommen dann, je nach Bedarf, Standardflanschnaben (siehe Seite 12) oder sonstige fallspezifische Naben, Flansche oder Adapter.

* Die Anschlußmaße entsprechen der DIN-Norm.
Die Dimensionierung der Verschraubung ist daraufhin zu überprüfen, ob das zu übertragende Drehmoment reibschlüssig übertragen wird. Nötigenfalls sind größere genormte Anschlüsse vorzusehen.
Bei Verwendung der CENTA Flanschnaben ist das übertragbare Drehmoment durch eine höhere Schraubenanzahl erhöht.

** Nach Bedarf

Sehen Sie bitte Seite 7

* Dyn. Torsional Stiffness
Dyn. Drehsteifigkeit

$$\frac{1}{C_{Tdyn}} = \frac{1}{C_{links}} + \frac{L}{C_{tube}}$$

$$C_{Tdyn} = \frac{C_{links} \cdot C_{tube}}{L \cdot C_{links} + C_{tube}}$$

length of tube
Rohrlänge L in [m]

C_{links} is stiffness of 2 sets of links
Steifigkeit für 2 Gelenke

C_{tube} is stiffness of 1 m (1000 mm) tube
Steifigkeit für 1 m Rohr

Balancing

The common balancing quality for U-joint-shafts is Q16 according VDI 2060. If not agreed differently, the CENTALINK-shafts are balanced as follows:

a) flanges, flangehubs and innerpart to quality Q6,3

b) the links to quality Q16.

The links for the CENTALINK consist of forged aluminium alloy.

They are weighed and brought to the same weight within a close tolerance. Thus they will be as a set within the unbalance tolerance. They can therefore be mounted and exchanged as required.

Wuchtung

Die übliche Wuchtgüte für Gelenkwellen ist Q16 nach VDI 2060. Falls nicht anders vereinbart, werden CENTALINK-Gelenkwellen wie folgt gewuchtet:

a) Flansch, Flanschnaben und Mittelteil mit Wuchtgüte Q6,3.

b) Die Lenker mit Wuchtgüte Q16.

Die Lenker der CENTALINK bestehen aus geschmiedeter hochfester Aluminiumlegierung.

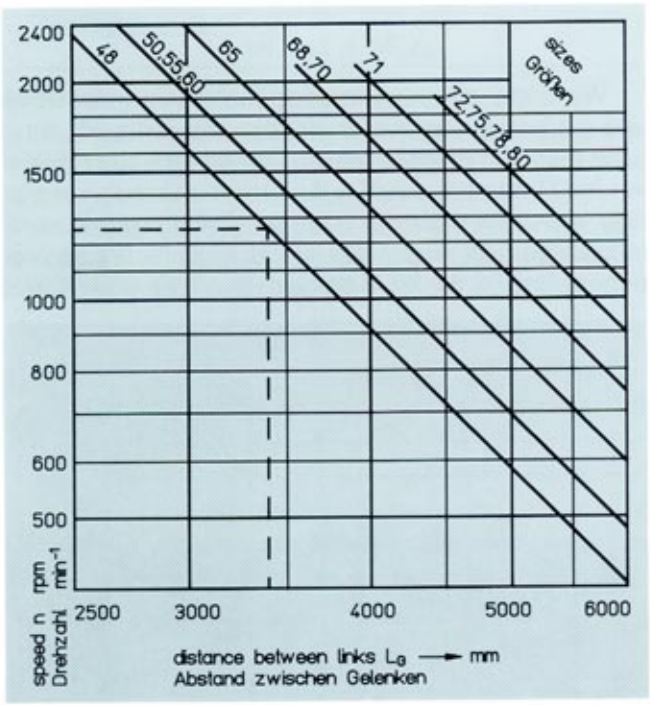
Sie werden ausgewogen und innerhalb einer engen Toleranz auf gleiches Gewicht gebracht. Danach liegen sie auch als Satz innerhalb der Unwuchttoleranz. Sie können daher beliebig eingebaut und ausgetauscht werden.

Allowable Speed

The value in the technical data tables shows the absolute maximum allowable speed. For longer lengths the allowable speed is also limited by the critical speed of the tube, and if necessary it has to be reduced. The diagram below shows the limiting values for speed and length of shaft sizes. Each combination of speed and length below the relevant diagonal lines is permissible.

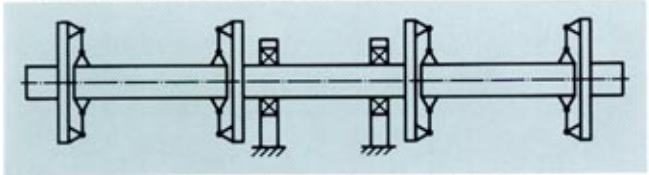
e.g. for size 48: n = 1250 rpm, thus:
L_{Gmax} = 3400 mm.

The radial stiffness of the links has hereby already been considered. A further conditions is, that the bearings and shafts, that are supporting the CENTALINK shaft, have sufficient rigidity.

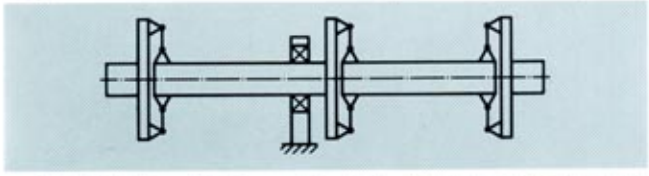


Should longer distances have to be spanned, 2 or more shafts have to be used.

The following sketches show 2 principles for such shafts:



2 U joint shafts with intermediate shaft supported by 2 bearings.



1 U joint shaft and 1 intermediate shaft with only 1 bearing and only 1 joint. The bearing has to be able to spherically adjust.

Zulässige Drehzahl

Der Wert in der Tabelle der technischen Daten gibt die absolut höchste zulässige Drehzahl an. Bei größeren Längen wird die zulässige Drehzahl jedoch auch durch die biegekritische Drehzahl des Rohres begrenzt, und gegebenenfalls reduziert. Nebenstehendes Diagramm zeigt für die einzelnen Gelenkwellengrößen die Grenzwerte für Drehzahl und Länge. Die schrägen Linien stellen die zulässigen Maxima für die einzelnen Größen dar, jede Kombination aus Drehzahl und Länge unterhalb der jeweiligen Linie ist zulässig.

z. B. für Größe 48: n = 1250 min^{-1}, daraus folgt:
L_{Gmax} = 3400 mm.

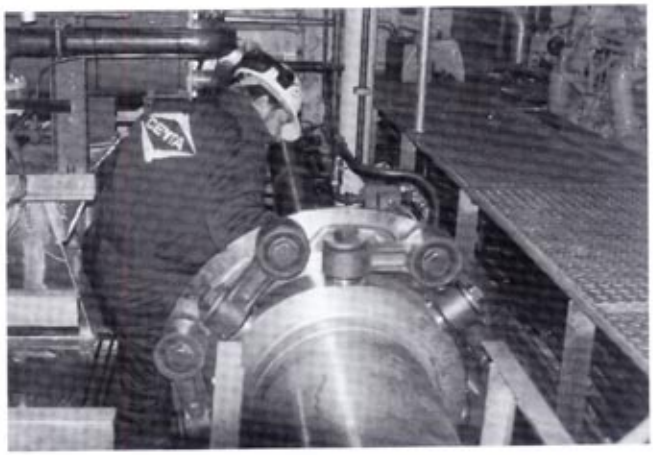
Hierbei ist die radiale Elastizität der Lenker berücksichtigt. Außerdem ist vorausgesetzt, daß die die Gelenkwelle tragenden Wellen und Lagerungen hinreichend steif sind.

Falls größere Abstände zu überbrücken sind, dann müssen 2 oder mehr Gelenkwellen verwendet werden.

Die Skizzen unten links zeigen 2 Prinzipien für solche Gelenkwellenstränge:

Obere Skizze:
2 Gelenkwellen mit 2-fach gelagerter Zwischenwelle.

Untere Skizze:
1 Gelenkwelle und einmal gelagerte Zwischenwelle mit nur 1 Gelenk. Das Lager muß sich spährisch einstellen können.



One of four CENTALINK-shaft lines size 86 in ferry „KATTEGAT"
P = 5800 kW / 560 rpm. T = 99 KNm each shaft

Eine von vier CENTALINK-Wellensträngen Größe 86 in der Fähre „KATTEGAT"
P = 5800 kW / 560 min^{-1} T = 99 KNm je Wellenstrang

The angle has to be checked at each joint separately, and the largest angle α_1 or α_2 has to stay within the allowable range.

The resulting total angle ß is not relevant for the selection of the shafts, as long as the two angles α_1 and α_2 are within their limits.

These rules also apply analogously for single joints.

The **continuously allowable angular misalignment** is about 1 degree. However, in the interest of long life this value should be kept as low as possible.

For **transient conditions** (eg. engine starting and stopping, very rough sea etc) up to 3 degrees are allowable.

For **shock situations** 6 degrees are allowable. These figures apply to each single joint.

The relation between angular misalignment, distance of the joints and the resulting radial misalignment lies in the following formula:

$$\triangle W_r = L_G \cdot \tan\alpha$$

Once the allowable misalignment is determined and a certain radial displacement is required, the resulting minimum distance L_G of the shafts can be calculated according to the a.m. formula as well. For an easy, fast layout these relationship are shown in the following diagramm for various allowable angles α.

Die Abwinkelung muß an jedem Gelenk für sich allein überprüft werden, und der jeweils größte Winkel α_1 oder α_2 darf den zulässigen Wert für $\triangle K_w$ nicht überschreiten.

Der resultierende Gesamtwinkel ß ist für die Auslegung nicht relevant, solange die beiden Winkel α_1 und α_2 im zulässigen Bereich bleiben.

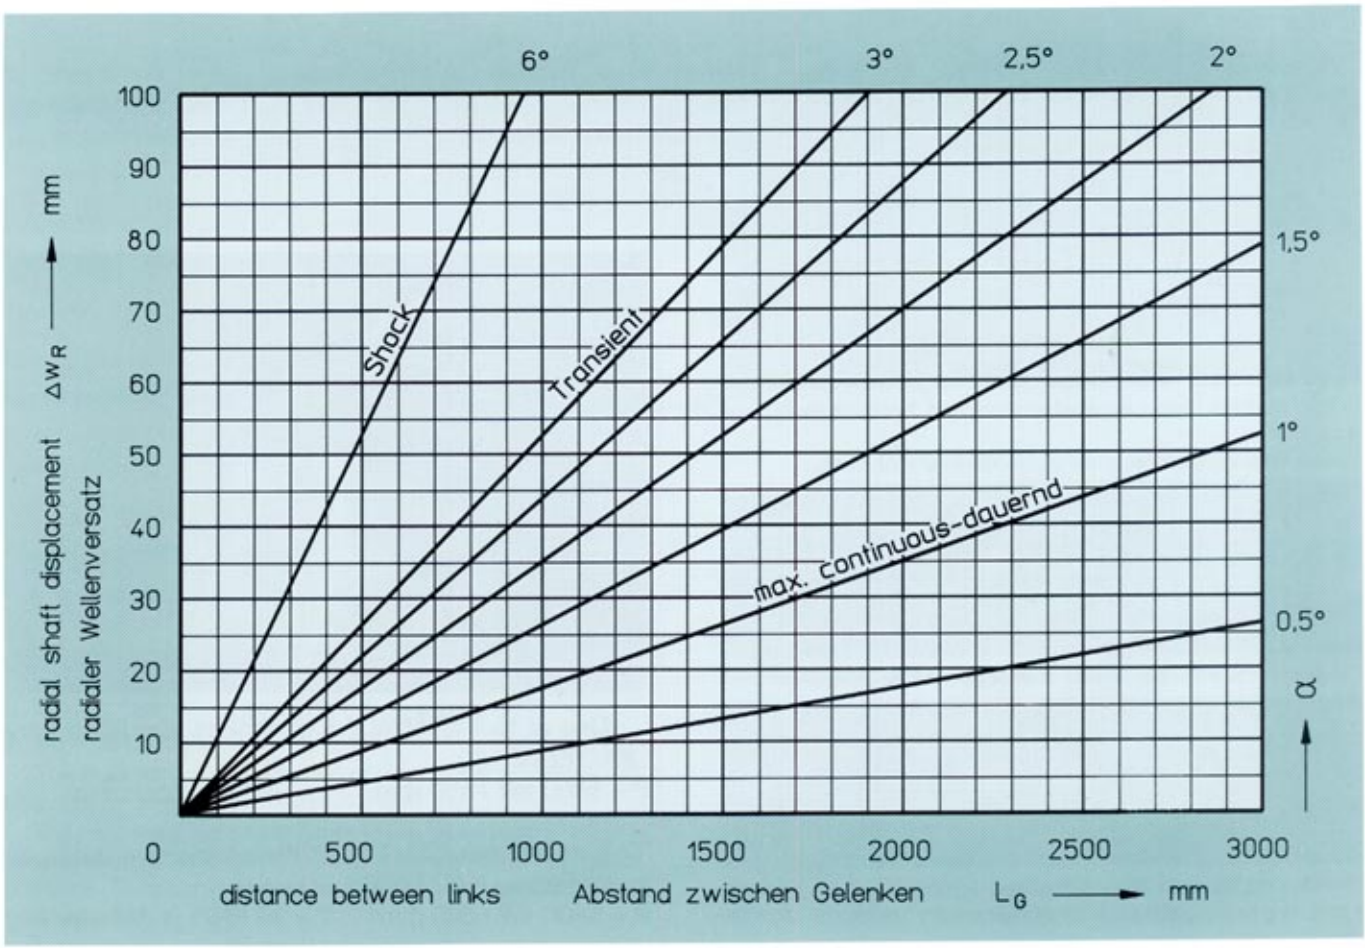
Der dauernd zulässige Winkelversatz beträgt ca. 1°. Er sollte jedoch im Interesse einer langen Lebensdauer so klein wie möglich gehalten werden.

Für **transiente Betriebszustände** (z. B. An- und Abstellen der Motoren, schwerer Seegang usw.) sind bis zu 3 Grad zulässig, und für **Schocksituationen** sind 6 Grad zulässig. Diese Werte gelten jeweils für ein Gelenk.

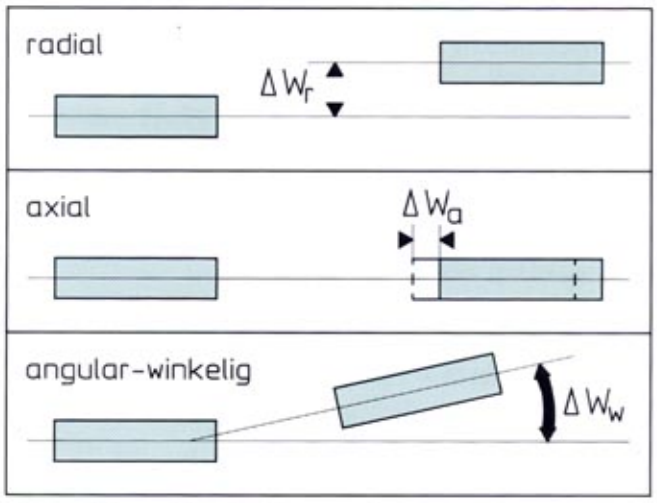
Der Zusammenhang zwischen zulässigem Winkelversatz, Abstand der Gelenke und dem daraus resultierenden radialen Versatz ergibt sich aus folgender Formel:

$$\triangle W_r = L_G \cdot \tan\alpha$$

Wenn die zulässige Winkelabweichung ermittelt ist und ein bestimmter Wellenversatz gefordert wird, dann kann man aus obiger Formel auch den daraus resultierenden Mindestabstand L_G der Gelenke berechnen. Für eine bequeme, schnelle Auslegung sind diese Zusammenhänge in folgendem Strahlendiagramm für verschiedene zulässige Winkel α dargestellt.



Misalignment Definition
Wellenversatz



Allowable axial misalignment

The value for $\triangle K_a$ in the technical data table is the maximum value for transient operation situation (eg. shock, heavy sea etc.).

The continuous (static) axial misalignment on installation of the shaft should be as low as possible, not greater than 20% of $\triangle K_a$.

$\triangle W_a \leqq 0{,}2 \cdot \triangle K_a$ for continuous operation

$\triangle W_a \leqq \triangle K_a$ for transient operation

axial reaction force:

$F_a = \triangle W_a \cdot C_a$ (KN)

Allowable radial and angular misalignment

For cardanic shafts a radial misalignment is always converted to angular misalignment. Additionally there may be an angular misalignment of the connected shafts.

Therefore both kinds of misalignment have to be checked at the same time.

There are 2 typical kinds of arrangements for such shafting.

Z-Arrangement

Driven and driving shafts are in parallel,yet displaced radially to each other. The radial misalignment of the connected shafts will be converted to an angular misalignment of the middle part.

W-Arrangement

Driven and driving shafts are not in parallel, but relate to each other in the resulting angle ß.

The angle α_1 produces a radial misalignment $\triangle W_r$ at the same time.

The angles α_1 and α_2 of both joints can be equal or different.

Zulässiger axialer Wellenversatz

Der Wert für $\triangle K_a$ in der Tabelle der technischen Daten gilt als maximaler Wert für transiente Betriebszustände (z. B. Shock, schwerer Seegang usw.).

Bei der Installation der Gelenkwelle sollte der fest vorgegebene, dauernde (statische) axiale Wellenversatz möglichst gering sein, höchstens jedoch 20% vom $\triangle K_a$.

$\triangle W_a \leqq 0{,}2 \cdot \triangle K_a$ für Dauerbetrieb

$\triangle W_a \leqq \triangle K_a$ für Transientbetrieb

Reaktionskraft bei axialem Versatz:

$F_a = \triangle W_a \cdot C_a$ (KN)

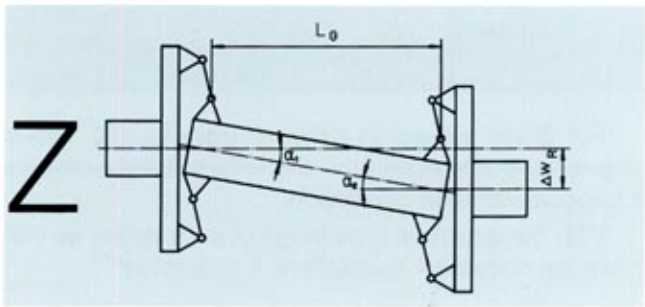
Zulässiger radialer und winkeliger Versatz

Bei Gelenkwellen wird ein radialer Versatz immer in einen Winkelversatz umgewandelt. Zusätzlich kann ein winkeliger Versatz der verbundenen Wellen vorliegen.

Diese beiden Versatzarten müssen daher gemeinsam betrachtet werden. Man unterscheidet bei Gelenkwellen 2 typische Anordnungen:

Z-Anordnung

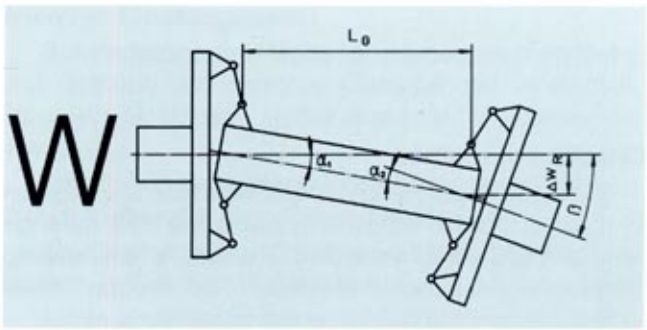
An- und Abtriebswellen sind parallel, jedoch zueinander radial versetzt. Der radiale Versatz der verbundenen Wellen wird in eine winkelige Verlagerung des Mittelteiles umgewandelt. $\alpha_1 \approx \alpha_2$



W-Anordnung

An- und Abtriebswellen sind nicht parallel, sondern stehen zueinander unter dem resultierenden Winkel ß. Aus dem Winkel α_1 resultiert gleichzeitig auch ein radialer Wellenversatz $\triangle W_r$.

Die Winkel α_1 und α_2 der beiden Gelenke können gleich oder verschieden sein.



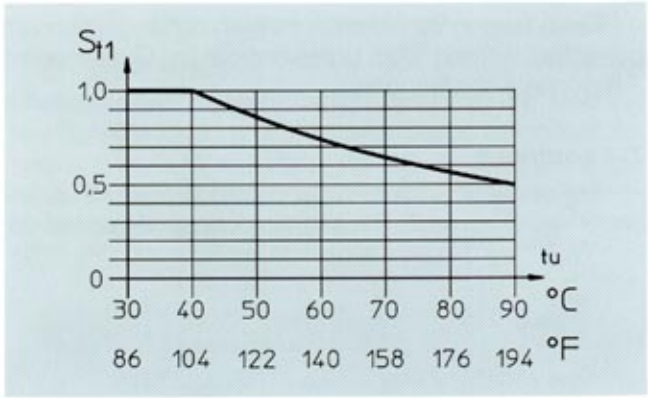
Explanation of technical data and selection of CENTALINK

Nominal torque

First the CENTALINK shaft selection has to be based on the nominal torque T_{KN}. This is allowable continuously within the permitted speed range. Under difficult operation conditions additional service factors may be required. For high ambient temperature the temperature factor of S_{t1} has to be considered.

$$T_{KN} \geqq \frac{P \cdot 9{,}55}{n \cdot S_{t1}}$$

T_{KN} = nominal torque of CENTALINK (kNm)
P = power to be transmitted (kW)
n = speed (rpm)
S_{t1} = temperature factor according to diagram



For drives subject to torsional vibration (eg. diesel engines) the selection of the shaft has to be checked by a torsional vibration calculation.

With our extensive knowledge of such drives we can make the necessary calculations if requested.

Maximum torque

The maximum torque is that which may occur in transient operation (start-up, shock, passing through resonance) and for a limited length of time.

Direction of rotation

Centalink shafts can be assembled to suit any direction of rotation, but for technical reasons the links must be fitted so that the links are pulled. Therefore when ordering please give the direction of rotation "cw" or "ccw" when looking at the driving end, as the example.

Erläuterung der technischen Daten und Auslegung von CENTALINK

Nenndrehmoment

Die Auslegung der CENTALINK Gelenkwellen muß zunächst nach dem Nenndrehmoment T_{KN} erfolgen. Dieses ist im zulässigen Drehzahlbereich dauernd zulässig, wenn nicht erschwerende Einsatzbedingungen noch sonstige Betriebsfaktoren erfordern. Bei höheren Umgebungstemperaturen muß der Temperaturfaktor S_{t1} berücksichtigt werden.

$$T_{KN} \geqq \frac{P \cdot 9{,}55}{n \cdot S_{t1}}$$

T_{KN} = Nenndrehmoment von CENTALINK (KNm)
P = zu übertragende Leistung (KW)
n = Drehzahl (min^{-1})
S_{t1} = Temperaturfaktor nach Diagramm

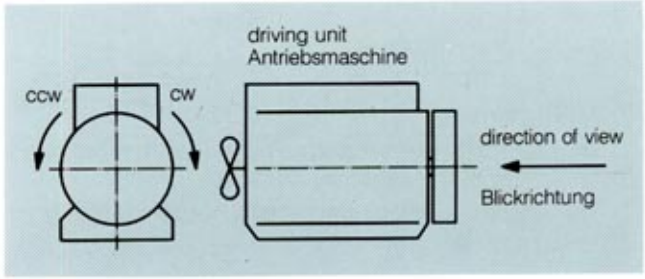
Bei Antrieben mit Drehschwingungen (z. B. Dieselmotoren) muß die Auslegung der Gelenkwelle immer durch eine Drehschwingungsrechnung überprüft werden. Unser Know how im Berechnen von Drehschwingungen und im Auslegen von entsprechenden Kupplungen steht Ihnen dazu gerne zur Verfügung.

Maximaldrehmoment

Das Maximaldrehmoment ist das Drehmoment, welches im transienten Betrieb (Anfahren, Stöße, Resonanzdurchfahrt usw.) höchstens und mit begrenzter Anzahl auftreten darf.

Drehrichtung

Die CENTALINK-Gelenkwellen sind jeweils nur für eine Drehrichtung ausgelegt, nämlich die Drehrichtung, wobei die Lenker unter Zug stehen. Daher bitten wir bei Bestellung immer um Angabe der Drehrichtung bei Blick auf die treibende Maschine, gemäß folgendem Beispiel:



Drehrichtung: cw oder ccw

CENTALINK joints offer the following outstanding advantages:

* compensation for considerable axial, radial and angular misalignment
* with very low reacting forces, and linear characteristics
* constant velocity transmission, angular deflection of the two joints may be different
* silent operation, transmitted noise reduced. The transmission of noise is interrupted in four places by rubber bushes.
* free of backlash, torsionally stiff. The single joints are also radially stiff
* free of maintenance, free of wear, with fail-safe-feature
* radially exchangeable without disturbing connected machinery
* easy visual check of the condition of the rubber bushes, easy and fast exchange of the links is possible without special tools
* long shaft distances can be spanned
* combinations with torsionally flexible CENTAX-elements allow optimal tuning of the torsional situation (page 14)
* the design is protected by international patents.

Die CENTALINK Gelenkwellen bieten folgende hervorragende Eigenschaften:

* Ausgleich von großen axialen, radialen und winkeligen Verlagerungen
* Dabei geringe Rückstellkräfte, mit linearer Kennlinie, d. h. proportional zur Auslenkung, und fast nicht beeinflußt vom übertragenen Drehmoment.
* Homokinetische Übertragung, der Beugewinkel der beiden Gelenke kann unterschiedlich sein.
* Geräuschfreie Arbeitsweise und Geräuschdämpfung, die Weiterleitung von Geräuschen und Vibrationen wird gedämpft, da der Körperschall durch die Gummibuchsen 4 mal nacheinander unterbrochen wird.
* Spielfrei, drehsteif. Das einzelne Gelenk ist auch radial steif.
* Wartungsfrei, verschleißfrei, durchdrehsicher.
* Mittelteil radial montierbar, ohne Verschiebung der Wellen.
* Leichte visuelle Überprüfung der Gummibuchsen, einfacher, schneller Austausch der Lenker ohne Spezialwerkzeug möglich.
* Große Wellenabstände können überbrückt werden.
* Kombinationen mit drehelastischen CENTAX-Elementen erlauben optimale Abstimmung der Drehschwingungslage. (Seite 14)
* Die Konstruktion ist durch internationale Patente geschützt.

Important areas of application

Ship main and auxiliary drives, between engine and gear and between gear and jet-drive, propeller, generator, hydraulic pump, waterpump etc.

Drive of **rail cars** between engine and gear or between gear and axle.

Windturbines, cooling towers, fan drives, mills, glazing rollers, steel mills. General construction and machine industry and heavy engineering.

Wichtige Einsatzgebiete

Schiffshaupt- und Nebenantriebe, zwischen Motor und Getriebe und zwischen Getriebe und Jet-Antrieb, Propeller, Generator, Hydraulikpumpe, Wasserpumpe usw.

Antrieb von **Schienenfahrzeugen,** zwischen Motor und Getriebe oder Getriebe und Achse.

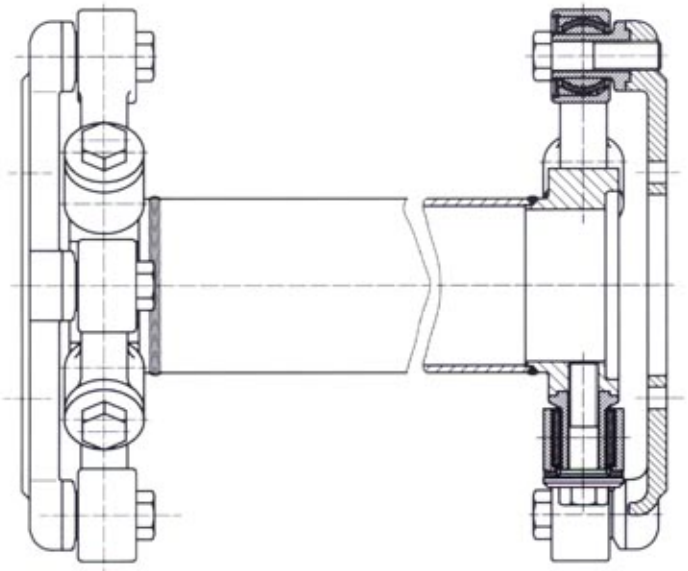
Windkraftwerke — Kühltürme — Ventilatorantriebe — Mühlen — Kalander Walzwerke.

Allgemeiner Maschinen- und Anlagenbau.

CENTALINK®

The silent driveshaft

The internationally patented CENTALINK shafts are on the market since 1991, more than 1000 units perform well in severe applications. Many of them have reached more than 20.000 hrs in service without any problems.



The CENTALINK shaft consists of links which are designed for efficiency using flexible bushes for push and pull. In each link there is a cylindrical flexible bush, which is connected radially to the hub and a spheroidal flexible bush which is connected axially to the flange.

This ingenious new design results in a very simple, highly flexible low cost and easy to assemble link coupling. There are between 3 and 8 links per joint depending on the shaft size.

The rubber joints of the CENTALINK shaft are based on well proven, well dimensioned rubber bushes or spherical joints, where the rubber is vulcanised to the inner and outer metal part and is under high precompression. Such couplings have been well proven in similar application, e.g. couplings for highspeed trains.

All movements of the joints are absorbed flexibly by the rubber bushes — without relative movement of the metal — and therefore free of wear.

Die international patentierten CENTALINK-Gelenkwellen sind seit 1991 auf dem Markt, mehr als 1000 Einheiten haben sich in harten Einsätzen bestens bewährt. Viele davon haben Laufzeiten von mehr als 20.000 h ohne Probleme erreicht.

Die CENTALINK Gelenkwelle besteht aus sinnvoll angeordneten, für Zug und Druck ausgelegten Lenkern mit gummielastischen Buchsen.

In jedem Lenker befinden sich eine zylindrische Gummibuchse, die radial mit der Nabe verschraubt ist und eine sphärische Gummibuchse, die axial mit einem Flansch verschraubt ist.

Diese neuartige Konstruktion ergibt eine sehr einfache, hochelastische, preiswerte und gut montierbare Lenkerkupplung. Je nach Baugröße sind 3-8 Lenker je Gelenk angeordnet.

Die Gummigelenke der CENTALINK Gelenkwelle basieren auf bewährten, reichlich dimensionierten Gummibuchsen bzw. Kugelgelenken, wobei das Gummi am inneren und äußeren Metall anvulkanisiert ist und unter hoher Druckvorspannung steht. Derartige Gummigelenke haben sich seit langer Zeit in vergleichbaren Anwendungsfällen, z. B. in Kupplungen für Hochgeschwindigkeitszüge, bestens bewährt.

Alle Bewegungen der Gelenke werden in den Gummibuchsen elastisch — ohne Relativbewegung zum Metall — und damit verschleißfrei aufgenommen.

This catalogue shows the extent of our CENTALINK-shaft range at the time of printing. This program is still being extended with further sizes and series.

If you are unable to find a suitable shaft for your application please do not hesitate to contact us. The experience of Centa gained during 25 years of coupling manufacture with more than 5 million couplings sold combined with our extensive range of 20 coupling series allows us to provide a good technical and economic solution for almost all problems.

We reserve the right to amend any dimension or detail specified or illustrated in this publication without notice and without incurring any obligation to provide such modification to such couplings previously delivered. Please ask for an application drawing and current data before making detailed coupling selection.

We would like to draw your attention to the need to prevent accidents or injury. No safety guards are included in our supply. Copyright to this technical document is held by CENTA Antriebe Kirschey GmbH 1992.

Catalogue No. CL-4-99

Dieser Katalog zeigt nur das bei Drucklegung vorhandene Programm der CENTALINK-Gelenkwellen. Dieses Programm wird jedoch ständig in Hinsicht auf weitere Baugrößen und Bauformen erweitert.

Falls Sie für Ihren Einsatzfall nicht die geeignete Gelenkwelle finden, fragen Sie bitte bei uns an. Die reiche Erfahrung der Firma Centa — gewonnen in 25 Jahren mit mehr als 5 Millionen verkauften CENTA-Kupplungen — und das umfangreiche Programm von 20 Kupplungsbaureihen bieten für fast alle Probleme eine technisch gute und wirtschaftlich günstige Lösung.

Wir behalten uns vor, die Maße, die technischen Daten und die Konstruktion zu ändern; alle Angaben dieses Kataloges sind unverbindlich. Fragen Sie bitte nach verbindlichen Einbauzeichnungen und Daten, wenn Sie eine Gelenkwelle einplanen.

Wir verweisen auf die rechtlichen Vorschriften für die Unfallverhütung. Eventuell vorzunehmende Abdeckungen oder dergleichen gehören nicht zu unserem Lieferumfang. Diese technische Unterlage hat gesetzlichen Schutz nach DIN 34.

CENTALINK® und CENTAX® sind eingetragene Warenzeichen der Firma CENTA Antriebe

NEG MICON
FOR INFORMATION ONLY

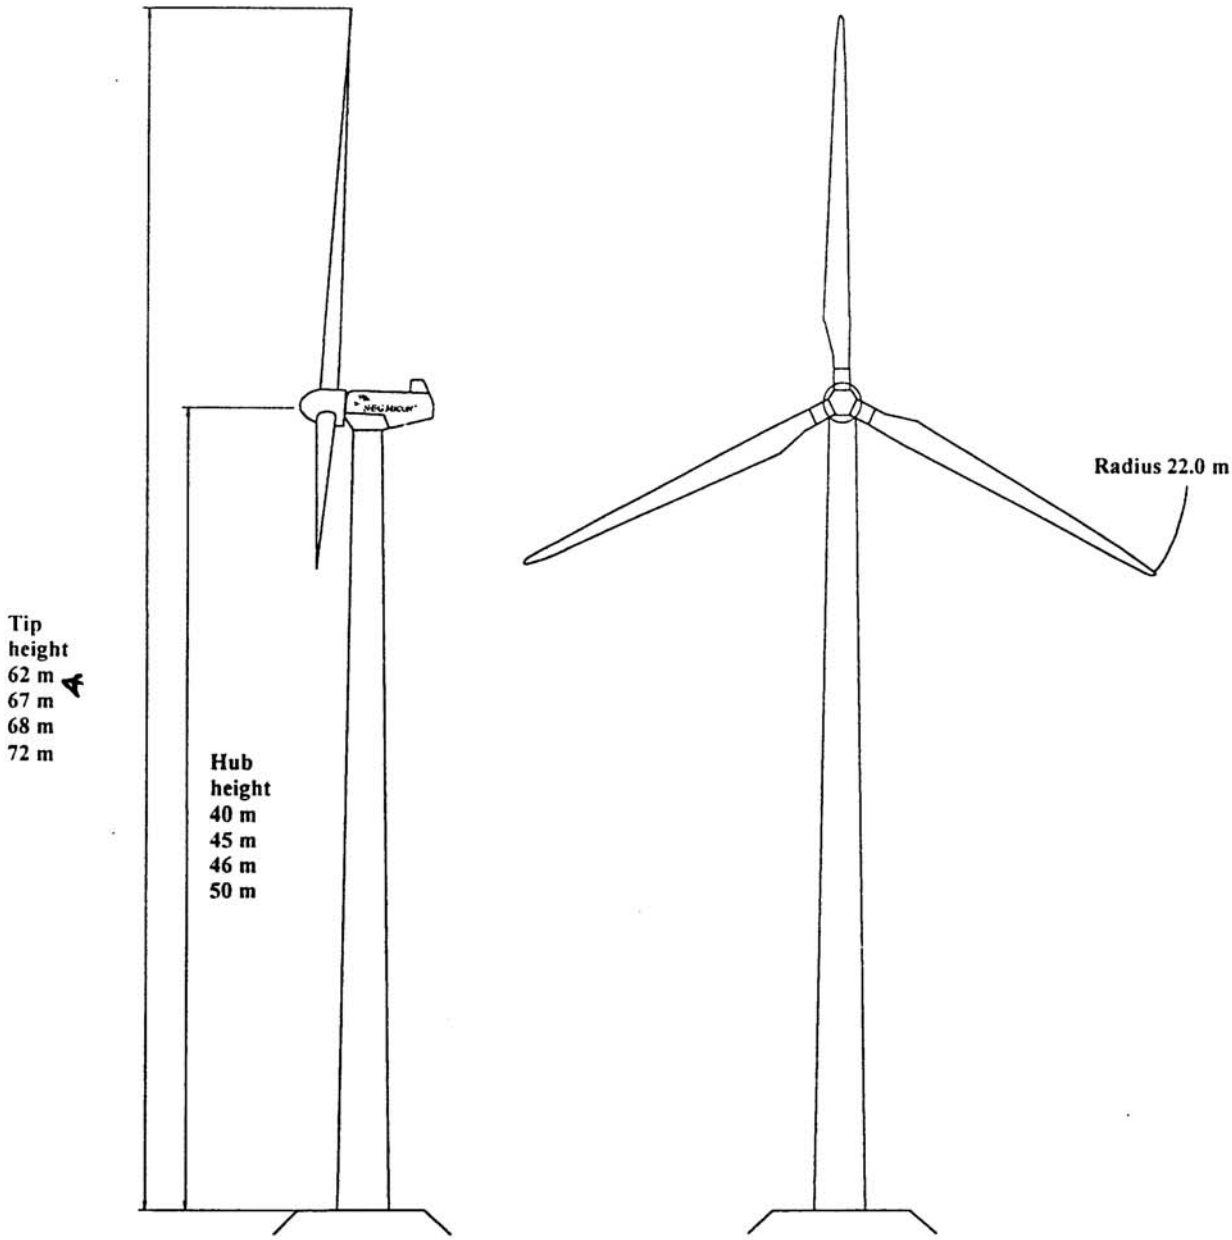
Main Specification

NM 750/44 - 60Hz

volver

R&D-TIC 98

0 Illustration



1 Main Data

Nominal Power	750-175	kW
Rotor diameter	44.0	m
Swept area	1520	m^2
Hub height	40	m
Rotational speed approx.	27/18	rpm
Total weight (at 40 m hub height)	--	tons

2	Nacelle Bed (IEC I+)		
	Manufacture		NEG Micon
	Type		20 t platform
	Material		Welded steel plate
	Surface treatment		Galvanised and painted
	Standard colour		RAL 7035
	Corrosion class	4	Acc. to DS/R-454, marine specification
	Weight (without components mounted)	7	tons
	Total weight (without rotor and tower)	22	tons

3	Rotor		
	Number of blades	3	pc
	Diameter	44.0	m
	Swept area	1520	m^2
	Hub height over terrain	40	m
	Rotor speed (synchronous)	27/18	rpm
	Tip speed (synchronous)	62.1	m/s
	Rotor shaft tilt	5	°
	Tip angle (standard)	-1.0	°
	Solidity (Total blade area/rotor area)	4.3	%
	Power regulation		Stall
	Rotor orientation		Upwind
	Total weight with hub (LM blades – type I)	10.5	tons

4a	Blades – type I		
	Manufacture		LM Glasfiber A/S
	Type		LM 19.1
	Blade length	19.04	m
	Material		Glasfiber-polyester/Carbon fibre-epoxy
	Type of rotor air brake		Pivotable blade tip
	Blade profiles		FFA-W3 NACA 63-serie
	Twist	20	°
	Largest cord	1.65	m
	Tip cord (at blade tip bottom)	0.5	m
	Blade area	21.9	m^2
	Weight each	1900	kg

5	Hub		
	Manufacture		NEG Micon
	Design/Type		NM750/48/Spherical
	Material		Meehanite SFF 400
	Surface treatment		Sand blast-metallized-painted
	Weight	4	tons

10	Oil pump for Cooling by Oil Cooler Unit		
	Manufacture		GalTech
	Type		2SPA-11D-7A
	Motor		MEZ-4AP80-2-B3/B5-2/3
	Voltage	480	Volt
	Power	1.1	kW
	Pump capacity	30	l/min.
	Maximum working pressure	15	bar
	Weight	9.6	kg

11	Oil Cooler Unit		
	Manufacture		Nissens A/S
	Type		HP 6-2
	Voltage	480	Volt
	Power	0.9	kW
	Weight without oil	65	kg

12	Cooling Pump for Generator		
	Manufacture		Grundfoss
	Type		CH4-20
	Motor type		Grundfoss
	Voltage	480	Volt
	Power	0.75	kW
	Pump capacity	30	l/min.
	Weight (without cooling water)	9.6	kg

13	Radiator for Cooling the generator.		
	Manufacture		Nissens A/S
	Type		942101A4
	Capacity	44	kW
	Weight (without cooling water)	60	kg

14	Mechanical Brake		
	Manufacture		Sime
	Type		2TWA36– Fail safe – hydraulic release
	Brake disc		Steel, mounted on high speed shaft
	Number of callipers	1	Pc
	Weight (Brake caliper/brake disc)	120/90	Kg

15	Coupling		
	Manufacture		Centa
	Type		CL-60
	Weight	45	kg

16	Generator			
	General standard data – 2 speed generator			
	Rated power output	750	175	kW
	Type			Water cooled
	Form of mounting			B3- foot mount
	Enclosure			IP54
	Isolation class			Class F
	Number of poles	4	6	
	Synchronous rotation speed	1800	1200	rpm
	Voltage		690	Volt
	Frequency		60	Hz

16a	Generator – type I						
	Manufacture			ELIN			
	Type			MCT-445L21F9Z-9			
	Maximum power at class F utilisation	774	210	kW			
	Full load current (at rated output)	710	200	Ampere			
	Maximum current (at class F utilisation)	728	209	Ampere			
	No load current	130	60	Ampere			
	Reactive power consumption at full load	390	130	kVAr			
	Reactive power consumption at no load	160	72	kVAr			
	Rotational speed at rated power output	1812	1208	rpm			
	Slip at rated power output	0.67	0.67	%			
	Electrical data			Efficiency %		Power factor (cos. φ)	
		Load		G1	G2	G1	G2
		110 %		96.8	95.0	0.89	0.84
		100 %		96.9	95.2	0.89	0.84
		75 %		96.9	95.3	0.89	0.82
		50 %		96.5	94.9	0.87	0.75
		25 %		94.5	92.0	0.75	0.55
	Weight (without cooling water)		3450	kg			

17	Slip Rings		
	Manufacture		Jørgen Hansen IDK
	Type		BGB-Engineering

18	Hydraulic Power Unit for Mechanical Brake		
	Manufacture		Sime
	Type		TE2L
	Motor type		Standard 4-pole/B3
	Voltage	400	Volt
	Power	0.37	kW
	Working pressure range	140-180	bar
	Relief valve	190-210	bar
	Oil type	SHC 524	Mobil
	Oil capacity	2.5	l
	Weight (without hydraulic oil)	40	kg

19	Hydraulic Power Unit for Blade Tip Air Brakes		
	Manufacture		AVN Hydraulic
	Type		AVN-V24
	Motor type		PM 50/42
	Voltage	24	Volt DC
	Working pressure range	95-100	bar
	Relief blow disc		bar
	Oil type	SHC 524	Mobil
	Oil capacity	3	l
	Weight (without hydraulic oil)	30	kg

20 a	Yaw System – Ball Bearing Slewing Ring		
	Manufacture		Rothe Erde
	Type		Ball bearing, internal gearing
	Weight	520	kg

20 b	Yaw System – Yaw Gear and Motors		
	Manufacture – gear/motor		Bonfiglioli Trasmittal
	Type - gear		73ST3F
	Motor type (brake motor)		ATA 80 B-5
	Voltage	400	Volt
	Power	0.37	kW
	Number of yaw gears	4	pc
	Weight		kg

20 c	Yaw System – Yaw Friction		
	Manufacture		NEG Micon
	Type		NM 20T
	Number of yaw friction units	3	pc
	Weight	76	kg

21	Tower				
	Manufacture		NEG Micon		
	Type		Conical, tubular		
	Material		Welded steel plate		
	Surface treatment		3-layer painting system		
	Corrosion class outside/inside	4/3	Acc. to DS/R-454, marine specification		
	Colour		RAL 7035		
	Access conditions		Internal, safety harness and ladder cage		
	Hub height over foundation	**40.0**			m
	Tower height	38.6			m
	Top diameter	1.64			m
	Bottom diameter	3.00			m
	Number of sections	2			pc
	Total weight	---			ton

22	Wind Turbine Controller/Power Cabinet		
	Manufacture		NEG Micon
	Type		WP3000
	Voltage	690	Volt
	Operation area, voltage	620-757	Volt (60 sec. average)
	Maximum voltage	771	Volt (0.5 sec. average)
	Maximum cut-in current	840	Ampere
	Cut-in system		Soft with thyristors
	Frequency area	60 ± 1	Hz (0.1 sec. average)
	Maximum power output	840	KW
	Capacitor banks	300	kVAr (5steps: 60+60+60+60+60)
	Weight	425	Kg

23	Climate and Site Conditions		
	Calculated minimum life	20	years
	Operational temperature limits	-20 to + 35	°C
	A-factor	7.9	m/s
	Form factor, k	2.0	
	Yearly average wind in 50 m hub height	7.0	m/s
	Terrain wind speed	0.01	
	Extreme wind speed	40	m/s (10 min. average)
	Survival wind speed	60	m/s (2 sec. average)
	Automatic stop limit	25	m/s (10 min. average)
	Turbulence intensity acc. to IEC II low (15m/s)	15	%
	Air density	1.28	kg/m³
	Distance between wind turbines in single rows	3	rotor diameters
	Distance between wind turbines in wind farms	5	rotor diameters
	Maximum hill slope	5	°

The power curve is shown at standard conditions according to DIN ISO 2533:
Air temperature 15 °C, air pressure 1013 hPa and maximum turbulence intensity of 15%

NEG Micon A/S reserves the right to change specifications and to use components of alternative manufacture without prior notice. Alternative components will be of the same high quality and standard as in this survey.

6	**Rotor shaft**		
	Manufacture		NEG Micon
	Design/Type		NEGM/forged shaft and flange
	Material		34CrNiMo6V
	Surface treatment		Painted
	Weight	2.3	tons

7	**Main Bearing**		
	Manufacture		SKF or FAG
	Design/Type		Spherical roller bearing
	Number of	1	pc
	Weight	112	kg

8	**Main Bearing Housing**		
	Manufacture		NEG Micon
	Design/Type		NEGM/Flange bearing
	Number of	1	pc
	Weight	440	kg

9b	**Gearbox – type II**		
	Manufacture		Flender
	Type		PEAS 4300
	Design		Planetary (1 step) parallel shafts (2 steps)
	Gear house material		Cast
	Ratio approx.		
	Mechanical power	807	KW
	Safety against fatigue in cog root		$S_F > 1.6$
	Safety against pitting		$S_H > 1.25$
	Safety against scuffing		$S_S > 1.5$
	Shaft seals		Maintenance free labyrinth-type
	Lubrication		Splash- with lubrication channels
	Oil sump approx.	65	l
	Oil type		Tribol 1510/320
	Weight without oil	5.5	tons

Mobilith SHC Series

Grease

Product Description

Mobilith SHC Series greases are supreme performance products designed for a wide variety of applications at extremes of temperature. They combine the unique features of a polyalphaolefin (PAO) synthetic base fluid with those of a high quality lithium complex thickener. The wax-free nature of the PAO base oil and the low coefficient of traction (compared with mineral oils), provide excellent low temperature pumpability and very low starting and running torque. These products offer the potential for energy savings and can reduce operating temperatures in the load zone of rolling element bearings. The lithium complex thickener contributes excellent adhesion, structural stability and resistance to water. The greases have a high level of chemical stability and are formulated with special additive combinations to provide excellent protection against wear, rust and corrosion at high and low temperatures. Mobilith SHC Series greases are available in five grades, varying in base oil viscosity from ISO VG 100 to 1500 and in NLGI grade from 2 to 00.

The Mobilith SHC Series of greases is used in the widest range of applications, and a broad range of operating temperatures, depending on grade. They are used not only in numerous industrial applications, but also find significant usage in automotive, marine and aerospace sectors.

Mobilith SHC Series greases have become the products of choice for many users, in many industries worldwide. Their reputation is based on their exceptional quality, reliability, versatility and the performance benefits they deliver.

Features & Benefits

The Mobil SHC brand of oils & greases are recognised and appreciated around the world for their innovation and outstanding performance. These molecular design PAO synthetic products, pioneered by ExxonMobil research scientists, symbolise the continuing commitment to using advanced technology to provide outstanding products. A key factor in the development of Mobilith SHC Series were the close contacts between our scientists and application specialists with key Original Equipment Manufacturers (OEMs) to ensure that our product offerings would provide exceptional performance in the continually evolving industrial equipment designs.

Our work with equipment builders has helped confirm the results from our own laboratory tests showing the exceptional performance of the Mobilith SHC Series lubricants. These benefits include longer grease life, enhanced bearing protection and bearing life, wide temperature range of application, and the potential for improved mechanical efficiency and energy savings.

To combat high thermal exposure of the oil our product formulation scientists chose proprietary synthetic base oils for Mobilith SHC Series oils because of their exceptional thermal/oxidative resistance potential. Our scientists developed a state-of-the-art lithium complex thickener technology and used specific additives to enhance the performance of each grade of the Mobilith SHC Series product family. The Mobilith SHC Series greases offer the following features and benefits:

Features	Advantages and Potential Benefits
Outstanding high temperature and low temperature performance	Wide application temperature ranges, with excellent protection at high temperatures and low torque, easy start-up at low temperatures
Excellent protection against wear, rust and corrosion	Reduced downtime and maintenance costs because of reduced wear, rust and corrosion
Excellent thermal stability and oxidation resistance	Extended service life with longer intervals between relubrication and improved bearing life
Low traction coefficient	Potential improved mechanical life and reduced energy consumption
Includes high viscosity grades with high VI, no wax base stocks	Outstanding protection of slow speed, heavily loaded bearings with good low temperature performance
Outstanding structural stability in the presence of water	Retains excellent grease performance in hostile aqueous environments
Low volatility	Helps resists viscosity increase at high temperatures to maximise relubrication intervals and bearing life

Applications

Application Considerations: While Mobilith SHC Series greases are compatible with most mineral oil based products, admixture may detract from their performance. Consequently it is recommended that before changing a system to one of the Mobilith SHC Series, it should be thoroughly cleaned out to achieve the maximum performance benefits.

While the Mobilith SHC Series greases share many performance benefits, their applications are best described in terms of each product grade:

- Mobilith SHC 100 is an antiwear grease primarily recommended for higher speed applications such as electric motors, where reduced friction, low wear and long service life are required. It is an NLGI 2 Grade / ISO VG 100 grease with PAO synthetic base fluid. Its operating temperature range is -50º C to 180º C.
- Mobilith SHC 220 is a multipurpose, extreme pressure grease recommended for heavy-duty automotive and industrial applications. It uses an ISO VG 220 PAO synthetic fluid and although it is a NLGI 2 Grade product, it has the low temperature pumpability of most NLGI 0 Grade mineral oil based greases. Mobilith SHC 220 has a recommended operating temperature range of -40º C to 180º C.
- Mobilith SHC 460 is an NLGI 1.5 Grade grease with ISO VG 460 synthetic base and is an extreme pressure grease recommended for tough industrial applications. It provides outstanding bearing protection under heavy loads at low-to-moderate speeds and in applications where water resistance is a critical factor. Mobilith SHC 460 has demonstrated outstanding performance in steel mills, paper mills and marine applications. The recommended operating temperature range is -40º C to 180º C.
- Mobilith SHC PM is a NLGI 1.5 Grade grease with ISO VG 460 synthetic base oil and is an extreme pressure grease recommended for critical rolling element bearing applications in paper machines. It provides outstanding protection against rust and acid water corrosion, making it ideal for the wet end of the paper machine. The heavy viscosity base fluid and anti-wear additive make it an excellent grease for the highly loaded press section roll bearings. The low volatility and excellent high temperature oxidation stability of the synthetic base fluid maximise relubrication intervals and bearing life in the high temperature felt roll and calendar stack bearings. The recommended operating temperature range is -40°C to 180°C with appropriate relubrication intervals.
- Mobilith SHC 1000 Special is a NLGI 2 Grade grease with ISO VG 1000 synthetic base oil and strongly fortified with solid lubricants including micronised graphite and molybdenum disulphide for maximum protection of plain or rolling element bearings operating under boundary lubrication regimes. This product is designed to extend bearing life under conditions of extremely slow speeds, heavy loads and high temperatures. Mobilith SHC 1000 Special has a recommended operating temperature of -30°C to 180°C with appropriate relubrication intervals. The wax-free synthetic base fluid provides excellent low temperature mobility / pumpability.

ExxonMobil Lubricants & Specialties

- Mobilith SHC 1500 is an NLGI 1 Grade / ISO VG 1500 grease with PAO synthetic base fluid. It is intended for use in plain and rolling element bearings operating at extremely slow speeds, under heavy loads and high temperatures. Mobilith SHC 1500 has a recommended operating temperature range of -20 to 180º C with appropriate relubrication intervals. Continuous lubrication with Mobilith SHC 1500 has been very effective in prolonging bearing life in a severe roll press application. Mobilith SHC 1500 has also provided excellent performance in rotary kiln roller bearings and in slag transfer rail car bearings.
- Mobilith SHC 007 is an NLGI 00 Grade / ISO VG 460 grease with PAO synthetic base fluid; it has a recommended operating temperature range of -50º C to 180º C with appropriate relubrication intervals. Its primary use is in non-driven heavy-duty truck trailer wheel hubs. It is also well suited for use in grease filled gear cases subject to high temperatures, where conventional semi fluid greases will not provide acceptable lubricant life.

Mobiltemp SHC® Series

Grease

Product Description

Mobiltemp SHC Series products are supreme performance antiwear greases primarily intended for high temperature applications. They combine the unique features of polyalphaolefin (PAO) synthetic base fluids with those of an organo-clay, non-soap thickener. The excellent resistance to thermal/oxidative degradation provided by the PAO base, coupled with the excellent high temperature structural stability and high dropping point of the clay thickener result in an outstanding high temperature greases. The wax-free nature of the synthetic base fluid and its high viscosity index also provide superior low temperature lubrication as well as excellent film protection at high temperatures.

Because the PAO base oil has low traction properties (compared to mineral oil), Mobiltemp SHC Series also offer the potential for energy savings through reduced friction and lower torque, and reduced temperatures in the load zone of rolling element bearings. The Mobiltemp SHC Series is available as three products: Mobiltemp SHC 32 is an NLGI 1 1/2 grade with ISO VG 32 base oil; Mobiltemp SHC 100 is an NLGI 2 grade with ISO VG 100 base oil; Mobiltemp SHC 460 Special is an NLGI 1 grade with ISO VG 460 base oil, plus molybdenum disulphide for extra wear protection.

The Mobiltemp SHC Series of greases is used in numerous high temperature applications, as well as applications where low temperature start-up or running torque are important. They provide excellent grease life at high temperatures and offer extended relubrication periods and energy savings potential.

Mobiltemp SHC Series greases have become the products of choice for many users, in many industries worldwide. Their reputation is based on very wide application temperature range, and their excellent overall performance.

Features & Benefits

The Mobil SHC brand of oils & greases are recognised and appreciated around the world for their innovation and outstanding performance. These molecular design PAO synthetic products, pioneered by ExxonMobil research scientists, symbolise the continuing commitment to using advanced technology to provide outstanding products. A key factor in the development of Mobiltemp SHC Series were the close contacts between our scientists and application specialists with key Original Equipment Manufacturers (OEMs) to ensure that our product offerings would provide exceptional performance in the continually evolving industrial equipment designs.

Our work with equipment builders has helped confirm the results from our own laboratory tests showing the exceptional performance of the Mobiltemp SHC Series lubricants. These benefits include superb high temperature performance including thickener integrity and oxidation life with enhanced bearing protection and bearing life.

To combat high thermal exposure of the oil our product formulation scientists chose PAO synthetic base oils for Mobiltemp SHC Series oils because of their exeptional thermal/oxidative resistance potential. Our formulators used a special clay thickener to provide excellent structural stability and high dropping point. Mobiltemp SHC Series greases offer the following benefits:

ExxonMobil Lubricants & Specialties

Features	Advantages and Potential Benefits
Outstanding high and low temperature performance	Reduced downtime and lower maintenance costs
Excellent resistance to oxidation and maintenance of grease structure at high temperatures	Extended service life with longer intervals between relubrication
Low coefficient of traction	Reduced energy consumption potential
Outstanding low temperature pumpability	Easier low temperature start-up and lower running torque
Very good antiwear protection	Extended bearing life, reduced unanticipated downtime

Applications

Mobiltemp SHC greases offer excellent high temperature grease life, bearing protection and grease integrity along with excellent low temperature capability and good wear protection. Specific applications include:

- For Mobiltemp SHC 32
- Sealed or re-packable ball and roller bearings
- Splines, screws and some enclosed gearing
- Extreme temperature applications with a recommended operating temperature range of -50º C to 180º C (with appropriate relubrication intervals).
- For Mobiltemp SHC 100
- High speed bearings and thrust bearings where a wide temperature range is desired
- It is particularly suitable for use in electric motor bearings where operating conditions demand reduced friction, low wear and long service life
- Extreme temperature applications with a recommended operating temperature range of -50º C to 200º C (with appropriate relubrication intervals).
- For Mobiltemp SHC 460 Special
- The presence of molybdenum disulphide makes it particularly suitable for the lubrication of sliding machine elements such as cams and ways, which are subject to long relubrication intervals, limited motion or shock loading.
- Oven conveyor or kiln bearings which are subject to high temperatures or cycling between high and normal temperatures
- Extreme temperature applications with a recommended operating temperature range of -40º C to 180º C (with appropriate relubrication intervals).

Mobilgear® SHC XMP Series

Gear Oil

Product Description

Mobilgear SHC XMP Series supreme performance, fully synthetic industrial gear oils designed to provide optimum equipment protection and oil life even under extreme conditions. Mobil's polyalphaolefin (PAO) technology has been selected for its exceptional oxidation resistance and thermal properties, naturally high viscosity index, excellent low temperature fluidity and absence of undesirable compounds that are often found in mineral oils. The high viscosity index and low traction coefficient of this oil combine to provide a significant reduction in power consumption in many gear drives. Mobilgear SHC XMP Series lubricants contain an advanced and carefully blended proprietary additive system designed to provide excellent protection against conventional wear modes such as scuffing but also provides a high level of resistance against micropitting fatigue. In addition, compared to conventional gear oil chemistries, it offers the potential for improved lubrication of gearbox rolling element bearings. Mobilgear SHC XMP Series products offer outstanding rust and corrosion protection versus conventional gear oils, including seawater and acidic water protection. They show no tendency to plug fine filters even when wet and have excellent compatibility with ferrous and non-ferrous metals even at elevated temperatures.

Mobilgear SHC XMP lubricants are recommended for enclosed industrial gear drives including steel-on-steel spur, helical, and bevel gears. It is especially recommended for applications that may be subject to micropitting: especially heavily loaded gearboxes with surface-hardened tooth metallurgies. It may also be used in gear applications where extreme low and/or high temperatures are encountered and applications where corrosion may be severe.

Because of their unique mix of properties, including resistance to micropitting wear, and their performance in tough applications and wide temperature range, Mobilgear SHC XMP Series products enjoy a growing reputation among customers and OEMs around the world.

Features & Benefits

The Mobil brand lubricants designated as SHC is recognised and appreciated around the world for innovation and outstanding performance. These molecular design PAO synthetic products, pioneered by our research scientists, symbolise the continuing commitment to using advanced technology to provide outstanding products. A key factor in the development of Mobilgear SHC XMP Series was the close contacts between our scientists and application specialists with key OEMs to ensure that our product offerings will provide exceptional performance with the rapidly evolving industrial gear designs and operation.

Our work with equipment builders has helped confirm the results from our own laboratory tests showing the exceptional performance of the Mobilgear SHC XMP Series lubricants. Not least among the benefits shown in work with OEMs is the ability to resist micropitting wear which can occur with some highly loaded, case-hardened gearing applications. This cooperative work also demonstrated the all-round balanced performance benefits for the new Mobilgear SHC XMP technology, including a wide temperature range of application.

ExxonMobil Lubricants & Specialties
All products may not be available locally. For more information, contact your local sales office or visit www.exxonmobil.com.
ExxonMobil is comprised of numerous affiliates and subsidiaries, many with names that include Esso, Mobil, or ExxonMobil. To address the issue of micropitting gear wear, our product formulation scientists designed a proprietary combination of additives which would resist traditional gear wear mechanisms as well as protecting against micropitting. Our formulators chose proprietary PAO synthetic base oils to provide exceptional oil life and deposit control and resistance to thermal/oxidative and chemical degradation, as well as the balance of the performance features. The wax-free nature of the synthetic base oil also provides low temperature fluidity characteristcs unmatched by mineral products and is a key benefit for remote, low ambient, applications. The Mobilgear SHC XMP Series lubricants offer the following benefits:

Features	Advantages and Potential Benefits
Superb protection from micropitting fatigue wear as well as high resistance to traditional scuffing wear	Extended gear and bearing life in enclosed gear drives operating under extreme conditions of load, speed and temperature
	Reduced unexpected downtime and less maintenance – especially critical for difficult to access gearboxes.
Excellent resistance to degradation at high temperatures	Extended oil life and drain intervals reduced oil consumption and manpower costs
Low traction PAO base stocks for improved gear efficiency	Reduced energy consumption and lower operating temperatures
High viscosity index base stocks reduce viscosity change with temperature	Ability to operate at both high and low temperatures: especially critical in remote applications with no oil heating or cooling
Excellent resistance to rust and corrosion and very good demulsibility	Smooth, trouble-free operation at high temperatures or in water-contaminated applications
	Excellent compatibility with soft metals
No filter plugging, even in presence of water	Less filter changes and reduced maintenance costs
Excellent compatibility with common gearbox materials of construction and with mineral-based gear oils	Easy changeover from mineral products

Applications

Application Considerations: While the Mobilgear SHC XMP Series are compatible with mineral oil based products, admixture may detract from their performance. Consequently it is recommended that before changing a system to one of the Mobilgear SHC XMP Series, it should be thoroughly cleaned out and flushed to achieve the maximum performance benefits.

Mobilgear SHC XMP Series supreme performance, fully synthetic industrial gear oils designed to provide optimum equipment protection and oil life even under extreme conditions. They are especially formulated to resist micropitting of modern, case hardened gearing and can operate in both high and low temperature environments. Typical applications include:

- Wind turbines, especially highly loaded and shock loaded units, remotely located units and extreme temperature environments
- Plastic extruder gearboxes
- Modern, highly loaded gearboxes used in the paper, steel, oil, textile, lumber and cement industries where gear protection and optimum oil life are required.

Specifications & Approvals

Health & Safety

Based on available information, this product is not expected to produce adverse effects on health when used for the intended application and the recommendations provided in the Material Safety Data Sheet (MSDS) are followed. MSDS's are available upon request through your sales contract office, or via the Internet. This product should not be used for purposes other than its intended use. If disposing of used product, take care to protect the environment.

The Mobil logotype, the Pegasus design and Delvac are trademarks of ExxonMobil Corporation, or one of its subsidiaries.

ExxonMobil Lubricants & Specialties
All products may not be available locally. For more information, contact your local sales office or visit www.exxonmobil.com.
ExxonMobil is comprised of numerous affiliates and subsidiaries, many with names that include Esso, Mobil, or ExxonMobil. Nothing in this document is intended to override or supersede the corporate separateness of local entities. Responsibility for local action and accountability remains with the local ExxonMobil-affiliate entities. Due to continual product research and development, the information contained herein is subject to change without notification. Typical Properties may vary slightly.

Dellisten er gældende for pumper mærket model F, H, I eller K med variantkoder:
Pumper mærket model A, B, C, D, E og G kan ikke serviceres og må erstattes af nye pumper.
This parts list applies to pumps marked model F, H, I or K with the variant codes:
Pumps marked model A, B, C, D, E and G cannot be serviced and must be replaced with new pumps.
Diese Teilliste gilt für Pumpen Modell F, H, I oder K mit den Variantencodes:
Pumpen Modell A, B, C, D, E und G können nicht gewartet werden und müssen durch neue Pumpen ersetzt werden.

Dansk

GRUNDFOS centrifugalpumpe, type CH 4, er en horisontal flertrinspumpe.

Bliver pumpen beskadiget eller tilstopper, så en demontering af pumpen er påkrævet, følges nedenstående anvisning.

Før demontering af pumpen påbegyndes, afbrydes strømtilførselen. Suge- og trykrør afmonteres.

Demontering og montering af el-førende dele foretages efter lokalt gældende regler.

Nedenstående positionsnumre, se "Tegning til demontering og montering" og "Serviceværktøj".

Henvisninger i " ", se indholdsfortegnelsen.

Demontering af pumpe

Støttebolte (unbrakoskruer), pos. 26, afmonteres, hvorefter endestykke, pos. 6, aftages. Sidder endestykket fast, løsnes det med et let slag på kanten. Ved at afmontere ventilatoren (se "Demontering af stator med hus") har man mulighed for at fastholde akselen, når møtrikken, pos. 67, løsnes (venstregevind). Møtrik, spændestykke (spændeskive), pos. 66, løber, pos. 49, kammer, pos. 4, og afstandsbøsning, pos. 64, aftages.

For CH 4-60 er rækkefølgen for demonteringen: Møtrik, pos. 67, spændestykke, pos. 66, løber, pos. 49, kammer med leje, pos. 4a, lejering, pos. 47a, og afstandsstykke, pos. 64a.

Sidder kammeret fast, løsnes det ved at presse en skruetrækker ned mellem kamrene og vippe det fri. *Vær opmærksom på, at kammeret ikke deformeres.*

Demontering fortsættes nu i nævnte rækkefølge indtil akseltætning, pos. 105: Løber, kammer og afstandsbøsning.

Tætningsringene i akseltætningen tåler ikke slag eller stød.

Den roterende del af akseltætningen trækkes fri af akselen.

Den stationære del af akseltætningen skal kun afmonteres, såfremt akseltætningen er utæt.

Er akseltætningen utæt, vippes stopringen, pos. 62, fri af recessen og trækkes af akselen. Stopringen kan ikke genanvendes.

Skruer, pos. 28, løsnes og aftages. Vær opmærksom på, at aksel med rotor ikke følger med topstykket, når dette trækkes fri af motoren.

NB: Lejeafdækning, pos. 155, og slyngskive, pos. 79, kan følge med topstykket. Er dette tilfældet, afmonteres de topstykket, før den stationære del af akseltætningen trykkes ud af topstykket fra motorsiden.

Pumpen er nu adskilt.

Spaltering, pos. 45

Er spalteringene slidt eller deformeret, udskiftes de ved at vippe holderen, pos. 65, op og fri af kammeret/endestykket med specialaftrækker, se "Serviceværktøj".

Demontering af stator med hus

El-kablet afmonteres klemkassen.

Skruer, pos. 152, løsnes og aftages sammen med ventilatorskærm, pos. 151.

Ventilator, pos. 156, vippes fri af akselen med to skruetrækkere ført ind under ventilatoren.

Skruer, pos. 28, løsnes og aftages.

Stator med hus løsnes med et let slag af en gummihammer og trækkes fri af pumpen.

Er kuglelejer eller aksel med rotor defekt, skal pumpen demonteres.

Montering

Før monteringen påbegyndes, skal alle dele være rengjorte og kontrollerede for eventuelle fejl/slitage. Dele, der ikke er fejlfrie, erstattes af nye.

Ved eftersyn bør følgende dele udskiftes: Møtrik for aksel, pakninger og diverse O-ringe.

Spaltering, pos. 45

Spalteringen placeres oven på holderen i kammeret/endestykket, hvorefter holderen, pos. 65, trykkes ned over spalteringen og i indgreb med kammeret/endestykket.

Spalteringen skal kunne bevæges frit (sideværts) mellem holderen og kammeret/endestykket.

Akseltætning, pos. 105

Ved monteringen skal tætningsringene i akseltætningen være fejlfrie og tætningsfladerne glatte og rene. *Tætningsringene må ikke udsættes for slag eller stød.*

Recessen i topstykket og O-ringen til den stationære del af akseltætningen fugtes med vand. Den stationære tætningsring inkl. O-ring trykkes i recessen på topstykket. O-ringen skal vende ind mod topstykket.

Kuglelejer, pos. 153 og 154, monteres på akselen. Type og placering, se "Delliste" og "Snittegning".

Montering af pumpe

Lejeafdækning, pos. 155, føres ned over akselen til anlæg mod kuglelejets yderste ring. Den buede side på lejeafdækningen skal vende væk fra kuglelejet, se "Tegning til demontering og montering". Slyngskive, pos. 79, trækkes ned over pumpeakselen til anlæg mod motorakselen.

Topstykke, pos. 2, med den stationære del af akseltætningen monteres og trykkes i bund på statorhusets reces. Kan topstykket ikke trykkes i bund, kontrolleres, om bølgefjeder, pos. 158, er placeret korrekt, se fig. 1.

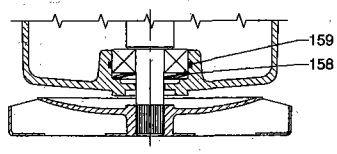

Fig. 1

Vær opmærksom på, at trykstudsen på topstykket og klemkassen på motoren vender i samme retning som før demonteringen.

Skruer, pos. 28, smøres med gevindpasta THREAD-EZE (delnummer, se "Tilspændingsmomenter"). Skruerne monteres og spændes diagonalt, se "Tilspændingsmomenter".

Ny stopring, pos. 62, føres ned over akselen og i indgreb med recessen på akselen.

Den roterende del af akseltætningen monteres, se "Akseltætninger" og "Tegning til demontering og montering". *Vær opmærksom på, at tætningsringene i akseltætningen, pos. 105, ikke tåler slag eller stød, og at gummidelene fugtes med vand.*

Kontrollér, at enderne af fjederen er i indgreb med slibesporet i tætningsringen og medbringertappen på afstandsstykket.

Monteringen fortsættes nu i nævnte rækkefølge til og med sidste løber: Pakning, pos. 37, løber, pos. 49, kammer, pos. 4, og afstandsbøsning, pos. 64.

For CH 4-60 fortsættes monteringen til og med næstsidste løber.

Derefter monteres: Afstandsstykke, pos. 64a, kammer med leje, pos. 4a, lejering, pos. 47a, og løber, pos. 49.

Vær opmærksom på, at den sidst monterede løber går i indgreb med splineakselen.

Gevindet på akselenden smøres med Gardolube (delnummer, se "Tilspændingsmomenter"), før spændestykke (spændeskive), pos. 66, og møtrik, pos. 67, monteres.

Ved at fastholde rotorakselen kan møtrikken fastspændes, se "Tilspændingsmomenter".

Husk pakning, pos. 37, mellem endestykke og kammer. Endestykke, pos. 6, monteres med spædeproppen, pos. 21, i samme retning som afgangsstudsen på topstykket.

Støttebolte (unbrakoskruer), pos. 26, smøres med gevindpasta THREAD-EZE (delnummer, se "Tilspændingsmomenter"), før de monteres og spændes diagonalt, se "Tilspændingsmomenter".

For ikke at beskadige kuglelejerne skal pumpeakselen understøttes gennem studsen på endestykket, når ventilatoren, pos. 156, drives i bund mod rotorakselen.

Kontrollér ved at dreje ventilatoren rundt, at pumpen går let og uhindret.

Ventilatorskærm, pos. 151, monteres på motoren og fastspændes med skruer, pos. 152.

El-kablet tilsluttes klemkassen.

Pumpen er nu færdigmonteret og klar til afprøvning efter følgende testspecifikationer:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

Montering af stator med hus

O-ring, pos. 159, trykkes ned i recessen på statoren, og bølgefjeder, pos. 158, monteres, se fig. 1.

Stator med hus, pos 150, placeres vertikalt med pumpetilslutningen opad.

Vær opmærksom på, at enden af rotorakselen kan passere frit gennem statorhuset, når pumpedelen med rotorakselen monteres i statorhuset.

Pumpen drejes således, at trykstuds og klemkasse er i samme position som før demonteringen.

Skruer, pos. 28, monteres og krydsspændes jævnt til angivne moment, se "Tilspændingsmomenter".

For ikke at beskadige kuglelejerne skal pumpeakselen understøttes gennem studsen på endestykket, når ventilatoren, pos. 156, drives i bund mod rotorakselen.

Kontrollér ved at dreje ventilatoren rundt, at pumpen går let og uhindret.

Ventilatorskærm, pos. 151, monteres på motoren og fastspændes med skruer, pos. 152.

El-kablet tilsluttes klemkassen.

Pumpen er nu færdigmonteret og klar til afprøvning efter følgende testspecifikationer:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

English

The GRUNDFOS centrifugal pump, type CH 4, is a horizontal multistage pump.

If it is necessary to dismantle the pump, either because it is choked or damaged, please follow the instructions below.

Before dismantling the pump, disconnect the electricity supply to the motor. Then remove the suction and discharge pipes.

The dismantling and assembly of electric parts should be carried out in accordance with local regulations.

Position numbers, see "Drawing for dismantling and assembly" and "Service tools".

References in " ", see table of contents.

Dismantling of pump

Remove the staybolts (hexagon socket head screws), pos. 26, and the suction chamber, pos. 6. If the suction chamber sticks, loosen it with a light blow on the edge. Remove the fan (see "Dismantling of stator with housing") and hold the shaft when the nut, pos. 67, is slackened (left-hand thread). Remove the nut, the clamp (washer), pos. 66, the impeller, pos. 49, the chamber, pos. 4, and the spacing pipe, pos. 64.

In the case of CH 4-60, continue the dismantling in the following order: Nut, pos. 67, clamp, pos. 66, impeller, pos. 49, chamber with bearing, pos. 4a, bearing ring, pos. 47a, and spacer, pos. 64a.

If the chamber sticks, loosen it by inserting a screwdriver between the chambers and turning it. *Take care not to deform the chamber.*

Then remove the parts in the following order up to the shaft seal, pos. 105: Impeller, chamber and spacing pipe.

Do not expose the shaft seal rings to blows or knocks.

Pull the rotating shaft seal part off the shaft.

The stationary shaft seal part should only be removed if the shaft seal leaks.

If the shaft seal leaks, push the stop ring, pos. 62, free of the recess and pull it off the shaft. The stop ring cannot be reused.

Slacken and remove the screws, pos. 28. Take care not to remove the shaft with rotor together with the pump head when this is removed from the motor.

Note: The bearing cover plate, pos. 155, and the diverting disc, pos. 79, may stick to the pump head. If this is the case, remove the stationary shaft seal part from the motor side.

The pump is now dismantled.

Neck ring, pos. 45

If the neck rings are worn, they must be replaced. Push the retainer, pos. 65, free of the chamber/suction chamber by means of a special puller, see "Service tools". Remove the neck ring.

Dismantling of stator with housing

Remove the electric cable from the terminal box.

Slacken and remove the screws, pos. 152, together with the fan cover, pos. 151.

Remove the fan, pos. 156, from the shaft by means of two screwdrivers.

Slacken and remove the screws, pos. 28.

Loosen the stator with housing with a light blow of a rubber mallet and pull it off the pump.

If the ball bearings or the shaft with rotor is defective, the pump must be dismantled.

Assembly

Before assembly, clean and check all parts and replace possible defective parts.

The following parts should always be replaced when the pump is overhauled: Nut for shaft, gaskets and all O-rings.

Neck ring, pos. 45

Position the neck ring on the retainer in the chamber/suction chamber. Then press the retainer, pos. 65, over the neck ring so that it engages with the chamber/suction chamber.

It must be possible to move the neck ring freely (sideways) between the retainer and the chamber/suction chamber.

Shaft seal, pos. 105

The seal rings must be intact, and the seal faces must be smooth and clean. *Do not expose the seal rings to blows or knocks.*

Moisten the recess of the pump head and the O-ring for the stationary shaft seal part with water. Press the stationary seal ring with O-ring home in the recess of the pump head. The O-ring must point towards the pump head.

Fit the ball bearings, pos. 153 and 154, to the shaft. For type and position, see "Parts list" and "Sectional drawing".

Assembly of pump

Fit the bearing cover plate, pos. 155, to the shaft so that it touches the outer ring of the ball bearing. The curved side of the bearing cover plate must point away from the ball bearing, see "Drawing for dismantling and assembly". Fit the diverting disc, pos. 79, to the pump shaft and push it until it touches the motor shaft.

Fit the pump head, pos. 2, with the stationary shaft seal part and press it home on the recess of the stator housing. If it is not possible to press home the pump head, check whether the corrugated spring, pos. 158, is positioned correctly, see fig. 1.

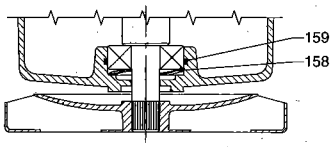

Fig. 1

Make sure that the discharge port of the pump head and the terminal box on the motor point in the same direction as before dismantling.

Lubricate the screws, pos. 28, with thread paste THREAD-EZE (part number, see "Torques"). Fit the screws and tighten diagonally, see "Torques".

Fit a new stop ring, pos. 62, to the shaft so that it engages with the recess of the shaft.

Fit the rotating shaft seal part, see "Shaft seals" and "Drawing for dismantling and assembly". *Do not expose the seal rings, pos. 105, to blows or knocks. Moisten the rubber parts with water.*

Check that the ends of the spring engage with the ground groove in the seal ring and the driving dog of the spacer.

Continue the assembly in the order mentioned until the last impeller has been fitted: Gasket, pos. 37, impeller, pos. 49, chamber, pos. 4, and spacing pipe, pos. 64.

In the case of CH 4-60, continue the assembly up to the last impeller but one.

Then fit the spacer, pos. 64a, the chamber with bearing, pos. 4a, the bearing ring, pos. 47a, and the impeller, pos. 49.

Make sure that the last impeller engages with the spline shaft.

Lubricate the threaded shaft end with Gardolube (part number, see "Torques") before the clamp (washer), pos. 66, and the nut, pos. 67, are fitted.

Hold the rotor shaft and tighten the nut, see "Torques".

Do not forget the gasket, pos. 37, between the suction chamber and the chamber. Fit the suction chamber, pos. 6, with the priming plug, pos. 21, in the same direction as the discharge port of the pump head.

Lubricate the staybolts (hexagon socket head screws), pos. 26, with thread paste THREAD-EZE (part number, see "Torques") before they are fitted and tightened diagonally, see "Torques".

In order not to damage the ball bearings, the pump shaft should be supported through the port of the suction chamber when the fan, pos. 156, is driven home against the rotor shaft.

Check the pump by turning the fan.

Fit the fan cover, pos. 151, to the motor and fit and tighten the screws, pos. 152.

Connect the electric cable to the terminal box.

The pump is now assembled, and it can be tested according to the following test specifications:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

Assembly of stator with housing

Press the O-ring, pos. 159, into the recess of the stator, and fit the corrugated spring, pos. 158, see fig. 1.

Stand the stator with housing, pos. 150, upright with the pump connection uppermost.

The end of the rotor shaft must be able to pass freely through the stator housing when the pump with rotor shaft is fitted in the stator housing.

Turn the pump so that the discharge port and the terminal box are in the same position as before dismantling.

Fit and tighten the screws, pos. 28, diagonally to the torque stated, see "Torques".

In order not to damage the ball bearings, the pump shaft should be supported through the port of the suction chamber when the fan, pos. 156, is driven home against the rotor shaft.

Check the pump by turning the fan.

Fit the fan cover, pos. 151, to the motor and fit and tighten the screws, pos. 152.

Connect the electric cable to the terminal box.

The pump is now assembled, and it can be tested according to the following test specifications:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

Deutsch

Die GRUNDFOS Kreiselpumpe, Typ CH 4, ist eine horizontale mehrstufige Pumpe.

Ist Demontage der Pumpe entweder infolge Verstopfung oder infolge Beschädigung notwendig, bitte die nachstehenden Anweisungen befolgen.

Vor der Demontage der Pumpe die Versorgungsspannung abschalten. Saug- und Druckrohr demontieren.

Die Demontage und Montage der elektrischen Teile müssen in Übereinstimmung mit den örtlichen Vorschriften des VDE bzw. EVU vorgenommen werden.

Positionsnummern, siehe "Zeichnung für Demontage und Montage" und "Servicewerkzeuge".

Hinweise in " ", siehe Inhaltsverzeichnis.

Demontage der Pumpe

Stehbolzen (Innensechskantschrauben), Pos. 26, demontieren und Sauggehäuse, Pos. 6, abziehen. Falls das Sauggehäuse festsitzt, wird dieses durch einen leichten Schlag auf die Kante gelöst. Lüfter demontieren (siehe "Demontage des Stators mit Gehäuse") und beim Lösen der Mutter, Pos. 67 (Linksgewinde), die Welle festhalten. Mutter, Spannstück (Unterlegscheibe), Pos. 66, Laufrad, Pos. 49, Kammer, Pos. 4, und Distanzhülse, Pos. 64, abnehmen.

Bei CH 4-60 ist die Reihenfolge der Demontage: Mutter, Pos. 67, Spannstück, Pos. 66, Laufrad, Pos. 49, Kammer mit Lager, Pos. 4a, Lagerring, Pos. 47a, und Distanzstück, Pos. 64a.

Falls die Kammer festsitzt, ist sie mit einem Schraubendreher zu lösen, der zwischen die Kammern eingeführt wird. *Es ist darauf zu achten, daß die Kammer nicht verformt wird.*

Weitere Demontage bis zur Wellenabdichtung, Pos. 105, in der erwähnten Reihenfolge vornehmen: Laufrad, Kammer und Distanzhülse.

Die Dichtungsringe der Wellenabdichtung vertragen keine Schläge oder Stöße.

Das rotierende Wellenabdichtungsteil von der Welle abziehen.

Das stationäre Wellenabdichtungsteil ist nur zu demontieren, falls die Wellenabdichtung undicht ist.

Falls die Wellenabdichtung undicht ist, den Stopring, Pos. 62, vom Rezeß abhebeln und von der Welle abziehen. Der Stopring kann nicht wiederverwendet werden.

Schrauben, Pos. 28, lösen und abnehmen. Es ist darauf zu achten, daß die Welle mit Rotor mit dem Kopfstück nicht abgezogen wird.

Achtung: Die Lagerabdeckung, Pos. 155, und die Schleuderscheibe, Pos. 79, können am Kopfstück hängen. In diesem Falle werden diese Teile vom Kopfstück entfernt, bevor das stationäre Wellenabdichtungsteil von der Motorseite her, aus dem Kopfstück gedrückt wird.

Die Pumpe ist jetzt demontiert.

Spaltring, Pos. 45

Bei eventuellem Verschleiß müssen die Spaltringe ausgewechselt werden. Halter, Pos. 65, von der Kammer/dem Sauggehäuse mit einem Spezialauszieher aushebeln, siehe "Servicewerkzeuge". Spaltring entfernen.

Demontage des Stators mit Gehäuse

Das elektrische Kabel vom Klemmenkasten entfernen.

Schrauben, Pos. 152, lösen und mit der Lüfterabdeckung, Pos. 151, abnehmen.

Lüfter, Pos. 156, mit zwei Schraubendrehern von der Welle abhebeln. Die beiden Schraubendreher unter den Lüfter einführen.

Schrauben, Pos. 28, lösen und abnehmen.

Stator mit Gehäuse durch einen leichten Schlag mit einem Gummihammer lösen und von der Pumpe freiziehen.

Falls die Kugellager oder die Welle mit Rotor defekt ist, muß die Pumpe demontiert werden.

Montage

Vor der Montage alle Teile reinigen, kontrollieren und evtl. defekte Teile gegen neue auswechseln.

Bei Überholung der Pumpe sollten die folgenden Teile immer ausgewechselt werden: Mutter für Welle, Dichtungen und alle O-Ringe.

Spaltring, Pos. 45

Spaltring auf dem Halter in der Kammer/dem Sauggehäuse anbringen und den Halter, Pos. 65, so über den Spaltring drücken, daß er in die Kammer/das Sauggehäuse einrastet.

Der Spaltring muß frei (seitwärts) zwischen dem Halter und der Kammer/dem Sauggehäuse bewegt werden können.

Wellenabdichtung, Pos. 105

Bei der Montage müssen die Dichtungsringe intakt und die Flächen glatt und sauber sein. *Die Dichtungsringe vertragen keine Schläge oder Stöße.*

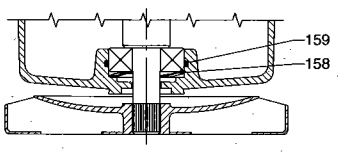
Den Rezeß des Kopfstückes und den O-Ring für das stationäre Wellenabdichtungsteil mit Wasser anfeuchten. Den stationären Dichtungsring mit O-Ring in den Rezeß des Kopfstückes drücken. Der O-Ring muß zum Kopfstück zeigen.

Kugellager, Pos. 153 und 154, auf die Welle montieren. Typ und Stellung, siehe "Teilliste" und "Schnittzeichnung".

Montage der Pumpe

Lagerabdeckung, Pos. 155, auf die Welle stecken und bis zum Anschlag gegen den äußeren Ring des Kugellagers drücken. Die gebogene Seite der Lagerabdeckung muß vom Kugellager abgewandt sein, siehe "Zeichnung für Demontage und Montage". Schleuderscheibe, Pos. 79, auf die Pumpenwelle stecken und bis zum Anschlag gegen die Motorwelle drücken.

Kopfstück, Pos. 2, mit dem stationären Wellenabdichtungsteil aufsetzen und gegen den Rezeß des Statorgehäuses drücken. Falls das Kopfstück nicht korrekt nach unten gedrückt werden kann, prüfen, ob die gewellte Feder, Pos. 158, korrekt montiert ist, siehe Abb. 1.



TM01 6526 2599

Abb. 1

Es ist darauf zu achten, daß der Druckstutzen des Kopfstückes und der Klemmenkasten des Motors in derselben Richtung wie vor der Demontage angebracht werden.

Schrauben, Pos. 28, mit Gewindepaste THREAD-EZE (Teilnummer, siehe "Anzugsmomente") bestreichen. Schrauben einsetzen und kreuzweise anziehen, siehe "Anzugsmomente".

Einen neuen Stopring, Pos. 62, auf die Welle setzen und mit dem Rezeß der Welle in Eingriff bringen.

Das rotierende Wellenabdichtungsteil montieren, siehe "Wellenabdichtungen" und "Zeichnung für Demontage und Montage". *Die Dichtungsringe der Wellenabdichtung, Pos. 105, vertragen keine Schläge oder Stöße. Gummiteile mit Wasser anfeuchten.*

Prüfen, daß die Federenden in die geschliffene Vertiefung des Dichtungsringes und in den Mitnehmerzapfen des Zwischenstükkes einrasten.

Die Montage bis einschließlich des letzten Laufrades fortsetzen: Dichtung, Pos. 37, Laufrad, Pos. 49, Kammer, Pos. 4, und Distanzhülse, Pos. 64.

Bei CH 4-60 die Montage bis einschließlich des zweitletzten Laufrades fortsetzen.

Danach Distanzstück, Pos. 64a, Kammer mit Lager, Pos. 4a, Lagerring, pos. 47a, und Laufrad, Pos. 49, montieren.

Prüfen, daß das letzte Laufrad in die Vielnutwelle eingreift.

Das Gewinde des Wellenzapfens mit Gardolube (Teilnummer, siehe "Anzugsmomente") bestreichen, bevor das Spannstück (Unterlegscheibe), Pos. 66, und die Mutter, Pos. 67, montiert werden.

Rotorwelle beim Anziehen der Mutter festhalten, siehe "Anzugsmomente".

Vergessen Sie nicht, die Dichtung, Pos. 37, zwischen Sauggehäuse und Kammer zu montieren. Sauggehäuse, Pos. 6, mit dem Einfüllstopfen, Pos. 21, in die gleiche Richtung wie den Druckstutzen des Kopfstückes montieren.

Stehbolzen (Innensechskantschrauben), Pos. 26, mit Gewindepaste THREAD-EZE (Teilnummer, siehe "Anzugsmomente") bestreichen, bevor sie montiert und kreuzweise angezogen werden, siehe "Anzugsmomente".

Um die Kugellager nicht zu beschädigen, die Pumpenwelle durch den Stutzen des Sauggehäuses abstützen, wenn der Lüfter, Pos. 156, gegen die Rotorwelle getrieben wird.

Pumpe durch Drehen des Lüfters prüfen.

Lüfterabdeckung, Pos. 151, auf den Motor montieren und mit den Schrauben, Pos. 152, befestigen.

Das elektrische Kabel an den Klemmenkasten anschließen.

Die Pumpe ist jetzt wieder zusammengebaut und kann nach der folgenden Testspezifikation geprüft werden:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

Montage des Stators mit Gehäuse

O-Ring, Pos. 159, in den Rezeß des Stators drücken, und die gewellte Feder, Pos. 158, montieren, siehe Abb. 1.

Stator mit Gehäuse, Pos. 150, senkrecht mit dem Pumpenanschluß nach oben stellen.

Es ist darauf zu achten, daß die Rotorwelle frei durch das Statorgehäuse passieren kann, wenn die Pumpe mit Rotorwelle in das Statorgehäuse montiert wird.

Pumpe so drehen, daß der Druckstutzen und der Klemmenkasten in dieselbe Richtung wie vor der Demontage angebracht werden.

Schrauben, Pos. 28, einsetzen und kreuzweise bis zum angegebenen Moment anziehen, siehe "Anzugsmomente".

Um die Kugellager nicht zu beschädigen, die Pumpenwelle durch den Stutzen des Endstücks abstützen, wenn der Lüfter, Pos. 156, gegen die Rotorwelle getrieben wird.

Pumpe durch Drehen des Lüfters prüfen.

Lüfterabdeckung, Pos. 151, auf den Motor montieren und mit den Schrauben, Pos. 152, befestigen.

Das elektrische Kabel an den Klemmenkasten anschließen.

Die Pumpe ist jetzt wieder zusammengebaut und kann nach der folgenden Testspezifikation geprüft werden:

CH 4: 96 46 87 25.
CH 4N: 96 46 87 29.

Declaration of Conformity

We **GRUNDFOS** declare under our sole responsibility that the products **CH** and **CHN** to which this declaration relates, are in conformity with the Council Directives on the approximation of the laws of the EEC Member States relating to

- Machinery (89/392/EEC).
  Standard used: EN 292.
- Electromagnetic compatibility (89/336/EEC).
  Standards used: EN 50 081-1 and EN 50 082-2.
- Electrical equipment designed for use within certain voltage limits (73/23/EEC).
  Standards used: EN 60 335-1 and EN 60 335-2-51.

Konformitätserklärung

Wir **GRUNDFOS** erklären in alleiniger Verantwortung, daß die Produkte **CH** und **CHN**, auf die sich diese Erklärung bezieht, mit den folgenden Richtlinien des Rates zur Angleichung der Rechtsvorschriften der EG-Mitgliedstaaten übereinstimmen:

- Maschinen (89/392/EWG).
  Norm, die verwendet wurde: EN 292.
- Elektromagnetische Verträglichkeit (89/336/EWG).
  Normen, die verwendet wurden: EN 50 081-1 und EN 50 082-2.
- Elektrische Betriebsmittel zur Verwendung innerhalb bestimmter Spannungsgrenzen (73/23/EWG).
  Normen, die verwendet wurden: EN 60 335-1 und EN 60 335-2-51.

Déclaration de Conformité

Nous **GRUNDFOS** déclarons sous notre seule responsabilité que les produits **CH** et **CHN** auxquels se réfère cette déclaration sont conformes aux Directives du Conseil concernant le rapprochement des législations des Etats membres CEE relatives à

- Machines (89/392/CEE).
  Standard utilisé: EN 292.
- Compatibilité électromagnétique (89/336/CEE).
  Standards utilisés: EN 50 081-1 et EN 50 082-2.
- Matériel électrique destiné à employer dans certaines limites de tension (73/23/CEE).
  Standards utilisés: EN 60 335-1 et EN 60 335-2-51.

Dichiarazione di Conformità

Noi **GRUNDFOS** dichiariamo sotto la nostra esclusiva responsabilità che i prodotti **CH** e **CHN** ai quali questa dichiarazione si riferisce sono conformi alle Direttive del Consiglio concernente il ravvicinamento delle legislazioni degli Stati membri CEE relative a

- Macchine (89/392/CEE).
  Standard usato: EN 292.
- Compatibilità elettromagnetica (89/336/CEE).
  Standard usati: EN 50 081-1 e EN 50 082-2.
- Materiale elettrico destinato ad essere utilizzato entro certi limiti di tensione (73/23/CEE).
  Standard usati: EN 60 335-1 e EN 60 335-2-51.

Declaración de Conformidad

Nosotros **GRUNDFOS** declaramos bajo nuestra única responsabilidad que los productos **CH** y **CHN** a los cuales se refiere esta declaración son conformes con las Directivas del Consejo relativas a la aproximación de las legislaciones de los Estados Miembros de la CEE sobre

- Máquinas (89/392/CEE).
  Norma aplicada: EN 292.
- Compatibilidad electromagnética (89/336/CEE).
  Normas aplicadas: EN 50 081-1 y EN 50 082-2.
- Material eléctrico destinado a utilizarse con determinadas límites de tensión (73/23/CEE).
  Normas aplicadas: EN 60 335-1 y EN 60 335-2-51.

Declaração de Conformidade

Nós **GRUNDFOS** declaramos sob nossa única responsabilidade que os produtos **CH** e **CHN** aos quais se refere esta declaração estão em conformidade com as Directivas do Conselho das Comunidades Europeias relativas à aproximação das legislações dos Estados Membros respeitantes à

- Máquinas (89/392/CEE).
  Norma utilizada: EN 292.
- Compatibilidade electromagnética (89/336/CEE).
  Normas utilizadas: EN 50 081-1 e EN 50 082-2.
- Material eléctrico destinado a ser utilizado dentro de certos limites de tensão (73/23/CEE).
  Normas utilizadas: EN 60 335-1 e EN 60 335-2-51.

Δήλωση Συμμόρφωσης

Εμείς η **GRUNDFOS** δηλώνουμε με αποκλειστικά δική μας ευθύνη ότι τα προιόντα **CH** και **CHN** συμμορφώνονται με την Οδηγία του Συμβουλίου επί της σύγκλισης των νόμων των Κρατών Μελών της Ευρωπαικής Ενωσης σε σχέση με τα

- Μηχανήματα (89/392/EEC).
  Πρότυπο που χρησιμοποιήθηκε: EN 292.
- Ηλεκτρομαγνητική συμβατότητα (89/336/EEC).
  Πρότυπα που χρησιμοποιήθηκαν: EN 50 081-1 και EN 50 082-2.
- Ηλεκτρικές συσκευές σχεδιασμένες γιά χρήση εντός ορισμένων ορίων ηλεκτρικής τάσης (73/23/EEC).
  Πρότυπα που χρησιμοποιήθηκαν: EN 60 335-1 και EN 60 335-2-51.

Overeenkomstigheidsverklaring

Wij **GRUNDFOS** verklaren geheel onder eigen verantwoordelijkheid dat de produkten **CH** en **CHN** waarop deze verklaring betrekking heeft in overeenstemming zijn met de Richtlijnen van de Raad inzake de onderlinge aanpassing van de wetgevingen van de Lid-Staten betreffende

- Machines (89/392/EEG).
  Norm: EN 292.
- Elektromagnetische compatibiliteit (89/336/EEG).
  Normen: EN 50 081-1 en EN 50 082-2.
- Elektrisch materiaal bestemd voor gebruik binnen bepaalde spanningsgrenzen (73/23/EEG).
  Normen: EN 60 335-1 en EN 60 335-2-51.

Försäkran om överensstämmelse

Vi **GRUNDFOS** försäkrar under ansvar, att produkterna **CH** och **CHN**, som omfattas av denna försäkran, är i överensstämmelse med Rådets Direktiv om inbördes närmande till EU-medlemsstaternas lagstiftning, avseende

- Maskinell utrustning (89/392/EC).
  Använd standard: EN 292.
- Elektromagnetisk kompatibilitet (89/336/EC).
  Använda standarder: EN 50 081-1 och EN 50 082-2.
- Elektrisk material avsedd för användning inom vissa spänningsgränser (73/23/EC).
  Använda standarder: EN 60 335-1 och EN 60 335-2-51.

Vastaavuusvakuutus

Me **GRUNDFOS** vakuutamme yksin vastuullisesti, että tuotteet **CH** ja **CHN**, jota tämä vakuutus koskee, noudattavat direktiivejä jotka käsittelevät EY:n jäsenvaltioiden koneellisia laitteita koskevien lakien yhdenmukaisuutta seur.:

- Koneet (89/392/EY).
  Käytetty standardi: EN 292.
- Elektromagneettinen vastaavuus (89/336/EY).
  Käytetyt standardit: EN 50 081-1 ja EN 50 082-2.
- Määrättyjen jänniterajoitusten puitteissa käytettävät sähköiset laitteet (73/23/EY).
  Käytetyt standardit: EN 60 335-1 ja EN 60 335-2-51.

Overensstemmelseserklæring

Vi **GRUNDFOS** erklærer under ansvar, at produkterne **CH** og **CHN**, som denne erklæring omhandler, er i overensstemmelse med Rådets direktiver om indbyrdes tilnærmelse til EF medlemsstaternes lovgivning om

- Maskiner (89/392/EØF).
  Anvendt standard: EN 292.
- Elektromagnetisk kompatibilitet (89/336/EØF).
  Anvendte standarder: EN 50 081-1 og EN 50 082-2.
- Elektrisk materiel bestemt til anvendelse inden for visse spændingsgrænser (73/23/EØF).
  Anvendte standarder: EN 60 335-1 og EN 60 335-2-51.

Before beginning installation procedures, these installation and operating instructions should be studied carefully. The installation and operation should also be in accordance with local regulations and accepted codes of good practice.

1. General data

1.1 Applications

The CH/CHN range of GRUNDFOS horizontal multistage centrifugal pumps are designed for the pumping of water and other thin, non-aggressive and non-explosive liquids, not containing solid particles or fibres.

1.2 Operating conditions

1.2.1 Liquid temperature

0°C to +90°C.

1.2.2 Ambient temperature

Up to +55°C.

1.2.3 Maximum operating pressure

0°C to +40°C: Up to 10 bar.
+41°C to +90°C: Up to 6 bar.

1.2.4 Maximum Inlet Pressure

The actual inlet pressure plus the pressure when the pump is operating against a closed valve should always be lower than the “maximum operating pressure”.

1.2.5 Minimum inlet pressure

The table below applies to the **maximum flow rates** of the pumps and a barometric pressure of 760 mmHg.

The values stated are the minimum inlet pressures/maximum suction lifts “H” [m head] at the pump suction port. The values are stated at different liquid temperatures. **The head loss in the suction pipe should therefore be taken into account.**

The maximum suction lift may be limited by the actual head.

Type	H [m head]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4.1	*3.6	*2.7	2.8
CHN 2	*4.1	*3.6	*2.7	2.8
CH 4	*7.5	*7.0	*6.1	*0.6
CHN 4	*7.5	*7.0	*6.1	*0.6
CH 8	*6.3	*5.8	*4.9	0.6
CH 12	*5.6	*5.1	*4.2	1.3
60 Hz				
CH 2	*3.1	*2.6	*1.7	3.8
CHN 2	*3.1	*2.6	*1.7	3.8
CH 4	*6.8	*6.3	*5.4	0.1
CHN 4	*6.8	*6.3	*5.4	0.1
CH 8	*6.9	*6.4	*5.5	0.0
CH 12	*3.5	*3.0	*2.1	3.4

“H” = minimum inlet pressure during operation.

“H” marked * = maximum suction lift during operation.

1 m head ≈ 0.1 bar.

1.3 Technical data

1.3.1 Electrical data

See the pump nameplate.

1.3.2 Dimensions

See page 50.

1.4 Sound pressure level

The sound pressure level of the pump is lower than the limiting values stated in the EC Council Directive 89/392/EEC relating to machinery.

2. Installation

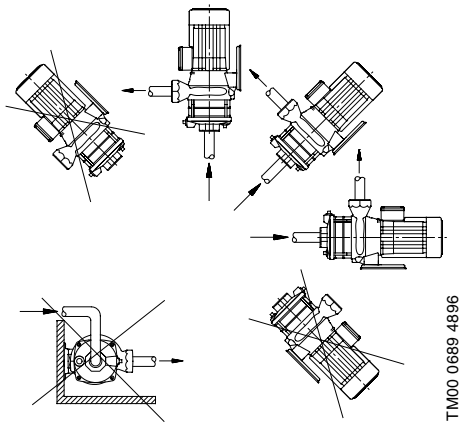
2.1 Pump location

The pump should be installed so that the suction pipe is as short and the suction lift as small as possible.

The pump should be sited in a well ventilated but frost-free position (see section *5.1 Frost protection*). It may be sited outside, but it should be protected from the elements by means of a suitable cover.

The pump may be installed in one of the positions shown in fig. 1.

Fig. 1

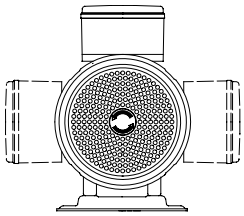


TM00 0689 4896

2.2 Position of terminal box

The terminal box can be turned to any one of the positions shown in fig. 2 before the pump is installed.

Fig. 2



TM00 0690 5192

To change the position of the terminal box:

1. Remove the four screws which, from the motor side, are screwed into the discharge chamber.
2. Turn the stator housing to the required position.
3. Replace the screws and tighten securely.

2.3 Pipework

The pipes should be fitted so that any tension caused by variations in temperature does not affect the pump.

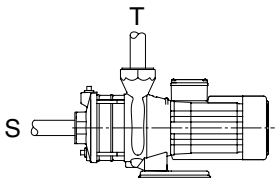
GB

2.3.1 Suction pipe

If the pump is to draw liquid from a level lower than the pump suction port, a foot/non-return valve must be fitted to the end of the suction pipe, below the lowest liquid level, since the pump is not self-priming.

The suction pipe is connected to the pump suction port S, fig. 3.

Fig. 3



TM00 0691 4896

When the suction pipe is longer than 10 metres or the suction lift is greater than 4 metres, the diameter of the suction pipe must be larger than that of the pump suction port.

Every joint of the suction pipe must be completely tight.

If a hose is used as suction pipe, it must be non-collapsible. A strainer is recommended in cases where solids could enter the suction pipe and block the pump.

2.3.2 Discharge pipe

The discharge pipe is connected to the discharge port T, fig. 3.

The discharge pipe should be at least the same diameter as the discharge port of the pump, to minimize pressure drop, high flow velocities and noise.

2.3.3 Bypass

If there is any danger of the pump running against a closed discharge valve, a minimum liquid flow through the pump should be ensured by connecting a bypass/a drain to the discharge pipe. The drain can for instance be connected to a tank.

A minimum flow rate equal to 10% of the flow rate at maximum efficiency is needed at all times. Flow rate and head at maximum efficiency are stated on the pump nameplate.

2.4 Installation examples

The pump is suitable for a wide range of applications.

Some examples are shown on page 49.

GB

3. Electrical connections

The electrical connections should be carried out in accordance with local regulations.

The operating voltage and frequency are marked on the nameplate. Please make sure that the motor is suitable for the electricity supply on which it will be used.

Never make any connections in the pump terminal box unless the electricity supply has been switched off.

The pump must be connected to an external mains switch.

Single-phase motors, 1 x 110/220 V, 60 Hz, do not incorporate motor protection and must be connected to an approved motor starter.

Other single-phase motors incorporate a thermal overload switch and require no additional motor protection.

Three-phase motors must be connected to a motor starter, the set nominal current of which must correspond to the electrical data on the pump nameplate.

Do not start the pump until it has been filled with liquid.

Connections should be made as shown on the inside of the terminal box cover.

Choose one of the two cable entries and knock out the pre-cut disk.

3.1 Checking of direction of rotation

(Three-phase motors)

Arrows on the motor fan cover indicate the correct direction of rotation.

The pump should rotate counter-clockwise when viewed from the motor end.

To reverse the direction of rotation, switch off the electricity supply and interchange any two of the incoming supply wires.

4. Starting

4.1 Priming

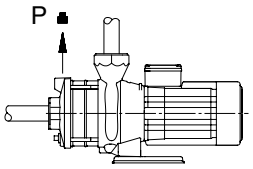
Do not start the pump until it has been filled with liquid and vented.

In systems with hot liquids, extreme caution should be exercised when venting the pump to eliminate the risk of personal injury caused by escaping water.

Booster systems and systems where the liquid level on the suction side is above the pump inlet:

1. Close the isolating valves either side of the pump.
2. Remove the priming plug P, fig. 4.
3. Slowly open the suction valve and keep it open until a steady stream of liquid runs out the priming port.
4. Close the valve, replace the priming plug and tighten securely.
5. Open the suction valve.
6. Start the pump and slowly open the discharge valve until it is fully open.

Fig. 4



TM00 0692 4896

Pumping from tanks and wells where the liquid level on the suction side is below the pump inlet:

1. Close the discharge isolating valve.
2. Remove the priming plug P, fig. 4.
3. Pour water through the priming port. Make sure that the suction pipe and pump are completely filled with liquid and vented.
4. Replace the priming plug and tighten securely.
5. Start the pump and slowly open the discharge valve until it is fully open.

4.2 Frequency of starts and stops

Maximum 100 starts per hour.

5. Operation and maintenance

Under normal operating conditions, the pump does not require any maintenance.

If the pump has been used for pumping liquids that may leave impurities in the pump, it should be flushed through with clean water immediately after use.

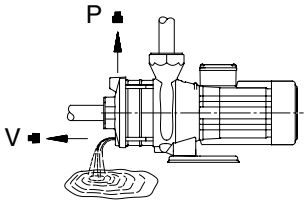
5.1 Frost protection

Pumps which are not being used during periods of frost should be drained to avoid damage.

Remove the priming and drain plugs P and V, fig. 5.

Do not replace the plugs until the pump is to be used again.

Fig. 5



TM00 0693 4896

6. Fault finding chart

Before attempting to diagnose any fault, make sure that the electricity supply has been switched off.

GB

Fault	Cause
1. Pump does not start.	a) Supply failure. b) Control circuit has cut out or is defective. c) Motor is defective. d) Pump is blocked by impurities.
2. Pump runs but gives no water.	a) Pump is not filled with liquid. b) Suction or discharge pipe is blocked by impurities. c) Pump is blocked by impurities. d) Suction lift is too great. e) Leakage in suction pipe. f) Foot or non-return valve is blocked.
3. Pump runs at reduced capacity.	a) Wrong direction of rotation (three-phase). b) Suction lift is too great. c) Suction or discharge pipe is blocked. d) Pump is blocked by impurities. e) Foot or non-return valve is partly blocked.
4. Pump stops during operation.	a) Thermal overload switch in motor or external motor protection cuts out. b) Control circuit has cut out.

7. Disposal

Disposal of this product or parts of it must be carried out according to the following guidelines:

1. Use the local public or private waste collection service.
2. In case such waste collection service does not exist or cannot handle the materials used in the product, please deliver the product or any hazardous materials from it to your nearest GRUNDFOS company or service workshop.

1. Sicherheitshinweise

1.1 Allgemeines

Diese Montage- und Betriebsanleitung enthält grundlegende Hinweise, die bei Installation, Betrieb und Wartung zu beachten sind. Sie ist daher unbedingt vor Montage und Inbetriebnahme vom Monteur sowie dem zuständigen Fachpersonal/Betreiber zu lesen. Sie muß ständig am Einsatzort der Anlage verfügbar sein.

Diese Montage- und Betriebsanleitung bezieht sich auf Pumpen der Baureihen CH und CHN.

Es sind nicht nur die unter diesem Abschnitt “Sicherheitshinweise” aufgeführten, allgemeinen Sicherheitshinweise zu beachten, sondern auch die unter den anderen Abschnitten eingefügten, speziellen Sicherheitshinweise.

1.2 Kennzeichnung von Hinweisen

Die in dieser Montage- und Betriebsanleitung enthaltenen Sicherheitshinweise, die bei Nichtbeachtung Gefährdungen für Personen hervorrufen können, sind mit allgemeinem Gefahrensymbol “Sicherheitszeichen nach DIN 4844-W9” besonders gekennzeichnet.

Achtung ***Dieses Symbol finden Sie bei Sicherheitshinweisen, deren Nichtbeachtung Gefahren für die Maschine und deren Funktionen hervorrufen kann.***

Hinweis ***Hier stehen Ratschläge oder Hinweise, die das Arbeiten erleichtern und für einen sicheren Betrieb sorgen.***

Direkt an der Anlage angebrachte Hinweise wie z.B.

- Fließrichtungspfeil
- Kennzeichnung für Fluidanschlüsse

müssen unbedingt beachtet und in vollständig lesbarem Zustand gehalten werden.

1.3 Personalqualifikation und -schulung

Das Personal für Bedienung, Wartung, Inspektion und Montage muß die entsprechende Qualifikation für diese Arbeiten aufweisen.

Verantwortungsbereich, Zuständigkeit und die Überwachung des Personals müssen durch den Betreiber genau geregelt sein.

1.4 Gefahren bei Nichtbeachtung der Sicherheitshinweise

Die Nichtbeachtung der Sicherheitshinweise kann sowohl eine Gefährdung für Personen als auch für die Umwelt und Anlage zur Folge haben. Die Nichtbeachtung der Sicherheitshinweise kann zum Verlust jeglicher Schadenersatzansprüche führen.

Im einzelnen kann Nichtbeachtung beispielsweise folgende Gefährdungen nach sich ziehen:

- Versagen wichtiger Funktionen der Anlage
- Versagen vorgeschriebener Methoden zur Wartung und Instandhaltung
- Gefährdung von Personen durch elektrische und mechanische Einwirkungen

1.5 Sicherheitsbewußtes Arbeiten

Die in dieser Montage- und Betriebsanleitung aufgeführten Sicherheitshinweise, die bestehenden nationalen Vorschriften zur Unfallverhütung sowie eventuelle interne Arbeits-, Betriebs- und Sicherheitsvorschriften des Betreibers, sind zu beachten.

1.6 Sicherheitshinweise für den Betreiber/Bediener

Gefährdungen durch elektrische Energie sind auszuschließen (Einzelheiten hierzu siehe z.B. in den Vorschriften des VDE und der örtlichen Energieversorgungsunternehmen).

1.7 Sicherheitshinweise für Wartungs-, Inspektions- und Montagearbeiten

Der Betreiber hat dafür zu sorgen, daß alle Wartungs-, Inspektions- und Montagearbeiten von autorisiertem und qualifiziertem Fachpersonal ausgeführt werden, das sich durch eingehendes Studium der Montage- und Betriebsanleitung ausreichend informiert hat.

Grundsätzlich sind Arbeiten an der Pumpe nur im Stillstand durchzuführen. Die in der Montage- und Betriebsanleitung beschriebene Vorgehensweise zum Stillsetzen der Anlage muß unbedingt eingehalten werden.

Unmittelbar nach Abschluß der Arbeiten müssen alle Sicherheits- und Schutzeinrichtungen wieder angebracht bzw. in Funktion gesetzt werden.

Vor der Wiederinbetriebnahme sind die im Abschnitt *5. Inbetriebnahme* aufgeführten Punkte zu beachten.

1.8 Eigenmächtiger Umbau und Ersatzteilherstellung

Umbau oder Veränderungen an Pumpen sind nur nach Absprache mit dem Hersteller zulässig. Originalersatzteile und vom Hersteller autorisiertes Zubehör dienen der Sicherheit. Die Verwendung anderer Teile kann die Haftung für die daraus entstehenden Folgen aufheben.

1.9 Unzulässige Betriebsweisen

Die Betriebssicherheit der gelieferten Pumpen ist nur bei bestimmungsgemäßer Verwendung entsprechend Abschnitt *2.1 Verwendungszweck* der Montage- und Betriebsanleitung gewährleistet. Die in den technischen Daten angegebenen Grenzwerte dürfen auf keinen Fall überschritten werden.

2. Allgemeines

2.1 Verwendungszweck

Die GRUNDFOS CH und CHN Pumpen sind horizontale, mehrstufige Kreiselpumpen zur Förderung von Wasser und anderen dünnflüssigen, nicht-aggressiven und nicht-explosiven Medien ohne abrasive oder langfaserige Bestandteile.

2.2 Betriebsbereich

2.2.1 Medientemperatur

0°C bis +90°C.

2.2.2 Umgebungstemperatur

Max. +55°C.

2.2.3 Max. Betriebsdruck

0°C bis +40°C: max. 10 bar.
+41°C bis +90°C: max. 6 bar.

2.2.4 Max. Zulaufdruck

Vorhandener Zulaufdruck + Pumpenenddruck (Pumpendruck bei Betrieb gegen geschlossenes Ventil) darf den “max. Betriebsdruck” nicht übersteigen.

2.2.5 Min. Zulaufhöhe

Die nachstehende Tabelle zeigt die Zulaufhöhen bei den **max. Förderströmen** der Pumpen und bei einem barometrischen Druck von 760 mmHg ~ 1013 hPa.

Die angeführten Werte sind min. Zulaufhöhen/max. Saughöhen “H” [mWS] am Pumpensaugstutzen bei verschiedenen Medientemperaturen. **Deshalb muß der Druckverlust in der Saugleitung beachtet werden.**

Wenn die Pumpe in Saugbetrieb eingesetzt wird, ist zu beachten, daß die max. Saughöhe kleiner sein muß als die max. Förderhöhe der Pumpe.

Typ	H [mWS]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

“H” = min. Zulaufhöhe während des Betriebes.

Wert “H” markiert mit * = max. Saughöhe während des Betriebes.

1 mWS ≈ 0,1 bar.

2.3 Technische Daten

2.3.1 Elektrische Daten

Siehe Leistungsschild.

2.3.2 Abmessungen

Siehe Seite 50.

2.4 Schalldruckpegel

Der Schalldruckpegel der Pumpe liegt unter den Grenzwerten, die in der EG-Richtlinie 89/392/EWG für Maschinen angeführt sind.

D

3. Montage

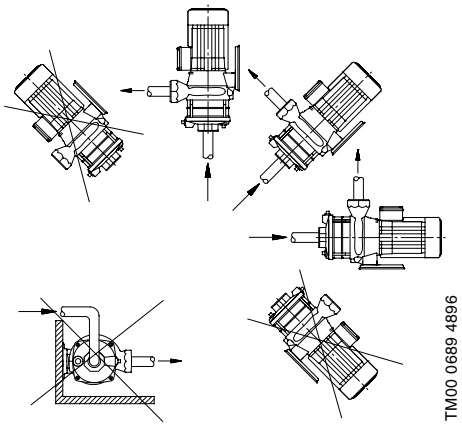
3.1 Aufstellung

Die Aufstellung der Pumpe sollte so erfolgen, daß die Saugleitung so kurz und die Saughöhe so gering wie möglich ist.

Der Aufstellungsort sollte gut belüftet und frostfrei sein (siehe Abschnitt *6.1 Frostsicherung*). Die Pumpe darf auch im Freien montiert werden, sollte aber gegen Regen geschützt sein, z.B. mit einem Schutzdach.

Die Pumpe darf in einer der in Abb. 1 gezeigten Lagen montiert werden.

Abb. 1

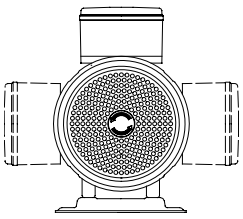


TM00 0689 4896

3.2 Klemmenkastenstellung

Die Klemmenkastenstellung kann wie in Abb. 2 gezeigt geändert werden, bevor die Pumpe montiert wird.

Abb. 2



TM00 0690 5192

Änderung der Klemmenkastenstellung:

1. Die vier Schrauben, die von der Motorseite her in das Druckgehäuse geschraubt sind, entfernen.
2. Statorgehäuse in die gewünschte Stellung drehen.
3. Schrauben wieder einsetzen und fest anziehen.

3.3 Rohrleitungen

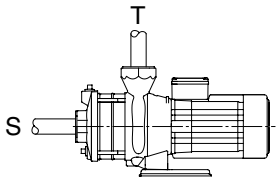
Die Pumpe muß spannungsfrei eingebaut werden, so daß Rohrleitungskräfte, z.B. durch Temperaturexpansion, ihre Funktion nicht beeinträchtigen können.

3.3.1 Saugleitung

In Anlagen, in denen der Mediumstand auf der Saugseite unterhalb der Pumpe liegt, muß die Saugleitung mit einem Fuß- oder Rückschlagventil versehen werden. Die Pumpe ist nicht selbstansaugend.

Die Saugleitung ist an den Saugstutzen S der Pumpe anzuschließen, Abb. 3.

Abb. 3



TM00 0691 4896

Bei Saugleitungen länger als 10 m oder Saugtiefen größer als 4 m muß der Durchmesser der Saugleitung größer als der des Saugstutzens sein.

Alle Verbindungen der Saugleitung müssen dicht sein.

Als flexible Saugleitung sind verstärkte Schläuche zu verwenden. Um eine Verunreinigung der Pumpe zu vermeiden, kann die Saugleitung mit einem Saugkorb (Filter/Sieb) versehen werden.

Achtung ***Die max. Saughöhe darf auch bei Verunreinigungen des Filters/Siebes nicht überschritten werden.***

3.3.2 Druckleitung

Die Druckleitung ist an den Druckstutzen T der Pumpe anzuschließen, Abb. 3.

Wir empfehlen, den Durchmesser der Druckleitung gleich oder größer als den des Druckstutzens zu wählen, um Druckverluste, große Strömungsgeschwindigkeiten und Geräusche zu minimieren.

3.3.3 Bypass (Umlaufleitung)

In Anlagen, bei denen die Möglichkeit besteht, daß die Pumpe gegen ein geschlossenes Absperrventil in der Druckleitung arbeitet, muß ein Mindest-Förderstrom durch die Pumpe fließen. Das wird dadurch sichergestellt, daß ein Bypass oder ein Ablauf zu einem Behälter o.ä. auf der Druckseite der Pumpe installiert wird.

Ein Mindest-Förderstrom von 10% des Förderstroms im Wirkungsgradbestpunkt muß immer durch die Pumpe fließen. Der Förderstrom und die Förderhöhe im Wirkungsgradbestpunkt sind dem Leistungsschild der Pumpe zu entnehmen.

3.4 Montagebeispiele

Die Pumpe eignet sich für viele Anwendungsgebiete.

Auf Seite 49 sind einige Beispiele gezeigt.

4. Elektrischer Anschluß

Der elektrische Anschluß muß durch einen Fachmann in Übereinstimmung mit den örtlichen Vorschriften des EVU bzw. VDE vorgenommen werden.

Es ist darauf zu achten, daß die auf dem Leistungsschild angegebenen Daten mit der vorhandenen Stromversorgung übereinstimmen.

Vor jedem Eingriff im Klemmenkasten der Pumpe muß die Versorgungsspannung abgeschaltet sein.

Die Pumpe muß an einen externen Netzschalter angeschlossen werden.

Einphasenmotoren, 1 x 110/220 V, 60 Hz, besitzen **keinen** eingebauten Motorschutz und müssen deshalb an einen externen Motorschutzschalter angeschlossen werden.

Die übrigen Einphasenmotoren besitzen einen eingebauten Thermoschalter und benötigen keinen weiteren Motorschutz.

Drehstrommotoren müssen an einen VDE-geprüften Motorschutzschalter angeschlossen werden, dessen eingestellter Nennstrom mit den Stromdaten des Pumpen-Leistungsschildes übereinstimmt.

Auf eine allpolige Trennung mit Kontaktöffnungsweite von min. 3 mm (pro Pol) ist zu achten.

Die Pumpe darf nicht in Betrieb genommen werden, bevor sie mit dem Fördermedium gefüllt ist.

Der elektrische Anschluß ist in Übereinstimmung mit dem im Klemmenkasten vorhandenen Schaltbild vorzunehmen.

Eine der beiden Kabeleinführungen wählen und die vorgeprägte Scheibe ausbrechen.

4.1 Kontrolle der Drehrichtung

(Drehstrommotoren)

Die richtige Drehrichtung ist durch Pfeile auf der Lüfterhaube vorgegeben.

Vom Motor gesehen, muß die Pumpe entgegen dem Uhrzeigersinn laufen.

Ist die Drehrichtung falsch, sind zwei Phasen der Stromversorgung des Motors zu vertauschen.

5. Inbetriebnahme

5.1 Auffüllen

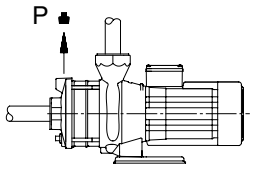
Vor der Inbetriebnahme muß die Pumpe unbedingt mit dem Fördermedium aufgefüllt und entlüftet sein.

Bei Anlagen mit heißen Medien ist bei der Entlüftung der Pumpe äußerste Vorsicht geboten, um Personenschäden durch austretendes Wasser zu vermeiden.

In Druckerhöhungsanlagen und Anlagen, in denen der Mediumstand auf der Saugseite oberhalb der Pumpe liegt:

1. Absperrventile auf der Saug- und Druckseite schließen.
2. Einfüllstopfen P demontieren, Abb. 4.
3. Das Absperrventil auf der Saugseite so weit öffnen, bis das Medium aus dem Einfüllstutzen herausläuft.
4. Absperrventil schließen und Einfüllstopfen wieder einsetzen und fest anziehen.
5. Das Absperrventil auf der Saugseite ganz öffnen.
6. Pumpe einschalten und Absperrventil auf der Druckseite sofort langsam öffnen.

Abb. 4



TM00 0692 4896

Pumpen aus Behältern und Brunnen, in denen der Mediumstand auf der Saugseite unterhalb der Pumpe liegt:

1. Absperrventil auf der Druckseite schließen.
2. Einfüllstopfen P demontieren, Abb. 4.
3. Medium durch den Einfüllstutzen einfüllen. Es ist darauf zu achten, daß die Pumpe ganz aufgefüllt und entlüftet ist.
4. Einfüllstopfen wieder einsetzen und fest anziehen.
5. Pumpe einschalten und Absperrventil auf der Druckseite sofort langsam öffnen.

5.2 Schalthäufigkeit

Max. 100 Schaltungen pro Stunde.

6. Betrieb und Wartung

Unter normalen Betriebsbedingungen ist die Pumpe wartungsfrei.

Ist die Pumpe zur Förderung von unreinen Medien benutzt worden, die Verunreinigungen in der Pumpe hinterlassen haben, ist sofort nach Beendigung der Förderung die Pumpe mit sauberem Wasser durchzuspülen.

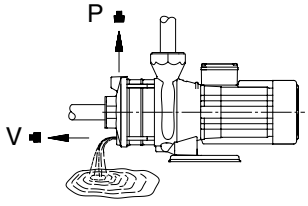
6.1 Frostsicherung

Pumpen, die in Frostperioden nicht verwendet werden und in nicht frostfreien Räumen installiert sind, sollten entleert werden, um Beschädigungen zu vermeiden.

Dazu die Einfüll- und Entleerungsstopfen P und V entfernen, Abb. 5.

Die Stopfen sind erst vor der erneuten Inbetriebnahme einzusetzen.

Abb. 5



TM00 0693 4896

D

7. Störungsübersicht

Vor Beginn der Störungssuche muß die Versorgungsspannung unbedingt abgeschaltet sein.

Störung	Ursache
1. Pumpe läuft nicht an.	a) Keine oder fehlerhafte Stromversorgung zum Motor. b) Steuerstromkreislauf ausgefallen oder schadhaft. c) Motor defekt. d) Pumpe durch Verunreinigungen blockiert.
2. Pumpe läuft, fördert aber kein Wasser.	a) Pumpe ist nicht mit Medium gefüllt. b) Saug- oder Druckleitung verstopft. c) Pumpe verstopft. d) Saughöhe zu groß. e) Saugleitung undicht. f) Fuß- oder Rückschlagventil blockiert.
3. Pumpe läuft mit verringerter Leistung.	a) Falsche Drehrichtung (Drehstrommotoren). b) Saughöhe zu groß. c) Saug- oder Druckleitung verunreinigt. d) Pumpe verunreinigt. e) Fuß- oder Rückschlagventil blockiert.
4. Pumpe schaltet während des Betriebes ab.	a) Der Thermoschalter im Motor oder der externe Motorschutz löst aus. b) Steuerstromkreislauf ausgefallen.

8. Entsorgung

Dieses Produkt sowie Teile davon müssen umweltgerecht entsorgt werden:

1. Hierfür sollten die örtlichen öffentlichen oder privaten Entsorgungsgesellschaften in Anspruch genommen werden.
2. Falls eine solche Organisation nicht vorhanden ist, oder die Annahme der im Produkt verwendeten Werkstoffe verweigert wird, kann das Produkt oder eventuelle umweltgefährdende Werkstoffe an die nächste GRUNDFOS Gesellschaft oder Werkstatt geliefert werden.

1. Généralités

1.1 Applications

Les pompes GRUNDFOS CH et CHN sont des pompes centrifuges multicellulaires horizontales pour le pompage d'eau claire et d'autres liquides non agressifs et non explosifs, sans particules abrasives ou fibreuses.

1.2 Limites d'utilisation

1.2.1 Température du liquide

De 0°C à +90°C.

1.2.2 Température ambiante

Jusqu'à +55°C.

1.2.3 Pression de service maximale

0°C à +40°C: Jusqu'à 10 bars.
+41°C à +90°C: Jusqu'à 6 bars.

1.2.4 Pression d'entrée maximale

La pression d'entrée effective + la pression de la pompe à vanne fermée ne doivent pas dépasser la "pression de service maximale".

1.2.5 Pression d'entrée minimale

Le tableau ci-dessous s'applique au **débit maximal** de la pompe et à une pression barométrique de 760 mmHg.

La pression d'entrée minimale/hauteur d'aspiration maximale "H" [mCE] à l'aspiration de la pompe est indiquée à différentes températures de liquide. **Pour cette raison, la perte de charge dans la tuyauterie d'aspiration doit être prise en compte.**

La hauteur d'aspiration maximale peut être limitée par la hauteur manométrique réelle.

Type	H [mCE]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

"H" = pression d'entrée minimale lors du fonctionnement.

"H" marquée * = hauteur d'aspiration maximale lors du fonctionnement.

1 mCE ≈ 0,1 bar.

1.3 Caractéristiques techniques

1.3.1 Données électriques

Voir la plaque signalétique de la pompe.

1.3.2 Dimensions

Voir page 50.

1.4 Niveau de pression acoustique

Le niveau de pression acoustique de la pompe est inférieur aux seuils indiqués dans la Directive du Conseil 89/392/CEE (relative aux machines).

F

2. Installation

2.1 Positionnement de la pompe

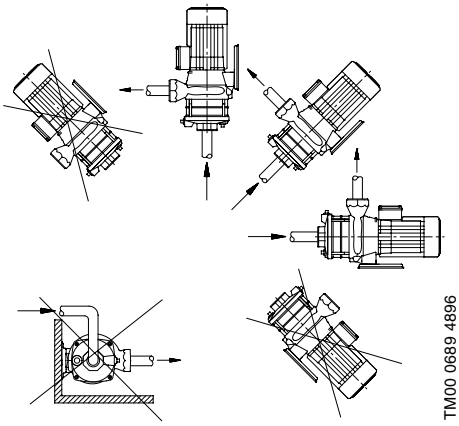
La tuyauterie d'aspiration doit être aussi courte et la hauteur d'aspiration aussi petite que possible.

La pompe doit, autant que possible, être placée dans un endroit bien ventilé sans risque de gel (voir paragraphe *5.1 Protection contre le gel*). Elle peut être placée à l'extérieur, mais à l'abri de la pluie, par exemple sous un petit toit ou tout autre système de protection.

La pompe peut être montée dans les positions indiquées par la figure 1.

F

Fig. 1

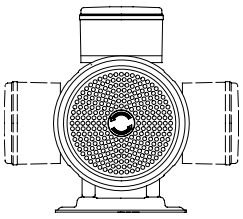


TM00 0689 4896

2.2 Position de la boîte à bornes

La boîte à bornes peut être placée suivant la figure 2 avant que la pompe soit installée.

Fig. 2



TM00 0690 5192

Pour changer la position de la boîte à bornes:

1. Enlever les quatre vis qui, du côté moteur, sont vissées dans la chambre de refoulement.
2. Tourner le corps de stator vers la position voulue.
3. Remettre et serrer les vis.

2.3 Tuyauterie

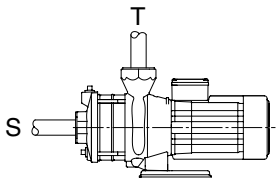
Vérifier que les contraintes de tuyauterie ne s'exercent pas sur la pompe, en particulier celles dues aux variations de température de l'eau.

2.3.1 Tuyauterie d'aspiration

Si le niveau d'eau côté aspiration est en dessous de l'orifice d'aspiration de la pompe, il faut monter un clapet de retenue/pied sur la tuyauterie d'aspiration. La pompe n'est pas auto-amorçante.

Raccorder la tuyauterie d'aspiration à l'orifice S de la pompe, fig. 3.

Fig. 3



TM00 0691 4896

Si la longueur de la tuyauterie d'aspiration excède 10 m ou la hauteur d'aspiration est supérieure à 4 m, la tuyauterie d'aspiration doit être de dimension supérieure à celle de l'orifice d'aspiration.

Veiller à ce que les jonctions de la tuyauterie d'aspiration soient étanches.

N'employer un tube flexible à l'aspiration que si celui-ci est renforcé. Dans le cas d'un pompage d'eau chargée, il est recommandé de munir l'extrémité de la tuyauterie d'une crépine.

2.3.2 Tuyauterie de refoulement

Raccorder la tuyauterie de refoulement à l'orifice T de la pompe, fig. 3.

La tuyauterie et l'orifice de refoulement doivent au moins être de dimension égale pour limiter les pertes de charge, la vitesse d'écoulement et le bruit.

2.3.3 By-pass

S'il y a un risque pour que la pompe refoule contre une vanne fermée, un débit minimum doit être assuré en installant un by-pass/une purge du côté refoulement. La purge peut être, par exemple, connectée à un réservoir.

Un débit minimum égal à 10% du débit au rendement maximum doit être assuré. Le débit et la hauteur manométrique au rendement maximum sont indiqués sur la plaque signalétique de la pompe.

2.4 Exemples d'applications

La pompe est utilisable pour un vaste domaine d'applications.

Quelques exemples sont montrés à la page 49.

3. Branchement électrique

Le branchement électrique doit être exécuté conformément aux prescriptions locales.

Vérifier si la tension et la fréquence de l'alimentation électrique correspondent à la tension et à la fréquence indiquées sur la plaque signalétique.

Ne jamais effectuer aucune opération dans la boîte à bornes sans que l'alimentation électrique n'ait été coupée.

La pompe doit être reliée à un interrupteur principal externe.

Les moteurs monophasés, 1 x 110/220 V, 60 Hz, n'ont pas de protection moteur incorporée et, par conséquence, il faut les protéger par un disjoncteur extérieur.

Les autres moteurs monophasés sont équipés d'un rupteur thermique et n'exigent pas de protection moteur extérieure.

Les moteurs triphasés doivent être connectés à un disjoncteur, l'intensité nominale de consigne duquel doit correspondre aux données électriques inscrites sur la plaque signalétique des pompes.

Avant la mise en marche de la pompe, il faut la remplir de liquide.

Le branchement électrique s'effectue comme indiqué par le schéma de raccordement du couvercle de la boîte à bornes.

Choisir une des deux entrées de câble et percer le disque prédécoupé dans le presse-étoupe.

3.1 Contrôle du sens de rotation

(Moteurs triphasés)

Le sens de rotation correct est indiqué par des flèches sur le couvercle du ventilateur moteur.

Le sens de rotation correct est l'inverse de celui des aiguilles d'une montre, vu du côté moteur.

Si le moteur tourne dans le mauvais sens, couper l'alimentation électrique et inverser deux phases du moteur.

4. Mise en marche

4.1 Amorçage

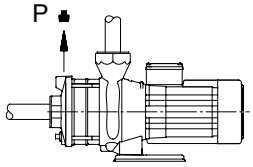
Ne pas mettre la pompe en marche avant de l'avoir remplie et purgée.

Dans les installations d'eau chaude, lorsque la pompe est purgée, faire très grande attention à l'eau chaude que s'échappe de la pompe.

Systèmes de surpression et systèmes dans lesquels le niveau d'eau côté aspiration est en charge:

1. Fermer les vannes d'isolement.
2. Enlever le bouchon de remplissage P, fig. 4.
3. Ouvrir progressivement la vanne côté aspiration et laisser ouvert jusqu'à obtention d'un filet d'eau constant.
4. Fermer la vanne, remettre en place le bouchon de remplissage et serrer avec précaution.
5. Ouvrir entièrement la vanne d'isolement côté aspiration.
6. Démarrer la pompe et ouvrir progressivement la vanne d'isolement côté refoulement jusqu'à ouverture complète.

Fig. 4



TM00 0692 4896

Pompage de réservoirs, puits, etc. où le niveau d'eau côté aspiration est en dessous de l'orifice d'aspiration de la pompe:

1. Fermer la vanne d'isolement côté refoulement.
2. Enlever le bouchon de remplissage P, fig. 4.
3. Verser de l'eau à travers l'orifice de remplissage. S'assurer que la tuyauterie d'aspiration et la pompe sont purgées et entièrement remplies d'eau.
4. Remettre le bouchon de remplissage et serrer avec précaution.
5. Démarrer la pompe et ouvrir progressivement la vanne d'isolement côté refoulement jusqu'à ouverture complète.

4.2 Fréquence de démarrages et d'arrêts

Maximum: 100 démarrages par heure.

5. Fonctionnement et entretien

En fonctionnement normal, la pompe ne nécessite pas d'entretien.

Si la pompe a été utilisée pour le pompage de liquides chargés, il faut la nettoyer à l'eau claire immédiatement après utilisation.

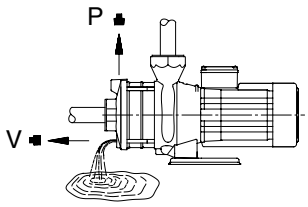
5.1 Protection contre le gel

Si la pompe n'est pas utilisée pendant les périodes de gel, il faut la vidanger pour éviter de l'endommager.

Pour vidanger la pompe, enlever les bouchons de remplissage et de vidange P et V, fig. 5.

Ne pas replacer les bouchons avant réutilisation de la pompe.

Fig. 5



TM00 0693 4896

F

6. Recherche des pannes

Avant d'effectuer toute sorte d'opérations, être sûr que l'alimentation électrique ait bien été coupée.

Pannes	Causes
1. La pompe ne démarre pas.	a) Pas d'électricité. b) Le circuit de commande est coupé ou défectueux. c) Le moteur est défectueux. d) La pompe est bloquée par des impuretés.
2. La pompe tourne mais ne débite pas d'eau.	a) La pompe n'est pas remplie de liquide. b) La tuyauterie d'aspiration ou de refoulement est bouchée par des impuretés. c) La pompe est bouchée par des impuretés. d) La hauteur d'aspiration est trop élevée. e) La tuyauterie d'aspiration fuit. f) Le clapet de retenue/pied est bloqué.
3. Débit et pression trop faibles.	a) Le sens de rotation du moteur n'est pas correct (triphasé). b) La hauteur d'aspiration est trop élevée. c) La tuyauterie d'aspiration ou de refoulement est bouchée. d) La pompe est bouchée par des impuretés. e) Le clapet de retenue/pied est partiellement bloqué.
4. La pompe déclenche lors du fonctionnement.	a) Le rupteur thermique ou la protection moteur extérieure déclenche. b) Le circuit de commande est coupé.

F

7. Dispositions

Dispositions relatives à l'utilisation du produit et de ses composants:

1. Utiliser un service local public ou privé d'assainissement.
2. Si aucun service d'assainissement n'est compétent pour le type de matériel, veuillez renvoyer le produit à GRUNDFOS ou un centre de réparation agréé.

Nous nous réservons tout droit de modifications.

Prima di procedere all'installazione, leggere attentamente queste istruzioni. L'installazione ed il funzionamento dovranno inoltre essere conformi alla locale regolamentazione ed alla pratica della regola d'arte.

1. Dati generali

1.1 Applicazioni

Le pompe centrifughe multistadio orizzontale GRUNDFOS di tipo CH e CHN sono progettate per il pompaggio di acqua e altri liquidi non densi, non aggressivi e non esplosivi, che non contengano particelle solide o fibre.

1.2 Condizioni di funzionamento

1.2.1 Temperatura del liquido

0°C a +90°C.

1.2.2 Temperatura ambiente

Fino a +55°C.

1.2.3 Massima pressione di funzionamento

Da 0°C a +40°C: Max. 10 bar.
Da +41°C a +90°C: Max. 6 bar.

1.2.4 Pressione battente massima all'aspirazione

La pressione in aspirazione più la pressione differenziale erogata dalla pompa a bocca chiusa, deve sempre essere minore della "massima pressione di funzionamento".

1.2.5 Pressione battente minima all'aspirazione

I dati indicati nella tabella sottoriportata si riferiscono ad una pressione atmosferica di 760 mm Hg e **al valore massimo della portata**.

Sono riportati i valori di pressione battente minima/altezza massima di aspirazione "H" [m] alla bocca di aspirazione della pompa. Sono indicati i valori corrispondenti a diverse temperature del liquido. **La perdita di carico del tubo aspirante deve essere computata a parte.**

L'altezza massima di aspirazione può essere limitata dal valore della prevalenza.

Tipo	H [m]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

"H" = pressione battente minima all'aspirazione durante il funzionamento.

"H" marcato * = massima altezza di aspirazione durante il funzionamento.

1 m ≈ 0,1 bar.

1.3 Dati tecnici

1.3.1 Dati elettrici

Fare riferimento ai dati di targa sulla pompa.

1.3.2 Dimensioni

Vedere pag. 50.

1.4 Livello di rumorosità

Il livello sonoro è inferiore ai limiti stabiliti dalla Direttiva EC 89/392/EEC relativa alle macchine.

I

I

2. Installazione

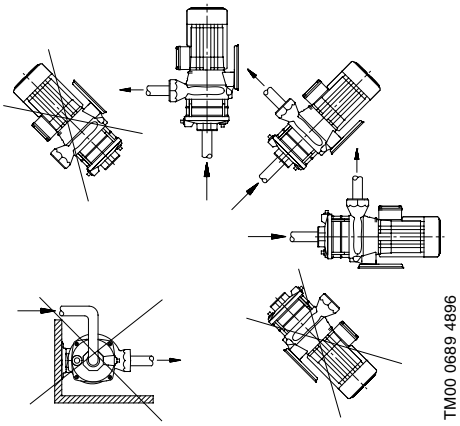
2.1 Collocazione della pompa

La lunghezza del tubo di aspirazione e l'altezza di sollevamento dovranno essere le più contenute possibili.

Dovrà essere posizionata in ambiente (pozzetto) ventilato e senza possibilità di gelo (vedere pragrafo *5.1 Protezione dal gelo*). Può essere posta all'esterno, ma protetta dalla pioggia tramite tettoia o similare.

La pompa potrà essere installata in una delle posizioni illustrate nella fig. 1.

Fig. 1

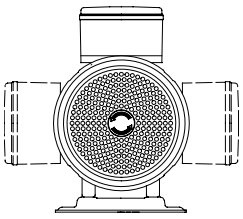


TM00 0689 4896

2.2 Posizionamente morsettiera

Per facilitare gli allacciamenti elettrici la morsettiera può essere ruotata come indicato in fig. 2.

Fig. 2



TM00 0690 5192

Per cambiare la posizione della morsettiera:

1. A questo scopo allentare le quattro viti Phillips che fissano il motore sulla camera di mandata.
2. Ruotare nella posizione voluta.
3. Serrare in croce le quattro viti.

2.3 Tubazioni

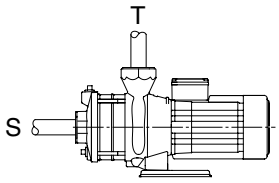
I tubi devono essere montati in modo da evitare che eventuali tensioni, causate da variazioni di temperatura, danneggino la pompa.

2.3.1 Tubo di aspirazione

Se la pompa deve sollevare il liquido da un livello più basso rispetto alla bocca di aspirazione, è necessario montare una valvola di fondo all'estremità del tubo di aspirazione al di sotto del livello dinamico, dal momento che si tratta di una pompa non autoadescante.

Il tubo di aspirazione è collegato alla bocca di aspirazione S, vedi fig. 3.

Fig. 3



TM00 0691 4896

Quando il tubo di aspirazione è più lungo di 10 metri oppure il dislivello geodetico è più di 4 metri, il diametro del tubo di aspirazione deve essere incrementato.

Ogni giunto del tubo di aspirazione deve essere ben serrato.

Se viene usato un tubo flessibile come tubo di aspirazione, questo deve essere del tipo "armato", si raccomanda di montare un filtro nel caso in cui particelle solide possano entrare nel tubo di aspirazione e bloccare poi la pompa.

2.3.2 Tubo di mandata

Il tubo di mandata è collegato alla bocca di mandata T, vedi fig. 3.

Il tubo di mandata deve essere almeno dello stesso diametro della bocca di mandata della pompa. Questo per evitare cadute di pressione e rumorosità dovuta all'aumento di velocità del liquido.

2.3.3 Bypass

Se esiste rischio di funzionamento della pompa con la valvola di mandata chiusa, è opportuno consentire un flusso minimo di liquido attraverso la pompa prevedendo in mandata un tubo di by-pass o di scarico in serbatoio.

E' sempre necessaria una portata minima pari al 10% della portata al massimo rendimento. I valori di portata e prevalenza al massimo rendimento sono indicati sulla targhetta.

2.4 Esempi di installazione

La pompa è idonea per un'ampia gamma di applicazioni.

Alla pag. 49 sono illustrati alcuni esempi.

3. Collegamenti elettrici

I collegamenti elettrici devono essere eseguiti da un elettricista qualificato secondo le norme vigenti.

La tensione e la frequenza di esercizio sono indicate sulla targhetta. Accertare che il motore sia adatto al tipo di alimentazione cui sarà collegato.

Prima di accedere alla morsettiera, accertarsi che l'alimentazione elettrica sia stata tolta e non possa venire accidentalmente riattivata.

La pompa deve essere collegata ad un interruttore generale esterno.

I motori monofase 1 x 110/220 V, 60 Hz, non hanno termoprotettore interno e devono essere alimentati da adatto motoprotettore.

Gli altri motori monofase hanno un termoprotettore interno e per questo non richiedono un motoprotettore esterno.

I motori trifase devono essere collegati ad un motoprotettore la cui corrente nominale deve corrispondere al valore indicato sulla targhetta pompa.

Non avviate la pompa senza averla prima riempita con il liquido pompato.

I collegamenti devono essere eseguiti secondo lo schema sito all'interno del coperchio morsettiera.

Scegliete uno dei due pressacavi e spingete fuori il dischetto preimprontato.

3.1 Controllo del senso di rotazione

(Motori trifase)

Le frecce sul copriventola del motore indicano il corretto senso di rotazione.

La pompa deve ruotare in senso antiorario quando la si vede dal lato motore.

Per cambiare il senso di rotazione, interrompere l'alimentazione elettrica ed invertire due delle tre fasi.

4. Avviamento

4.1 Adescamento

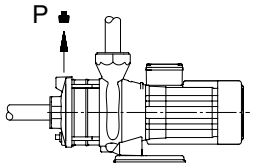
Non avviare la pompa prima di averla riempita con acqua e disaerata.

Negli impianti con liquidi caldi, molta attenzione deve essere posta nella fase di sfogo dell'aria al fine di evitare danni alla persona per fuoriuscita di acqua.

Gruppi autoclave ed impianti dove il livello del liquido all'aspirazione si trova al di sopra della bocca di aspirazione:

1. Chiudere le valvole a monte e a valle della pompa.
2. Togliere il tappo di adescamento P, fig. 4.
3. Aprire lentamente la valvola sull'aspirazione e mantenerla aperta fino alla fuoriuscita di un flusso di liquido costante dall'orifizio di adescamento.
4. Chiudere la valvola, riavvitare il tappo di adescamento e serrare bene.
5. Aprire la valvola sull'aspirazione.
6. Avviare la pompa ed aprire lentamente la valvola sulla mandata fino alla sua completa apertura.

Fig. 4



TM00 0692 4896

Pompaggio da serbatoi e pozzi dove il livello del liquido all'aspirazione si trova al di sotto della bocca di aspirazione:

1. Chiudere la valvola sulla mandata.
2. Togliere il tappo di adescamento P, fig. 4.
3. Riempire completamente pompa e tubo di aspirazione attraverso l'orifizio di adescamento.
4. Riavvitare il tappo di adescamento e serrare bene.
5. Avviare la pompa ed aprire lentamente la valvola sulla mandata fino alla sua completa apertura.

4.2 Frequenza degli avvii ed arresti

100 avviamenti max. per ora.

5. Funzionamento e manutenzione

In condizioni normali non è necessaria una manutenzione preventiva.

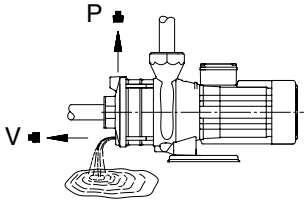
Se la pompa è stata usata per liquidi torbidi o aggressivi, risciacquatela immediatamente dopo l'uso.

5.1 Protezione dal gelo

Durante il periodo invernale le pompe non funzionanti dovranno essere svuotate totalmente svitando i tappi di riempimento e drenaggio, P e V, fig. 5.

Non inserite i tappi se non quando avvierete la pompa.

Fig. 5



TM00 0693 4896

6. Tabella ricerca guasti

Prima di procedere al rilevamento dei guasti, togliere tensione alla pompa.

Difetta	Causa
1. La pompa non parte.	a) Mancanza di corrente. b) Circuito di controllo difettoso. c) Motore difettoso. d) Pompa bloccata da impurità.
2. La pompa è avviata ma non dà acqua.	a) Pompa disadescata. b) Tubo di aspirazione o mandata otturato da impurità. c) Pompa bloccata da impurità. d) Altezza di aspirazione eccessiva. e) Perdita nel tubo di aspirazione. f) Valvola di fondo o di ritegno bloccata.
3. La pompa funziona con valori di Q/H ridotti.	a) Senso di rotazione errato (trifase). b) Altezza di aspirazione eccessiva. c) Tubo di aspirazione o mandata otturato. d) Pompa bloccata da impurità. e) Valvola di fondo o di ritegno parzialmente bloccata.
4. La pompa si arresta durante il funzionamento.	a) Protezione termica interna o esterna scattata. b) Circuito di controllo scattato.

I

7. Smaltimento

Lo smaltimento di questo prodotto, o di parte di esso, deve essere effettuato secondo le seguenti regole generali:

1. Usare i sistemi locali, pubblici o privati, di raccolta dei rifiuti.
2. In caso che tali sistemi non esistano o non possano smaltire tale materiale, allora inviare il rifiuto alla più vicina GRUNDFOS o officina di assistenza autorizzata.

Antes de empezar con los procedimientos de instalación, deben leerse cuidadosamente estas instrucciones de instalación y funcionamiento, que deben también cumplir con la normativa local vigente.

1. Datos generales

1.1 Aplicaciones

Las bombas centrífugas multicelulares horizontales GRUNDFOS, tipos CH y CHN, están diseñadas para el bombeo de agua y otros líquidos limpios, no agresivos y no explosivos, que no contengan partículas sólidas o fibrosas.

1.2 Condiciones de funcionamiento

1.2.1 Temperatura del líquido

0ºC a +90ºC.

1.2.2 Temperatura ambiente

Hasta +55ºC.

1.2.3 Presión máxima de funcionamiento

0ºC a +40ºC: Hasta 10 bares.
+41ºC a 90ºC: Hasta 6 bares.

1.2.4 Presión máxima de entrada

La presión actual de entrada + la presión cuando la bomba está funcionando contra válvula cerrada debe ser siempre inferior a la “presión máxima de funcionamiento”.

1.2.5 Presión mínima de entrada

La siguiente tabla se refiere a los **caudales máximos** de las bombas y una presión barométrica de 760 mmHg.

Los valores indicados son las presiones mínimas de entrada/alturas máximas de aspiración “H” [m.c.a.] en la boca de aspiración de la bomba. Los valores están indicados a diferentes temperaturas del líquido. **Debe por lo tanto tenerse en cuenta la pérdida de carga en la tubería de aspiración.**

La altura máxima de aspiración puede estar limitada por la altura real.

Tipo	H [m.c.a.]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

“H” = presión mínima de entrada durante el funcionamiento.

“H” marcada * = altura máxima de aspiración durante el funcionamiento.

1 m.c.a. ≈ 0,1 bar.

1.3 Datos técnicos

1.3.1 Datos eléctricos

Ver la placa de identificación de la bomba.

1.3.2 Dimensiones

Ver página 50.

1.4 Nivel de ruido

El nivel de ruido de la bomba es inferior a los valores límite indicados en la Directiva del Consejo de la CEE 89/392/CEE sobre maquinaria.

E

2. Instalación

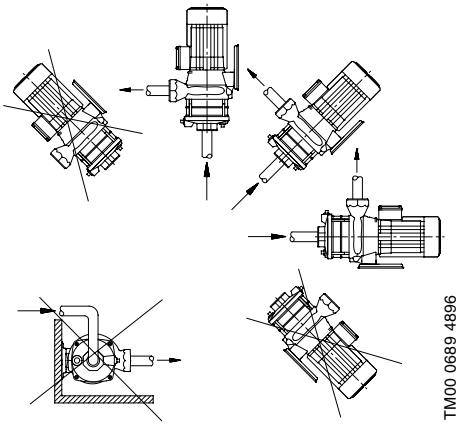
2.1 Ubicación de la bomba

La bomba debe instalarse de tal manera que la tubería de aspiración sea lo más corta posible y la altura de aspiración lo más pequeña posible.

La bomba debe instalarse en un lugar bien ventilado, pero sin riesgo de heladas (ver sección *5.1 Protección contra heladas*). Puede instalarse en el exterior, pero debe estar protegida mediante una cubierta adecuada.

La bomba puede instalarse en cualquiera de las posiciones indicadas en fig. 1.

Fig. 1

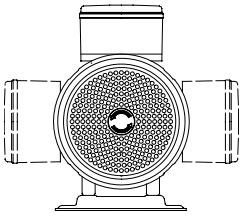


TM00 0689 4896

2.2 Posición de la caja de terminales

La caja de terminales puede girarse a cualquiera de las posiciones indicadas en la fig. 2 antes de instalar la bomba.

Fig. 2



TM00 0690 5192

Para cambiar la posición de la caja de terminales:

1. Quitar los cuatro tornillos que, desde el lado del motor, están atornillados en la cámara de descarga.
2. Girar la carcasa del estator a la posición deseada.
3. Volver a poner los tornillos y apretarlos bien.

2.3 Tuberías

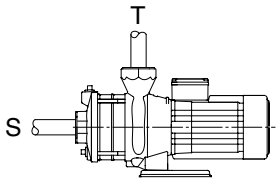
Las tuberías deben instalarse de forma que ninguna tensión causada por variaciones de la temperatura afecte a la bomba.

2.3.1 Tubería de aspiración

Si la bomba va a extraer líquido desde un nivel que está por debajo de la boca de aspiración, hay que instalar una válvula de pie/de retención en el extremo de la tubería de aspiración, por debajo del nivel mínimo del líquido, dado que la bomba no es autocebante.

Se conecta la tubería de aspiración a la boca de aspiración S de la bomba, fig. 3.

Fig. 3



TM00 0691 4896

Cuando la tubería de aspiración mide más de 10 m o la altura de aspiración es mayor de 4 m, el diámetro de la tubería de aspiración debe ser mayor que el diámetro de la boca de aspiración de la bomba.

Todas las juntas de la tubería de aspiración deben ser herméticas.

Si se utiliza una manguera como tubería de aspiración, ésta debe ser rígida. Se recomienda instalar un filtro cuando es posible que sólidos entren en la tubería de aspiración y bloqueen la bomba.

2.3.2 Tubería de descarga

Se conecta la tubería de descarga a la boca de aspiración T, fig. 3.

La tubería de descarga debe tener por lo menos el mismo diámetro que la boca de descarga para minimizar las pérdidas de carga, altas velocidades del líquido y ruido.

2.3.3 Bypass

Si existe el riesgo de que la bomba funcione contra válvula cerrada, hay que asegurar un caudal mínimo de líquido a través de la bomba, conectando un bypass o una salida de agua a la tubería de descarga. Esta salida puede estar colocada en un depósito.

Siempre es necesario un caudal mínimo igual al 10% del caudal al rendimiento máximo. El caudal y la altura al rendimiento máximo están indicados en la placa de identificación de la bomba.

2.4 Ejemplos de instalación

La bomba es apta para una amplia gama de aplicaciones.

En la página 49 se muestran algunos ejemplos.

3. Conexión eléctrica

La conexión eléctrica debe realizarse de acuerdo con las normativas locales.

La tensión y frecuencia de funcionamiento están indicadas en la placa de identificación. Comprobar que el motor es adecuado para el suministro eléctrico donde va a ser utilizado.

Nunca hacer conexiones en la caja de terminales de la bomba sin antes desconectar el suministro eléctrico.

La bomba debe conectarse a un interruptor principal externo.

Los motores monofásicos, 1 x 110/220 V, 60 Hz, no llevan protección y deben conectarse a un arrancador homologado.

Los otros motores monofásicos incorporan un térmico y no requieren protección adicional.

Los motores trifásicos deben conectarse a un arrancador, cuya intensidad nominal debe coincidir con los datos eléctricos de la placa de identificación.

No arrancar la bomba hasta que esté llena de líquido.

Las conexiones deben realizarse como se indica dentro de la tapa de la caja de terminales.

Elegir una de las dos entradas de cable y quitar el disco precortado.

3.1 Comprobación del sentido de giro

(Motores trifásicos)

El sentido de giro correcto está indicado mediante flechas en la tapa del ventilador del motor.

Vista desde el extremo del motor, la bomba debe girar en sentido contrario de las agujas del reloj.

Para cambiar el sentido de giro, desconectar el suministro eléctrico e intercambiar dos de los cables de entrada.

4. Arranque

4.1 Cebado

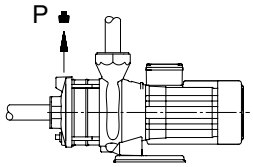
No arrancar la bomba hasta que esté llena de líquido y purgada.

En instalaciones con líquidos calientes, tener mucho cuidado al purgar la bomba para eliminar el riesgo de lesiones a personas causadas por escapes de agua.

Sistemas de presión y sistemas, donde el nivel del líquido en la aspiración está por encima de la entrada de la bomba:

1. Cerrar las válvulas de corte en ambos lados de la bomba.
2. Quitar el tapón de cebado P, fig. 4.
3. Abrir despacio la válvula de aspiración y mantenerla abierta hasta que un chorro contínuo de líquido salga por la boca de cebado.
4. Cerrar la válvula, volver a colocar el tapón de cebado y apretarlo bien.
5. Abrir la válvula de aspiración.
6. Arrancar la bomba y abrir despacio la válvula de descarga hasta que esté completamente abierta.

Fig. 4



TM00 0692 4896

Bombeo desde depósitos y pozos, donde el nivel del líquido en la aspiración está por debajo de la entrada de la bomba:

1. Cerrar la válvula de corte de la descarga.
2. Quitar el tapón de cebado P, fig. 4.
3. Verter líquido por la boca de cebado. Comprobar que la tubería de aspiración y la bomba estén completamente llenas de líquido y purgadas.
4. Volver a poner el tapón de cebado y apretarlo bien.
5. Arrancar la bomba y abrir despacio la válvula de descarga hasta que éste completamente abierta.

E

4.2 Frecuencia de arranques y paradas

Máx. 100 arranques a la hora.

5. Funcionamiento y mantenimiento

Bajo condiciones de funcionamiento normales, la bomba no necesita mantenimiento.

Si se ha utilizado para bombear líquidos que pueden dejar impurezas en la bomba, hay que lavarla bien con agua limpia inmediatamente después de su utilización.

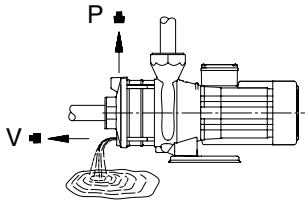
5.1 Protección contra heladas

Las bombas que no se utilizan durante periodos de heladas deben vaciarse para evitar daños.

Quitar los tapones de cebado P y de vaciado V, fig. 5.

No volver a poner los tapones hasta que la bomba vaya a utilizarse de nuevo.

Fig. 5



TM00 0693 4896

6. Localización de fallos

Antes de intentar diagnosticar un fallo, comprobar que el suministro eléctrico está desconectado.

Fallo	Causa
1. La bomba no arranca.	a) Fallo del suministro eléctrico. b) El circuito de control se ha disparado o está defectuoso. c) La bomba está defectuosa. d) La bomba está bloqueada por impurezas.
2. La bomba funciona pero no da agua.	a) La bomba no está llena de líquido. b) La tubería de aspiración o de descarga está bloqueada por impurezas. c) La bomba está bloqueada por impurezas. d) La altura de aspiración es demasiado grande. e) Hay fugas en la tubería de aspiración. f) La válvula de pie o de retención está bloqueada.
3. La bomba funciona a capacidad reducida.	a) Sentido de giro contrario (trifásica). b) La altura de aspiración es demasiado grande. c) La tubería de aspiración o de descarga está bloqueada. d) La bomba está bloqueada por impurezas. e) La válvula de pie o de retención está parcialmente bloqueada.
4. La bomba para durante su funcionamiento.	a) Se dispara el térmico del motor o la protección externa. b) El circuito de control se ha disparado.

E

7. Eliminación

La eliminación de este producto o partes de él debe realizarse según las siguientes directrices:

1. Utilice el servicio local, público o privado, de recogida de resíduos.
2. En caso de que tal servicio no exista o no pueda tratar los materiales utilizados en el producto, por favor entréguelo al distribuidor o servicio técnico GRUNDFOS más cercano.

Nos reservamos el derecho a modificaciones.

Antes de iniciar os procedimentos de instalação, estas Instruções de Instalação e Funcionamento devem ser estudadas cuidadosamente. A instalação e o funcionamento devem estar de acordo com as normas locais e regras geralmente aceites.

1. Informações gerais

1.1 Aplicações

A gama CH/CHN de bombas centrífugas multicelulares horizontais GRUNDFOS destina-se a bombear água e outros líquidos finos, não agressivos e não explosivos, sem partículas ou fibras sólidas.

1.2 Condições de funcionamento

1.2.1 Temperatura do líquido

0°C a +90°C.

1.2.2 Temperatura ambiente

Até +55°C.

1.2.3 Pressão máxima de funcionamento

0°C a +40°C: máxima 10 bar.
+41°C a +90°C: máxima 6 bar.

1.2.4 Pressão máxima de admissão

A pressão de admissão actual mais a pressão durante o funcionamento da bomba com uma válvula fechada deverá ser sempre inferior à "pressão máxima de funcionamento".

1.2.5 Pressão mínima de admissão

O quadro seguinte refere-se aos **caudais máximos** das bombas e a uma pressão barométrica de 760 mm Hg.

Os valores indicados correspondem às pressões mínimas de admissão/alturas máximas de aspiração "H" [m] no lado de aspiração da bomba. Os valores são estabelecidos a diferentes temperaturas do líquido. **A perda de carga no tubo de aspiração deverá portanto ser considerada.**

A altura máxima de aspiração pode ser limitada pela altura manométrica efectiva.

Tipo	H [m]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

"H" = pressão mínima de admissão durante o funcionamento.

"H" com * = altura máxima de aspiração durante o funcionamento.

1 m ≈ 0,1 bar.

1.3 Características técnicas

1.3.1 Características eléctricas

Ver chapa sinalética da bomba.

1.3.2 Dimensões

Ver página 50.

1.4 Nível de pressão sonora

O nível de pressão sonora da bomba é inferior aos valores máximos definidos na Directiva do Conselho da UE 889/392/CEE relativamente a maquinaria.

P

2. Instalação

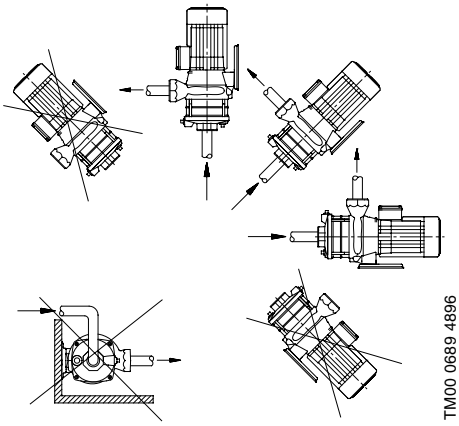
2.1 Localização da bomba

A bomba deve ser instalada de modo que o tubo de aspiração fique tão curto e a altura de aspiração tão pequena quanto possível.

A bomba deve ser colocada num local bem ventilado mas sem risco de congelamento (ver parágrafo *5.1 Protecção contra a formação de gelo*). Pode ser colocada no exterior mas protegida das intemperides através de uma protecção adequada.

A bomba pode ser colocada numa das posições da fig. 1.

Fig. 1



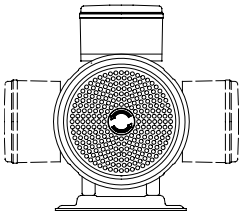
TM00 0689 4896

P

2.2 Posição da caixa de terminais

Antes da instalação da bomba pode-se colocar a caixa de terminais numa das posições indicadas na fig. 2.

Fig. 2



TM00 0690 5192

Para mudar a posição da caixa de terminais:

1. Retirar os 4 parafusos do lado do motor, que estão aparafusados à câmara de descarga.
2. Rodar a caixa do estator para a posição exigida.
3. Colocar de novo os parafusos e apertá-los bem.

2.3 Tubagem

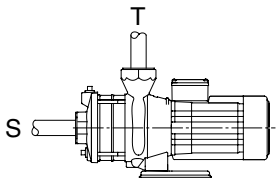
Os tubos devem ser montados de modo que a dilatação causada pelas variações de temperatura não afecte a bomba.

2.3.1 Tubo de aspiração

Se a bomba tem de bombear líquido de um nível inferior ao eixo de aspiração da bomba, deve-se montar uma válvula de pesca/retenção na extremidade do tubo de aspiração, abaixo do nível inferior do líquido, uma vez que a bomba não é auto-ferrante.

O tubo de aspiração está ligado do lado da admissão S da bomba, fig. 3.

Fig. 3



TM00 0691 4896

Se o tubo de aspiração tem mais de 10 metros ou a altura de aspiração é superior a 4 metros, o diâmetro do tubo de aspiração tem de ser superior ao diâmetro de admissão da bomba.

Todas as juntas do tubo de aspiração devem estar bem apertadas.

Se utilizar uma mangueira no tubo de aspiração esta deve ser rígida. A utilização de um filtro é recomendada nos casos em que elementos sólidos podem penetrar no tubo de aspiração e bloquear a bomba.

2.3.2 Tubo de descarga

O tubo de descarga está ligado ao lado de saída T, fig. 3.

O tubo de descarga deverá ter pelo menos o mesmo diâmetro do lado de saída da bomba, para evitar quedas de pressão, velocidades de circulação altas e ruídos.

2.3.3 “Bypass”

Se existe o perigo de a bomba poder funcionar contra uma válvula fechada na compressão, deve assegurar-se a passagem de um caudal mínimo através da bomba, ligando um “bypass” ou dreno à tubagem de compressão. O dreno pode por exemplo ser ligado a um tanque.

Um caudal mínimo igual a 10% do caudal no ponto de rendimento máximo terá que ser sempre assegurado. O caudal e altura manométrica ao ponto de rendimento máximo estão inscritos na chapa de características da bomba.

2.4 Exemplos de instalações

A bomba é apropriada a uma vasta gama de aplicações.

Alguns exemplos são apresentados na página 49.

3. Ligações eléctricas

As ligações eléctricas devem ser feitas de acordo com as normas locais.

A tensão e frequência de funcionamento estão indicadas na placa de identificação. Verificar se o motor é apropriado para o abastecimento eléctrico onde vai ser utilizado.

Não devem ser feitas quaisquer ligações na caixa de terminais da bomba, sem que a alimentação eléctrica tenha sido desligada.

A bomba deve ser ligada a um interruptor de rede exterior.

Os motores monofásicos 1 x 110/220 V, 60 Hz, não incorporam uma protecção de motor e devem estar ligados a um arranque adequado.

Os outros motores monofásicos incorporam um interruptor térmico e não necessitam de protecção adicional.

Os motores trifásicos devem ser ligados a um arrancador, cuja regulação da corrente nominal deverá corresponder às características eléctricas, da chapa sinalética da bomba.

Não accionar a bomba antes de estar ferrada.

As ligações devem ser feitas conforme indicado no interior da tampa da caixa de terminais.

Escolher uma das duas entradas para o cabo eléctrico e quebrar a tampa de protecção, da entrada do bucim.

3.1 Verificação da direcção de rotação

(Motores trifásicos)

As setas na tampa do ventilador do motor indicam a direcção correcta da rotação.

A rotação da bomba deverá ser no sentido contrário ao dos ponteiros do relógio quando vista da extremidade do motor.

Para inverter a direcção da rotação desligar a corrente eléctrica e trocar dois dos fios eléctricos de entrada.

4. Arranque

4.1 Enchimento

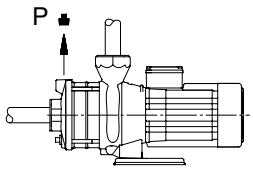
Ligar a bomba só depois de estar ferrada e ventilada.

Em sistemas com líquidos quentes a temperaturas elevadas, deverão ser tomadas grandes precauções quando se ferra a bomba, para evitar o risco de danos pessoais causados por esguinchos de água.

Sistemas de pressurização e sistemas em que o nível do líquido está acima da admissão da bomba:

1. Fechar as válvulas de isolamento de cada lado da bomba.
2. Retirar a tampa de enchimento P, fig. 4.
3. Abrir lentamente a válvula de ar e manté-la aberta até sair um caudal de líquido constante do lado de enchimento.
4. Fechar a válvula, colocar a tampa de enchimento e apertá-la bem.
5. Abrir a válvula de ar.
6. Accionar a bomba e abrir lentamente a válvula de descarga até estar completamente aberta.

Fig. 4



TM00 0692 4896

Bombear água de reservatórios e poços onde o nível do líquido no lado de aspiração está abaixo da admissão da bomba:

1. Fechar a válvula de descarga.
2. Retirar a tampa de enchimento P, fig. 4.
3. Deitar água através do lado de enchimento. Verificar se o tubo de aspiração e a bomba estão completamente ferrados e ventilados.
4. Colocar de novo a tampa e apertá-la bem.
5. Accionar a bomba e abrir lentamente a válvula de descarga até estar completamente aberta.

4.2 Frequência dos arranques e paragens

Máximo 100 arranques por hora.

P

5. Funcionamento e manutenção

Em condições normais de funcionamento, a bomba não necessita de manutenção.

Se a bomba foi utilizada para bombear líquidos que possam ter deixado impurezas na bomba, deve ser lavada com água limpa logo após a utilização.

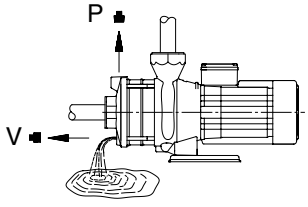
5.1 Protecção contra a formação de gelo

As bombas que não são utilizadas durante períodos de formação de gelo devem ser esvaziadas para evitar danos.

Retirar as tampas de enchimento e descarga P e V, fig. 5.

Não colocar as tampas antes da bomba ser usada de novo.

Fig. 5



TM00 0693 4896

6. Tabela de localização de avarias

Antes de tentar diagnosticar qualquer avaria, verificar se a alimentação eléctrica foi desligada.

Avaria	Causa
1. A bomba não arranca.	a) Falha na corrente de energia. b) Circuito de controlo está desligado ou defeituoso. c) Motor defeituoso. d) Bomba bloqueada devido a impurezas.
2. A bomba trabalha mas não sai água.	a) A bomba não está ferrada. b) Tubos de aspiração ou descarga bloqueados devido a impurezas. c) Bomba bloqueada devido a impurezas. d) Excesso de altura de aspiração. e) Fuga no tubo de aspiração. f) Válvula de pesca/retenção bloqueada.
3. A bomba funciona a capacidade reduzida.	a) Direcção errada de rotação (trifásica). b) Excesso de altura de elevação. c) Tubos de aspiração ou descarga bloqueados ou defeituosos. d) Bomba bloqueada devido a impurezas. e) Válvula de pesca ou retenção parcialmente bloqueada.
4. A bomba para durante o funcionamento.	a) O interruptor térmico do motor ou da protecção exterior do motor desliga. b) Circuito de controlo está desligado.

7. Desperdício

P

O desperdício deste produto ou peças deve ser considerado em conformidade com as seguintes directrizes:

1. Utilizar o local público para o efeito ou o serviço de recolha de sucata.
2. Em caso deste serviço de recolha não existir ou a impossibilidade de manuseamento deste produto, agradecemos que este produto ou quaisquer materiais do mesmo sejam entregues na empresa GRUNDFOS ou serviço de reparações mais próximo.

Πριν από την έναρξη των διαδικασιών εγκατάστασης, παρακαλούμε να μελετήσετε προσεκτικά αυτές τις Οδηγίες Εγκατάστασης και Λειτουργίας. Η εγκατάσταση και λειτουργία θα πρέπει επίσης να πραγματοποιηθούν σύμφωνα με τους τοπικούς κανονισμούς και τους παραδεκτούς κανόνες σωστής χρήσης.

1. Γενικά Χαρακτηριστικά

1.1 Εφαρμογές

Η σειρά οριζόντιων πολυβάθμιων φυγόκεντρων αντλιών CH/CHN της GRUNDFOS σχεδιάστηκε για την άντληση νερού και άλλων λεπτόρευστων, μη-διαβρωτικών και μη-εκρηκτικών υγρών, που δεν περιέχουν στερεά σωματίδια ή ίνες.

1.2 Συνθήκες Λειτουργίας

1.2.1 Θερμοκρασία Υγρού

0˚C έως +90˚C.

1.2.2 Θερμοκρασία Περιβάλλοντος

Εως +55˚C.

1.2.3 Μέγιστη Πίεση Λειτουργίας

0˚C έως +40˚C: Εως 10 bars.
+41˚C έως +90˚C: Εως 6 bars.

1.2.4 Μέγιστη Πίεση Εισόδου

Η υπάρχουσα πίεση εισόδου συν την πίεση όταν η αντλία λειτουργεί με κλειστή βαλβίδα πρέπει να είναι πάντα μικρότερη από την "μέγιστη πίεση λειτουργίας".

1.2.5 Ελάχιστη Πίεση Εισόδου

Ο παρακάτω πίνακας αναφέρεται στις παροχές των αντλιών και σε μία βαρομετρική πίεση των 760 mmHg.

Οι τιμές που αναφέρονται είναι οι ελάχιστες πιέσεις εισόδου/μέγιστη ικανότητα αναρρόφησης "H" [m ύψους] στο στόμιο αναρρόφησης της αντλίας. Οι τιμές αναφέρονται σε διαφορετικές θερμοκρασίες υγρού. **Κατά συνέπεια, θα πρέπει να ληφθεί υπόψη η απώλεια στο σωλήνα αναρρόφησης.**

Η μέγιστη ικανότητα αναρρόφησης μπορεί να περιοριστεί από τις πραγματικές απώλειες.

Τάση	H [m ύψους]			
50 Hz	**20˚C**	**40˚C**	**55˚C**	**90˚C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

"H" = ελάχιστη πίεση εισόδου κατά τη λειτουργία.

"H" σημειωμένο με * = μέγιστη ικανότητα αναρρόφησης κατά τη λειτουργία.

1 m ύψους ≈ 0,1 bar.

GR

1.3 Τεχνικά Χαρακτηριστικά

1.3.1 Ηλεκτρικά Χαρακτηριστικά

Βλέπε την πινακίδα της αντλίας.

1.3.2 Διαστάσεις

Βλέπε σελίδα 50.

1.4 Στάθμη ηχητικής πίεσης

Η στάθμη ηχητικής πίεσης της αντλίας είναι μικρότερη από τις οριακές τιμές που ορίζονται στην Οδηγία του Συμβουλίου της ΕΚ 89/392/ΕΟΚ σχετικά με τα μηχανήματα.

2. Εγκατάσταση

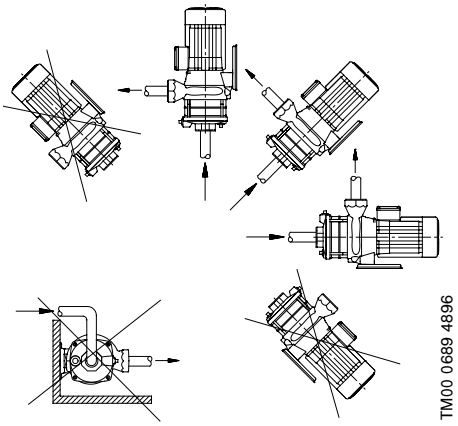
2.1 Τοποθέτηση της Αντλίας

Η αντλία πρέπει να τοποθετηθεί με τέτοιο τρόπο ώστε ο σωλήνας αναρρόφησης και το ύψος αναρρόφησης να είναι όσο το δυνατό μικρότερα.

Η αντλία πρέπει να τοποθετείται σε καλά αεριζόμενο χώρο, αλλά προστατευμένο έναντι του παγετού (βλέπε παράγραφο *5.1 Προστασία Εναντι Παγετού*). Μπορεί επίσης να τοποθετηθεί σε εξωτερικούς χώρους αρκεί να προστατεύεται από τα στοιχεία της φύσης κάτω από ένα σκέπαστρο ή οποιοδήποτε άλλο σύστημα προστασίας.

Η αντλία μπορεί να συναρμολογηθεί σε μία από τις παρακάτω θέσεις που απεικονίζονται στο σχήμα 1.

Σχήμα 1



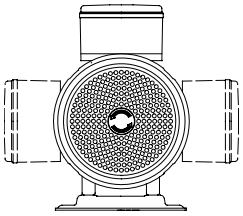
TM00 0689 4896

GR

2.2 Τοποθέτηση του Ακροκιβωτίου

Το ακροκιβώτιο μπορεί να τοποθετηθεί σε μια οποιαδήποτε από τις παρακάτω θέσεις πριν από την εγκατάσταση της αντλίας.

Σχήμα 2



TM00 0690 5192

Για να αλλάξετε τη θέση του ακροκιβωτίου:

1. Αφαιρέστε τις τέσσερις βίδες οι οποίες, από την πλευρά του κινητήρα, είναι βιδωμένες στο κέλυφος κατάθλιψης.
2. Γυρίστε το περίβλημα του στάτη στην επιθυμητή θέση.
3. Τοποθετείστε τις βίδες και σφίξτε.

2.3 Σωληνώσεις

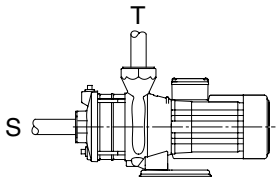
Οι σωλήνες πρέπει να τοποθετούνται με τέτοιο τρόπο ώστε οποιεσδήποτε συστολές/διαστολές που προκαλούνται από τις μεταβολές της θερμοκρασίας να μην καταπονούν την αντλία.

2.3.1 Σωλήνας Αναρρόφησης

Σε περίπτωση που η αντλία πρόκειται να αντλήσει υγρό από μία στάθμη που βρίσκεται χαμηλότερα από το στόμιο αναρρόφησης, μία ποδοβαλβίδα πρέπει να τοποθετηθεί στο άκρο του σωλήνα αναρρόφησης, κάτω από τη χαμηλότερη στάθμη του υγρού, εφόσον δεν πρόκειται για αντλία αυτόματης αναρρόφησης.

Ο σωλήνας αναρρόφησης συνδέεται στο στόμιο αναρρόφησης της αντλίας S, σχήμα 3.

Σχήμα 3



TM00 0691 4896

Οταν ο σωλήνας αναρρόφησης είναι μακρύτερος από 10 μέτρα ή το ύψος αναρρόφησης είναι μεγαλύτερο από 4 μέτρα, η διάμετρος του σωλήνα αναρρόφησης πρέπει να είναι μεγαλύτερη από αυτή του στομίου αναρρόφησης της αντλίας.

Ολοι οι σύνδεσμοι του σωλήνα πρέπει να είναι απόλυτα στεγανοί.

Μην χρησιμοποιείτε εύκαμπτο σωλήνα αναρρόφησης παρά μόνο εάν είναι ενισχυμένος. Συνιστάται η χρησιμοποίηση ενός φίλτρου στις περιπτώσεις που υπάρχει πιθανότητα να εισέλθουν στερεά στο σωλήνα αναρρόφησης και να φράξουν την αντλία.

2.3.2 Σωλήνας Κατάθλιψης

Ο σωλήνας κατάθλιψης είναι συνδεδεμένος στο στόμιο κατάθλιψης T, σχήμα 3.

Ο σωλήνας κατάθλιψης θα πρέπει να έχει τουλάχιστον την ίδια διάμετρο με το στόμιο κατάθλιψης της αντλίας για να ελαχιστοποιείται η πτώση πίεσης, οι υψηλές ταχύτητες ροής και ο θόρυβος.

2.3.3 Bypass (Παράκαμψη)

Αν υπάρχει κίνδυνος η αντλία να λειτουργήσει με κλειστή βάννα κατάθλιψης, θα πρέπει να εξασφαλιστεί μια ελάχιστη ροή υγρού μέσα στην αντλία συνδέοντας ένα bypass/απομάστευση στο σωλήνα κατάθλιψης. Η απομάστευση μπορεί, για παράδειγμα, να συνδεθεί σε μια δεξαμενή.

Σε όλες τις περιπτώσεις απαιτείται μια ελάχιστη παροχή ίση με το 10% της παροχής κατά τη μέγιστη απόδοση. Η παροχή και το μανομετρικό ύψος κατά τη μέγιστη απόδοση υποδεικνύονται στην πινακίδα της αντλίας.

2.4 Παραδείγματα Εγκατάστασης

Η αντλία μπορεί να χρησιμοποιηθεί σε ένα ευρύ φάσμα εφαρμογών.

Ορισμένα παραδείγματα αναφέρονται στη σελίδα 49.

3. Ηλεκτρικές Συνδέσεις

Οι ηλεκτρικές συνδέσεις θα πρέπει να πραγματοποιούνται σύμφωνα με τις τοπικές προδιαγραφές.

Η τάση και η συχνότητα τροφοδοσίας αναφέρονται στην πινακίδα. Βεβαιωθείτε ότι ο κινητήρας είναι κατάλληλος για την ηλεκτρική παροχή στην οποία θα χρησιμοποιηθεί.

Ποτέ μην πραγματοποιήσετε οποιαδήποτε σύνδεση στο ακροκιβώτιο της αντλίας χωρίς να διακόψετε προηγουμένως την ηλεκτρική παροχή.

Η αντλία πρέπει να είναι συνδεδεμένη με έναν εξωτερικό γενικό διακόπτη.

Οι μονοφασικοί κινητήρες, 1 x 110/220 V, 60 Hz, δεν διαθέτουν ενσωματωμένη προστασία του κινητήρα και κατά συνέπεια πρέπει να συνδέονται με έναν εγκεκριμμένο εκκινητή.

Αλλοι μονοφασικοί κινητήρες περιλαμβάνουν θερμικό διακόπτη υπερφόρτωσης και δεν χρειάζονται συμπληρωματική προστασία κινητήρα.

Οι τριφασικοί κινητήρες πρέπει να συνδέονται σε εκκινητή, η ρύθμιση της ονομαστικής έντασης του οποίου πρέπει να ανταποκρίνεται στα ηλεκτρικά χαρακτηριστικά που αναγράφονται στην πινακίδα των αντλιών.

Μη θέσετε σε λειτουργία την αντλία πριν τη γεμίσετε με υγρό.

Οι συνδέσεις πρέπει να πραγματοποιηθούν με τον τρόπο που υποδεικνύεται στο εσωτερικό του καλύμματος του ακροκιβωτίου.

Επιλέξτε μία από τις δύο εισόδους καλωδίου και αφαιρέστε τον ήδη κομμένο δίσκο.

3.1 Ελεγχος της Φοράς Περιστροφής

(Τριφασικοί κινητήρες)

Η σωστή φορά περιστροφής επισημαίνεται με βέλη στο κάλυμμα του ανεμιστήρα του κινητήρα.

Η σωστή φορά περιστροφής είναι η αντίθετη της φοράς των δεικτών του ρολογιού, όταν κοιτάμε από την πλευρά του κινητήρα.

Σε περίπτωση που ο κινητήρας περιστρέφεται με τη λανθασμένη φορά, κλείστε την ηλεκτρική παροχή και εναλλάξτε δύο από τις τρεις φάσεις.

4. Εκκίνηση

4.1 Πλήρωση της Αντλίας

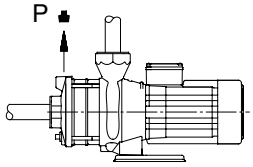
Μη θέσετε την αντλία σε λειτουργία εάν προηγουμένως δεν την έχετε γεμίσει με υγρό και εξαερώσει επαρκώς.

Σε εγκαταστάσεις ζεστού νερού, απαιτείται ιδιαίτερη προσοχή κατά την εξαέρωση της αντλίας προκειμένου να αποφευχθούν οι κίνδυνοι τραυματισμού που μπορεί να προκληθούν από τη διαφυγή καυτού νερού.

Πιεστικά συγκροτήματα και συστήματα όπου η στάθμη του υγρού στην πλευρά της αναρρόφησης βρίσκεται πάνω από την είσοδο της αντλίας:

1. Κλείστε τις αποφρακτικές βάννες και από τις δύο πλευρές της αντλίας.
2. Αφαιρέστε το πώμα πλήρωσης P, σχήμα 4.
3. Ανοίξτε σταδιακά τη βάννα αναρρόφησης και διατηρείστε την ανοικτή μέχρι να εξέλθει από το στόμιο ποσότητα υγρού με σταθερή ροή.
4. Κλείστε τη βάννα, επανατοποθετήστε το πώμα πλήρωσης και σφίξτε το προσεκτικά.
5. Ανοίξτε τη βάννα αναρρόφησης.
6. Θέστε σε λειτουργία την αντλία και ανοίξτε σταδιακά τη βάννα κατάθλιψης μέχρι να ανοίξει τελείως.

Σχήμα 4



TM00 0692 4896

Αντληση από δεξαμενές και φρεάτια όπου η στάθμη του υγρού στην πλευρά της αναρρόφησης βρίσκεται κάτω από την είσοδο της αντλίας:

1. Κλείστε την αποφρακτική βάννα της κατάθλιψης.
2. Αφαιρέστε το πώμα πλήρωσης P, σχήμα 4.
3. Πληρώσατε με νερό από το στόμιο αναρρόφησης. Βεβαιωθείτε ότι ο σωλήνας αναρρόφησης και η αντλία έχουν γεμίσει και εξαερωθεί επαρκώς.
4. Επανατοποθετήστε το πώμα πλήρωσης και σφίξτε προσεκτικά.
5. Θέστε σε λειτουργία την αντλία και ανοίξτε σταδιακά τη βάννα κατάθλιψης μέχρι να ανοίξει τελείως.

4.2 Συχνότητα Εκκινήσεων και Στάσεων

100 εκκινήσεις/ώρα το πολύ.

GR

5. Λειτουργία και Συντήρηση

Υπό φυσιολογικές συνθήκες λειτουργίας, η αντλία δεν χρειάζεται συντήρηση.

Σε περίπτωση που η αντλία έχει χρησιμοποιηθεί για υγρά που μπορεί να αφήσουν ακαθαρσίες, η αντλία θα πρέπει να καθαριστεί με καθαρό νερό αμέσως μετά τη χρήση της.

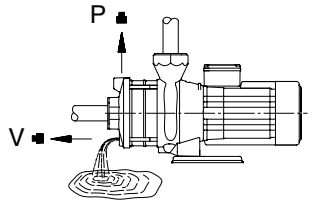
5.1 Προστασία Εναντι Παγετού

Αντλίες οι οποίες δεν χρησιμοποιούνται σε χρονικές περιόδους παγετού, θα πρέπει να αποστραγγίζονται για να αποφευχθούν πιθανές ζημιές.

Αφαιρέστε τα πώματα πλήρωσης και αποστράγγισης P και V, σχήμα 5.

Μην επανατοποθετείτε τα πώματα μέχρι την επαναχρησιμοποίηση της αντλίας.

Σχήμα 5



TM00 0693 4896

6. Πίνακας Εντόπισης Προβλημάτων

Πριν αποπειραθείτε να εντοπίσετε οποιοδήποτε πρόβλημα, βεβαιωθείτε ότι έχετε κλείσει την παροχή ρεύματος.

Πρόβλημα	Αιτία
1. Η αντλία δεν ξεκινάει.	a) Διακοπή της παροχής ηλεκτρικού ρεύματος. b) Το κύκλωμα ελέγχου παρουσιάζει διακοπή ή είναι ελαττωματικό. c) Ο κινητήρας είναι ελαττωματικός. d) Η αντλία έχει φράξει από ακαθαρσίες.
2. Η αντλία λειτουργεί, αλλά δεν αντλεί νερό.	a) Η αντλία δεν είναι γεμάτη με υγρό. b) Ο σωλήνας αναρρόφησης ή κατάθλιψης έχει φράξει από ακαθαρσίες. c) Η αντλία έχει φράξει από ακαθαρσίες. d) Το ύψος αναρρόφησης είναι πολύ μεγάλο. e) Υπαρξη διαρροής στο σωλήνα αναρρόφησης. f) Η ποδοβαλβίδα ή η βαλβίδα αντεπιστροφής έχουν φράξει.
3. Η αντλία λειτουργεί με μειωμένη δυνατότητα.	a) Λανθασμένη φορά περιστροφής (τριφασικοί κινητήρες). b) Το ύψος αναρρόφησης είναι πολύ μεγάλο. c) Ο σωλήνας αναρρόφησης ή κατάθλιψης έχει φράξει από ακαθαρσίες. d) Η αντλία έχει φράξει από ακαθαρσίες. e) Η ποδοβαλβίδα ή η βαλβίδα αντεπιστροφής είναι μερικώς φραγμένες.
4. Η αντλία παρουσιάζει διακοπές κατά τη διάρκεια της λειτουργίας.	a) Ο θερμικός διακόπτης υπερφόρτωσης ή η εξωτερική προστασία κινητήρα έχει διακόψει. b) Το κύκλωμα ελέγχου έχει διακόψει.

GR

7. Απόρριψη

Η απόρριψη εξαρτημάτων ή ολόκληρου του προιόντος αυτού πρέπει να γίνεται σύμφωνα με τις ακόλουθες οδηγίες:

1. Χρησιμοποιείστε τα δημοτικά ή ιδιωτικά μέσα αποκομμιδής απορριμάτων.
2. Στην περίπτωση που δεν υπάρχουν τα ανωτέρω μέσα, παρακαλούμε παραδώστε το προιόν ή οποιοδήποτε επιβλαβές υλικό από αυτό στη GRUNDFOS ή στο πλησιέστερο εργαστήριο επισκευών.

Υπόκειται σε τροποποιήσεις.

Alvorens de pomp te installeren dient u deze installatie- en bedieningsinstructies zorgvuldig te bestuderen. De installatie en bediening dienen volgens de in Nederland/België geldende regels en met kennis van zaken plaats te vinden.

1. Algemene gegevens

1.1 Toepassingen

De GRUNDFOS horizontale meertraps centrifugaalpompen serie CH en CHN zijn bestemd voor het verpompen van water en andere dunvloeibare, niet-agressieve en niet-explosieve vloeistoffen, die geen vaste delen of vezels bevatten.

1.2 Bedrijfsomstandigheden

1.2.1 Vloeistoftemperatuur

0°C tot +90°C.

1.2.2 Omgevingstemperatuur

Tot +55°C.

1.2.3 Maximum werkdruk

0°C tot +40°C: maximum 10 bar.
+41°C tot +90°C: maximum 6 bar.

1.2.4 Maximum inlaatdruk

De werkelijke inlaatdruk plus de druk als de pomp werkt met een gesloten persafsluiter, moet altijd lager zijn dan de maximum werkdruk.

1.2.5 Minimum inlaatdruk

Onderstaande tabel heeft betrekking op de **maximum doorstroomsnelheden** voor de diverse typen bij een barometerdruk van 760 mm Hg.

De opgegeven waarden zijn de minimum inlaatdrukken/maximum zuighoogten “H” (in m waterkolom) aan de zuigzijde van de pomp. Deze waarden zijn gegeven voor verschillende vloeistoftemperaturen. **Daarbij moet met het drukverlies in de zuigleiding rekening worden gehouden**.

De maximum aanzuighoogte kan beperkt worden door de opvoerhoogte van de pomp.

Type	H [mWk]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

“H” = de minimum inlaatdruk tijdens bedrijf.

“H” * = de maximum zuighoogte tijdens bedrijf.

1 m waterkolom ≈ 0,1 bar.

1.3 Technische gegevens

NL

1.3.1 Elektrische gegevens

Zie het typeplaatje van de pomp.

1.3.2 Afmetingen

Zie pagina 50.

1.4 Geluidsdrukniveau

Het geluidsdrukniveau van de pomp ligt binnen de grenzen als vermeld in de Richtlijn van de Europese Raad inzake de onderlinge aanpassing van de wetgevingen van de Lid-Staten betreffende machines (89/392/EEG).

2. Installatie

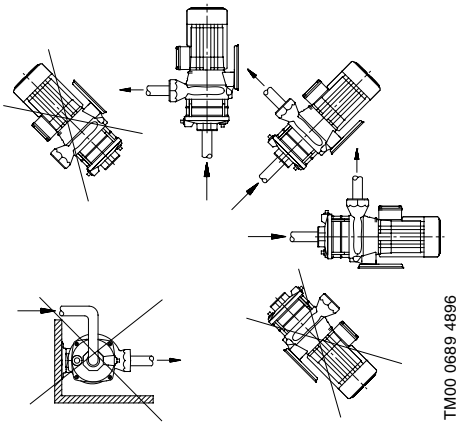
2.1 Plaatsing van de pomp

De pomp moet zo worden geïnstalleerd dat de zuigleiding zo kort mogelijk en de zuighoogte zo gering mogelijk is.

De pomp moet op een goed geventileerde, maar vorstvrije plaats worden opgesteld (zie punt *5.1 Vorstbeveiliging*). Hij kan buiten worden geplaatst, maar moet dan door een geschikte afdekking worden beschermd tegen de weersinvloeden.

De pomp kan in één van de in fig. 1 getoonde standen worden geplaatst.

Fig. 1

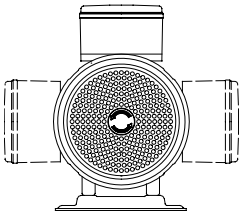


TM00 0689 4896

2.2 Stand van de klemmenkast

De elektrische klemmenkast kan vóór installatie van de pomp in één van de in fig. 2 getoonde standen worden gedraaid.

Fig. 2



TM00 0690 5192

Om de stand van de klemmenkast te wijzigen moet men:

1. De vier bouten, die vanaf de motorzijde in de kamer aan de perszijde zijn geschroefd, wegnemen.
2. Het statorhuis in de gewenste stand draaien.
3. De vier bouten weer aanbrengen en goed vastzetten.

2.3 Leidingen

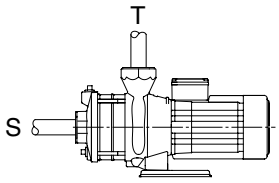
De leidingen moeten zo worden aangebracht dat eventuele spanningen als gevolg van wisselende temperaturen geen invloed hebben op de pomp.

2.3.1 Zuigleiding

Als de pomp vloeistof moet aanzuigen van een niveau dat lager is dan de zuigaansluiting van de pomp, moet een voetklep/terugslagklep worden aangebracht aan het einde van de zuigleiding beneden het laagst voorkomende vloeistofniveau, daar de pomp niet zelfaanzuigend is.

De zuigleiding moet aan de zuigaansluiting S van de pomp worden aangesloten, zie fig. 3.

Fig. 3



TM00 0691 4896

Als de zuigleiding langer is dan 10 meter of de zuighoogte groter dan 4 meter, moet de diameter van de zuigleiding groter zijn dan die van de zuigaansluiting van de pomp.

Alle koppelingen van de zuigleiding moeten volkomen lucht- en vloeistofdicht zijn en goed zijn aangedraaid.

Indien een slang wordt gebruikt als zuigleiding, mag die niet kunnen dichtklappen. Het verdient aanbeveling, een zeef aan te brengen wanneer vaste deeltjes in de zuigleiding kunnen worden meegevoerd en de pomp kunnen verstoppen of doen vastlopen.

2.3.2 Persleiding

De persleiding moet aan de persaansluiting T van de pomp worden aangesloten, zie fig. 3.

De persleiding moet tenminste dezelfde diameter hebben als de persaansluiting van de pomp, teneinde drukverlies, hoge vloeistofsnelheden en hinderlijk geluid tot een minimum te beperken.

2.3.3 Bypass

Indien er enig gevaar bestaat dat de pomp tegen een gesloten persafsluiter draait, dient een bypass/aftap op de persleiding te worden gemonteerd, zodat er altijd een kleine hoeveelheid vloeistof blijft stromen. De aftap kan bijvoorbeeld worden aangesloten op een reservoir.

De minimale capaciteit mag nooit lager zijn dan 10% van de capaciteit bij maximaal rendement. De capaciteit en de opvoerhoogte bij maximaal rendement staan vermeld op het typeplaatje van de pomp.

2.4 Installatievoorbeelden

De pomp is geschikt voor een groot aantal toepassingen.

Op pag. 49 worden enige voorbeelden getoond.

3. Elektrische aansluiting

De elektrische aansluiting moet worden uitgevoerd volgens de ter plaatse geldende voorschriften.

De spanning en frequentie zijn op de naamplaat van de pomp vermeld. Controleer of de motor geschikt is voor de netstroom, waarop hij zal worden aangesloten.

Zorg dat de voedingsspanning is uitgeschakeld, alvorens in de klemmenkast aansluitingen uit te voeren.

De pomp dient te zijn aangesloten op een externe netschakelaar.

Wisselstroommotoren, 1 x 110/220 V, 60 Hz, zijn niet voorzien van een beveiliging en moeten worden aangesloten op een goedgekeurde beveiligingsschakelaar.

Andere wisselstroommotoren zijn voorzien van een thermische overbelastingsschakelaar en hebben geen verdere beveiliging nodig.

Draaistroommotoren moeten worden aangesloten aan een motorstarter met motorbeveiligingschakelaar. Deze dient afgesteld te worden in overeenstemming met de nominaalstroom welke staat gespecificeerd op het typeplaatje.

Start de pomp niet voordat hij met vloeistof is gevuld.

De aansluitingen moeten worden gemaakt volgens het schema dat zich aan de binnenkant van het deksel van de aansluitdoos bevindt.

Kies één van de twee kabelingangen en verwijder de voorgesneden ring.

3.1 Controle van de draairichting

(Draaistroommotoren)

De juiste draairichting is aangegeven door pijlen op het deksel van de ventilator van de motor.

De pomp moet linksom draaien, gezien vanaf de motorzijde.

Om de draairichting te veranderen schakelt u de stroomtoevoer uit en verwisselt twee van de drie stroomtoevoerdraden.

4. Starten

4.1 Vullen

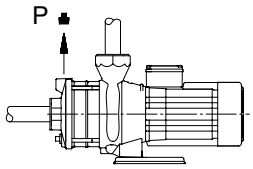
Start de pomp niet voordat hij met vloeistof gevuld en ontlucht is.

In systemen met hete vloeistoffen dient tijdens het ontluchten rekening gehouden te worden met gevaar voor verbranding door uitstromend water.

Situaties waarbij het vloeistofpeil aan de zuigzijde hoger is dan de inlaatopening van de pomp:

1. Sluit de afsluiters aan weerszijden van de pomp.
2. Neem de plug P, fig. 4, weg.
3. Open langzaam de zuigafsluiter en houd deze open tot een gelijkmatige stroom vloeistof uit de opening stroomt.
4. Zet de zuigafsluiter dicht, breng de plug weer op zijn plaats en draai hem goed vast aan.
5. Open de zuigafsluiter.
6. Start de pomp en open langzaam de persafsluiter tot deze geheel open staat.

Fig. 4



TM00 0692 4896

Pompen van water of vloeistoffen uit tanks of putten waar het vloeistofpeil aan de zuigzijde lager is dan de inlaatopening van de pomp:

1. Sluit de afsluiter aan de perszijde van de pomp.
2. Neem de plug P, fig. 4, weg.
3. Giet water of vloeistof door de opening tot de zuigleiding en de pomp geheel gevuld en ontlucht zijn.
4. Breng de plug weer op zijn plaats en draai hem goed vast aan.
5. Start de pomp en open langzaam de persafsluiter tot deze geheel open staat.

4.2 Frequentie van starten en stoppen

Maximum 100 maal starten per uur.

5. Bedrijf en onderhoud

Onder normale bedrijfsomstandigheden heeft de pomp geen onderhoud nodig.

Als de pomp gebruikt is voor vloeistoffen die verontreinigingen in de pomp kunnen achterlaten, moet hij onmiddellijk na gebruik met schoon water worden doorgespoeld.

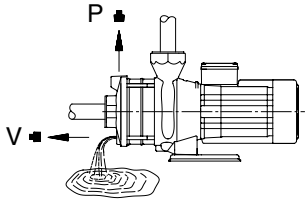
5.1 Vorstbeveiliging

Bij pompen, die tijdens vorstperioden niet in gebruik zijn, moet de vloeistof worden afgetapt om schade te voorkomen.

Verwijder daartoe de vul- en aftapplug P en V, fig. 5.

Breng de pluggen niet weer aan voordat de pomp opnieuw moet worden gebruikt.

Fig. 5



TM00 0693 4896

NL

6. Storingstabel

Schakel vóór het zoeken naar storingen eerst de voedingsspanning uit.

Storing	Dorzaak
1. Pomp start niet.	a) Geen stroomtoevoer. b) Stuurstroomcircuit is uitgeschakeld, afgeslagen of defect. c) Motor is defect. d) Pomp is verstopt door verontreiniging.
2. Pomp loopt, maar levert geen vloeistof.	a) Pomp is niet met vloeistof gevuld. b) Zuig- of persleiding is verstopt door verontreinigingen. c) Pomp is verstopt door verontreinigingen. d) Opvoerhoogte is te groot. e) Lekkage in de zuigleiding. f) Voet- of terugslagklep is geblokkeerd.
3. Pomp loopt met geringere capaciteit.	a) Verkeerde draairichting (draaistroommotor). b) Opvoerhoogte is te groot. c) Zuig- of persleiding is verstopt. d) Pomp is verstopt door verontreinigingen. e) Voet- of terugslagklep is gedeeltelijk geblokkeerd.
4. Pomp stopt tijdens bedrijf.	a) Thermische overbelastingsschakelaar of externe motorbeveiliging is afgeslagen. b) Stuurstroomcircuit is afgeslagen.

7. Afvalverwerking

Na gebruik van deze pomp of onderdelen dienen de volgende richtlijnen in acht genomen te worden.

1. Neem de overheids- en gemeentelijke richtlijnen voor afvalverwerking in acht.
2. Als de afvalverwerkende instanties ons product niet kunnen verwerken, dan kunt u ons product bij ons inleveren.

NL

Läs noggrant igenom denna monterings- och driftsinstruktion innan installation av pumpen påbörjas. I övrigt skall installation och drift ske enligt lokala föreskrifter och gängse praxis.

1. Allmänt

1.1 Användning

GRUNDFOS CH- och CHN-pumpar är horisontella flerstegs centrifugalpumpar för pumpning av rent vatten och andra tunnflytande, icke-aggressiva och icke-explosiva vätskor utan fasta beståndsdelar och fibrer.

1.2 Driftsområde

1.2.1 Vätsketemperatur

0°C till 90°C.

1.2.2 Omgivningstemperatur

Max. 55°C.

1.2.3 Max. driftstryck

0°C till 40°C: Max. 10 bar.
41°C till 90°C: Max. 6 bar.

1.2.4 Max. tilloppstryck

Aktuellt tilloppstryck + pumpens tryck mot stängd ventil skall vara mindre än “max. driftstryck”.

1.2.5 Min. tilloppstryck

Vid pumpens **max. flöde** och barometerstånd 760 mm Hg gäller nedanstående tabell.

Det är min. tilloppstryck / max. sughöjd “H” [m] vid pumpens sugstuds, som är angivet vid olika vätsketemperaturer, **varför hänsyn skall tas till tryckfall i sugledningen**.

Max. sughöjd begränsas eventuellt av den aktuella lyfthöjden.

Typ	H [m]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

“H” = min. tilloppstryck vid drift.

“H” med * = max. sughöjd vid drift.

1 m ≈ 0,1 bar.

1.3 Tekniska data

1.3.1 Elektriska data

Se pumpens typskylt.

1.3.2 Mått

Se sida 50.

1.4 Ljudtrycksnivå

Pumpens ljudtrycksnivå ligger under de gränsvärden, som finns angivna i Europarådets direktiv 89/392/EEC (maskindirektivet).

S

2. Installation

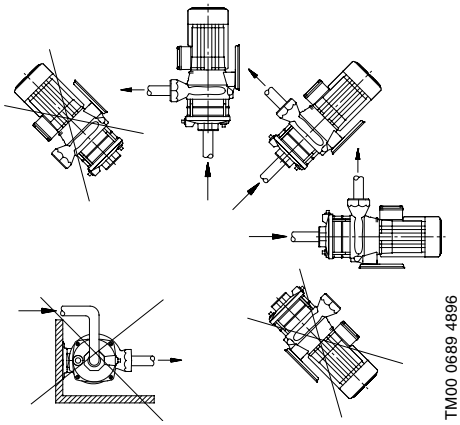
2.1 Placering av pumpen

Pumpen skall placeras så att sugrörslängden och sughöjden blir så kort som möjligt.

Pumpen bör placeras på frostfri plats (se avsnitt *5.1 Frostsäkring*) och med god ventilation. Den kan placeras utomhus, men bör skyddas mot direkt regn, t.ex. med en enkel takkonstruktion el. liknande.

Pumpen får sättas in i de lägen som visas i fig. 1.

Fig. 1

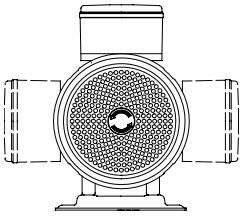


TM00 0689 4896

2.2 Kopplingsboxens placering

Kopplingsboxens position kan ändras till en av de i fig. 2 visade positionerna, innan pumpen monteras.

Fig. 2



TM00 0690 5192

Ändring av kopplingsboxens position:

1. Demontera de fyra skruvarna som sitter i toppstycket från motorsidan.
2. Vrid statorhuset till önskad position.
3. Montera skruvarna och dra åt.

S

2.3 Rörledningar

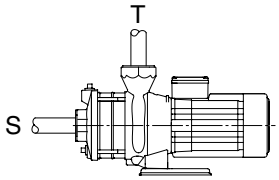
Rördragningen skall göras så att pumpen inte utsätts för mekanisk påverkan, ex. termisk expansion.

2.3.1 Sugledning

Är vätskenivån på sugsidan lägre än pumpen skall en back-/bottenventil monteras på sugledningen, eftersom pumpen inte är självsugande.

Sugledningen ansluts till pumpens sugstuds S, fig. 3.

Fig. 3



TM00 0691 4896

Om sugledningen är längre än 10 m eller sughöjden större än 4 m skall sugledningens diameter vara större än sugstudsens.

Se till att alla anslutningar på sugledningen är täta.

Används slang på sugsidan skall denna vara förstärkt så att ihopsugning förhindras. För att förhindra uppsugning av föroreningar kan sugledningen förses med ett skydd (sil eller filter).

2.3.2 Tryckledning

Tryckledningen ansluts till pumpens tryckstuds T, fig. 3.

Tryckledningens diameter bör vara minst lika stor som tryckstudsens diameter för att undvika tryckfall, höga vattenhastigheter och oljud.

2.3.3 Returledning

Om det finns risk för drift mot stängd tryckledning måste ett minimiflöde genom pumpen säkras genom att trycksidan förses med en returledning/avlopp till en tank eller liknande.

Minimiflödet skall vara minst 10% av flödet vid max. verkningsgrad. Flöde och tryckhöjd vid max. verkningsgrad framgår av pumpens typskylt.

2.4 Installationsexempel

Pumpen har många användningsmöjligheter.

På sida 49 visas några exempel.

3. Elanslutning

Elanslutning skall utföras i enlighet med lokalt gällande bestämmelser och normer.

Kontrollera att nätspänning och frekvens stämmer med värdena på typskylten.

Före varje ingrepp i pumpens kopplingsbox skall nätspänningen slås ifrån.

Pumpen skall anslutas till en extern arbetsbrytare.

1-fas motorer stämplade 1 x 110/220 V, 60 Hz, har inte inbyggt motorskydd och skall därför anslutas till externt motorskydd.

Övriga 1-fas motorer har inbyggt motorskydd och behöver därför inget ytterligare motorskydd.

3-fas motorer skall anslutas till ett motorskydd, om inställd märkström skall stämma överens med elektriska data på pumpens typskylt.

Pumpen skall inte startas innan den är fylld med vätska.

Den elektriska anslutningen görs enligt anvisningarna i kopplingsboxens lock.

Välj en av de två kabelgenomföringarna och ta bort blindpluggen.

3.1 Rotationsriktning

(3-fas motorer)

Pilarna på motorns ventilationskåpa visar rätt rotationsriktning.

Rotationsriktningen skall vara moturs, sett mot ventilationskåpan.

Om rotationsriktningen är felaktig, skall två faser kastas om i motorns anslutning till motorskyddet.

4. Igångkörning

4.1 Vätskepåfyllning

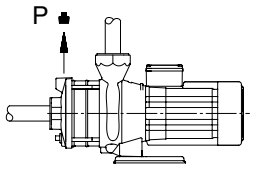
Innan pumpen kan startas, skall den fyllas med vatten och avluftas.

Vid anläggning med heta vätskor bör man, under avluftning, vara extra försiktig för att förhindra personskador förorsakat av utströmmande vätska.

I tryckstegringsanläggningar och anläggningar där vätskenivån på sugsidan ligger över pumpen:

1. Stäng avstängningsventilerna på sug- och trycksidan.
2. Skruva ur påfyllningsproppen P, fig. 4.
3. Öppna gradvis ventilen på sugsidan och håll den öppen, tills en jämn vattenstråle flödar ut från påfyllningsstudsen.
4. Stäng ventilen, sätt i påfyllningsproppen och dra åt den tills den blir tät.
5. Öppna ventilen på sugsidan helt.
6. Starta pumpen och öppna avstängningsventilen på trycksidan gradvis till helt öppet läge.

Fig. 4



TM00 0692 4896

Pumpning från tank eller brunn, där vätskenivån på sugsidan ligger under pumpen:

1. Stäng avstängningsventilen på trycksidan.
2. Skruva ur påfyllningsproppen P, fig. 4.
3. Häll vatten i påfyllningshålet. Se till att sugledning och pump blir helt fyllda och avluftade.
4. Sätt i påfyllningsproppen igen och dra åt den så att den blir tät.
5. Starta pumpen och öppna avstängningsventilen på trycksidan gradvis till helt öppet läge.

4.2 Start/stopp

Max. 100 starter per timma.

5. Drift och underhåll

Pumpen kräver inte något underhåll vid normal drift.

Om pumpen använts för orena vätskor skall den rensköljas direkt efter användningen.

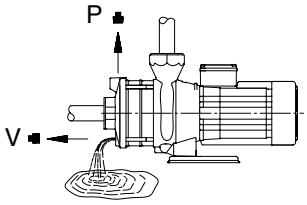
5.1 Frostsäkring

Pumpar som inte används i frostperioder, bör tömmas så att inte några skador kan uppstå.

Skruva ur påfyllnings- och tömningspropp P och V, fig. 5.

Sätt sedan inte i propparna förrän pumpen skall tas i drift igen.

Fig. 5



TM00 0693 4896

S

6. Felsökning

Om felsökning skall påbörjas, skall strömmen vara frånslagen.

Fel	Orsak
1. Pumpen startar inte.	a) Spänningsförsörjning till motorn saknas eller är felaktig. b) Ev. styrkrets defekt. c) Motorn defekt. d) Pumpen blockerad av föroreningar.
2. Pumpen går men ger inget vatten.	a) Pumpen ej fylld med vätska. b) Sug- eller tryckledning blockerad av föroreningar. c) Pumpen blockerad av föroreningar. d) Sughöjden för stor. e) Sugledningen otät. f) Back-/bottenventil delvis blockerad.
3. Reducerat tryck och vätskemängd.	a) Motorns rotationsriktning fel (3-fas). b) Sughöjden för stor. c) Sug- eller tryckledning blockerad. d) Pumpen blockerad av föroreningar. e) Back-/bottenventil delvis blockerad.
4. Pumpen slår ifrån vid drift.	a) Termokontakt i motorn eller externt motorskydd löser ut. b) Ev. styrkrets defekt.

7. Destruktion

Destruktion av denna produkt eller delar härav skall ske enligt följande riktlinjer:

1. Använd lokalt gällande offentliga eller privata förordningar eller regler för destruktion.
2. Om sådana föreskrifter eller förordningar saknas eller att material som ingår i produkten inte emottages, kan produkten eller därifrån eventuella miljöfarliga material lämnas till närmaste GRUNDFOS-bolag.

S

Rätt till ändringar förbehålles.

7.	**Hävittäminen**	**44**

Ennenkuin pumpun asennus aloitetaan, on tämä asennus- ja käyttöohje luettava huolellisesti. Asennuksen ja käytön tulee muilta osin tapahtua paikallisten säännösten ja yleisen käytännön mukaisesti.

1. Yleistä

1.1 Käyttö

GRUNDFOS CH ja CHN pumput ovat makaavia monijaksoisia keskipakopumppuja veden ja muiden kevytjuoksuisten nesteiden pumppaukseen, jotka eivät sisällä kiintoaineita tai kuituja eivätkä ole aggressiivisia tai räjähdysalttiita.

1.2 Käyttöalue

1.2.1 Nesteen lämpötila

0°C ... +90°C.

1.2.2 Ympäristölämpötila

Enint. +55°C.

1.2.3 Suurin käyttöpaine

0°C ... +40°C: enint. 10 bar.
+41°C ... +90°C: enint. 6 bar.

1.2.4 Suurin tulopaine

Todellinen tulopaine lisättynä pumpun maks. paineella (nollatuotolla) tulee olla pienempi kuin “suurin käyttöpaine”.

1.2.5 Min. tulopaine

Pumpun **maksimituotolla** ja 760 mmHg ilmanpaineella pätevät alempana esitetyn taulukon arvot.

Taulukko ilmoittaa eri nestelämpötiloilla min. tulopaineen / maks. imukork. “H” [mvp] pumpun imuyhteessä, **joten painehäviöt pumpun imuputkessa on huomioitava**.

Suurinta imukorkeutta voi mahd. rajoittaa vaadittava nostokorkeus.

Malli	H [mvp]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

“H” = min. tulopaine käytön aikana.

“H” * = maks. imukorkeus käytön aikana.

1 mvp ≈ 0,1 bar.

1.3 Tekniset tiedot

1.3.1 Sähkötiedot

Katso pumpun laitekilvestä.

1.3.2 Mitat

Katso sivu 50.

1.4 Äänenpainetaso

Pumpun äänenpainetaso alittaa Euroopan Neuvoston direktiivin 89/392/EY (konedirektiivi) raja-arvot.

SF

2. Asennus

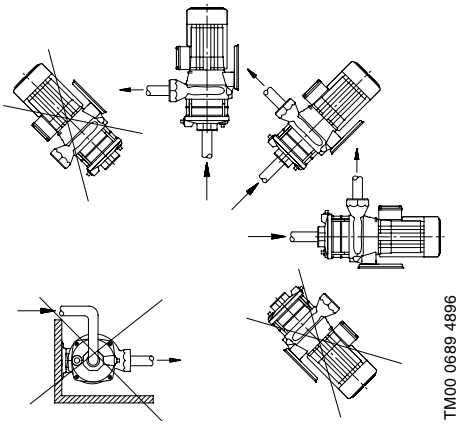
2.1 Pumpun sijoitus

Pumppu sijoitetaan niin, että imuputki on mahdollisimman lyhyt ja imukorkeus mahdollisimman pieni.

Pumppu on sijoitettava jäätymättömään tilaan (katso kohta *5.1 Jäätymisvaara*), jossa on hyvä ilmanvaihto. Se voidaan sijoittaa ulkotilaan, mutta tulee suojata suoralta sateelta katoksella tai muulla vastaavalla.

Pumppu voidaan asentaa kuvan 1 mukaisesti.

Kuva 1

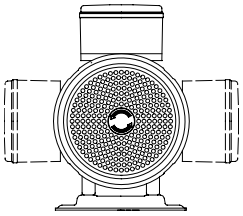


TM00 0689 4896

2.2 Kytkentärasian asento

Kytkentärasia voidaan kääntää kuvan 2 asentoihin ennen pumpun asennusta.

Kuva 2



TM00 0690 5192

SF

Kytkentärasian asennon muuttaminen:

1. Irroita moottoripuolen laipan 4 pulttia.
2. Käännä staattoripesä toivottuun asentoon.
3. Kiinnitä ja kiristä pultit entisiin reikiinsä.

2.3 Putkisto

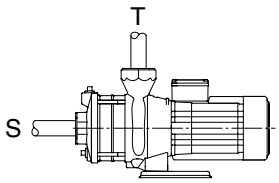
Putkisto tulee asentaa niin, että pumppuun ei kohdistu mekaanisia voimia, esim. lämpölaajenemisesta aiheutuvia.

2.3.1 Imuputki

Jos nestepinta imupuolella on pumpun alapuolella, on imuputkeen asennettava pohja/takaiskuventtiili, koska pumppu ei ole itseimevä.

Imuputki kiinnitetään pumpun imuyhteeseen S, kuva 3.

Kuva 3



TM00 0691 4896

Imuputken pituuden ollessa suurempi kuin 10 m tai imukorkeuden ylittäessä 4 m tulee imuputken olla suurempi kuin imuyhde.

Imuputken kaikkien liitoksien on ehdottomasti oltava tiiviitä.

Jos imupuolella käytetään letkua, on tämän oltava rakenteeltaan tukikudosvahvisteinen, mikä estää letkun litistymisen. Jotta estettäisiin epäpuhtauksien pääsy imuputkeen, se voidaan varustaa siivilällä tai verkkosuotimella.

2.3.2 Paineputki

Paineputki kiinnitetään pumpun paineyhteeseen T, kuva 3.

Painehäviöiden, suurien virtausnopeuksien ja kohinan välttämiseksi on paineputken koon oltava vähintään sama kuin paineyhteen.

2.3.3 Paluukierto

Jos on olemassa vaara käytölle suljettua venttiiliä vastaan, on varmistettava vähimmäisvirtaama pumpun läpi varustamalla pumpun lähtöpuoli paluukierto/ohitusputkella takaisin säiliöön tai vastaavaan.

Minimivirtaaman on oltava vähintään 10% korkeimman hyötysuhteen virtaamasta. Korkeimman hyötysuhteen virtaama ja nostokorkeus ilmenee pumpun tyyppikilvestä.

2.4 Asennusesimerkkejä

Pumpulle löytyy monia käyttötarkoituksia ja asennusvaihtoehtoja.

Sivulla 49 on esitetty muutamia.

3. Sähköliitäntä

Sähköliitäntä suoritetaan kansallisten sääntöjen mukaisesti.

Tarkista, että syöttöjännite ja taajuus vastaavat pumppukilven arvoja.

Avattaessa pumpun kytkentärasia on pumpun syöttöjännite aina oltava katkaistuna.

Pumppuun on liitettävä ulkoinen verkkovirran katkaisija.

1-vaiheiset moottorit 1 x 110/220 V, 60 Hz, eivät ole varustettuja sisäänrakennetulla moottorisuojalla vaan vaativat ulkoisen moottorisuojan.

Muissa 1-vaiheisissa moottoreissa on sisäänrakennettu ylikuumenemissuoja eivätkä ne vaadi ulkoista moottorisuojaa.

3-vaiheisissa moottoreissa on liitettävämoottorisuoja, johon asetetun nimellisvirran on oltava yhdenmukainen pumpun tyyppikilven sähkötietojen kanssa.

Ennenkuin pumppu käynnistetään, se tulee täyttäänesteellä.

Sähköliitännät suoritetaan kytkentärasian kannen sisäpuolella olevan kaavion mukaisesti.

Valitse toinen kaapeliläpivienneistä ja poista suojalevy.

3.1 Pyörimissuunta

(3-vaiheiset)

Nuolet moottorin tuuletinkannessa osoittavat oikean pyörimissuunnan.

Pyörimissuunnan tulee olla vastapäivään moottorin takaa katsottuna.

Jos pyörimissuunta on väärä, tulee syöttövirta pumpulle katkaista ja vaihtaa moottorisuojan kaksi vaihetta keskenään.

4. Käyttöönotto

4.1 Nesteen täyttäminen

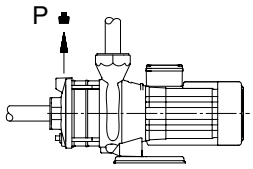
Ennenkuin pumppu käynnistetään, se tulee täyttää nesteellä ja ilmata.

Suoritettaessa ilmausta kuumien nesteiden kiertojärjestelmissä on aina oltava erittäin varovainen välttääkseen ulosvirtaavan nesteen aiheuttaman henkilövahingon vaaran.

Paineenkorotuslaitoksissa sekä laitoksissa, joissa nestepinta pumpun imupuolella on korkeammalla kuin pumppu:

1. Sulje sulkuventtiilit pumpun imu- ja painepuolella.
2. Avaa ja irroita pumpun pesäveden täyttötulppa P, kuva 4.
3. Avaa pumpun imupuolen sulkuventtiiliä hitaasti ja pidä se auki niin kauan kunnes neste valuu täyttötulpan aukosta tasaisena virtana.
4. Sulje venttiili ja asenna sekä kiristä täyttötulppa.
5. Aukaise imupuolen sulkuventtiili.
6. Käynnistä pumppu ja avaa painepuolen sulkuventtiili hitaasti, kunnes se on täysin auki.

Kuva 4



TM00 0692 4896

Pumppaaminen säiliöstä tai kaivosta, jossa nestepinta pumpun imupuolella on alempana kuin pumppu:

1. Sulje painepuolen sulkuventtiili.
2. Avaa ja irroita pumpun täyttötulppa P, kuva 4.
3. Kaada pumpattavaa nestettä täyttötulpan aukosta. Varmista, että imuputki ja pumppu ovat täysin nesteen täyttämät ja ilmattuja.
4. Asenna täyttötulppa ja kiristä se.
5. Käynnistä pumppu ja avaa painepuolen sulkuventtiili hitaasti, kunnes se on täysin auki.

4.2 Käynnistys/pysäytys

Enintään 100 käynnistystä per tunti.

5. Käyttö ja huolto

Pumppu on huoltovapaa normaalikäytössä.

Jos pumppua käytetään epäpuhtaiden nesteiden pumppaamiseen, tulee pumppu huuhdella vedellä heti käytön jälkeen.

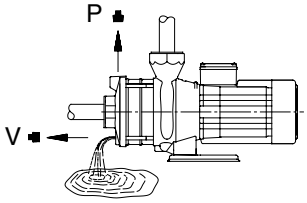
5.1 Jäätymisvaara

Pakkasolosuhteissa ja jäätymisen uhatessa pumppu on tyhjennettävä vaurioiden välttämiseksi.

Pumppu tyhjennetään avaamalla täyttö- ja tyhjennystulpat P ja V, kuva 5.

Asenna tulpat paikoilleen vasta sitten, kun pumppu otetaan uudelleen käyttöön.

Kuva 5



TM00 0693 4896

SF

6. Vianetsintä

Ennenkuin vianetsintä aloitetaan, on syöttöjännite katkaistava.

Vika	Syy
1. Pumppu ei käynnisty.	a) Virtakatkos tai väärä syöttöjännite. b) Katkos tai vika ohjausvirtapiirissä. c) Moottori viallinen. d) Pumppu tukkeutunut epäpuhtauksista.
2. Pumppu käy, mutta ei tuota nestettä.	a) Pumppu ei ole nesteen täyttämä. b) Imu- tai paineputki tukkeutunut. c) Pumppu tukkeutunut epäpuhtauksista. d) Liian suuri imukorkeus. e) Vuotoja imuputkessa. f) Pohja/takaiskuventtiili tukkeutunut.
3. Alentunut paine ja tuotto.	a) Moottorin pyörimissuunta väärä (3-vaihe moottorit). b) Imukorkeus on liian suuri. c) Imu- tai paineputki tukkeutunut. d) Pumppu tukkeutunut epäpuhtauksista. e) Pohja/takaiskuventtiili osittain tukkeutunut.
4. Pumppu pysähtyy käytön aikana.	a) Moottorin ylikuumenemissuoja tai ulkoinen moottorisuoja katkaisee virran. b) Ohjausvirtapiiri katkaisee käytön.

7. Hävittäminen

Tämän tuotteen tai sen osien hävittämisessä on noudatettava seuraavia ohjeita:

1. Käytä paikallisia yleisiä tai yksityisiä jätekeräilyn palveluja.
2. Jos jätekeräilyn palveluja ei ole, tai ne eivät vastaanota tai pysty käsittelemään tuotteen materiaaleja, voidaan tuote tai sen mahdolliset ympäristölle vaaralliset aineet toimittaa lähimpään GRUNDFOS-yhtiöön tai -huoltokorjaamoon.

Før installation af pumpen påbegyndes, skal denne monterings- og driftsinstruktion læses grundigt. Installation og drift skal i øvrigt ske i henhold til lokale forskrifter og gængs praksis.

1. Generelt

1.1 Anvendelse

GRUNDFOS CH og CHN pumper er horisontale, flertrins centrifugalpumper til pumpning af vand og andre tyndtflydende, ikke-aggressive og ikke-eksplosive væsker uden faste bestanddele og fibre.

1.2 Driftsområde

1.2.1 Medietemperatur

0°C til +90°C.

1.2.2 Omgivelsestemperatur

Maks. +55°C.

1.2.3 Maks. driftstryk

0°C til +40°C: Maks. 10 bar.
+41°C til +90°C: Maks. 6 bar.

1.2.4 Maks. tilløbstryk

Aktuelt tilløbstryk + pumpens tryk mod lukket ventil skal være mindre end "maks. driftstryk".

1.2.5 Min. tilløbstryk

Ved pumpens **maks. ydelse** og en barometerstand på 760 mmHg gælder nedenstående tabel.

Det er min. tilløbstryk/maks. sugehøjde "H" [mVS] ved pumpens sugestuds, der er opgivet ved forskellige medietemperaturer. **Derfor skal der tages hensyn til tryktab i sugeledningen.**

Maks. sugehøjde begrænses evt. af den aktuelle løftehøjde.

Type	H [mVS]			
50 Hz	**20°C**	**40°C**	**55°C**	**90°C**
CH 2	*4,1	*3,6	*2,7	2,8
CHN 2	*4,1	*3,6	*2,7	2,8
CH 4	*7,5	*7,0	*6,1	*0,6
CHN 4	*7,5	*7,0	*6,1	*0,6
CH 8	*6,3	*5,8	*4,9	0,6
CH 12	*5,6	*5,1	*4,2	1,3
60 Hz				
CH 2	*3,1	*2,6	*1,7	3,8
CHN 2	*3,1	*2,6	*1,7	3,8
CH 4	*6,8	*6,3	*5,4	0,1
CHN 4	*6,8	*6,3	*5,4	0,1
CH 8	*6,9	*6,4	*5,5	0,0
CH 12	*3,5	*3,0	*2,1	3,4

"H" = min. tilløbstryk under drift.

"H" med * = maks. sugehøjde under drift.

1 mVS ≈ 0,1 bar.

1.3 Tekniske data

1.3.1 Elektriske data

Se pumpens typeskilt.

1.3.2 Mål

Se side 50.

1.4 Lydtryksniveau

Pumpens lydtryksniveau ligger under de grænseværdier, der er angivet i Europarådets direktiv 89/392/EØF (maskindirektivet).

DK

2. Installation

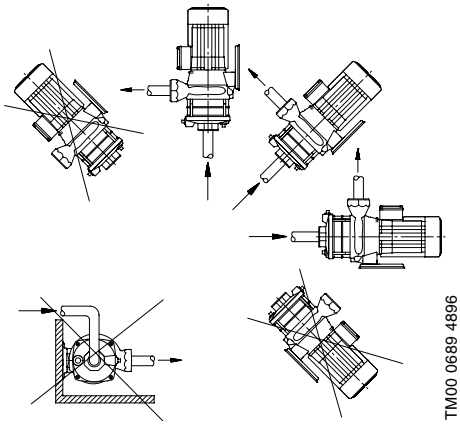
2.1 Placering af pumpen

Pumpen skal placeres således, at sugeledningen bliver så kort og sugehøjden så lille som muligt.

Pumpen bør placeres frostfrit (se afsnit *5.1 Frostsikring*) og med god ventilation. Den kan placeres udendørs, men bør beskyttes mod direkte regn med halvtag el.lign.

Pumpen må placeres som vist i fig. 1.

Fig. 1

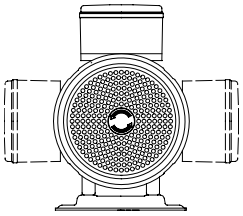


TM00 0689 4896

2.2 Klemkasseposition

Klemkassepositionen kan ændres til en af de i fig. 2 viste positioner, inden pumpen monteres.

Fig. 2



TM00 0690 5192

Ændring af klemkasseposition:

1. Demontér de fire skruer, der er skruet i topstykket fra motorsiden.
2. Drej statorhuset til ønsket position.
3. Montér og fastspænd skruerne.

DK

2.3 Rørledninger

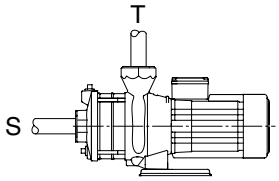
Rørføringen skal udføres, således at pumpen ikke udsættes for mekaniske påvirkninger, f.eks. på grund af termiske udvidelser.

2.3.1 Sugeledning

Er væskeniveauet på sugesiden under pumpen, skal sugeledningen monteres med en kontra-/bundventil, da pumpen ikke er selvansugende.

Sugeledningen tilsluttes pumpens sugestuds S, fig. 3.

Fig. 3



TM00 0691 4896

Ved sugeledninger længere end 10 m eller sugehøjder større end 4 m skal sugeledningens diameter være større end sugestudsens.

Sørg for, at samlinger i sugeledningen bliver tætte.

Anvendes der slange på sugesiden, skal denne være med indlæg, som hindrer sammensugning. For at undgå indsugning af urenheder kan sugeledningen forsynes med en sugekurv (si eller filter).

2.3.2 Trykledning

Trykledningen tilsluttes pumpens trykstuds T, fig. 3.

Trykledningens diameter bør mindst være den samme som trykstudsens for at minimere trykfald, store vandhastigheder og støj.

2.3.3 Returløb

Hvis der er risiko for drift mod afspærret afgangsledning, skal der sikres et min. flow gennem pumpen ved at forsyne pumpens afgangsside med et returløb/afløb til tank eller lignende.

Min. flow skal være mindst 10% af flow ved maks. virkningsgrad. Flow og trykhøjde ved maks. virkningsgrad er angivet på pumpens typeskilt.

2.4 Installationseksempler

Pumpen har mange anvendelsesmuligheder.

På side 49 er vist nogle eksempler.

3. El-tilslutning

El-tilslutning skal foretages i henhold til de lokalt gældende el-regulativer og normer.

Kontrollér, at netspænding og frekvens svarer til de på pumpeskiltet angivne værdier.

Ved ethvert indgreb i pumpens klemkasse skal forsyningsspændingen være afbrudt.

Pumpen skal tilsluttes en ekstern netspændingsafbryder.

1-fasede motorer stemplet 1 x 110/220 V, 60 Hz, har ikke indbygget motorbeskyttelse og skal derfor tilsluttes et eksternt motorværn.

Øvrige 1-fasede motorer har indbygget termoafbryder og kræver derfor ingen yderligere motorbeskyttelse.

3-fasede motorer skal tilsluttes et motorværn, hvis indstillede mærkestrøm skal stemme overens med de elektriske data på pumpens typeskilt.

Pumpen må ikke startes, før den er fyldt med væske.

Den elektriske tilslutning udføres som vist i klemkasselåget.

Vælg én af de to kabelindføringer, og fjern udslagsblanketten.

3.1 Omdrejningsretning

(3-fasede motorer)

Pilene på motorens ventilatorskærm angiver korrekt omdrejningsretning.

Omdrejningsretningen skal være mod uret, set mod ventilatorskærmen.

Er omdrejningsretningen forkert, afbrydes strømforsyningen, og to faser ved motorens tilslutning til motorværnet ombyttes.

4. Idriftsætning

4.1 Væskepåfyldning

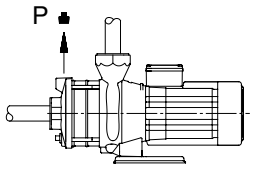
Før pumpen startes, skal den fyldes med væske og udluftes.

Ved anlæg med varme væsker skal der under udluftningen udvises største forsigtighed for at forhindre enhver risiko for personskade forårsaget af den udstrømmende væske.

Ved trykforøgeranlæg og anlæg, hvor væskeniveauet på sugesiden er over pumpen:

1. Luk afspærringsventilerne på suge- og trykside.
2. Demontér spædeproppen P, fig. 4.
3. Åbn ventilen på sugesiden gradvist, og hold den åben, indtil en jævn væskestrøm løber ud af spædestudsen.
4. Luk ventilen, montér spædeproppen og spænd tæt.
5. Åbn ventilen på sugesiden.
6. Start pumpen, mens afspærringsventilen på tryksiden gradvist åbnes til fuldt åben stilling.

Fig. 4



TM00 0692 4896

Pumpning fra beholdere og brønde, hvor væskeniveauet på sugesiden er under pumpen:

1. Luk afspærringsventilen på tryksiden.
2. Demontér spædeproppen P, fig. 4.
3. Hæld vand gennem spædestudsen. Sørg for, at sugeledning og pumpe bliver helt fyldt med væske og udluftet.
4. Montér spædeproppen og spænd tæt.
5. Start pumpen, mens afspærringsventilen på tryksiden gradvist åbnes til fuldt åben stilling.

4.2 Start/stop

Maks. 100 starter pr. time.

5. Drift og vedligeholdelse

Pumpen kræver ikke vedligeholdelse under normal drift.

Anvendes pumpen til urene væsker, renskylles pumpen med rent vand straks efter brug.

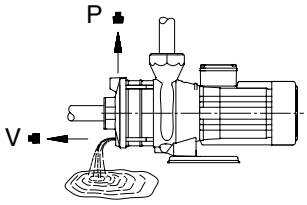
5.1 Frostsikring

Pumper, som ikke anvendes i frostperioder, skal tømmes for at undgå beskadigelse.

Demontér spæde- og tømmepropperne P og V, fig. 5.

Montér først propperne, når pumpen atter skal i drift.

Fig. 5



TM00 0693 4896

DK

6. Fejlfinding

Før fejlfindingen påbegyndes, skal forsyningsspændingen være afbrudt.

Fejl	Årsag
1. Pumpen starter ikke.	a) Manglende eller forkert el-forsyning til motor. b) Et eventuelt styrekredsløb er afbrudt eller defekt. c) Motor defekt. d) Pumpen blokeret af urenheder.
2. Pumpen kører, men giver ingen væske.	a) Pumpen ikke fyldt med væske. b) Suge- eller trykledning tilstoppet af urenheder. c) Pumpen tilstoppet af urenheder. d) Sugehøjde for stor. e) Sugeledning utæt. f) Kontra-/bundventil blokeret.
3. Reduceret tryk og væske-mængde.	a) Motorens omdrejningsretning forkert (3-faset). b) Sugehøjde for stor. c) Suge- eller trykledning tilstoppet. d) Pumpen tilstoppet af urenheder. e) Kontra-/bundventil delvis blokeret.
4. Pumpen kobler fra under drift.	a) Termoafbryder i motor ellerekstern motorbeskyttelse kobler ud. b) Et eventuelt styrekredsløb afbryder.

7. Bortskaffelse

Bortskaffelse af dette produkt eller dele deraf skal ske i henhold til følgende retningslinier:

1. Anvend de lokalt gældende offentlige eller private renovationsordninger.
2. Såfremt sådanne ordninger ikke findes eller ikke modtager de i produktet anvendte materialer, kan produktet eller eventuelle miljøfarlige materialer derfra afleveres til nærmeste GRUNDFOS-selskab eller -serviceværksted.

DK

Ret til ændringer forbeholdes.

Addresses revised 06.12.1999

GRUNDFOS®

6.1 OVERVIEW

Although setpoints can be entered manually using the front panel keys, it is much easier to use a computer to download values through the communications port. A free program called 239PC is available from Multilin to make this as convenient as possible. With 239PC running on your personal computer under Windows it is possible to:

- Program/modify setpoints
- Load/save setpoint files from/to disk
- Read actual values
- Monitor status
- Plot/print trends
- Read pre-trip data and trip record
- Get help on any topic
- Print the instruction manual from disk

The 239PC software allows immediate access to all the features of the 239 with easy to use pull down menus in the familiar Windows environment.

The 239PC software can run without a 239 connected to a computer and save settings to a file. If a 239 is connected to a serial port on a computer and communications is enabled, the 239 can be programmed from the *Setpoint* screens. In addition, measured values, status and trip messages can be displayed with the *Actual* screens.

6.2 HARDWARE CONFIGURATION

The 239 communications is setup as shown in the figure below.

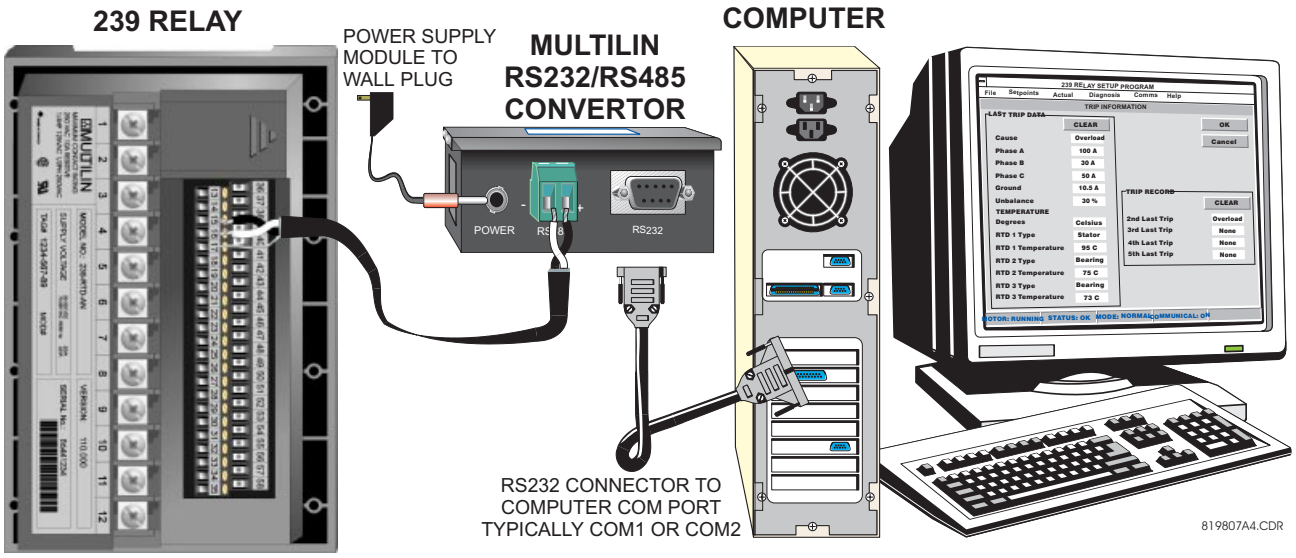

Figure 6–1: TYPICAL COMMUNICATIONS SETUP

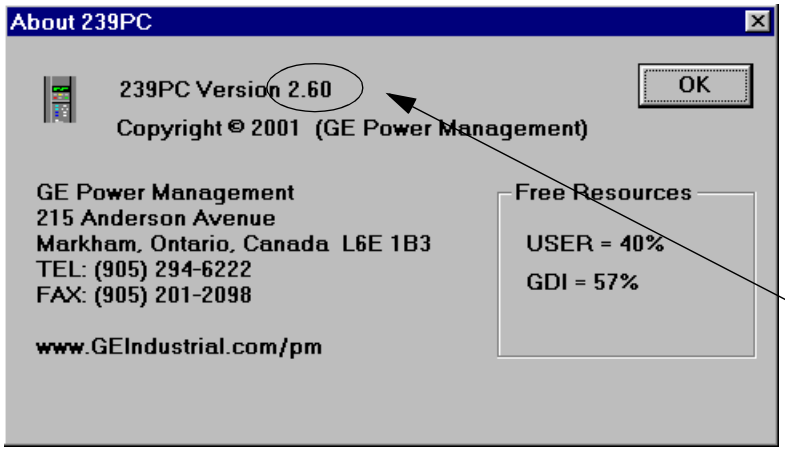
6.3 239PC VERSION

If the 239PC software is already installed, check if it needs to be upgraded as shown below. If the 239PC software is installed and is up-to-date then skip to 6.4: INSTALLING/UPGRADING 239PC on page 6–3.

1. Select the **Help > About 239PC** menu item.



2. No upgrade is required if the two versions are identical.

Front page of manual.

The following minimum requirements must be met for the 239PC software to operate on the computer.

- Windows® 3.1 / Windows 95 or higher is installed and running
- 10MB free hard disk space

If the 239PC software already exists and is being upgraded, then please note down exact path and the directory name of the current installation because it will be required during the new installation process.

1. Start Windows.
2. Insert the GE Multilin Products CD into the appropriate drive (alternately, you can go to the GE Multilin website at www.GEindustrial.com/multilin to continue the installation—the steps are roughly the same).
3. The following window will be displayed by your default web browser once the CD drawer, with the Product CD, is closed:

4. Use the mouse to click on **Software**. If 3.5" floppy disks are required, they may be created from the installation program on this CD, created from the GE Multilin website at www.GEindustrial.com/multilin, or ordered directly from the factory.

5. The browser will display the GE Multilin product list in alphabetical order. Choose the **239 Motor Protection Relay** from this list.

6. Select the 239PC program from the list of software and firmware items.

239 Software

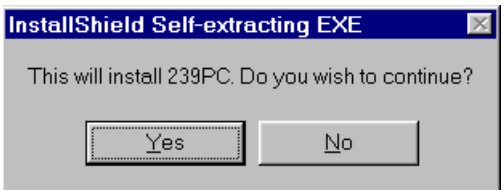
PC Program:

- 239PC Version 2.51 (.exe) [4M]

Relay Firmware:

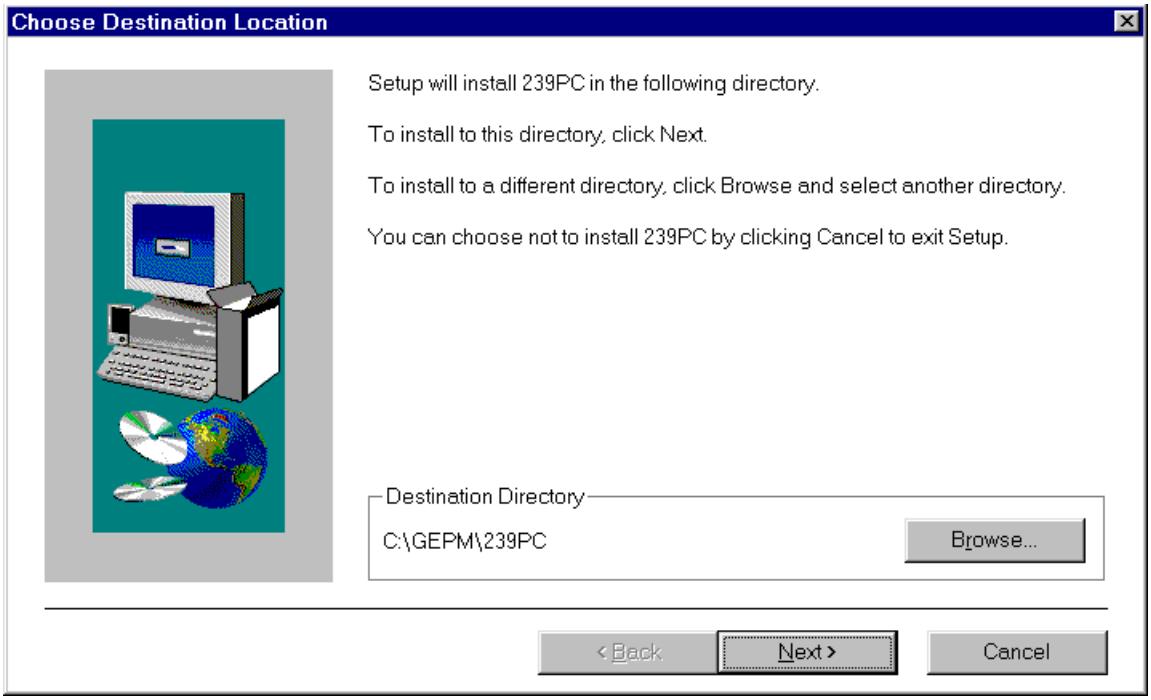
- 2.51 Firmware serial# beginning with B or C (.zip) [58k]
- 2.51 Firmware for serial# beginning with D (.zip) [59k]

7. The browser will launch the **File Download** window. Select the **Run this program from its current location** option and click **OK**. The following window will appear.



8. Verify that you wish to install 239PC by clicking **Yes**.
9. Click on **CONTINUE WITH 239 PC VERSION 2.50 INSTALLATION** to continue installing the PC software directly to your hard drive. If you wish to make a 1.44MB floppy disk containing the 239PC software, click on **Start Copying**.

10. The install program will prompt for a destination folder.



11. If the program is not to be installed in the default directory, or 239PC is already installed in a different location, click on **Browse** and enter the complete path for 239PC. If 239PC is already installed, the old files will be replaced with new ones. Click **Next** to continue with the installation process once the destination directory is correct.
12. The 239PC install program will ask you to choose between **Typical**, **Compact**, and **Custom** setup (**Typical** is fine for almost all cases). Choose the desired type of setup preferred and click **Next** to continue the installation process.
13. You will be prompted to choose a folder name to place the 239PC icon. Select a folder and click **Next** to continue.
14. Click on **Finish** to complete the installation of 239PC. It is recommended that you restart Windows before using the program.

NOTE

The 239PC program may also be installed from the GE Multilin website at www.GEindustrial.com/multilin. Follow the instructions above for installation.

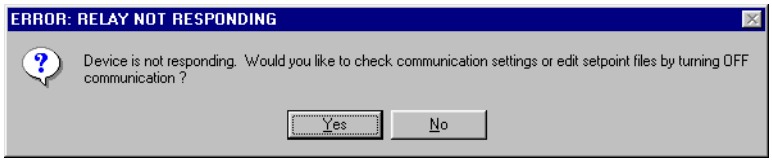
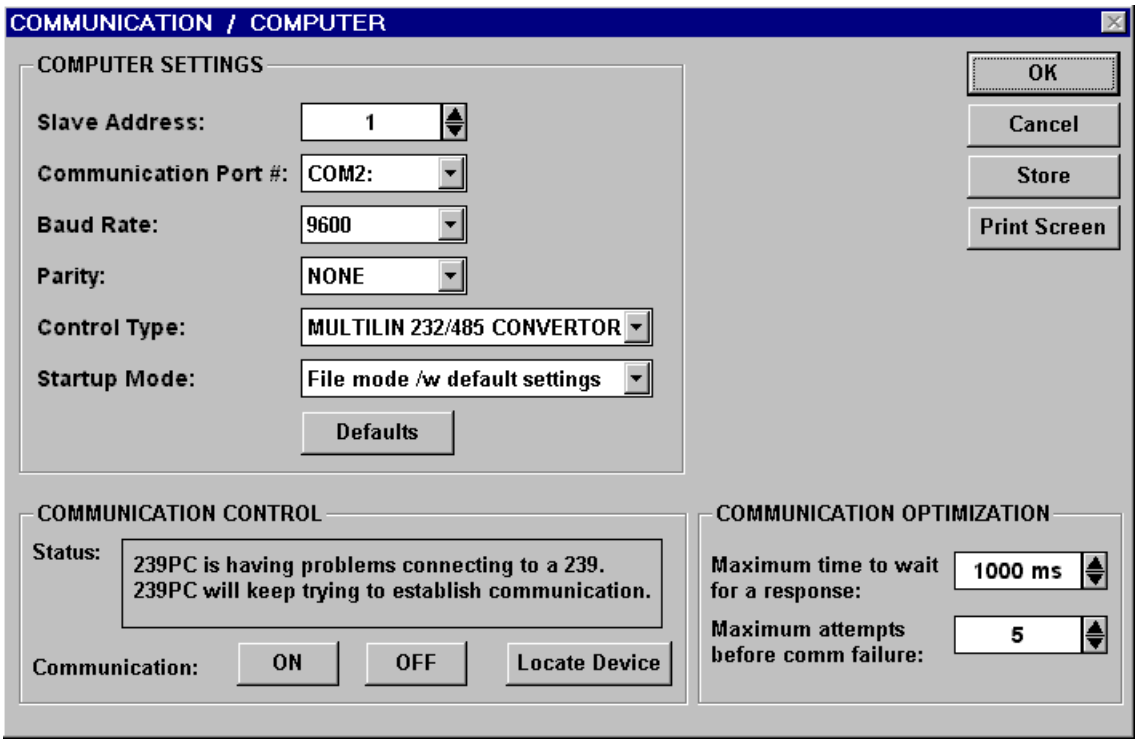
6.6 CONFIGURING 239PC

1. Start 239PC by double-clicking the **239PC** icon in the GE Multilin folder (or alternate folder containing the 239PC icon) or from the Start menu.
2. Once 239PC starts to execute, it will attempt to communicate with the relay. If communication is established successfully, the screen and LEDs on the relay graphic shown in the 239PC window will display the same information as the actual relay.

3. If 239PC cannot establish communication with the relay, the following message will be displayed.



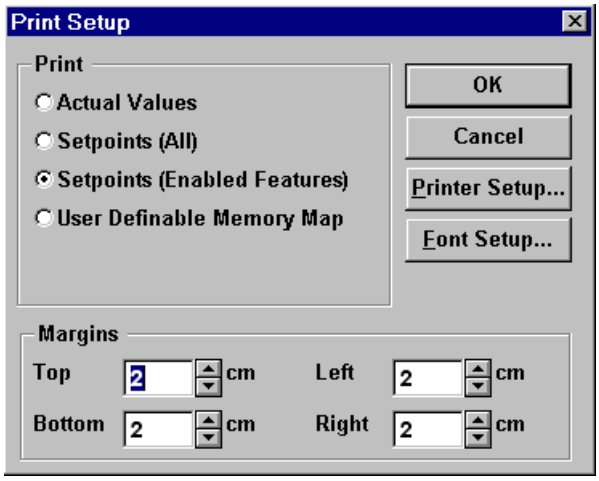
4. Click on **Yes** to edit the 239PC communication settings. This will display the **COMMUNICATION/ COMPUTER** window shown below.



5. Set **Slave Address** to match the relay address setpoint.
6. Set **Communication Port #** to the COM port where the relay is connected.
7. Set **Baud Rate** to match the relay baud rate setpoint.
8. Set **Parity** to match the relay parity setpoint.
9. If using the GE Multilin F485 converter, leave the **Control Type** setting as is.
10. Set **Startup Mode** to “Communicate with relay”.
11. Click the **ON** button to communicate with the relay and 239PC will notify when communications have been established with the relay. If it fails to communicate, check the following:
    - Ensure that the settings above match the relay settings.
    - Ensure the COM port setting matches the COM port being used.
    - Ensure the hardware is connected correctly as shown in Figure 6–1: TYPICAL COMMUNICATIONS SETUP on page 6–1.
    - Ensure the RS485 cable polarity is correct and connected to the correct relay terminals.

a) STEP 1—SAVING AND PRINTING SETPOINTS

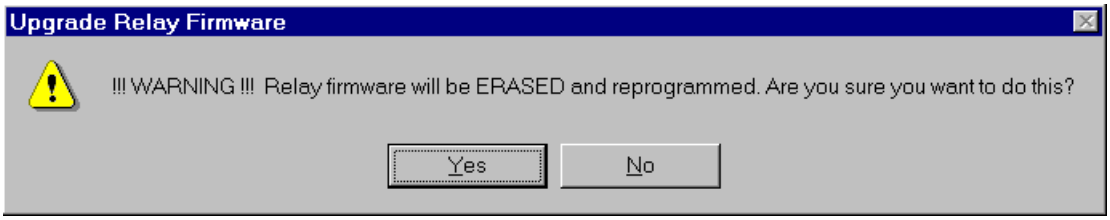
1. Save the 239 setpoints to a file by selecting **Save As** from the **File** menu.
2. 239PC will prompt for a file name and location. Choose an appropriate file name and directory then click **OK** to continue saving the setpoints.
3. Select **Print Setup** from the **File** menu.
4. The **Print Setup** dialog box (shown below) will appear. Select the desired information to be printed, in this case **Setpoints (All)**, and then click **OK**.



5. Select **Print** from the **File** menu.
6. Ensure the printer selected is setup and on-line and click **OK** to print setpoints.

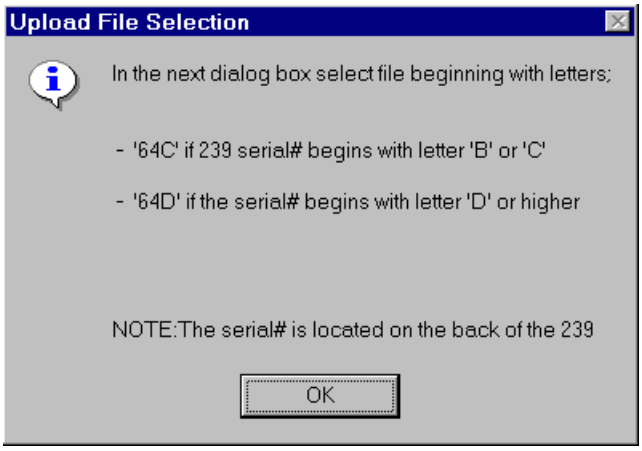
b) STEP 2—LOADING NEW FIRMWARE INTO THE 239

1. Select **Upgrade Firmware** from the **Communication** menu.
2. The following window will appear. Select **Yes** to proceed or **No** to abort the process.

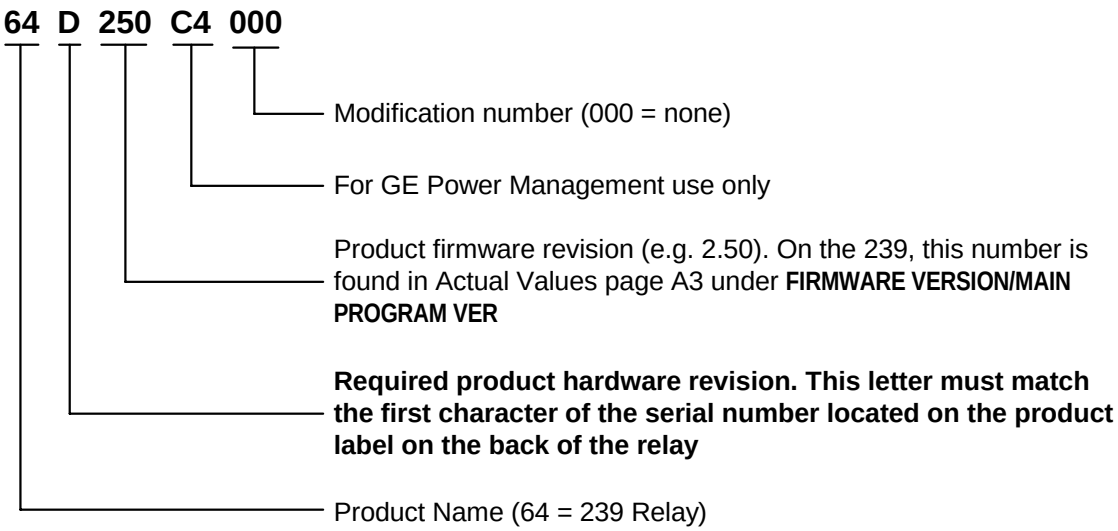


3. The file to be loaded into the 239 **must** match the hardware inside the 239.
   - If the 239 serial number begins with B or C, select the file beginning with the characters 64C.
   - If the 239 serial number begins with D, select the file beginning with the characters 64D.

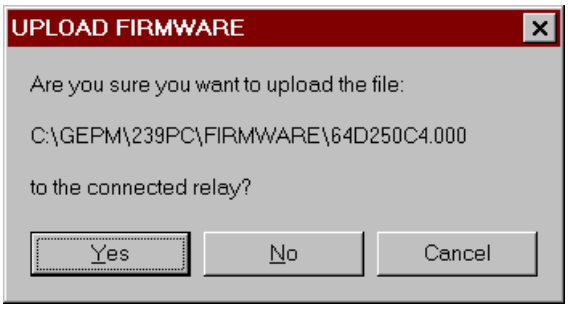
This is indicated in the following dialog box. Click **OK** to continue.



4. The Load Firmware dialog box appears. The firmware file name has the following format:



5. Locate the firmware file to be loaded into the relay and click OK to proceed.
6. The following dialog box will appear; select
   - **Yes** to proceed
   - **No** to load a different firmware file
   - **Cancel** to abort the process



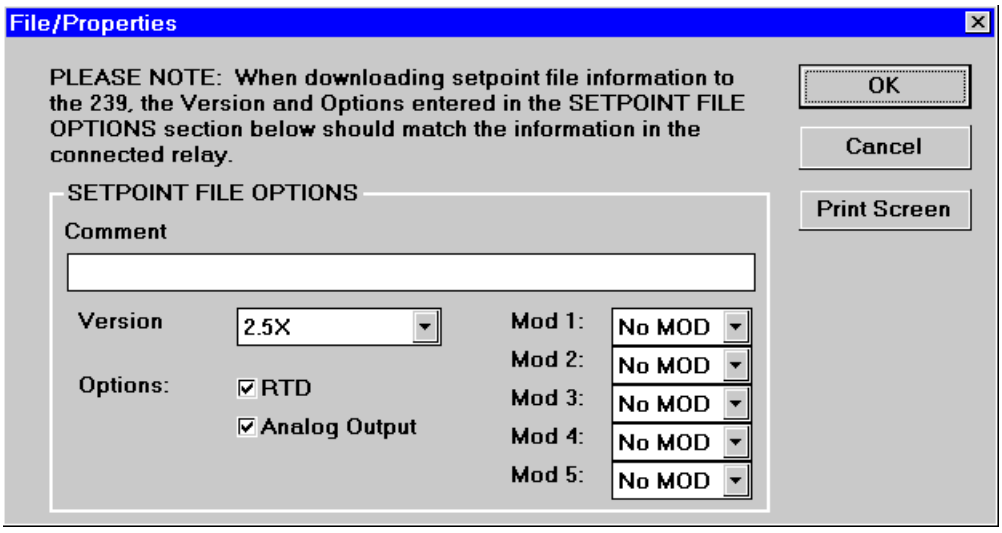
The program will now prepare the relay to receive the new firmware file. The 239 will display the UPLOAD MODE message. If the 239 has boot code revision 2.00 or earlier and a liquid crystal display, the UPLOAD MESSAGE may not appear. Also, if the 239 has boot code revision 3.00 or later and a vacuum fluorescent display, the UPLOAD MESSAGE may not appear. In both cases, the display returns to normal after the firmware upload has successfully completed.

7. A dialog box will appear indicating the file transfer progress and time elapsed. The entire download process takes approximately three minutes.
8. The following dialog box will appear when the firmware has been successfully loaded into the relay.

9. Carefully read any notes indicated in the box and click on **OK** to return to the main screen. If the relay does not communicate with the 239PC program, ensure the following setpoints agree with the 239PC settings shown in the **COMMUNICATION/COMPUTER** window.

c) STEP 3—LOADING SAVED SETPOINTS

1. Select **Open** from the **File** menu.
2. Select the file containing the setpoints to be loaded into the relay (saved in Step 1).
3. Select **Properties** from the **File** menu. The following dialog box will appear:



4. Change the **Version** and **Options** to match the firmware version and options of the 239 relay. The relay firmware and options can be in **A3: PRODUCT INFO/FIRMWARE VERSIONS** and **A3: PRODUCT INFO/**

MODEL INFORMATION, respectively. Also, select any MODs included with the relay. Click OK when finished.

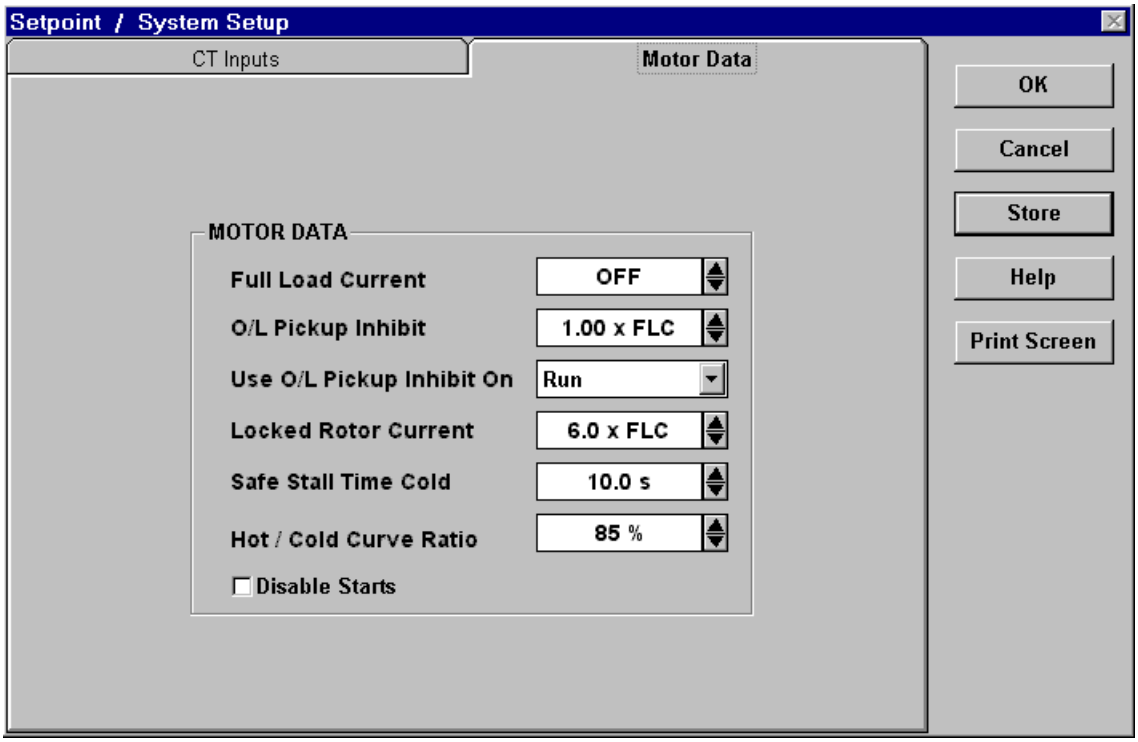
5. Select Send Info to Relay from the File menu to load the setpoints file into the 239 relay. If new setpoints were added to the upgrade software, they will be set to the factory defaults.
6. Upon successful completion of this procedure, the relay will have new firmware installed with the original setpoints.

6.8 USING 239PC

a) ENTERING SETPOINTS

All the 239 setpoints can be modified with 239PC. Setpoints pages S1 through S5 are available through the **Setpoints** menu.

For example, to change the value for setpoint **S2: SYSTEM SETUP/MOTOR DATA\OVERLOAD PICKUP INHIBIT**, choose the System Setup item from the Setpoints menu. This launches the **SETPOINT / SYSTEM SETUP** dialog box. Each subgroup (in this case, CT Inputs and Motor Data) are represented by folder tabs. Click the **Motor Data** tab to list the **S2: SYSTEM SETUP/MOTOR DATA** setpoints.



To change the **OVERLOAD PICKUP INHIBIT** setpoint, use the ▲ and ▼ buttons to choose an appropriate value and click **Store** to load into the relay.

All 239 setpoints can be changed in a similar manner.

b) ACTUAL VALUES

If a 239 is connected to a PC via the serial port, any measured value, status and last trip data can be displayed. Use the **Actual** pull-down menu to select various measured value screens. Monitored values will be displayed and continuously updated.

To plot a measured parameter, choose the **Trending** item from the **Actual** menu.

c) SAVING/PRINTING SETPOINT FILES

- To print and save all the setpoints to a file, follow the steps outlined in Section 6.7a) STEP 1—SAVING AND PRINTING SETPOINTS on page 6–9.

d) LOADING SETPOINT FILES

- To load an existing setpoints file to a 239 and/or send the setpoints to the 239, follow the steps outlined in Section 6.7c) STEP 3—LOADING SAVED SETPOINTS on page 6–11.

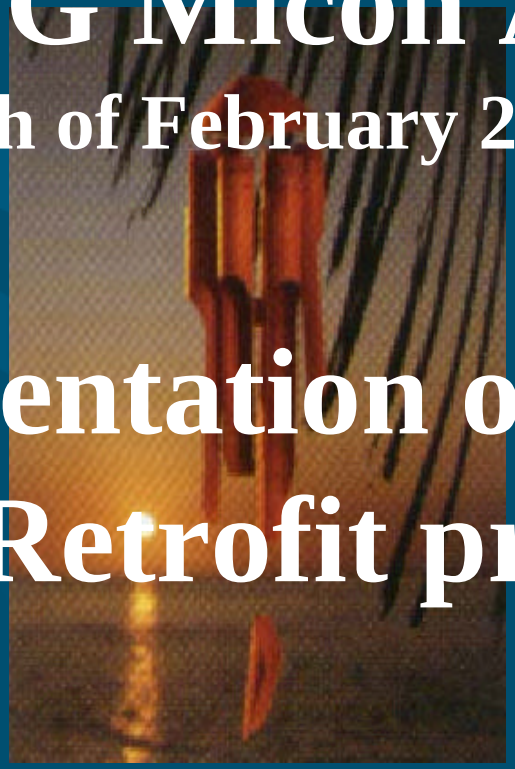
e) GETTING HELP

The complete instruction manual, including diagrams such as wiring, is available through on-line Help.

- Click on the **Help** menu and select the desired topic. Consult Help for an explanation of any feature, specifications, wiring, installation, etc.
- Context sensitive help can be activated by clicking on the desired function.
- For easy reference, any topic can be printed by selecting **File > Print Topic** while in Help. A laser printer is recommended for printing illustrations. Screen colors will appear in the printout if a color ink jet printer is used.

NEG Micon A/S

18th of February 2000



Presentation of the Gearbox Retrofit programme

N·E·G MICON®

Gearbox retrofit programme

This document reproduces the elements of a visual presentation and does not thoroughly describe the retrofit programme. Consequently, the document is not in any way binding for

NEG Micon A/S

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

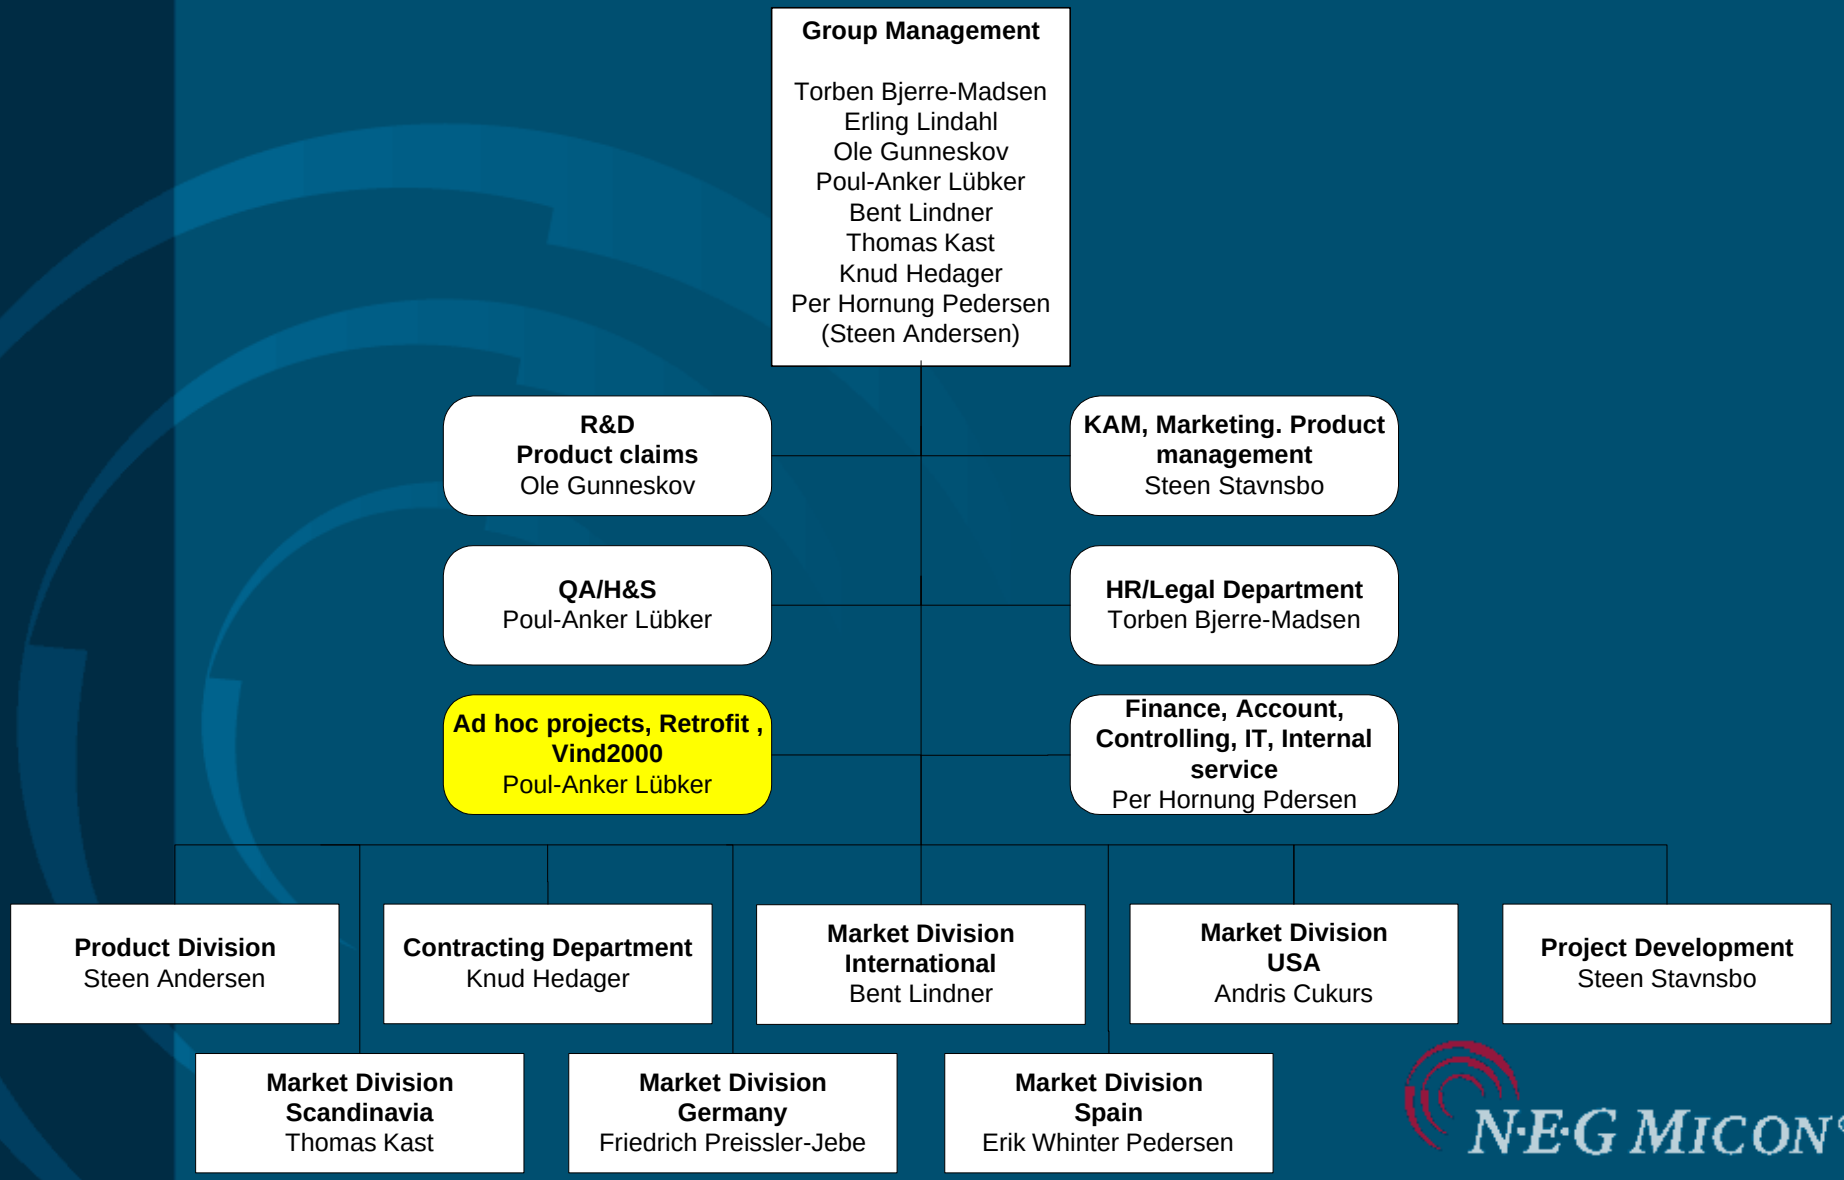
Agenda

- Top priority in the NEG Micon organisation
- Findings
- Conclusion - findings
- Decisions based on findings
- Lifetime of gearboxes until retrofit
- How to organise the programme
- Retrofit details
- Time schedule
- Exchange of gearbox
- Co-operation agreement and future with Flender

N·E·G MICON®

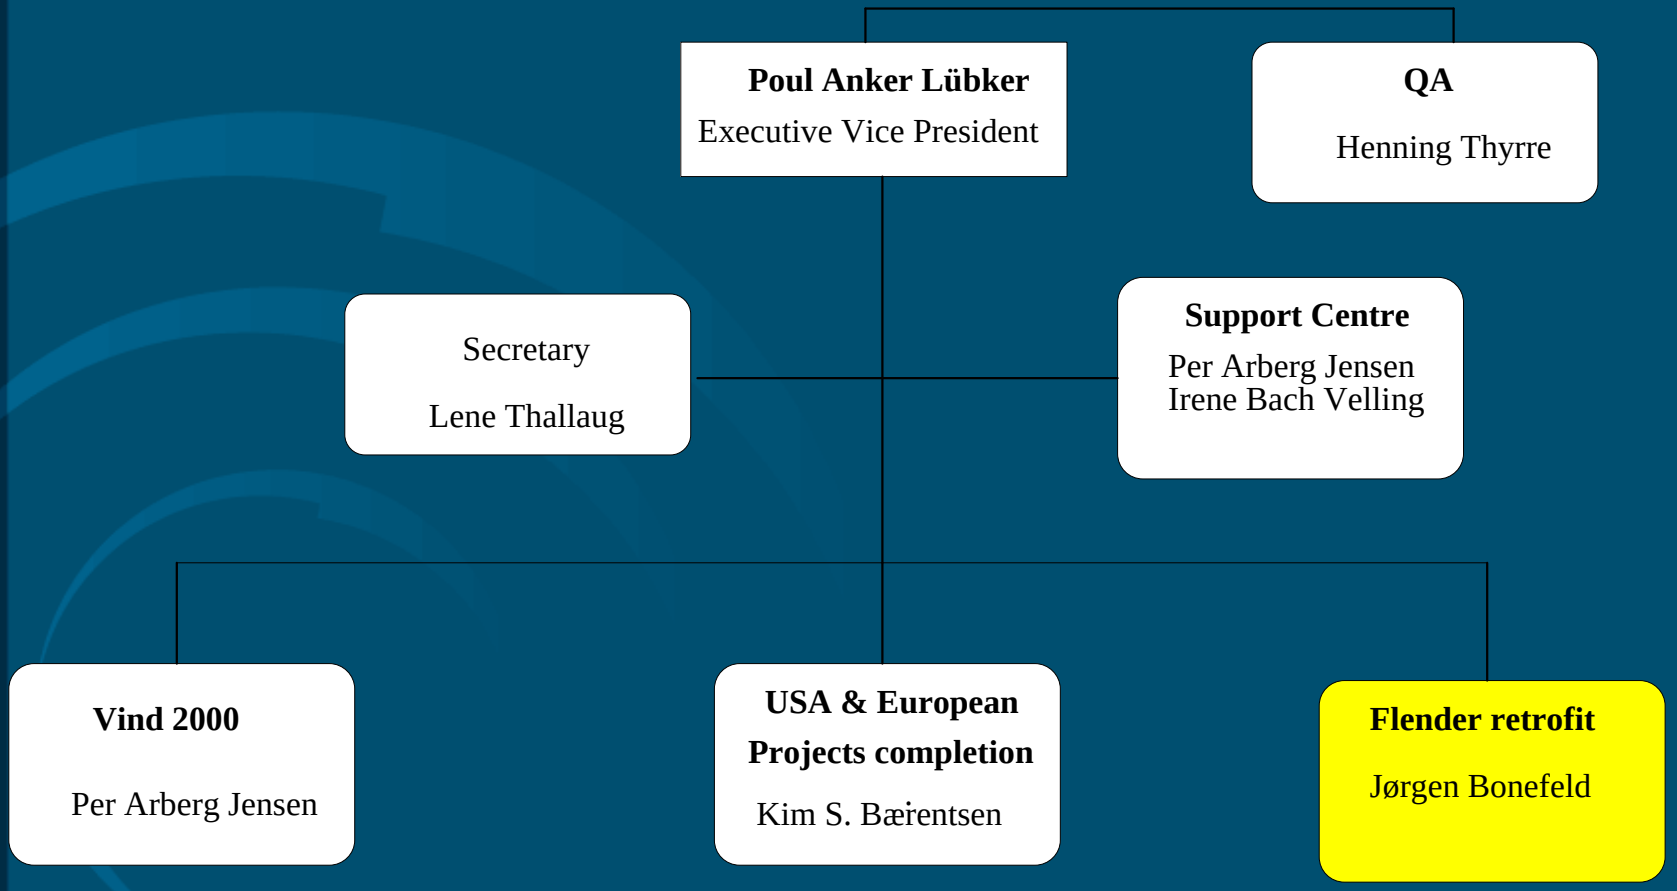
This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

NEG Micon Organisation



This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

NEG Micon Organisation, Ad hoc projects



This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Findings

- Experience of gearbox failures on:
  - PEAC 4280 used in NM 600/43 and NTK 600/43
  - PEAC 4300 used in NM 600/48, 750/44, 750/48
  - In total 9 different versions (different ratios)
- Other gearbox brands have been used in the same WTG models. These and other Flender gearbox types are ok
- The findings have shown different failure indications, so it is difficult to give an exact judgement
- Findings are based on statistical analyses of approx. 1000 WTG´s

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Number of PEAC gearboxes

Denmark	403	Argentina	10
USA	310	Japan	6
Germany	108	Sweden	6
China	125	Costa Rica	5
Spain	109	Sri Lanka	5
Canada	83	Finland	2
UK	25	Italy	2
Holland	35	Greece	1
Stock - worldwide, only 4300 with 3 different ratios, app.			**215**
Total			**1450**

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

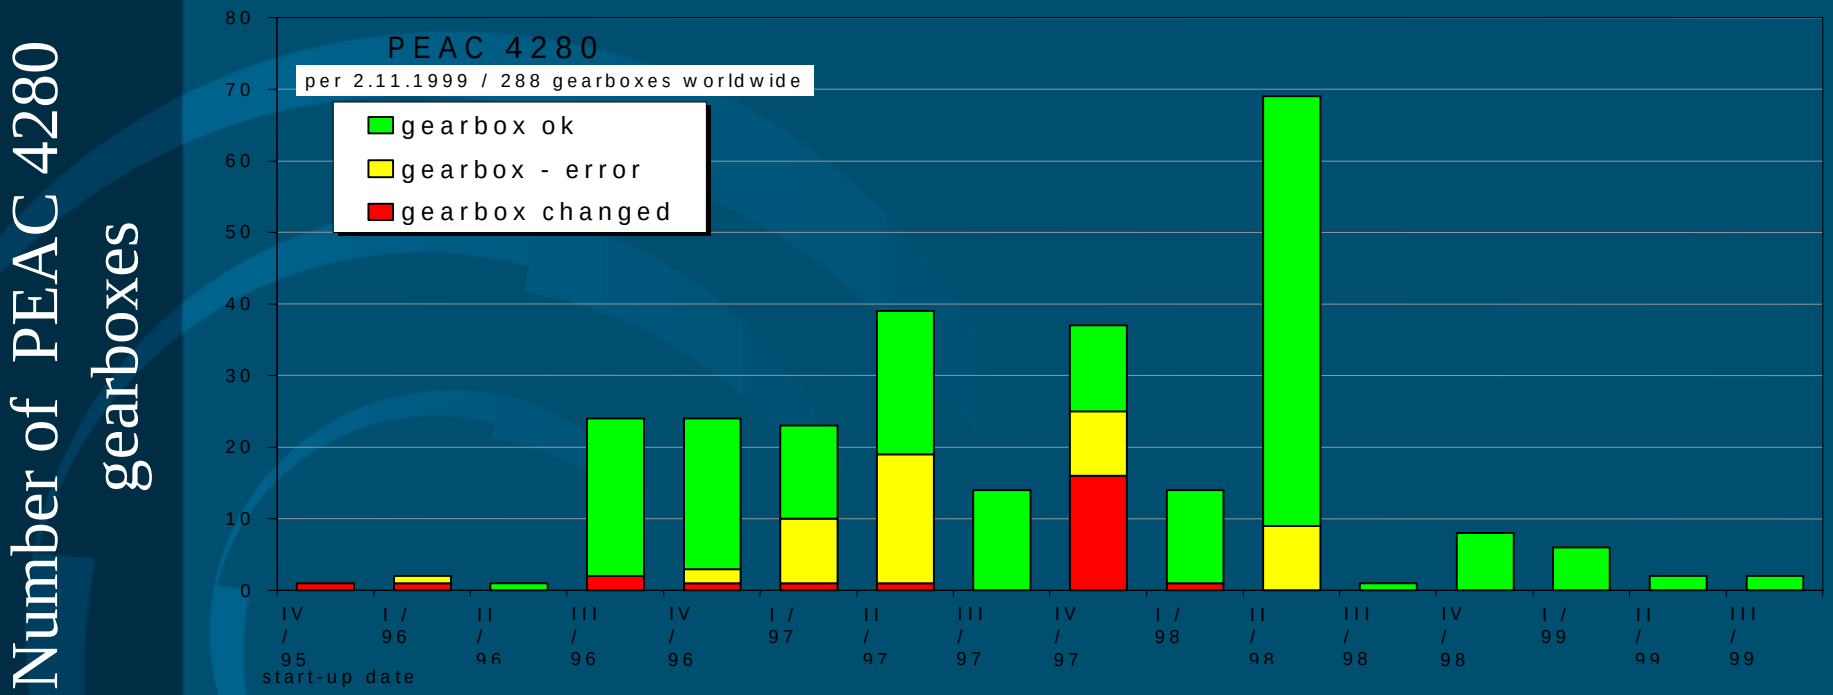
Findings of PEAC 4280 worldwide

• Total number of PEAC 4280:	309	
• Total number investigated:	292	93 %
• Percent changed:	26	9 %
• Percent with error:	51	17 %
• Percent OK:	215	74 %

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Findings of PEAC 4280 worldwide

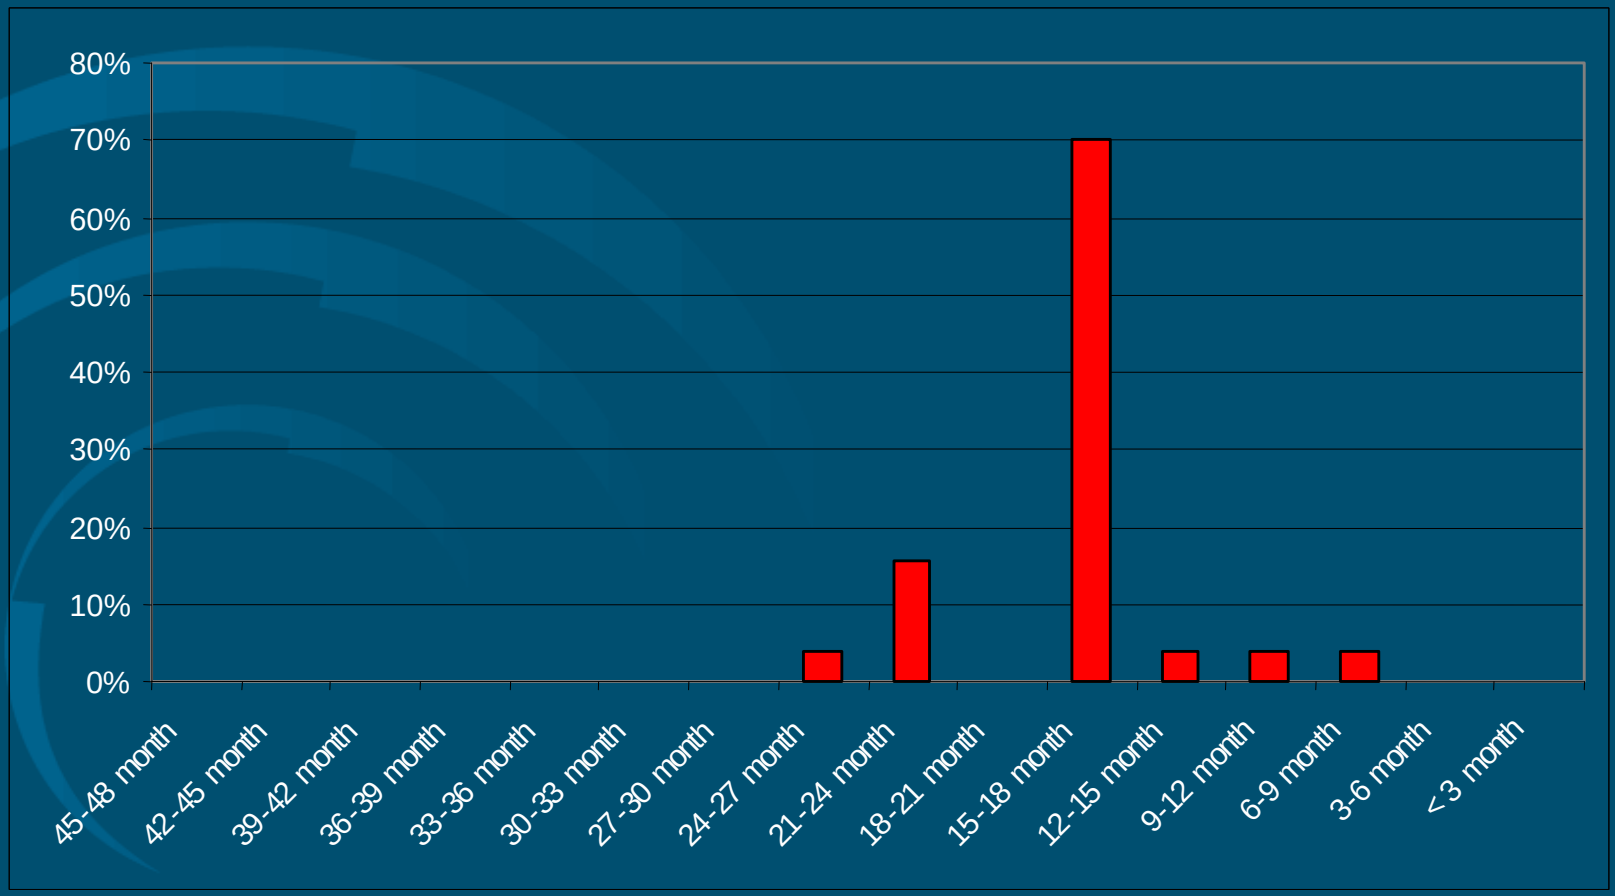


Increase of PEAC 4280 worldwide per operation start

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Findings of PEAC 4280 worldwide



Distribution of service life for exchanged PEAC 4280

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

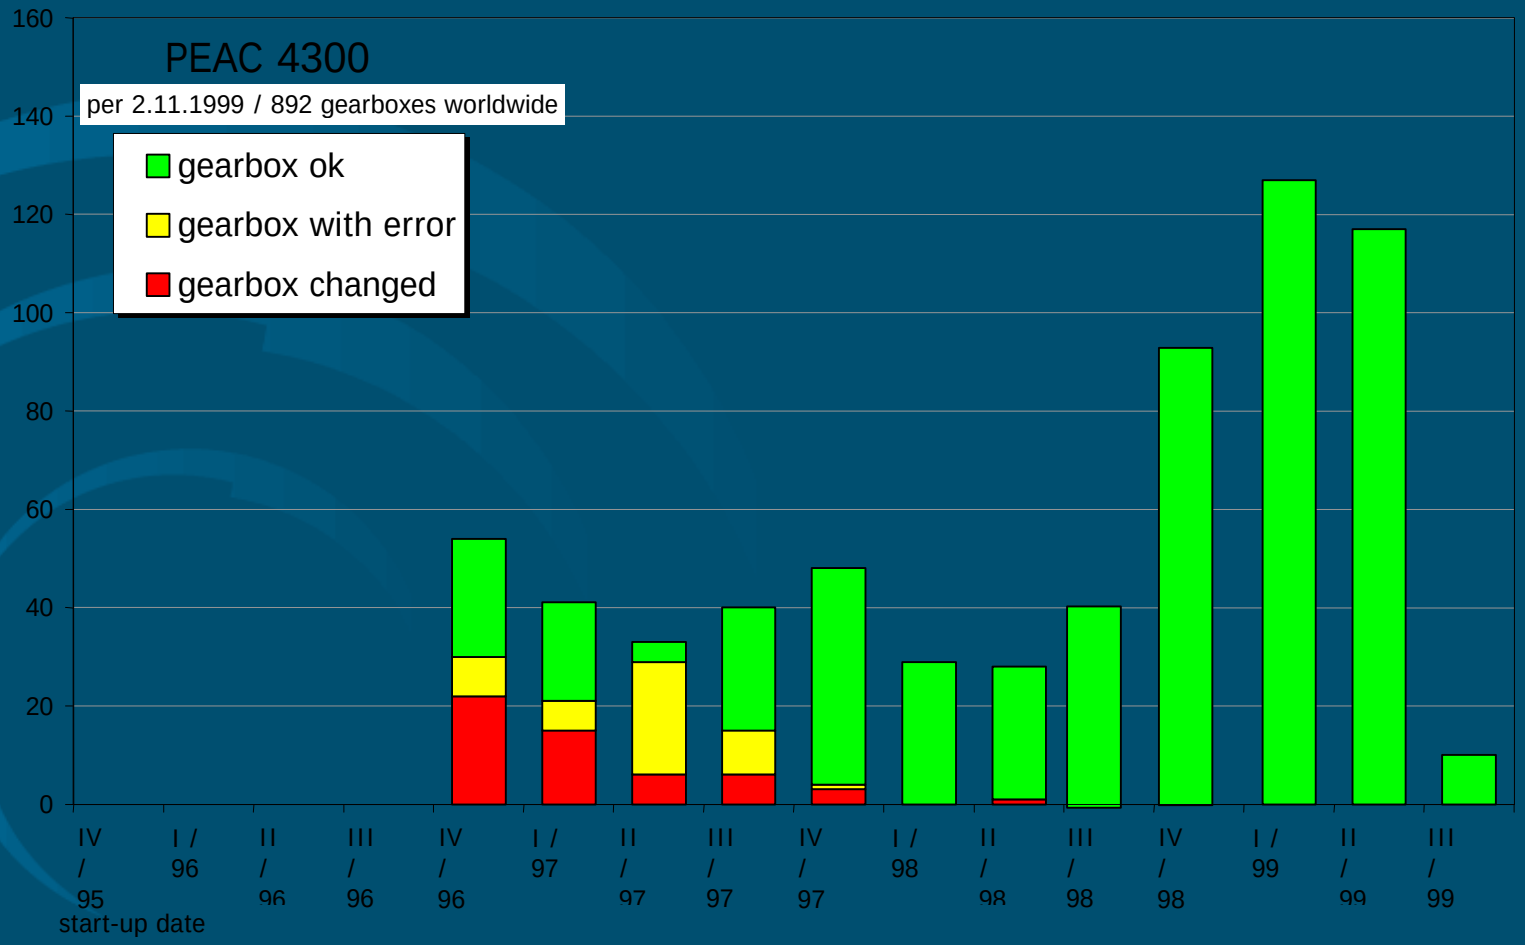
Findings of PEAC 4300 worldwide

- Total number of PEAC 4300: 1149
- Total number investigated: 891 78 %
- Percent changed: 50 6 %
- Percent with error: 47 5 %
- Percent OK: 791 89 %

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Findings of PEAC 4300 worldwide

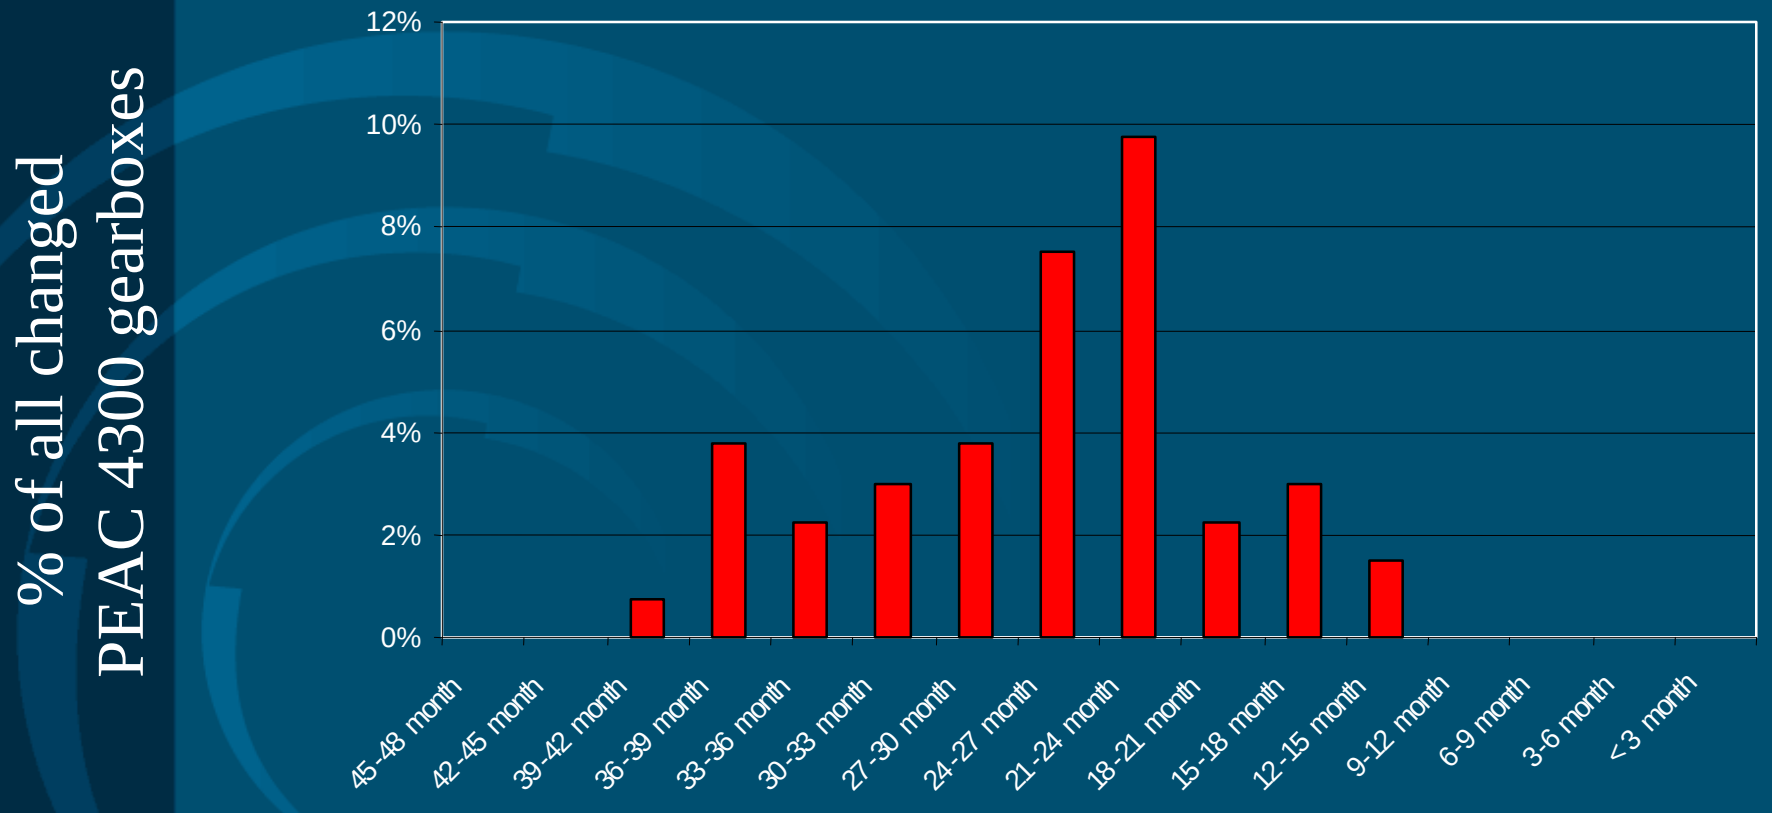


Increase of PEAC 4280 worldwide per operation start

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Findings of PEAC 4300 worldwide



Distribution of service life for exchanged PEAC 4300

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Conclusion - findings

- Apart from early fault due to grinding temper a low failure rate is expected in the first 2 years of operation
- After this time the failure rate increases
- Only 28 of a total of 76 exchanged had failed before preventive action could be taken

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Decisions based on findings

Due to the number of failures on Flender PEAC 4280 and 4300 gearboxes, it has been decided to retrofit these gearboxes in co-operation with Flender according to a co-operation agreement

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Lifetime of the gearboxes until retrofit?

- What has been done
  - Exchange of oil due to a sudden drop in the numbers of additives in the oil and to prevent micro-pitting
  - Mount filter, bypass and high pressure lubrication Improvement of lubrication, cooling system and cleanness of oil
  - Lower set point for oilsump temperature from max. 80ºC to max. 65ºC Increase lifetime of oil and improve operation conditions of the gearbox
  - Changed start temperature set point to 55ºC of oilpump to improve oil distribution in gearbox

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

How to organise the programme

- The programme will last for a time period of approx. 2 years starting beginning of 2000 acc. to a Main Time Schedule
- Until we have the retrofitted gearboxes:
  - Increased and intensive surveillance of gearboxes in operation => Install filter clogg-alarm, oil analysis and check availability
    - Filter Clogg measures the pressure over the oil filter, and with a drop of 2 bars an alarm will go off. Actions will be taken acc. to NEG Micon instructions but WTG will not be stopped. Clogg alarm and visual inspection may result in preventive measures being taken by NEG Micon (stopping of WTG if no gearbox is available)
    - Oil analysis in conn.with service as usual

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

How to organise the programme

- Until we have the retrofitted gearboxes, cont..:
  - Set up emergency procedures to ensure rapid exchange of unexpected exchanges of gearboxes
  - Gearboxes will be exchanged when we can see a failure under development
  - Approx. 215 gearboxes in service stock (only PEAC 4300) ready to be used or retrofitted at Flender

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

How to organise the programme

Develop management of activities:

- Most efficient method of gearbox exchange will be used
- Set up Main Time Schedule for gearbox exchange programme
- Set up central WTG availability surveillance centre
- Set up central information centre
- Set up Health and Safety plans
- Set up gear test stand in Denmark
  - Accelerated test at overload
  - Development of monitoring systems

- Organisation set up, education of supervisors has been ready since beginning of 2000

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

How to organise the programme

- Information from Information Centre will be relayed via normal communication lines
  - General information to NEG Micon key personnel
  - General information to the market
  - General customer info conc. the retrofit programme and specific info conc. the customer's own turbine
  - Customers will be informed approx. 2 months before exchange with a 2 weeks margin, starting 3rd quarter 2000
- Before starting the retrofit written agreements should be made with all customers

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

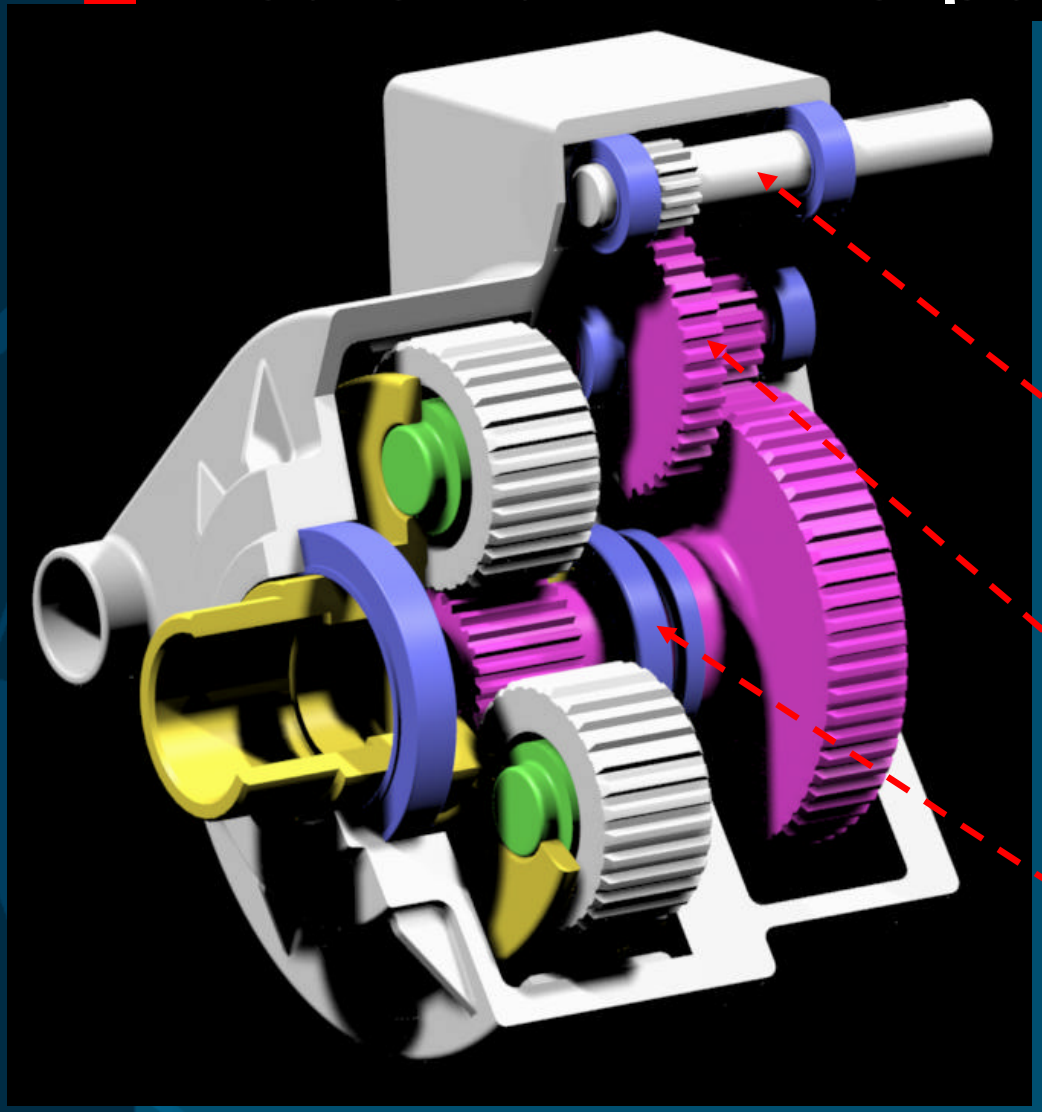
Retrofit details

- The retrofit work:
  - All PEAC 4280 and PEAC 4300 gearboxes will be retrofitted with new bearings and re-grinded. The new bearing will have the strength of a PEAK gearbox, which has shown no damages
    - During retrofit all components in the gearbox will be inspected and appropriate measures taken depending on the condition of each component

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Principal sketch no. I



The gearbox has 3 gearing stages

High-speed stage

Intermediate stage

Planetary stage

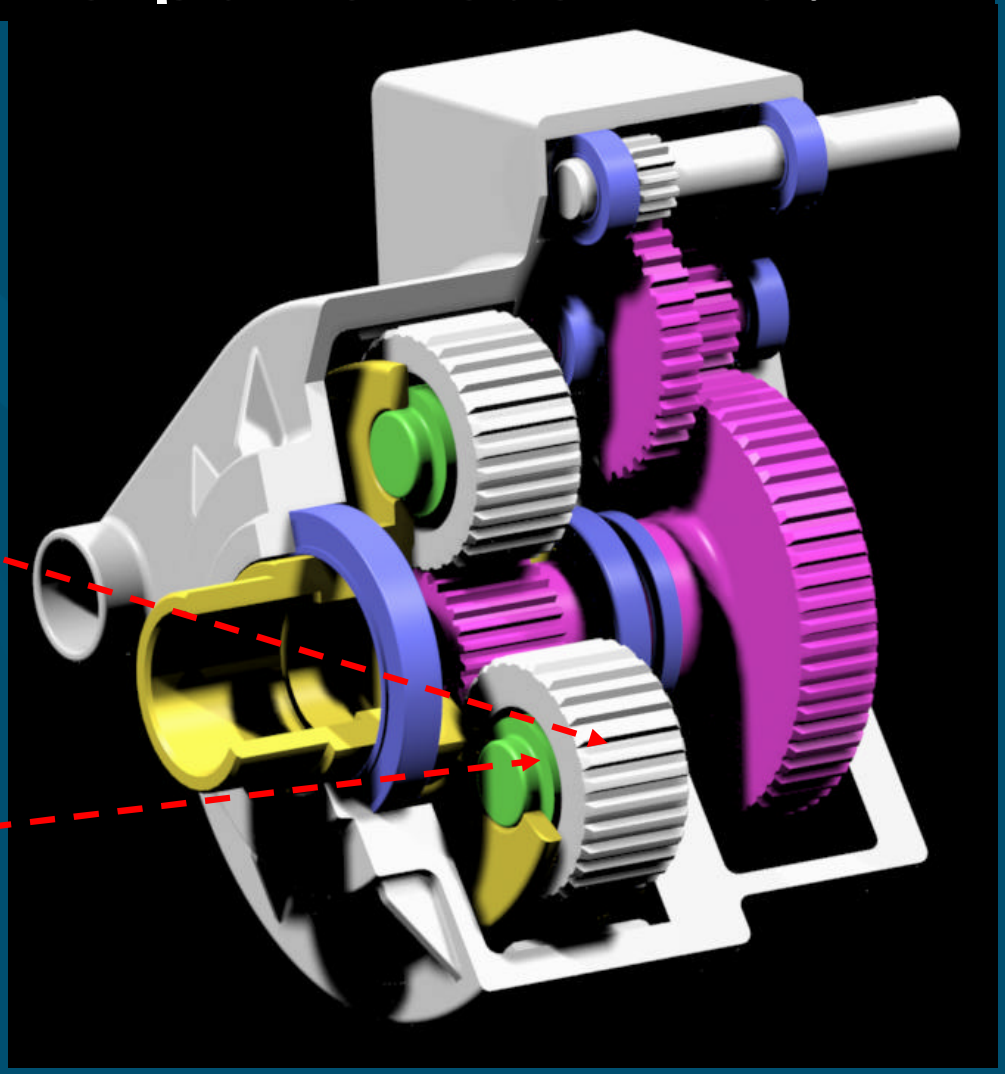
N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Principal sketch no. II

- Planetary stage:
  - Planet wheel (3)

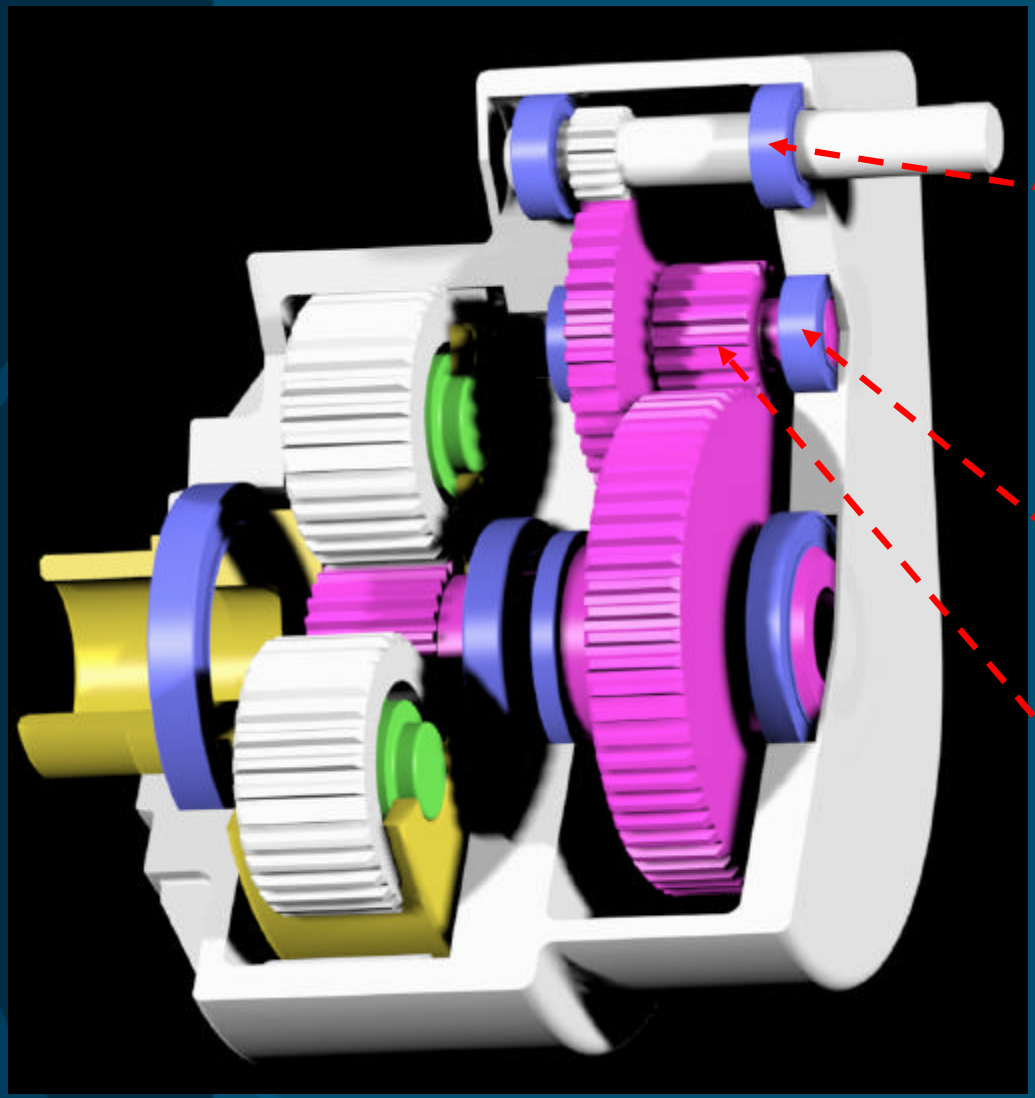
    All bearings exchanged to new and stronger double bearings. To fit the new bearings, new planet wheels are produced (increased rim thickness on PEAC 4300) and oil distribution improved



N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Principal sketch no.III



- High-speed stage:
  - Back bearing exchanged to new and stronger bearing arrangement with two instead of one bearing. Oil distribution improved
- Intermediate stage:
  - Back bearing exchanged to new and stronger bearing
  - Intermediate pinion
    - Re-grinding to optimised crowning to reduce the risk of development of micro-pitting => pitting

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Micro Pitting

- Micro pitting will occur in all gearboxes to a certain level. Subsequently, it will either increase or decrease
- Reasons for micro-pitting increase:
  - Overload
  - Wheel settings
  - Too few additives in the oil
  - Too high temperature
- An example
  - A dry teeth
  - Pressure mark
  - Dirty oil

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Grinding Temper

- Grinding temper is a result of:
  - Not 100% correct geometry of wheel after hardening process
    - Material stocking => Grinding at too high temperatures
  - Incorrect tool settings
  - Cooling oil too hot
- Result of grinding temper is case crushing

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Approvals

- The programme is approved by Det Norske Veritas (DNV) and will independently be challenged by some of the leading gear specialists in the world
  - Dr Hoffmann, University of Newcastle - submarine technology, independent gear specialist, UK
  - Don McVittie, Consultant, independent gear specialist, USA
  - Strange Skriver, independent wind turbine specialist, DK
- Final results of independent investigation are expected in beginning of March

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Quality Plan

- Actions on delivered old gearboxes at Flender
  - Receiving inspection of gearbox
  - Disassembly of gear and inspection of all parts
    - All exchanged parts will be scraped according to retrofit programme
    - Inspection for grinding temper on all re-worked parts according to retrofit programme. All other parts showing indication of grinding temper will be inspected
    - Reasons for possible failures in the gearbox will be determined

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Quality Plan

- Actions on the retrofitted gearbox
  - Inspection on all disassembled and reused parts
  - Receiving inspection of all new parts
  - Control of assembled gearbox
  - Control for grinding temper on all exchanged and new parts
  - Certificate will be issued for each gearbox
- NEG Micon will set up full-time QC inspection at Flender

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Test Programme

- The first PEAC 4280 and 4300 have been retrofitted and passed normal production tests at Flender with fine results
- Test of PEAC 4280 and 4300 gearboxes in wind turbines in Denmark and USA
- A special test programme has been set up testing noise, vibration and inside conditions of gearbox. Loads will be tested in co-operation with Wind Test
  - PEAC 4280 and PEAC 4300 50 Hz. Test programme is ongoing, and is looking good apart from some noise investigations. Final result is expected at the end of February 2000
  - US PEAC4300 60Hz wind turbine will be tested in first quarter of 2000

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Retrofit - Test Programme

- Overload test at Flender
  - Gears will be tested with 2 times nominal load for 200 hours
  - After the 200 hours test the gear will be tested additionally for 10 hours at overspeed (1800 rpm)
  - The test will take place during weeks 6 and 7. Final result is expected in week 10 after disassembly and inspection

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Time schedule

- Prototypes
  - Production release of 80 units
  - Additional 30 new PEAC 4280, with retrofit design, has been ordered to the retrofit programme. The first gears will be delivered in week 8.
  - Final retrofit design and production release is expected after final test in March 2000

- Flender will deliver 15 retrofitted PEAC 4280/4300 gearboxes per week beginning May/June year 2000 from new production facilities in Germany

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Time schedule

Gearboxes will be exchanged acc. to the following priorities:

- Gearboxes with indications of failures
- Gearboxes with potential risk of failure evaluated together with requirements of energy production and efficient use of logistics

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Exchange of gearbox

- Work on the wind turbine
  - Exchange gearbox with retrofitted gearbox
- The effect of the retrofit programme on the customers
  - The existing gearbox will be exchanged to a retrofitted gearbox
  - The retrofitted gearbox can be newer or max. 6 months older than the existing gearbox
  - A gearbox exchange will take 1 to 2 days, and will be carried out at a maximum wind speed of 10 m/s
  - Minor effect on avability

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Exchange of gearbox

- The effect of the retrofit programme conc. customers warranties
  - Existing or new warranties:
    - All existing warranties on gearboxes will stay in full force
    - New 2-year warranty on all renovated or new parts in the retrofitted gearbox from start of operation of retrofitted gearbox
    - 3-month total warranty after start of operation of retrofitted gearbox
    - 5-year warranty on grinding temper from start of operation of turbine

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

Future co-operation with Flender

- Flender is a pioneer and market leader in power transmissions with 100 years of experience
- Flender has been involved in the wind turbine industry for almost 20 years
- Flender and NEG Micon have co-operated for almost 15 years, and Flender will continue to be a strategic partner to NEG Micon in the development and delivery of gear units for future wind turbines

N·E·G MICON®

This document is property of NEG Micon and may not be disclosed in parts or in whole without written permission from NEG Micon

BEA-002 (17.04.2002)

SOBO®
Soft Braking Option

If you cannot control your stopping speed, you might not get a second chance!

The solution for:

- **Wind Turbines**
- **Escalators**
- **Winches**
- **Ventilation Systems**
- **SAG and Ball Mills**
- **Cement Tumblers**
- **Conveyors**
- **Cranes**
- **Mine Winders**
- **Ski Lifts**
- **Reservoir Gates**
- **Swing Bridges**
- **Your custom application …**

SVENDBORG BRAKES

With the SOBO®, the SOft Braking Option, you will have the best-performing brake on the market!

The advantages of SOBO brakes:

- *"SOFT" braking.*
- *Controlled and precise braking regardless of load.*
- *A cost-effective solution compared to any other brake system.*

SOBO:

- Is a patented ''intelligent'' brake system that regulates the load deceleration during a braking sequence.
- Ensures a controlled ''soft'' braking process, resulting in less wear and stress on the mechanical components of the brake system.
- Is a soft braking option that can be used for any of the following applications: Wind turbines, escalators, conveyor systems, mine winders, large ventilation fans, etc.
- Is a system that can be used for all types of crane braking applications, ski lifts, ship propeller drives and anchor winches or for any applications involving large masses that must be slowed or stopped.

SOBO is a Cost-effective solution!

Why you should consider SOBO when designing any mechanical system:

- *A combination of compact and powerful components easily integrated into any brake system for existing or forthcoming machinery.*
- *A better braking solution that prevents unnecessary wear on braking components caused by erratic or harsh braking processes.*
- *Less wear, less maintenance.*
- *Simple programming and reporting features to assist operators and maintenance personnel in the field.*
- *Can be used for both passive and active brake systems.*
- *Several levels of security within the controller to maintain a consistent process.*
- *Built-in warning signals can be sent to main PLC when operation is*

”Soft” Braking with SOBO

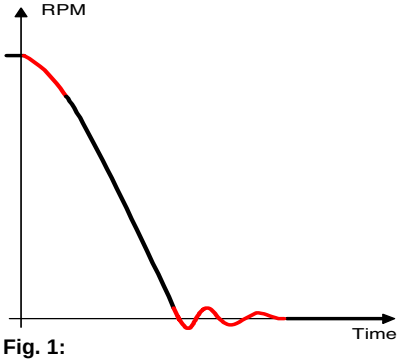

Fig. 1:

Illustrating the critical points of a “normal” braking

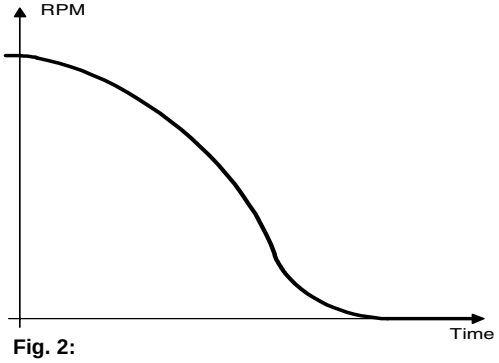

Fig. 2:

Non-controlled braking

A non-controlled or a "normal" braking sequence is relatively abrupt. The brake is activated with full braking force, creating "stress" at the beginning and end of the braking sequence, as shown in Fig. 1.

Fig. 3 shows the effects on the main shaft of a wind turbine. The shaft torque fluctuates, as the moment of inertia cannot be reduced as fast as the reduction in speed with this very rapid braking process.

The actual stop of the machinery will also create fluctuations of the moving parts, which will swing back and forth until the inertia has been reduced to zero - which may take several seconds or minutes. The fluctuations after stop are

SOBO-controlled braking

A SOBO-controlled braking sequence will be "soft", as the brake force will be applied in a controlled way. The brake pads will quickly make contact with the brake disc, but the brake force will be increased slowly and in a controlled manner. Fig. 2 shows the "soft" way in which the speed is reduced at the beginning of the braking sequence and, just as importantly, at the end.

Fig. 4 shows the dramatic reduction in the shaft torque of the wind turbine compared to non-controlled braking. The fluctuations and torque have been reduced to approx. 25%.

The unique parking sequence (see page 7) has firstly reduced the fluctuations and torque in the main shaft - but, just as importantly, the duration of these unwanted and destructive vibrations has also been reduced (to approx. 1/10).

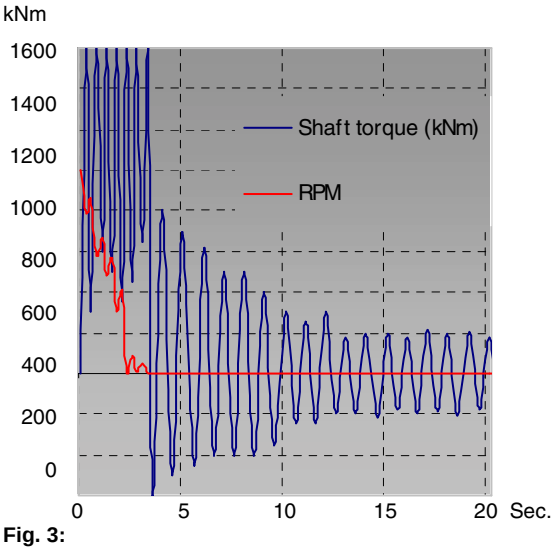

Fig. 3:

Stop of a MW wind turbine without brake control

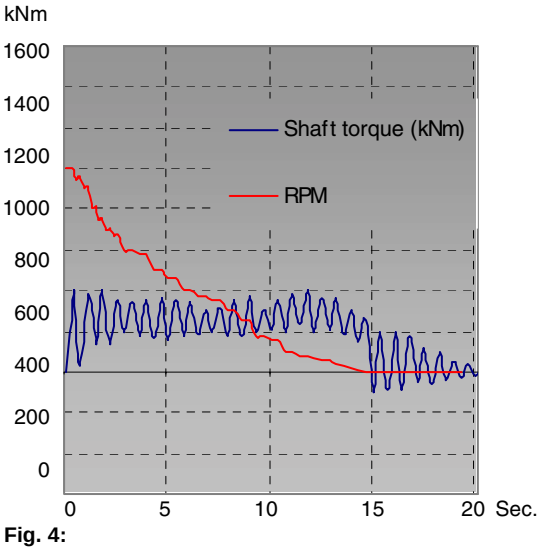

Fig. 4:

Stop of the same wind turbine using SOBO control

The concept is simple and complete

The SOBO concept can be designed as a turnkey system comprising the following components:

- SOBO Controller, electrical cabinet and speed sensor from SoboTech A/S.
- Hydraulic Power Unit from HydroTech International A/S.

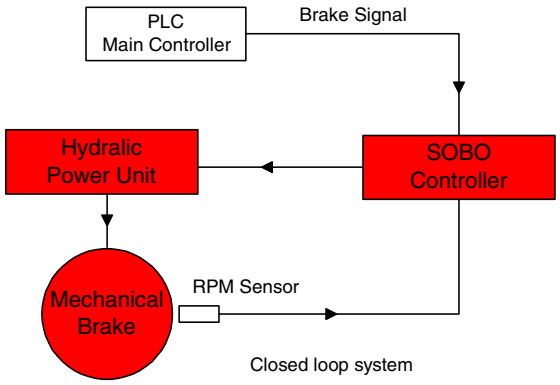

Fig. 5:

How does the SOBO system work ?

The sequence of operation:

- The SOBO controller "receives" a brake signal from the main PLC controller.
- The SOBO solenoid valves 20 and 21 are Pulse Width Modulated.
  (See page 5)
- The hydraulic pressure is reduced to zero in a controlled way as the hydraulic oil is returned to the tank.
- The spring pack in the brake calliper activates the brake.
- The SOBO solenoid valves are de-

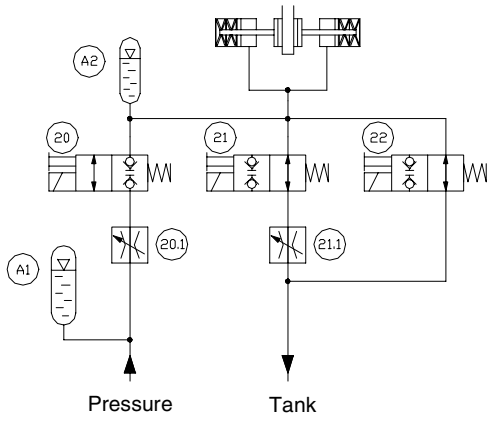

Fig. 6:

Hydraulic diagram, passive (fail safe) brake

Activating the brake

SOBO "soft" braking is a combination of hydraulic and electronic control. The adjustable throttle valves 20.1 and 21.1 and the SOBO accumulator A2 are the hydraulic components that make the braking "soft". The reduction in hydraulic pressure will not be instant, as the SOBO accumulator A2 and throttle valve 21.1 will try to keep the pressure up by "delaying" the flow of oil to the tank reservoir.

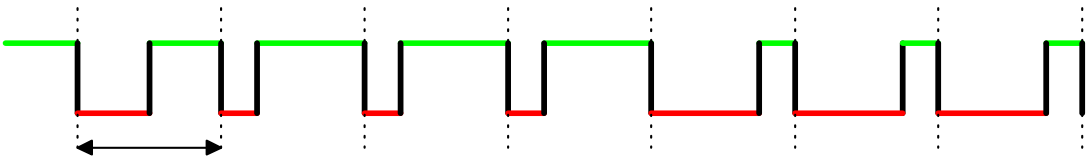
Releasing the brake

To release the brake after the braking cycle, the hydraulic system will operate in the opposite way. The brake is "lifted" in a "soft" way as the throttle valve 20.1 and the SOBO accumulator A2 delay the oil flow back to the brake cylinders. The pressure will increase, suppressing the brake springs and ultimately lifting the brakes.

The Pulse Width Modulation Principle

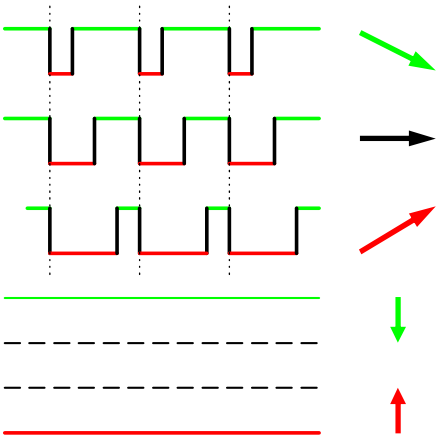
The SOBO modulation principle is a system based on ON/OFF Pulse Width Modulation of the two solenoid valves. This ON/OFF modulation based on the hydraulic and electronic components results in extremely safe and reliable braking.

The two solenoid valves "switch" ON / OFF at a rate of 10 times per sec., for example (Cycle time). By changing the time for brake OFF and ON, as shown below, it is possible to regulate the braking force. The SOBO controller will modulate the solenoid valves in such a way that the braking torque is regulated at all times to the actual need for "soft" and controlled braking of the mechanical machine concerned.



CycleTime (Pulse Width)

The Braking Force Control



= 75% / 25% ⇨ Less brake force

= 50% / 50% ⇨ Brake force does not change

= 25% / 75% ⇨ More brake force

= Brake OFF ⇨ The solenoid valves are energized

The SOBO Solenoid

Brake OFF

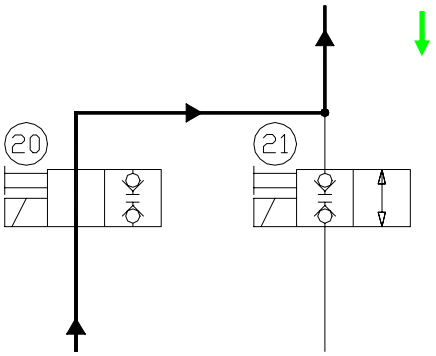


Fig. 7:

The solenoid valves are energized => Brake "lifted"

Brake ON

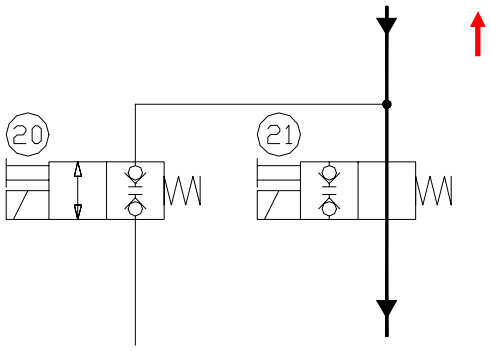

Fig. 8:

The solenoid valves are de-energized => Braking

The Deviation Band

The deviation band is one of the SOBO Controller's regulation functions. The deviation band effects regulation of brake torque by changing the Pulse Width Modulation of the solenoid valves (as explained on page 5). The deviation band determines the Pulse Width Modulation in such a way that an actual RPM value in the centre of the deviation band (the actual RPM value is equal to the programmed value) will result in "neutral" modulation of the solenoid valves, e.g. 50% / 50%, which means minimum change in brake torque. An actual RPM value above the midpoint of the deviation band will result in a Pulse Width Modulation that increases the braking torque, modulation e.g. 35% / 65% as shown in Fig. 9. An actual RPM value below the middle of the deviation band will result in a Pulse Width Modulation that decreases the braking torque, e.g. modulation 60% / 40% as shown in Fig. 9.

A "narrow" deviation band (B) will change the percentage of the Pulse Width Modulation as shown in Fig. 10. The difference between deviation band A and B is the effect the RPM deviation will have on the percentage of the solenoid valves' modulation - the percentage of the energized and de-energized time. The "wide" deviation band (A) will have less effect on the percentage change of the Pulse Width Modulation.

Configuration of the deviation band is carried out using the keyboard of the SOBO controller.

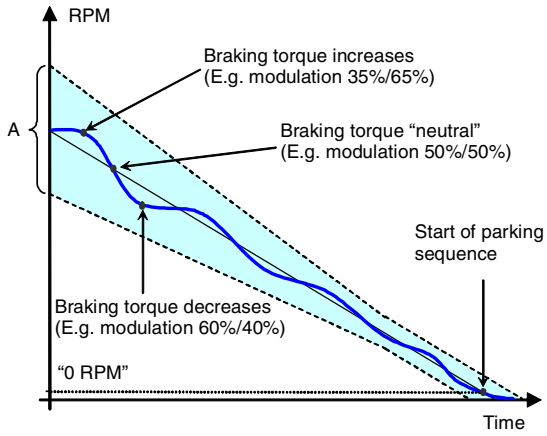

Fig. 9:

Illustrating a regulation sequence based on a "wide"

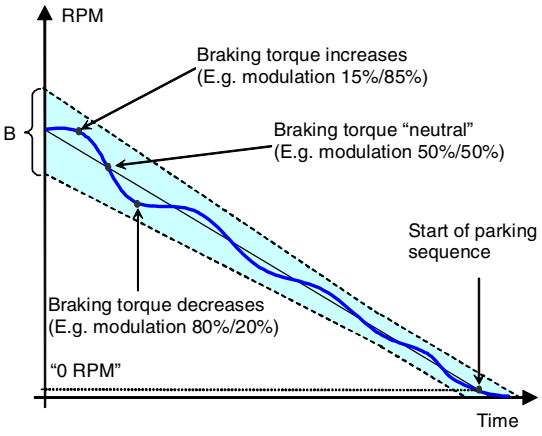

Fig. 10:

Illustrating a regulation sequence based on a "narrow"

Controlled Braking Torque

The basics of SOBO braking control and "soft" braking are firstly: To "apply" just enough braking torque to stop the brake disc rotation as required. The "0 RPM" value is an important part of the regulation as

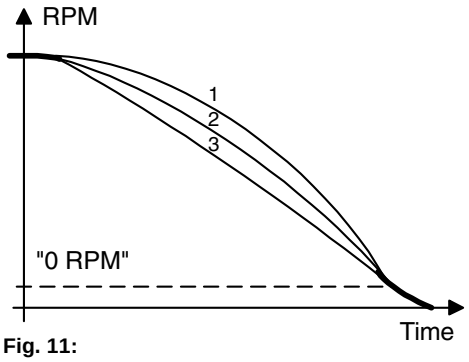

Fig. 11:

Illustrating 3 different curves for the RPM value as a function of time based on a conveyor system, for example, where curve 1 is a fully loaded conveyor, curve 2 is half loaded and curve 3 empty.

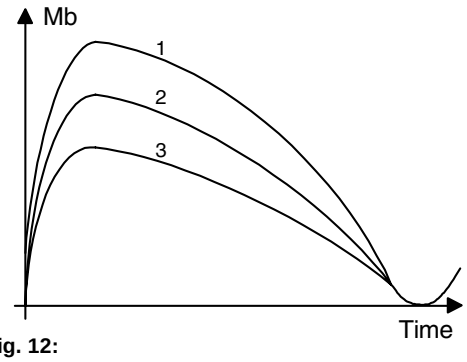

Fig. 12:

Illustrating the Braking Torque where curve 1 shows the extra braking torque "applied" to stop the fully loaded conveyor compared with the half loaded, curve

"0 RPM" and the SOBO Parking Sequence

One of the most unique functions of the SOBO Controller is the parking sequence. This function is particularly useful for stopping wind turbines and conveyors. The parking sequence is employed using 2 - 4 internal braking ramps that are built into the SOBO Controller. These braking ramps are based on the Pulse Width Modulation function and can be set to begin at a percentage of the nominal speed. This speed is pre-determined by the user to be the artificial zero RPM point (“0 RPM”).

When the artificial zero point (“0 RPM”) is reached, the braking ramps are activated to manage the braking sequence until the system reaches a true 0 RPM. These ramps can be set to any configuration, allowing for a parking sequence up to a maximum duration of 6 minutes. Using the parking sequence function reduces the amount of strain and fluctuation introduced into the drive system. This controlled braking torque will add to the lifetime of the mechanical machine involved.

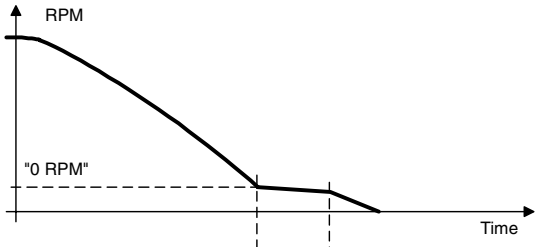

Fig. 13:

Illustrating the RPM value as a function of time in connection with a braking sequence where two internal braking ramps are activated at "0 RPM".

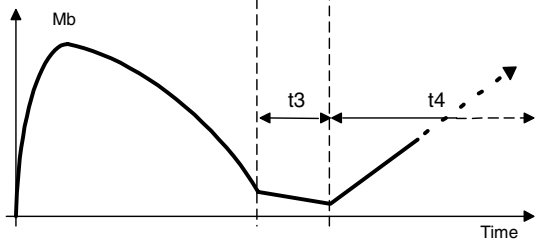

Fig. 14:

Illustrating the same braking sequence, showing the braking torque as a function of time. The braking torque is strong at the beginning and then gradually reduces as the inertia of the machine is reduced. The regulation after "0 RPM" is based on the two internal parking

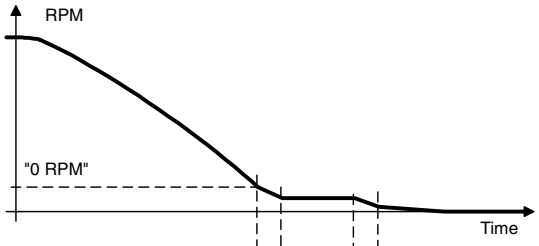

Fig. 15:

Illustrating a parking sequence where all four internal ramps are used. The difference in function compared to Fig. 13 is that the RPM value is kept at the same speed after "0 RPM". The machine is actually "free-wheeling" for

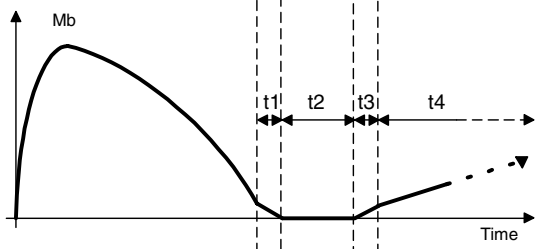

Fig. 16:

Illustrating the braking torque where the ramp t1 is the internal ramp that will bring the braking torque to 0. The ramp t2 is the time with no braking torque. The internal ramp t3 is the ramp for "neutral" and t4 the ramp for maxi-

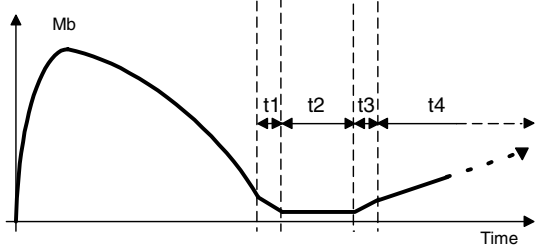

Fig. 17:

Illustrating the same parking sequence based on the 4 ramps as in Fig. 16, but the braking torque is not regulated to 0. The internal ramp t2 is regulated by the SOBO Controller for 0 braking torque, but the combination of SOBO regulation and a special hydraulic function will give a braking torque kept at a minimum value. The idea is to have the brake pads in

The SOBO Controller

The SOBO Controller is a programmable micro-processor-based controller. The SOBO concept comprises 3 different

models (see page 10). The controller is

extremely user-friendly with just one key

for each main function and minimum use

The Speed Sensor

The Speed Sensor (RPM Sensor) is an important part of the SOBO closed loop system. The proximity sensor (as below) is a commonly used RPM sensor, but the SOBO controller is also designed for encoders.

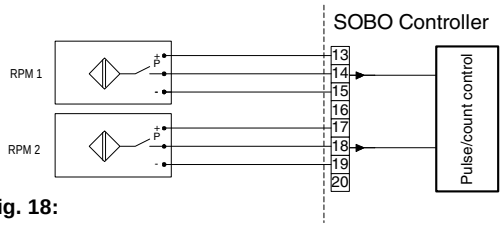

Fig. 18:

Note: The RUN BACK function requires 2 proximity switches or a two-channel encoder.

The Basic Connections

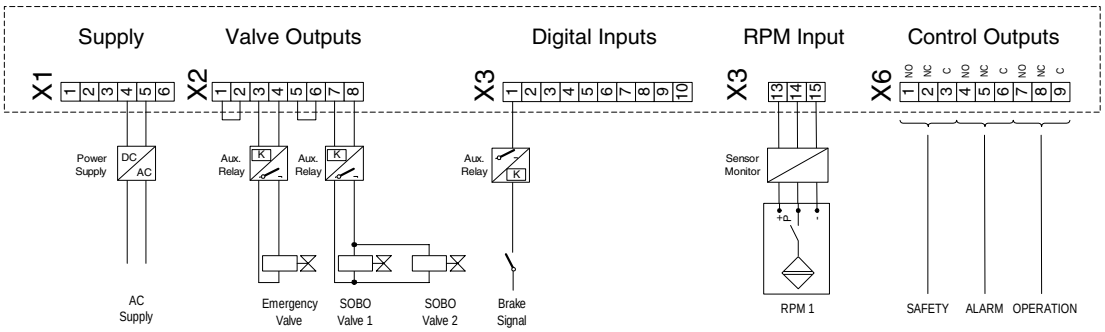

Fig. 19:

X1: 4,5, Power Supply: AC / 24 V DC.

X2: 3,4 and 7,8: 24 V DC output for the Solenoid Valves' auxiliary relays.

X3: 1-9: Digital inputs for Brake Signal and all other input commands to the controller.

X3: 13,14 and 15: Speed (RPM) Sensor signal.

X6: 1,2,3 - 4,5,6 - 7,8,9: Output signals from the SOBO Controller.

The **"SAFETY"** signal is a fail-safe relay output intended as the "Safety Chain" in applications where this function is used.

The **"ALARM"** signal is a fail-safe relay output. The relay will be deactivated in the event of any programmed alarm situation.

The Hydraulic Power Unit

The SOBO Hydraulic Power Unit is an integral part of the SOBO brake concept and as flexible as the SOBO Controller. The multipurpose specially engineered manifold block is designed for the max. pressure function, quick brake release and double-dump function. All the functions are activated and controlled by the SOBO control cabinet.

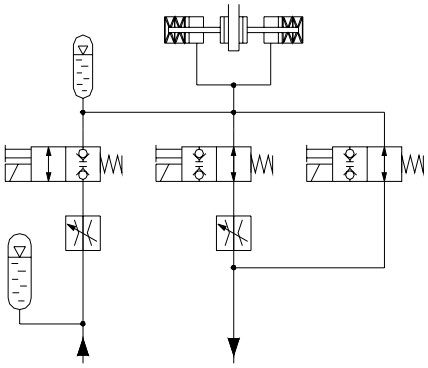

Fig. 20:

The passive (fail-safe) brake system is used for safety brake systems e.g. for escalators, mine winders, people conveyors and wind turbines.

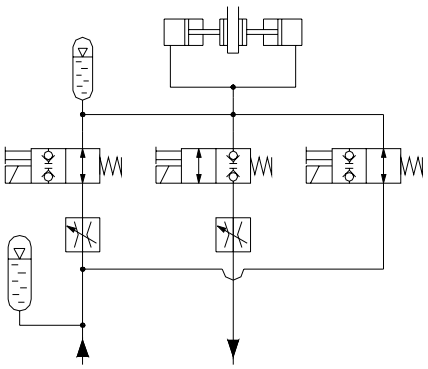

Fig. 21:

Active brakes are mainly used for applications where it may be fatal if the brake is applied when not wanted.

The Disc Brake

Svendborg Brakes is a world leader in the field of mechanical brakes, and springapplied disc brakes are the type most commonly used for SOBO brake applications.

One of the unique developments from Svendborg Brakes is the **AWA** (**A**utomatic **W**ear **A**djustment) brake, and this type can also be used as a "SOBO brake". The range of brakes includes brakes with a brake force from 2,000 N to 500,000 N.

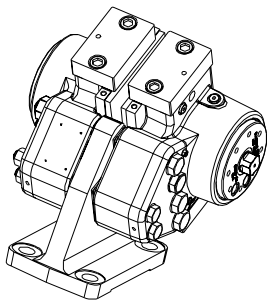

Fig. 22:

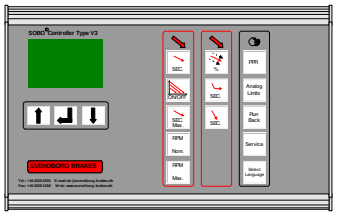
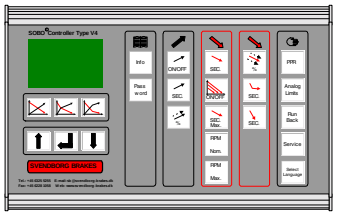
Svendborg Brakes has a large and rapidly growing R&D department that employs the most sophisticated design software. Our objective is to offer the solutions of tomorrow ahead of any other brake supplier.

Additional functions of the SOBO Controller

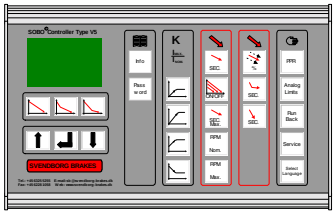
The SOBO Controller has some additional functions, which allow adjustment of the concept to suit present or future customer requirements. The following is an overview of these additional functions:



SOBO V3



SOBO V4



SOBO V5
